Third. Production is not only directly consumption and consumption directly production; nor is production merely a means of consumption and consumption the purpose of production. In other words, not only does each furnish the other with its object; production, the material object of consumption; consumption, the ideal object of production. On the contrary, either one is not only directly the other, not (?) only a means of furthering the other, but while it is taking place, creates the other as such for itself (?). Consumption completes the act of production by giving the finishing touch to the product as such, by destroying the latter, by breaking up its independent material form; by bringing to a state of readiness, through the necessity of repetition, the disposition to produce developed in the first act of production; that is to say, it is not only the concluding act through which the product becomes a product, but also [the one] through which the producer becomes a producer. On the other hand, production produces consumption, by determining the manner of consumption, and further, by creating the incentive for consumption, the very ability to consume, in the form of want. This latter identity mentioned under point 3, is much discussed in political economy in connection with the treatment of the relations of demand and supply, of objects and wants, of natural wants and those created by society.

Hence, it is the simplest matter with a Hegelian to treat production and consumption as identical. And this has been done not only by socialist writers of fiction but even by economists, e. g. Say; the latter maintained that if we consider a nation as a whole, or mankind *in abstracto* — her production is at the same time her consumption. Storch pointed out Say's error by calling attention to the fact that a nation does not entirely consume her product, but also creates means of production, fixed capital, etc. To consider society as a single individual is moreover a false mode of speculative reasoning. With an individual, production and consumption appear as different aspects of one act. The important point to be emphasized here is that if production and consumption be considered as activities of one individual or of separate individuals, they appear at any rate as aspects of one process in which production forms the actual starting point and is, therefore, the predominating factor. Consumption, as a natural necessity, as a want, constitutes an internal factor of productive activity, but the latter is the starting point of realization and, therefore, its predominating factor, the act into which the entire process resolves itself in the end. The individual produces a certain article and turns again into himself by consuming it; but he returns as a productive and a self-reproducing individual. Consumption thus appears as a factor of production.

In society, however, the relation of the producer to his product, as soon as it is completed, is an outward one, and the return of the product to the individual depends on his relations to other individuals. He does not take immediate possession of it. Nor does the direct appropriation of the product constitute his purpose, when he produces in society. Between the producer and the product distribution steps in, which determines by social laws his share in the world of products; that is to say, distribution steps in between production and consumption.

Does distribution form an independent sphere standing side by side with and outside of production?

b. Production and Distribution. In perusing the common treatises on economics one can not help being struck with the fact that everything is treated there twice; e. g., under distribution, there figure rent, wages, interest, and profit; while under production we find land, labor, and capital as agents of production. As regards capital, it is at once clear that it is counted twice: first, as an agent of production; second, as a source of income; as determining factors and definite forms of distribution, interest

and profit figure as such also in production, since they are forms, in which capital increases and grows, and are consequently factors of its own production. Interest and profit, as forms of distribution, imply the existence of capital as an agent of production. They are forms of distribution which have for their prerequisite capital as an agent of production. They are also forms of reproduction of capital.

In the same manner, wages is wage-labor when considered under another head; the definite character which labor has in one case as an agent of production, appears in the other as a form of distribution. If labor were not fixed as wage-labor, its manner of participation in distribution¹⁵⁹ would not appear as wages, as is the case e. g. under slavery. Finally, rent — to take at once the most developed form of distribution — by means of which landed property receives its share of the products, implies the existence of large landed property (properly speaking, agriculture on a large scale) as an agent of production, and not simply land, no more than wages represents simply labor. The relations and methods of distribution appear, therefore, merely as the reverse sides of the agents of production. An individual who participates in production as a wage laborer, receives his share of the products, i.e. of the results of production, in the form of wages. The subdivisions and organization of distribution are determined by the subdivisions and organization of production. Distribution is itself a product of production, not only in so far as the material goods are concerned, since only the results of production can be distributed; but also as regards its form, since the definite manner of participation in production determines the particular form of distribution, the form under which participation in distribution takes place. It is quite an illusion to place land under production, rent under distribution, etc.

Economists, like Ricardo, who are accused above all of having paid exclusive attention to production, define distribution, therefore, as the exclusive subject of political economy, because they instinctively¹⁶⁰ regard the forms of distribution as the clearest forms in which the agents of production find expression in a given society.

To the single individual distribution naturally appears as a law established by society determining his position in the sphere of production, within which he produces, and thus antedating production. At the outset the individual has no capital, no landed property. From his birth he is assigned to wage-labor by the social process of distribution. But this very condition

of being assigned to wage-labor is the result of the existence of capital and landed property as independent agents of production.

From the point of view of society as a whole, distribution seems to antedate and to determine production in another way as well, as a pre-economic fact, so to say. A conquering people divides the land among the conquerors establishing thereby a certain division and form of landed property and determining the character of production; or, it turns the conquered people into slaves and thus makes slave labor the basis of production. Or, a nation, by revolution, breaks up large estates into small parcels of land and by this new distribution imparts to production a new character. Or, legislation perpetuates land ownership in large families or distributes labor as an hereditary privilege and thus fixes it in castes.

In all of these cases, and they are all historic, it is not distribution that seems to be organized and determined by production, but on the contrary, production by distribution.

In the most shallow conception of distribution, the latter appears as a distribution of products and to that extent as further removed from and quasi-independent of production. But before distribution means distribution of products, it is first, a distribution of the means of production, and second, what is practically another wording of the same fact, it is a distribution of the members of society among the various kinds of production (the subjection of individuals to certain conditions of production). The distribution of products is manifestly a result of this distribution, which is bound up with the process of production and determines the very organization of the latter. To treat of production apart from the distribution which is comprised in it, is plainly an idle abstraction. Conversely, we know the character of the distribution of products the moment we are given the nature of that other distribution which forms originally a factor of production. Ricardo, who was concerned with the analysis of production as it is organized in modern society and who was the economist of production *par excellence*, for that very reason declares *not* production but distribution as the subject proper of modern economics. We have here another evidence of the insipidity of the economists who treat production as an eternal truth, and banish history to the domain of distribution.

What relation to production this distribution, which has a determining influence on production itself, assumes, is plainly a question which falls within the province of production. Should it be maintained that at least to

the extent that production depends on a certain distribution of the instruments of production, distribution in that sense precedes production and constitutes its prerequisite; it may be replied that production has in fact its prerequisite conditions, which form factors of it. These may appear at first to have a natural origin. By the very process of production they are changed from natural to historical, and if they appear during one period as a natural prerequisite of production, they formed at other periods its historical result. Within the sphere of production itself they are undergoing a constant change. E. g., the application of machinery produces a change in the distribution of the instruments of production as well as in that of products, and modern land ownership on a large scale is as much the result of modern trade and modern industry, as that of the application of the latter to agriculture.

All of these questions resolve themselves in the last instance to this: How do general historical conditions affect production and what part does it play at all in the course of history? It is evident that this question can be taken up only in connection with the discussion and analysis of production.

Yet in the trivial form in which these questions are raised above, they can be answered just as briefly. In the case of all conquests three ways lie open. The conquering people may impose its own methods of production upon the conquered (e. g. the English in Ireland in the nineteenth century, partly also in India); or, it may allow everything to remain as it was contenting itself with tribute (e. g. the Turks and the Romans); or, the two systems by mutually modifying each other may result in something new, a synthesis (which partly resulted from the Germanic conquests). In all of these conquests the method of production, be it of the conquerors, the conquered, or the one resulting from a combination of both, determines the nature of the new distribution which comes into play. Although the latter appears now as the prerequisite condition of the new period of production, it is in itself but a product of production, not of production belonging to history in general, but of production relating to a definite historical period. The Mongols with their devastations in Russia e. g. acted in accordance with their system of production, for which sufficient pastures on large uninhabited stretches of country are the main prerequisite. The Germanic barbarians, with whom agriculture carried on with the aid of serfs was the traditional system of production and who were accustomed to lonely life in the country, could introduce the same conditions in the Roman provinces so

much easier since the concentration of landed property which had taken place there, died away completely with the older systems of agriculture. There is a prevalent tradition that in certain periods robbery constituted the only source of living. But in order to be able to plunder, there must be something to plunder, i.e. there must be production.¹⁶¹ And even the method of plunder is determined by the method of production. A stockjobbing nation¹⁶² e. g. can not be robbed in the same manner as a nation of shepherds.

In the case of the slave the instrument of production is robbed directly. But then the production of the country in whose interest he is robbed, must be so organized as to admit of slave labor, or (as in South America, etc.) a system of production must be introduced adapted to slavery.

Laws may perpetuate an instrument of production, e. g. land, in certain families. These laws assume an economic importance if large landed property is in harmony with the system of production prevailing in society, as is the case e. g. in England. In France agriculture had been carried on on a small scale in spite of the large estates, and the latter were, therefore, broken up by the Revolution. But how about the legislative attempt to perpetuate the minute subdivision of the land? In spite of these laws land ownership is concentrating again. The effect of legislation on the maintenance of a system of distribution and its resultant influence on production are to be determined elsewhere.

c. Exchange and Circulation. Circulation is but a certain aspect of exchange, or it may be defined as exchange considered as a whole. Since *exchange* is an intermediary factor between production and its dependent, distribution, on the one hand, and consumption, on the other; and since the latter appears but as a constituent of production, exchange is manifestly also a constituent part of production.

In the first place, it is clear that the exchange of activities and abilities which takes place in the sphere of production falls directly within the latter and constitutes one of its essential elements. In the second place, the same is true of the exchange of products, in so far as it is a means of completing a certain product, designed for immediate consumption. To that extent exchange constitutes an act included in production. Thirdly, the so-called exchange between dealers and dealers¹⁶³ is by virtue of its organization determined by production, and is itself a species of productive activity. Exchange appears to be independent of and indifferent to production only in

the last stage when products are exchanged directly for consumption. But in the first place, there is no exchange without a division of labor, whether natural or as a result of historical development; secondly, private exchange implies the existence of private production; thirdly, the intensity of exchange, as well as its extent and character are determined by the degree of development and organization of production, as e. g. exchange between city and country, exchange in the country, in the city, etc. Exchange thus appears in all its aspects to be directly included in or determined by production.

The result we arrive at is not that production, distribution, exchange, and consumption are identical, but that they are all members of one entity, different sides of one unit. Production predominates not only over production itself in the opposite sense of that term, but over the other elements as well. With it the process constantly starts over again. That exchange and consumption can not be the predominating elements is self evident. The same is true of distribution in the narrow sense of distribution of products; as for distribution in the sense of distribution of the agents of production, it is itself but a factor of production. A definite [form of] production thus determines the [forms of] consumption, distribution, exchange, and *also the mutual relations between these various elements*. Of course, production *in its one-sided form* is in its turn influenced by other elements; e. g. with the expansion of the market, i.e. of the sphere of exchange, production grows in volume and is subdivided to a greater extent.

With a change in distribution, production undergoes a change; as e. g. in the case of concentration of capital, of a change in the distribution of population in city and country, etc. Finally, the demands of consumption also influence production. A mutual interaction takes place between the various elements. Such is the case with every organic body.

3. THE METHOD OF POLITICAL ECONOMY.

When we consider a given country from a politico-economic standpoint, we begin with its population, then analyze the latter according to its subdivision into classes, location in city, country, or by the sea, occupation in different branches of production; then we study its exports and imports, annual production and consumption, prices of commodities, etc. It seems to be the correct procedure to commence with the real and concrete aspect of conditions as they are; in the case of political economy, to commence with population which is the basis and the author of the entire productive activity of society. Yet, on closer consideration it proves to be wrong. Population is an abstraction, if we leave out e. g. the classes of which it consists. These classes, again, are but an empty word, unless we know what are the elements on which they are based, such as wage-labor, capital, etc. Those imply, in their turn, exchange, division of labor, prices, etc. Capital, e. g. does not mean anything without wage-labor, value, money, price, etc. If we start out, therefore, with population, we do so with a chaotic conception of the whole, and by closer analysis we will gradually arrive at simpler ideas; thus we shall proceed from the imaginary concrete to less and less complex abstractions, until we get at the simplest conception. This once attained, we might start on our return journey until we would finally come back to population, but this time not as a chaotic notion of an integral whole, but as a rich aggregate of many conceptions and relations. The former method is the one which political economy had adopted in the past at its inception. The economists of the seventeenth century, e. g., always started out with the living aggregate: population, nation, state, several states, etc., but in the end they invariably arrived, by means of analysis, at certain leading, abstract general principles, such as division of labor, money, value, etc. As soon as these separate elements had been more or less established by abstract reasoning, there arose the systems of political economy which start from simple conceptions, such as labor, division of labor, demand, exchange value, and conclude with state, international exchange and world market. The latter is manifestly the scientifically correct method. The concrete is concrete, because it is a combination of many objects with different destinations, i.e. a unity of diverse elements. In our thought, it therefore

appears as a process of synthesis, as a result, and not as a starting point, although it is the real starting point and, therefore, also the starting point of observation and conception. By the former method the complete conception passes into an abstract definition; by the latter, the abstract definitions lead to the reproduction of the concrete subject in the course of reasoning. Hegel fell into the error, therefore, of considering the real as the result of self-coordinating, self-absorbed, and spontaneously operating thought, while the method of advancing from the abstract to the concrete is but a way of thinking by which the concrete is grasped and is reproduced in our mind as a concrete. It is by no means, however, the process which itself generates the concrete. The simplest economic category, say, exchange value, implies the existence of population, population that is engaged in production under certain conditions; it also implies the existence of certain types of family, clan, or state, etc. It can have no other existence except as an abstract one-sided relation of an already given concrete and living aggregate.

As a category, however, exchange value leads an antediluvian existence. And since our philosophic consciousness is so arranged that only the image of the man that it conceives appears to it as the real man and the world as it conceives it, as the real world; it mistakes the movement of categories for the real act of production (which unfortunately (?) receives only its impetus from outside) whose result is the world; that is true — here we have, however, again a tautology — in so far as the concrete aggregate is a thought aggregate, in so far as the concrete subject of our thought is in fact a product of thought, of comprehension; not, however, in the sense of a product of a self-emanating conception which works outside of and stands above observation and imagination, but of a mental consummation of observation and imagination. The whole, as it appears in our heads as a thought-aggregate, is the product of a thinking mind which grasps the world in the only way open to it, a way which differs from the one employed by the artistic, religious, or practical mind. The concrete subject continues to lead an independent existence after it has been grasped, as it did before, outside of the head, so long as the head contemplates it only speculatively, theoretically. So that in the employment of the theoretical method [in political economy], the subject, society, must constantly be kept in mind as the premise from which we start.

But have these simple categories no independent historical or natural existence antedating the more concrete ones? *Ça depend*. For instance, in

his Philosophy of Law Hegel rightly starts out with possession, as the simplest legal relation of individuals. But there is no such thing as possession before the family or the relations of lord and serf, which are a great deal more concrete relations, have come into existence. On the other hand, one would be right in saying that there are families and clans which only *possess*, but do not *own* things. The simpler category thus appears as a relation of simple family and clan communities with respect to property. In earlier society the category appears as a simple relation of a developed organism, but the concrete substratum from which springs the relation of possession, is always implied. One can imagine an isolated savage in possession of things. But in that case possession is no legal relation. It is not true that the family came as the result of the historical evolution of possession. On the contrary, the latter always implies the existence of this "more concrete category of law." Yet so much may be said, that the simple categories are the expression of relations in which the less developed concrete entity may have been realized without entering into the manifold relations and bearings which are mentally expressed in the concrete category; but when the concrete entity attains fuller development it will retain the same category as a subordinate relation.

Money may exist and actually had existed in history before capital, or banks, or wage-labor came into existence. With that in mind, it may be said that the more simple category can serve as an expression of the predominant relations of an undeveloped whole or of the subordinate relations of a more developed whole, [relations] which had historically existed before the whole developed in the direction expressed in the more concrete category. In so far, the laws of abstract reasoning which ascends from the most simple to the complex, correspond to the actual process of history.

On the other hand, it may be said that there are highly developed but historically unripe forms of society in which the highest economic forms are to be found, such as co-operation, advanced division of labor, etc., and yet there is no money in existence, e. g. Peru.

In Slavic communities also, money, as well as exchange to which it owes its existence, does not appear at all or very little within the separate communities, but it appears on their boundaries in their inter-communal traffic; in general, it is erroneous to consider exchange as a constituent element originating within the community. It appears at first more in the mutual relations between different communities, than in those between the

members of the same community. Furthermore, although money begins to play its part everywhere at an early stage, it plays in antiquity the part of a predominant element only in one-sidedly developed nations, viz. trading nations, and even in most cultured antiquity, in Greece and Rome, it attains its full development, which constitutes the prerequisite of modern bourgeois society, only in the period of their decay. Thus, this quite simple category attained its culmination in the past only at the most advanced stages of society. Even then it did not pervade (?) all economic relations; in Rome e. g. at the time of its highest development taxes and payments in kind remained the basis. As a matter of fact, the money system was fully developed there only so far as the army was concerned; it never came to dominate the entire system of labor.

Thus, although the simple category may have existed historically before the more concrete one, it can attain its complete internal and external development only in complex (?) forms of society, while the more concrete category has reached its full development in a less advanced form of society.

Labor is quite a simple category. The idea of labor in that sense, as labor in general, is also very old. Yet, “labor” thus simply defined by political economy is as much a modern category, as the conditions which have given rise to this simple abstraction. The monetary system, e. g. defines wealth quite objectively, as a thing (?)¹⁶⁴ in money. Compared with this point of view, it was a great step forward, when the industrial or commercial system came to see the source of wealth not in the object but in the activity of persons, viz. in commercial and industrial labor. But even the latter was thus considered only in the limited sense of a money producing activity. The physiocratic system [marks still further progress] in that it considers a certain form of labor, viz. agriculture, as the source of wealth, and wealth itself not in the disguise of money, but as a product in general, as the general result of labor. But corresponding to the limitations of the activity, this product is still only a natural product. Agriculture is productive, land is the source of production *par excellence*. It was a tremendous advance on the part of Adam Smith to throw aside all limitations which mark wealth-producing activity and [to define it] as labor in general, neither industrial, nor commercial, nor agricultural, or one as much as the other. Along with the universal character of wealth-creating activity we have now the universal character of the object defined as wealth, viz. product in general,

or labor in general, but as past incorporated labor. How difficult and great was the transition, is evident from the way Adam Smith himself falls back from time to time into the physiocratic system. Now, it might seem as though this amounted simply to finding an abstract expression for the simplest relation into which men have been mutually entering as producers from times of yore, no matter under what form of society. In one sense this is true. In another it is not.

The indifference as to the particular kind of labor implies the existence of a highly developed aggregate of different species of concrete labor, none of which is any longer the predominant one. So do the most general abstractions commonly arise only where there is the highest concrete development, where one feature appears to be jointly possessed by many, and to be common to all. Then it can not be thought of any longer in one particular form. On the other hand, this abstraction of labor is but the result of a concrete aggregate of different kinds of labor. The indifference to the particular kind of labor corresponds to a form of society in which individuals pass with ease from one kind of work to another, which makes it immaterial to them what particular kind of work may fall to their share. Labor has become here, not only categorically but really, a means of creating wealth in general and is no longer grown together with the individual into one particular destination. This state of affairs has found its highest development in the most modern of bourgeois societies, the United States. It is only here that the abstraction of the category “labor,” “labor in general,” labor *sans phrase*, the starting point of modern political economy, becomes realized in practice. Thus, the simplest abstraction which modern political economy sets up as its starting point, and which expresses a relation dating back to antiquity and prevalent under all forms of society, appears in this abstraction truly realized only as a category of the most modern society. It might be said that what appears in the United States as an historical product, — viz. the indifference as to the particular kind of labor — appears among the Russians e. g. as a natural disposition. But it makes all the difference in the world whether barbarians have a natural predisposition which makes them applicable alike to everything, or whether civilized people apply themselves to everything. And, besides, this indifference of the Russians as to the kind of work they do, corresponds to their traditional practice of remaining in the rut of a quite definite occupation until they are thrown out of it by external influences.

This example of labor strikingly shows how even the most abstract categories, in spite of their applicability to all epochs — just because of their abstract character — are by the very definiteness of the abstraction a product of historical conditions as well, and are fully applicable only to and under those conditions.

The bourgeois society is the most highly developed and most highly differentiated historical organization of production. The categories which serve as the expression of its conditions and the comprehension of its own organization enable it at the same time to gain an insight into the organization and the conditions of production which had prevailed under all the past forms of society, on the ruins and constituent elements of which it has arisen, and of which it still drags along some unsurmounted remnants, while what had formerly been mere intimation has now developed to complete significance. The anatomy of the human being is the key to the anatomy of the ape. But the intimations of a higher animal in lower ones can be understood only if the animal of the higher order is already known. The bourgeois economy furnishes a key to ancient economy, etc. This is, however, by no means true of the method of those economists who blot out all historical differences and see the bourgeois form in all forms of society. One can understand the nature of tribute, tithes, etc., after one has learned the nature of rent. But they must not be considered identical.

Since, furthermore, bourgeois society is but a form resulting from the development of antagonistic elements, some relations belonging to earlier forms of society are frequently to be found in it but in a crippled state or as a travesty of their former self, as e. g. communal property. While it may be said, therefore, that the categories of bourgeois economy contain what is true of all other forms of society, the statement is to be taken *cum grano salis*. They may contain these in a developed, or crippled, or caricatured form, but always essentially different. The so-called historical development amounts in the last analysis to this, that the last form considers its predecessors as stages leading up to itself and perceives them always one-sidedly, since it is very seldom and only under certain conditions that it is capable of self-criticism; of course, we do not speak here of such historical periods which appear to their own contemporaries as periods of decay. The Christian religion became capable to assist us to an objective view of past mythologies as soon as it was ready for self-criticism to a certain extent, *dynamei* so-to-say. In the same way bourgeois political economy first came

to understand the feudal, the ancient, and the oriental societies as soon as the self-criticism of the bourgeois society had commenced. So far as bourgeois political economy has not gone into the mythology of purely (?) identifying the bourgeois system with the past, its criticism of the feudal system against which it still had to wage war resembled Christian criticism of the heathen religions or Protestant criticism of Catholicism.

In the study of economic categories, as in the case of every historical and social science, it must be borne in mind that as in reality so in our mind the subject, in this case modern bourgeois society, is given and that the categories are therefore but forms of expression, manifestations of existence, and frequently but one-sided aspects of this subject, this definite society; and that, therefore, the origin of [political economy] *as a science* does not by any means date from the time to which it is referred *as such*. This is to be firmly held in mind because it has an immediate and important bearing on the matter of the subdivisions of the science.

For instance, nothing seems more natural than to start with rent, with landed property, since it is bound up with land, the source of all production and all existence, and with the first form of production in all more or less settled communities, viz. agriculture. But nothing would be more erroneous. Under all forms of society there is a certain industry which predominates over all the rest and whose condition therefore determines the rank and influence of all the rest.

It is the universal light with which all the other colors are tinged and are modified through its peculiarity. It is a special ether which determines the specific gravity of everything that appears in it.

Let us take for example pastoral nations (mere hunting and fishing tribes are not as yet at the point from which real development commences). They engage in a certain form of agriculture, sporadically. The nature of land-ownership is determined thereby. It is held in common and retains this form more or less according to the extent to which these nations hold on to traditions; such e. g. is land-ownership among the Slavs. Among nations whose agriculture is carried on by a settled population — the settled state constituting a great advance — where agriculture is the predominant industry, such as in ancient and feudal societies, even the manufacturing industry and its organization, as well as the forms of property which pertain to it, have more or less the characteristic features of the prevailing system of land ownership; [society] is then either entirely dependent upon agriculture,

as in the case of ancient Rome, or, as in the middle ages, it imitates in its city relations the forms of organization prevailing in the country. Even capital, with the exception of pure money capital, has, in the form of the traditional working tool, the characteristics of land ownership in the Middle Ages.

The reverse is true of bourgeois society. Agriculture comes to be more and more merely a branch of industry and is completely dominated by capital. The same is true of rent. In all the forms of society in which land ownership is the prevalent form, the influence of the natural element is the predominant one. In those where capital predominates the prevailing element is the one historically created by society. Rent can not be understood without capital, nor can capital, without rent. Capital is the all dominating economic power of bourgeois society. It must form the starting point as well as the end and be developed before land-ownership is. After each has been considered separately, their mutual relation must be analyzed.

It would thus be impractical and wrong to arrange the economic categories in the order in which they were the determining factors in the course of history. Their order of sequence is rather determined by the relation which they bear to one another in modern bourgeois society, and which is the exact opposite of what seems to be their natural order or the order of their historical development. What we are interested in is not the place which economic relations occupy in the historical succession of different forms of society. Still less are we interested in the order of their succession "in idea" (*Proudhon*), which is but a hazy (?) conception of the course of history. We are interested in their organic connection within modern bourgeois society.

The sharp line of demarkation (abstract precision) which so clearly distinguished the trading nations of antiquity, such as the Phenicians and the Carthaginians, was due to that very predominance of agriculture. Capital as trading or money capital appears in that abstraction, where capital does not constitute as yet the predominating element of society. The Lombardians and the Jews occupied the same position among the agricultural nations of the middle ages.

As a further illustration of the fact that the same category plays different parts at different stages of society, we may mention the following: one of the latest forms of bourgeois society, viz. stock companies, appear also at its beginning in the form of the great chartered monopolistic trading

companies. The conception of national wealth which is imperceptibly formed in the minds of the economists of the seventeenth century, and which partly continues to be entertained by those of the eighteenth century, is that wealth is produced solely for the state, but that the power of the latter is proportional to that wealth. It was as yet an unconsciously hypocritical way in which wealth announced itself and its own production as the aim of modern states considering the latter merely as a means to the production of wealth.

The order of treatment must manifestly be as follows: first, the general abstract definitions which are more or less applicable to all forms of society, but in the sense indicated above. Second, the categories which go to make up the inner organization of bourgeois society and constitute the foundations of the principal classes; capital, wage-labor, landed property; their mutual relations; city and country; the three great social classes, the exchange between them; circulation, credit (private). Third, the organization of bourgeois society in the form of a state, considered in relation to itself; the “unproductive” classes; taxes; public debts; public credit; population; colonies; emigration. Fourth, the international organization of production; international division of labor; international exchange; import and export; rate of exchange. Fifth, the world market and crises.

4. PRODUCTION, MEANS OF PRODUCTION, AND CONDITIONS OF PRODUCTION, THE RELATIONS OF PRODUCTION AND DISTRIBUTION.^{[165](#)}

THE CONNECTION BETWEEN FORM OF STATE AND PROPERTY ON THE ONE HAND AND RELATIONS OF PRODUCTION AND DISTRIBUTION(1) ON THE OTHER. LEGAL RELATIONS. FAMILY RELATIONS.

Notes on the points to be mentioned here and not to be omitted:¹⁶⁶

1. *War* attains complete development before peace; how certain economic phenomena, such as wage-labor, machinery, etc., are developed at an earlier date through war and in armies than within bourgeois society. The connection between productive force and the means of communication is made especially plain in the case of the army.

2. The relation between the idealistic and realistic methods of writing history; namely, the so-called history of civilization which is all a history of religion and states.

In this connection something may be said of the different methods hitherto employed in writing history. The so-called objective [method]. The subjective. (The moral and others). The philosophic.

3. *Secondary and tertiary*. Conditions of production which have been taken over or transplanted; in general, those that are not original. Here [is to be treated] the effect of international relations.

4. Objections to the materialistic character of this view. Its relation to naturalistic materialism.

5. The dialectics of the conceptions productive force (means of production) and relation of production, dialectics whose limits are to be determined and which does not do away with the concrete difference.

6. The unequal relation between the development of material production and art, for instance. In general, the conception of progress is not to be taken in the sense of the usual abstraction. In the case of art, etc., it is not so important and difficult to understand this disproportion as in that of practical social relations, e. g. the relation between education in the United States and Europe. The really difficult point, however, that is to be

discussed here is that of the unequal (?) development of relations of production as legal relations. As, e. g., the connection between Roman civil law (this is less true of criminal and public law) and modern production.

7. This conception of development appears to imply necessity. On the other hand, justification of accident. *Varia*. (Freedom and other points). (The effect of means of communication). World history does not always appear in history as the result of world history.

8. The starting point [is to be found] in certain facts of nature embodied subjectively and objectively in clans, races, etc.

4. Produktion, Produktionsmittel und Produktionsverhältnisse. Produktionsverhältnis und Verkehrsverhältnisse. Staats- und Eigentumsformen im Verhältnis zu den Produktions- und Verkehrsverhältnissen. Rechtsverhältnisse. Familienverhältnisse.

Notabene in bezug auf Punkte, die hier zu erwähnen und nicht vergessen werden dürfen:

1. Der Krieg ist früher ausgebildet, wie der Frieden: [Auszuführen wäre] die Art, wie durch den Krieg und in den Armeen etc. gewisse ökonomische Verhältnisse wie Lohnarbeit, Maschinerie etc. früher entwickelt [werden] als im Inneren der bürgerlichen Gesellschaft. Auch das Verhältnis von Produktivkraft und Verkehrsverhältnissen wird besonders anschaulich in der Armee.

2. Verhältnis der bisherigen idealen Geschichtsschreibung zur realen. Namentlich die sogenannte Kulturgeschichte, die alle Religions- und Staatengeschichte.

Bei der Gelegenheit kann auch etwas gesagt werden über die verschiedenen Arten der bisherigen Geschichtsschreibung. Sogenannte objektive. Subjektive. (Moralische und andere.) Philosophische.

3. Sekundäres und Tertiäres. Ueberhaupt abgeleitete, übertragene, nicht ursprüngliche Produktionsverhältnisse. Hier [ist das] Einspielen der internationalen Verhältnisse [zu behandeln].

4. Vorwürfe über Materialismus dieser Auffassung. Verhältnis zum naturalistischen Materialismus.

5. Dialektik der Begriffe Produktivkraft (Produktionsmittel) und Produktionsverhältnis, eine Dialektik, deren Grenzen zu bestimmen sind und den realen Unterschied nicht aufhebt.

6. Das unegale Verhältnis der Entwicklung der materiellen Produktion zum Beispiel zur künstlerischen. Ueberhaupt ist der Begriff des Fortschritts

nicht in der gewöhnlichen Abstraktion zu fassen. Bei der Kunst etc. ist diese Disproportion noch nicht so wichtig und schwierig zu fassen als innerhalb praktisch-sozialer Verhältnisse selbst, zum Beispiel das Bildungsverhältnis der Vereinigten Staaten zu Europa. Der eigentlich schwierige Punkt, der hier zu erörtern, ist aber der, wie die Produktionsverhältnisse als Rechtsverhältnisse in ungleiche (?) Entwicklung treten. Also zum Beispiel das Verhältnis des römischen Privatrechts (im Kriminalrecht und öffentlichen ist das wenige der Fall) zur modernen Produktion.

7. Diese Auffassung erscheint als notwendige Entwicklung. Aber Berechtigung des Zufalls. Varia.¹⁶⁷ (Die Freiheit und anderes noch.) (Einwirkung der Kommunikationsmittel.) Weltgeschichte eigentlich¹⁶⁸ nicht immer in der Geschichte als weltgeschicht[liches] Resultat.

8. Der Ausgangspunkt [ist] natürlich von der Naturbestimmtheit [zunehmen]; subjektiv und objektiv, Stämme, Rassen etc.

It is well known that certain periods of highest development of art stand in no direct connection with the general development of society, nor with the material basis and the skeleton structure of its organization. Witness the example of the Greeks as compared with the modern nations or even Shakespeare. As regards certain forms of art, as e. g. the epos, it is admitted that they can never be produced in the world-epoch making form as soon as art as such comes into existence; in other words, that in the domain of art certain important forms of it are possible only at a low stage of its development. If that be true of the mutual relations of different forms of art within the domain of art itself, it is far less surprising that the same is true of the relation of art as a whole to the general development of society. The difficulty lies only in the general formulation of these contradictions. No sooner are they specified than they are explained. Let us take for instance the relation of Greek art and of that of Shakespeare's time to our own. It is a well known fact that Greek mythology was not only the arsenal of Greek art, but also the very ground from which it had sprung. Is the view of nature and of social relations which shaped Greek imagination and Greek [art] possible in the age of automatic machinery, and railways, and locomotives, and electric telegraphs? Where does Vulcan come in as against Roberts & Co.; Jupiter, as against the lightning rod; and Hermes, as against the Credit Mobilier? All mythology masters and dominates and shapes the forces of nature in and through the imagination; hence it disappears as soon as man gains mastery over the forces of nature. What becomes of the Goddess

Fame side by side with Printing House Square?¹⁶⁹ Greek art presupposes the existence of Greek mythology, i.e. that nature and even the form of society are wrought up in popular fancy in an unconsciously artistic fashion. That is its material. Not, however, any mythology taken at random, nor any accidental unconsciously artistic elaboration of nature (including under the latter all objects, hence [also] society). Egyptian mythology could never be the soil or womb which would give birth to Greek art. But in any event [there had to be] *a* mythology. In no event [could Greek art originate] in a society which excludes any mythological explanation of nature, any mythological attitude towards it and which requires from the artist an imagination free from mythology.

Looking at it from another side: is Achilles possible side by side with powder and lead? Or is the Iliad at all compatible with the printing press and steam press? Does not singing and reciting and the muses necessarily go out of existence with the appearance of the printer's bar, and do not, therefore, disappear the prerequisites of epic poetry?

But the difficulty is not in grasping the idea that Greek art and epos are bound up with certain forms of social development. It rather lies in understanding why they still constitute with us a source of aesthetic enjoyment and in certain respects prevail as the standard and model beyond attainment.

A man can not become a child again unless he becomes childish. But does he not enjoy the artless ways of the child and must he not strive to reproduce its truth on a higher plane? Is not the character of every epoch revived perfectly true to nature in child nature? Why should the social childhood of mankind, where it had obtained its most beautiful development, not exert an eternal charm as an age that will never return? There are ill-bred children and precocious children. Many of the ancient nations belong to the latter class. The Greeks were normal children. The charm their art has for us does not conflict with the primitive character of the social order from which it had sprung. It is rather the product of the latter, and is rather due to the fact that the unripe social conditions under which the art arose and under which alone it could appear can never return.

(End of Manuscript.)

ENDNOTES

¹ Cf. Seligman, “The Economic Interpretation of History.” MacMillan. 1902.

² Aristotle, d. Rep. L. I, c. 9 (edit. I Bekkeri Oxonii, 1837)

“ἐκαστου γὰρ κτήματος διττὴ ἡ χρῆσις ἐστίν ... ἡ μὲν οἰκεία, ἡ δὲ οὐκ οἰκεία τοῦ πράγματος, οἷον ὑποδηματος ἢ τε ὑπόδησις καὶ ἡ μεταβλητική. Ἀμφότεραι γὰρ ὑποδηματος χρήσεις· καὶ γὰρ ἢ ἀλλαττομενος τῷ δεομένῳ ὑποδηματος ἀντὶ νομίσματος ἢ τροφῆς χρῆται τῷ ὑποδηματι ἢ ὑπόδημα, ἀλλ’ οὐ τὴν οἰκείαν χρῆσιν· οὐ γὰρ ἀλλαγῆς ἕνεκεν γέγονεν. Τὸν αὐτὸν δὲ τρόπον ἔχει καὶ περὶ τῶν ἄλλων κτημάτων.”

(“Of everything which we possess there are two uses: — one is the proper, and the other the improper or secondary use of it. For example, a shoe is used for wear, and is used for exchange; both are uses of the shoe. He who gives a shoe in exchange for money or food to him who wants one, does indeed use the shoe as a shoe, but this is not its proper or primary purpose, for a shoe is not made to be an object of barter. The same may be said of all possessions.” The Politics of Aristotle, translated into English by B. Jowett, Oxford, 1885, v. I., page 15.)

³ That is the reason why German compilers are so fond of dwelling on use-value, calling it a “good.” See e. g. L. Stein, “System der Staatswissenschaften,” v. I., chapter on “goods” (Güter). For intelligent information on “goods” one must turn to treatises on commodities.

⁴ A ridiculous presumption has gained currency of late to the effect that common property in its primitive form is specifically a Slavonian, or even exclusively Russian form. It is the primitive form which we can prove to have existed among Romans, Teutons, and Celts; and of which numerous examples are still to be found in India, though in a partly ruined state. A closer study of the Asiatic, especially of Indian forms of communal ownership would show how from the different forms of primitive communism different forms of its dissolution have been developed. Thus e. g. the various original types of Roman and Teutonic private property can be traced back to various forms of Indian communism.

⁵ “La Ricchezza è una ragione tra due persone.” (“Value is a relation between two persons”) Galiani, “Della Moneta,” page 220 in vol. II. of Custodi’s collection of “Scrittori classici Italiani di Economia Politica. Parte Moderna,” Milano, 1803.

⁶ “In its natural state, matter ... is always destitute of value.” McCulloch, “A Discourse on the Rise, Progress, Peculiar Objects, and Importance of Political Economy,” 2nd edition, Edinburgh, 1825, pg. 48. It is evident how even a McCulloch stands above the fetishism of German “thinkers”, who declare “matter” and half a dozen other foreign things to be elements of value. Cf. e. g. L. Stein, l. c. v. I., page 110.

⁷ Berkeley, *The Querist*, London, 1750.

⁸ Thomas Cooper, *Lectures on the Elements of Political Economy*, London, 1831, page 99.

⁹ F. List could never grasp the difference between labor as a source of use-value and labor as the creator of certain social form of wealth or exchange value, because comprehension was altogether foreign to his practical mind; he therefore saw in the modern English economists mere plagiarists of Moses, the Egyptian.

¹⁰ It can be readily understood what kind of “service” is rendered by the category “service” to economists of the type of J. B. Say and F. Bastiat, whose pondering sagacity, as Malthus has justly remarked, always abstracts from the specially definite forms of economic relations.

¹¹ “Egli è proprio ancora delle misure d’aver si fatta relazione colle cose misurate, che in certo modo la misurata divien misura della misurante.” Montanari, *Della Moneta*, page 48 in v. III of Custodi’s “Scrittori classici Italiani di Economia Politica. Parte Antica.” (“It is the property of measure to be in such a relation to the things measured, that in a certain way the thing measured becomes the measure of the measuring thing.”)

¹² It is in that sense that Aristotle (see the passage quoted at the beginning of this chapter) conceives exchange value.

¹³ This expression is used by Genovesi.

¹⁴ Aristotle makes the same remark with reference to the private family as the primitive community. But the primitive form of family is the tribal family, from the historical dissolution of which the private family develops. ἐν μὲν οὖν τῇ πρώτῳ κοινωνίᾳ (τοῦτο δ’ ἐστὶν οἰκία) φανερόν ὅτι οὐδὲν ἐστὶν ἔργον αὐτῆς (namely τῆς ἀλλαγῆς) “And in the first community, which is the family, this art is obviously of no use.” Jowett’s transl. l. c.)

¹⁵ “Money is, in fact, only the instrument for carrying on buying and selling (but, if you please, what do you understand by buying and selling?) and the consideration of it no more forms a part of the

science of political economy, than the consideration of ships, or steam engines, or of any other instrument employed to facilitate the production and distribution of wealth.” Th. Hodgskin, *Popular Political Economy*, etc. London, 1827, page 178, 179.

¹⁶ A comparative study of the writings and characters of Petty and Boisguillebert, outside of the light which it would throw upon the difference of French and English society at the end of the seventeenth and the beginning of the eighteenth centuries, would disclose the origin of the national contrast between English and French Political Economy. The same contrast reasserts itself in Ricardo and Sismondi.

¹⁷ Petty had illustrated the productive power inherent in the division of labor on a much grander scale than that was done later by Adam Smith. See his “Essay concerning the multiplication of mankind, etc.,” 3rd edition, 1686, page 35-36. He not only brings out the advantages of the division of labor on the example of the manufacture of a watch, as Adam Smith did later on that of a needle, but considers also a city and an entire country from the point of view of a large manufacturing establishment. The *Spectator*, of November 26, 1711, refers to this “illustration of the admirable Sir William Petty.” McCulloch is, therefore, mistaken when he supposes that the *Spectator* confounded Petty with a writer forty years his junior. See McCulloch, “The Literature of Political Economy, a classified catalogue,” London, 1845, page 105. Petty is conscious of being the founder of a new science. His method, he says, “is not yet very usual, for instead of using only comparative and superlative Words, and intellectual Arguments,” he has undertaken to speak “in Terms of Number, Weight or Measure; to use only Arguments of Sense, and to consider only such Causes, as have visible Foundations in Nature; leaving those that depend upon the mutable Minds, Opinions, Appetites, and Passions of particular Men, to the Consideration of others.” (*Political Arithmetick*, etc., London, 1699. Preface.) (A new edition of “The Economic Writings of Sir William Petty,” edited by Chas. Henry Hull, has been published by the University Press at Cambridge, 1899. The above passage will be found in vol. I., page 244. The further references are given to this new, more accessible edition. Translator.) His wonderful keenness shows itself e. g. in the proposal to transport “all the moveables and people of Ireland, and of the Highlands of Scotland ... into the rest of Great Britain.” Thereby much labor-time would be saved, the productivity of labor increased, and “the King and his Subjects would thereby become more Rich and Strong.” (*Political Arithmetick*, ch. 4, page 285.) Or in the chapter of his *Political Arithmetic* in which he proves that England’s mission is the conquest of the world’s market at a time when Holland still played the leading part as a trading nation and France seemed to be on the way of becoming the ruling trading Power: “That the King of England’s Subjects, have Stock competent and convenient, to drive the Trade of the whole Commercial World” (l. c., ch. 10, page 311). “That the Impediments of England’s greatness are but contingent and removable” (l. c., ch. 5, page 298). A singular humor pervades all his writings. Thus, he shows that it was by material means

that Holland — at that time the model country with English economists, just as England is with continental economists to-day — conquered the world market “without such Angelical Wits and Judgments, as some attribute to the Hollanders” (l. c., page 258). He advocates “Liberty of Conscience” as a condition of trade, because “Dissenters ... are ... patient Men, and such as believe that Labour and Industry is their Duty towards God,” and “They believe that ... for those who have less Wealth, to think they have the more Wit and Understanding, especially of the things of God which they think chiefly belong to the Poor.” “From whence it follows that Trade is not fixt to any species of Religion as such; but rather ... to the Heterodox part of the whole” (l. c., page 262-264). He advocates an “allowance by Publick Tax” for those “who live by begging, cheating, stealing, gaming, borrowing without intention of restoring,” because “it were more for the publick profit” to tax the country for such persons “than to suffer them to spend extravagantly, at the only charge of careless, credulous, and good natured People” (-270). But he is opposed to taxes which transfer the wealth from industrious people “to such as do nothing at all, but eat and drink, sing, play, and dance; nay such as study the Metaphysicks” (ibid.). Petty’s writings are rarities of the bookseller’s trade and are to be found only in scattered poor old editions, which is the more surprising since William Petty was not only the father of English Political Economy, but also the ancestor of Henry Petty, alias Marquis of Lansdowne, the nestor of the English Whigs. However, the Lansdowne family could hardly bring out a complete edition of Petty’s works without prefacing it with his biography, and what can be said of most origins of the great Whig families holds good also in this case, viz., “the less said of them the better.” The keen-witted but cynical army surgeon who was as ready to plunder in Ireland under the shield of Cromwell as to crawl before Charles II. to get the title of baron which he needed for his plunderings, is a model hardly fit for public exhibition. Besides that, Petty seeks to prove in most of his writings which he published in his lifetime, that England’s prosperity reached its climax under Charles II., a heterodox view for the hereditary exploiters of the “glorious revolution.”

¹⁸ In contrast with the “black art of finance” of his time, Boisguillebert says: “La science financière n’est que la connaissance approfondie des intérêts de l’agriculture et du commerce.” *Le Détail de la France*, 1697. Eugène Daire’s edition of *Economistes financiers du XVIII. siècle*, Paris, 1843, vol. I., page 241.

¹⁹ But not *Romance* Political Economy, since the Italians reproduce the contrast between the English and French economists in the two respective schools of Naples and Milan, while the Spaniards of the earlier period are either pure Mercantilists; modified mercantilists like Ustariz; or, like Jovellanos (see his *Obras*, Barcelona, 1839-40), hold to the “golden mean” with Adam Smith.

²⁰ “La véritable richesse ... jouissance entière, non seulement des besoins de la vie, mais même de tous les superflus et de tout, ce qui peut faire plaisir à la sensualité,” Boisguillebert, “Dissertation sur

la nature de la richesse,” etc., l. c., page 403. But while Petty was a frivolous, rapacious and unprincipled adventurer, Boisguillebert, though an intendant under Louis XIV, championed the interests of the oppressed classes with a daring that was equal to his keenness of mind.

²¹ The French Socialism of the Proudhon type suffers from the same national hereditary disease.

²² “Benjamin Franklin, The Works of, etc.,” ed. by I. Sparks, vol. II., Boston, 1836. “A Modest Inquiry into the Nature and Necessity of a Paper Currency.”

²³ L. c., page 265.

²⁴ L. c., page 267.

²⁵ L. c., “Remarks and Facts relative to the American Paper Money,” 1764.

²⁶ See “Papers on American Politics; Remarks and Facts relative to the American Paper Money,” 1764, l. c.

²⁷ See e. g. Galiani, “Della Moneta,” in vol. 3 of Scrittori Classici italiani di Economia politica (Published by Custodi). Parte Moderna, Milano, 1803. “La fatica, he says, è l’unica che dà valore alla cosa” (“only effort can give value to any thing”). The designation of labor as “fatica,” strain, effort, is characteristic of the southerner.

²⁸ Steuart’s work, “An Inquiry into the Principles of Political Economy, being an Essay on the Science of Domestic Policy in Free Nations,” appeared first in London in two quarto volumes in the year 1767, ten years before Adam Smith’s “Wealth of Nations.” I quote from the Dublin edition of 1770. (The references to pages are the same for the standard London edition of 1767, except where otherwise stated. Translator.)

²⁹ Steuart, l. c., vol. I., page 181-183.

³⁰ Steuart, l. c., vol. I., page 361-362.

³¹ See chapter I., book II., vol. I. “of the reciprocal connections between Trade and Industry” (Translator).

³² He declares, therefore, the patriarchal form of agriculture which is devoted to the direct production of use-values for the owner of the land, to be an “abuse,” not in Sparta, or Rome, or even in Athens,

but in the industrial countries of the eighteenth century. This “abusive agriculture” is not “trade,” but a “direct means of subsisting.” Just as capitalistic agriculture clears the country of superfluous mouths, so does the capitalistic mode of manufacture clear the factory of superfluous hands.

³³ Thus e. g., Adam Smith says: “Equal quantities of labour, at all times and places, may be said to be of equal value to the labourer. In his ordinary state of health, strength and spirits, in the ordinary degree of his skill and dexterity, he must always lay down the same portion of his ease, his liberty, and his happiness. The price which he pays must always be the same, whatever may be the quantity of goods which he receives in return for it. Of these, indeed, it may sometimes purchase a greater and sometimes a smaller quantity; but it is their value which varies, not that of the labour which purchases them.... Labour alone, therefore, never varying in its own value ... is their [commodities’] real price, etc. Adam Smith (Book I., ch. V., page 34, Oxford, 1869. Translator.)

³⁴ David Ricardo, “On the Principles of Political Economy and Taxation,” 3rd edition, London, 1821, page 3.

³⁵ Sismondi, “Etudes sur l’Economie Politique,” t. II., Bruxelles, 1837. “C’est l’opposition entre la valeur usuelle ... et la valeur échangeable à laquelle le commerce a réduit toute chose,” page 161. [Paris edition, page 229, Transl.]

³⁶ Sismondi l. c., page 163-166 seq. [Paris edition, 230 etf. Transl.]

³⁷ Perhaps the silliest to be found are the annotations of J. B. Say to the French translation of Ricardo, made by Constancio, and the most pedantically arrogant are the remarks of Mr. MacLeod in his newly published “Theory of Exchange,” London, 1858.

³⁸ This objection raised against Ricardo by bourgeois economists was taken up later by the socialists. Having assumed the correctness of the formula, they charged the practice with contradiction to the theory and appealed to bourgeois society to realize in practice the conclusions which were supposed to follow from its theoretical principles. That was at least the way in which the English socialists turned Ricardo’s formula of exchange value against political economy. It remained for Mr. Proudhon not only to proclaim the fundamental principle of old society as the principle of the new, but also to declare himself the discoverer of the formula in which Ricardo summed up the combined results of classical English political economy. It has been proven that the utopian interpretation of the Ricardian formula was about forgotten in England when Mr. Proudhon “discovered” it on the other side of the Canal. (Cf. my work: “Misère de la Philosophie,” etc., Paris, 1847, paragraph on la valeur constituée.)

³⁹ True, Aristotle sees that the exchange value of commodities underlies their prices: “ὅτι ἡ ἀλλαγή ἦν πρὶν τὸ νόμισμα εἶναι, ὅλην· διαφέρει γὰρ οὐδὲν ἢ εἰ κλίνει πέντε ἀντι οἰκίας, ἢ ὅσου αἱ πέντε κλίνει.” (“It is clear that exchange existed before coin. For it does not make any difference whether you give five beds for a house, or as much money as five beds are worth”). On the other hand, since commodities acquire only in price the form of exchange value with respect to one another, he makes them commensurable through money. “Διὸ δεῖ πάντα τετιμῆσθαι· οὕτω γὰρ ἀεὶ ἔσται ἀλλαγή, εἰ δὲ τοῦτο, κοινωνία. Τὸ δὲ νόμισμα ὥσπερ μέτρον σύμμετρα ποιῆσαν ισάζει, οὔτε γὰρ ἂν μὴ οὔσης ἀλλαγῆς κοινωνία ἦν, οὐτ’ ἀλλαγῇ ισότητος μὴ οὔτ’ ισότης, μὴ οὔσης συμμετρίας.” (“Therefore all has to be appraised. In that way exchange may always take place, and, with it, society can exist. Coin, like measure, makes everything commensurable and equal, for without exchange there would be no society, without equality there would be no exchange, and without commensurability, no equality.”) He does not conceal from himself that these different objects measured by money are entirely incommensurable quantities. What he is after is the common unit of commodities as exchange values, which as an ancient Greek he was unable to find. He gets out of the difficulty by making commensurable through money what is in itself incommensurable, so far as it is necessary for practical purposes. “Τῇ μὲν οὖν ἀληθείᾳ ἀδύνατον τὰ τοσοῦτον διαφέροντα σύμμετρα γενέσθαι, πρὸς δὲ τὴν χρεῖαν ἐνδέχεται ἱκανῶς.” (“In truth it is impossible to make things that are so different, commensurable, but for practical purposes it is permissible.”) Aristotle, *Ethica Nicomachea*. l. 5, c. 8, edit. Bekkeri. Oxonii, 1837.

⁴⁰ The peculiar circumstance that, while the ounce of gold serves in England as the unit of the standard of money, it is not divided into aliquot parts has been explained as follows: “Our coinage was originally adapted to the employment of silver only — hence an ounce of silver can always be divided into a certain adequate number of pieces of coin; but as gold was introduced at a later period into a coinage adapted only to silver, an ounce of gold cannot be coined into an adequate number of pieces.” Maclaren: “A Sketch of the History of the Currency,” page 16, London, 1858.

⁴¹ “Money may continually vary in value and yet be as good a measure of value as if it remained perfectly stationary. Suppose, for instance, it is reduced in value.... Before the reduction, a guinea would purchase three bushels of wheat or 6 days’ labour; subsequently it would purchase only 2 bushels of wheat, or 4 days’ labour. In both cases, the relations of wheat and labour to money being given, their mutual relations can be inferred; in other words, we can ascertain that a bushel of wheat is worth 2 days’ labour. This, which is all that measuring value implies, is as readily done after the reduction as before. The excellence of a thing as a measure of value is altogether independent of its own variableness in value” (, Bailey, “Money and its Vicissitudes.” London, 1837).

⁴² “Le monete lequali oggi sono ideali sono le piu antiche d’ogni nazione, e tutte furono un tempo reali (the latter assertion is too sweeping), e perchè erano reali con esse si contava.” Galiani, “Della Moneta,” l. c., page 153 (“Coins which are ideal to-day [i.e., whose names no longer correspond to their value] are among the more ancient with every nation; at one time they were all real, and for that reason served for the purpose of counting.”)

⁴³ The romantic A. Müller says: “According to our idea every independent sovereign has the right to name the metal money, and to give it a nominal social value, rank, standing and title (, v. II., A. H. Müller, “Die Elemente der Staatskunst,” Berlin, 1809). As far as title is concerned the Hon. Hofrath is right; but he forgets the *substance*. How confused his “ideas” were, may be seen, e. g., from the following passage: “Everybody understands how much depends upon the right determination of the mint-price, especially in a country like England, where the government with *magnificent liberality* coins money gratuitously (Herr Müller seems to think that the members of the English government defray the mint expenses out of their own pockets), where it does not charge any mintage, etc., and thus if the mint-price of gold were set considerably above its market price, if instead of paying as now £3 17s. 10-1/2d. per 1 oz. of gold, it would set the price of an ounce of gold at £3 19s., all money would flow into the mint and exchanging for the silver contained there bring it into the market to be exchanged there for the cheaper gold; the latter would in the same manner be brought again to the mint and the entire coinage system would be upset” (l. c., page 280-281). To preserve order in English coinage, Müller falls back on “disorder.” While shilling and pence are mere names of certain parts of an ounce of gold represented by signs of silver and copper, he imagines that an ounce of gold is estimated in gold, silver and copper and thus confers upon the Englishmen the blessing of a triple standard of value. Silver as a measure of money, next to gold, was formally abolished only in 1816 by 56 George III., c. 68. As a matter of fact, it was legally abolished as early as 1734 by 14 George II., c. 42, and still earlier by actual practice. There were two circumstances that made A. Müller capable of a so-called higher conception of political economy: first, his wide ignorance of economic facts; second, his dilettanti-like visionary attitude toward philosophy.

⁴⁴ “Ἀνάχαρσις, πυνθανομένου τινὸς, πρὸς τί οἱ Ἕλληνες χρῶνται τῷ ἀργυρίῳ εἶπε πρὸς τὸ ἀριθμεῖν.” (Athen. Deipn. l. IV. 49. v. 2, ed. Schweighäuser, 1802.) (When Anacharsis was asked for what purpose the Greeks used money, he replied, “For reckoning.”)

⁴⁵ G. Garnier, one of the early French translators of Adam Smith, conceived the queer notion of fixing a proportion between the use of money of account and that of actual money. His proportion is 10 to 1. (G. Garnier, “Histoire de la Monnaie depuis les temps de la plus haute antiquité,” etc., t. 1, page 78.)

⁴⁶ The act of Maryland in 1723 by which tobacco was made the legal standard, but its value reduced to terms of English gold money, namely one penny equal to one pound of tobacco, reminds of the “leges barbarorum,” in which, inversely, certain sums of money were expressed in terms of oxen, cows, etc. In that case neither gold nor silver, but the ox and the cow were the actual material of the money of account.

⁴⁷ Thus, we read, e. g., in the “Familiar Words” of Mr. David Urquhart: “The value of gold is to be measured by itself; how can any substance be the measure of its own worth in other things? The worth of gold is to be established by its own weight, under a false denomination of that weight — and an ounce is to be worth so many pounds and fractions of pounds. This is falsifying a measure, not establishing a standard.”

⁴⁸ “Money is the measure of Commerce, and of the rate of everything, and therefore ought to be kept (as all other measures) as steady and invariable as may be. But this cannot be, if your money be made of two Metals, whose proportion ... constantly varies in respect of one another.” John Locke: *Some Considerations on the Lowering of Interest, etc.*, 1691 (, page 65 in his *Works* 7 ed., London, 1768, vol. III.)

⁴⁹ Locke says among other things: “ ... call that a Crown now, which before ... was but a part of a Crown.... An equal quantity of Silver is always the same Value with an equal quantity of Silver.... For if the abating 1-20 of the quantity of Silver of any Coin does not lessen its Value, the abating 19-20 of the quantity of the Silver of any Coin will not abate its Value. And so a single Penny, being called a Crown, will buy as much Spice, or Silk, or any other Commodity, as a Crown-Piece, which contains 20 times as much Silver.... Now [all that may be done] is giving a less quantity of Silver the Stamp and Denomination of a greater.... But 'tis Silver and not Names that pay Debts and purchase Commodities” (l. c., page 135-145 *passim*). If to raise the value of money means nothing but to give any desired name to an aliquot part of a silver coin, e. g., to call an eighth part of an ounce of silver a penny, then money may really be rated as high as you please. At the same time, Locke answered Lowndes that the rise of the market price above the mint price was due not to the rise of the value of silver, but to the lighter silver coins. Seventy-seven clipped shillings do not weigh a particle more than 62 full-weighted ones. Finally he pointed out with perfect right that, aside from the loss of weight in the circulating coin, the market price of silver bullion in England could rise to some extent above its mint price, since the export of silver bullion was allowed while that of silver coin was prohibited (l. c., page 54-116 *passim*). Locke was exceedingly careful not to touch upon the burning question of public debts, and no less carefully avoided the discussion of the delicate economic question, viz., the depreciation of the currency out of proportion to its real loss of silver, as was shown by the rate of exchange and the ratio of silver bullion to silver coin. We shall return to this

question in its general form in the chapter on the Medium of Circulation. Nicholas Barbon in “A Discourse Concerning Coining the New Money Lighter, in Answer to Mr. Locke’s Considerations, etc.,” London, 1696, tried in vain to entice Locke to difficult ground.

⁵⁰ Stuart, l. c., v. II., page 154.

⁵¹ The Querist, l. c., (-6-7.) The “Queries on Money” are generally clever. Among other things Berkeley is perfectly right in saying that by their progress the North American colonies “make it plain as daylight, that gold and silver are not so necessary for the wealth of a nation, as the vulgar of all ranks imagine.”

⁵² Price means here real equivalent in the sense commonly employed by English economic writers in the seventeenth century.

⁵³ Stuart, l. c., v. II., page 154, 299 [1st London edition, of 1767, v. I., page 526-531. Transl.].

⁵⁴ On the occasion of the last commercial crisis the ideal African money received loud praise from certain English quarters, after its seat was this time moved from the coast to the heart of Barbary. The freedom of the Berbers from commercial and industrial crises was ascribed to the ideal unit of measure of their bars. Would it not have been simpler to say that trade and industry are the *conditio sine qua non* of commercial and industrial crises?

⁵⁵ The Currency Question, The Gemini Letters, London, 1844, page 260-272, *passim*.

⁵⁶ John Gray: “The Social System. A Treatise on the Principle of Exchange, Edinburgh, 1831.” Compare with “Lectures on the Nature and Use of Money, Edinburgh, 1848,” by the same author. After the February revolution Gray sent a memorial to the provisional French government, in which he instructs the latter that France is not in need of an “organization of labour,” but of an “organization of exchange” of which the plan is fully worked out in his money system. Honest John did not suspect that sixteen years after the appearance of his “Social System” a patent for the same discovery would be taken out by the ingenious Proudhon.

⁵⁷ Gray, “The Social System,” etc., page 63: “Money should be merely a receipt, an evidence that the holder of it has either contributed certain value to the national stock of wealth or that he has acquired a right to the same value from some one who has contributed to it.”

⁵⁸ An estimated value being previously put upon produce, let it be lodged in a bank, and drawn out again, whenever it is required, merely stipulating, by common consent, that he who lodges any kind

of property in the proposed National Bank, may take out of it an equal value of whatever it may contain, instead of being obliged to draw out the self-same thing that he put in.” L. c., page 68.

⁵⁹ L. c., page 16.

⁶⁰ Gray: “Lectures on Money, etc.,” page 182.

⁶¹ L. c., page 169.

⁶² “The business of every country ought to be conducted on a national capital.” John Gray, “The Social System,” etc., page 171.

⁶³ “The land to be transformed into national property.” L. c., page 298.

⁶⁴ See e. g. W. Thompson: “An Inquiry into the Distribution of Wealth, etc.,” London, 1827. Bray, “Labour’s Wrongs and Labour’s Remedy,” Leeds, 1839.

⁶⁵ Alfred Darimont’s “De la Reforme des banques,” Paris, 1856, may be considered as a compendium of this melodramatic theory of money.

⁶⁶ “Di due sorte è la moneta, ideale e reale; e a dui diversi usi è adoperata, a valutare le cose e a comperarle. Per valutare è buona la moneta ideale, così come la reale e forse anche più. L’altro uso della moneta è di comperare quelle cose istesse, ch’ella apprezza ... i prezzi e i contratti si valutano in moneta ideale e si eseguono in moneta reale.” Galiani, l. c., page 112 sq. (“Money is of two kinds, ideal and real; and is adapted to two different uses: to determine the value of things and to buy them. For the purpose of valuation ideal money is as good as real and perhaps even better. The other use of money is to buy the same things which it appraises ... prices and contracts are determined in ideal money and are executed in real money.”)

⁶⁷ This, of course, does not prevent the market price of commodities to be above or below their value. However, this consideration is foreign to simple circulation and belongs to quite another sphere to be considered later, when we shall investigate the relation between value and market price.

⁶⁸ How deeply some beautiful souls are wounded by the merely superficial aspect of the antagonism which asserts itself in buying and selling, may be seen from the following abstract from M. Isaac Pereire’s: “Leçons sur l’industrie et les finances,” Paris, 1832. The fact that the same Isaac in his capacity of inventor and dictator of the “Credit mobilier” has acquired the reputation of the wolf of the Paris Bourse shows what lurks behind the sentimental criticism of economics. Says Mr. Pereire at

the time an apostle of St. Simons: “C’est parceque tous les individus sont isolés, séparés les uns des autres, soit dans leur travaux, soit pour la consommation, qu’il y a echange entre eux des produits de leur industrie respective. De la necessité de l’échange est derivée la necessité de determiner la valeur relative des objets. Les idées de la valeur et de l’échange sont donc intimement liées, et toutes deux dans leur forme actuelle exprime l’individualisme et l’antagonisme.... Il n’y a lieu a fixer la valeur des produits que parcequ’il y a vente at achat, en d’autres termes, antagonisme entre les divers membres de la société. Il n’y a lieu à s’occuper du prix, de valeur que là où il y avait vente et echat, c’est à dire, où chaque individu était obligé de lutter, pour se procurer les object nécessaires a l’entretien de son existence” (l. c., page 2, 3 passim). (“Since individuals are isolated and separated from one another both in their labors and in consumption, exchange takes place between them in the products of their respective industries. From the necessity of exchange arises the necessity of determining the relative value of things. The ideas of value and exchange are thus intimately connected and both express in their actual form individualism and antagonism.... The determination of values of products takes place only because there are sales and purchases, or, to put it differently, because there is an antagonism between different members of society. One has to occupy himself with price and value only where there is sale and purchase, that is to say, where every individual is obliged to struggle to procure for himself the objects necessary for the maintenance of his existence.”)

⁶⁹ “L’argent n’est que le moyen et l’acheminement, au lieu que les denrées utiles à la vie sont la fin et le but.” (“Money is but the ways and means, while the things useful in life are the end and object.”) Boisguillebert: “Le Détail de la France,” 1697, in Eugene Daires “Economistes financiers du XVIIIeme siècle, vol. I., Paris, 1843, page 210.

⁷⁰ In November, 1807, William Spence published a pamphlet in England under the title: “Britain Independent of Commerce.” The principle set forth in this pamphlet was further elaborated by William Cobbet in his “Political Register” under the virulent title, “Perish Commerce.” To this James Mill replied in 1808 in his “Defence of Commerce” which contains the passage quoted above from his “Elements of Political Economy” (-193, Transl.). In his controversy with Sismondi and Malthus on commercial crises, J. B. Say appropriated this clever device, and as it would be difficult to point out with what new idea this comical “prince de la science” had enriched political economy, his continental admirers have trumpeted him as the man who had unearthed the treasure of the metaphysical balance of purchases and sales; as a matter of fact, his merits consisted rather of the impartiality with which he equally misunderstood his contemporaries, Malthus, Sismondi and Ricardo.

⁷¹ The manner in which economists explain the different aspects of the commodity may be seen from the following examples:

“With money in possession, we have but one exchange to make in order to secure the object of desire, while with other surplus products we have two, the first of which (procuring the money) is infinitely more difficult than the second.” (G. Opdyke, “A Treatise on Political Economy,” New York, 1851, page 277-278.)

“The superior saleableness of money is the exact effect or natural consequence of the less saleableness of commodities.” (Th. Corbet, “An Inquiry into the Causes and Modes of the Wealth of Individuals.” etc., London, 1841, page 117.)

“Money has the quality of being always exchangeable for what it measures.” (Bosanquet, “Metallic, Paper and Credit Currency,” etc., London, 1842, page 100.)

“Money can always buy other commodities, whereas other commodities can not always buy money.” (Th. Tooke, “An Inquiry into the Currency Principle,” 2d ed., London, 1844, page 10.)

⁷² The same commodity can be bought and resold many times. It circulates, then, not merely as a commodity, but in a capacity which does not exist from the point of view of simple circulation, of the simple contrast of commodity and money.

⁷³ The quantity of money is immaterial “pourvu qu’il y en ait assez pour maintenir les prix contractés par les denrées” (as long as it is sufficient to maintain the existing prices of commodities). Boisguillebert, l. c. page 210.

“If the circulation of commodities of four hundred millions required a currency of forty millions, and ... this proportion of one-tenth was the due level, estimating both currency and commodities in gold; then, if the value of commodities to be circulated increased to four hundred and fifty millions, from natural causes ... I should say the currency, in order to continue at its level, must be increased to forty-five millions.” (William Blake, “Observations on the Effects Produced by the Expenditure of Government, etc.,” London, 1823, page 80.)

⁷⁴ “E la velocità del giro del danaro, non la quantità dei metalli che fa apparir molto a poco il danaro.” (Galiani, l. c. page 99.) (“It is the rapidity of the circulation of money and not the quantity of metals that causes a greater or smaller amount of money to appear.”)

⁷⁵ An example of an extraordinary decline of metallic circulation from its average level was furnished by England in 1858, as may be seen from the following extract from the London Economist: “From the nature of the case (namely, the isolated nature of simple circulation) very exact data cannot be procured as to the amount of cash that is fluctuating in the market, and in the hands of the not banking classes. But, perhaps, the activity or the inactivity of the mints of the great commercial nations is one of the most likely indications in the variations of that amount. Much will be manufactured when it is wanted; and little when little is wanted.... At the English mint the coinage was in 1855 £9,245,000; 1856, £6,476,000; 1857, £5,293,855. During 1858 the mint had scarcely anything to do.” (Economist, July 10, 1858.) But at the same time about eighteen million pounds sterling were lying in the bank vaults.

⁷⁶ Dodd, “Curiosities of Industry,” etc., London, 1854.

⁷⁷ “The Currency Question Reviewed, etc., by a Banker.” (Edinburgh, 1845, page 69.)

“Si un écu un peu usé était réputé valoir quelque chose de moins qu’un écu tout neuf, la circulation se trouverait continuellement arrêtée, et il n’y aurait pas un seul paiement qui ne fut matière à contestation.” (G. Garnier, l. c. t. I., page 24.) (“If an ecu slightly used would pass for a little less than an entirely new ecu, circulation would be continually interfered with, and not a payment would take place that would not give rise to controversy.”)

⁷⁸ W. Jacob, “An Inquiry Into the Production and Consumption of the Precious Metals.” (London, 1831, vol. II., ch. XXVI.)

⁷⁹ David Buchanan, “Observations on the Subjects Treated of in Dr. Smith’s Inquiry on the Wealth of Nations,” etc. (Edinburgh, 1841, page 3.)

⁸⁰ Henry Storch, “Cours d’Economic Politique.” etc., avec des notes par J. B Say. Paris, 1823, tom. IV., page 179. Storch published his work in French at St. Petersburg. J. B. Say immediately issued a Parisian reprint, supplemented with alleged “notes,” which as a matter of fact contain nothing but commonplaces. Storch (see his “Considerations sur la Nature du Revenu National,” Paris, 1824) took by no means kindly to this annexation of his work by the “prince de la science.”

⁸¹ Plato de Rep. L. II “νόμισμα ξύμβολον τῆς ἀλλαγῆς.” (“Money symbol of exchange.”) Opera omnia, etc., ed. G. Stallbaumius, London, 1850, page 304. Plato develops money only in two capacities — as a measure of value and a token of value, but demands, in addition to the token of value serving for home circulation, another one for trade between Greece and foreign countries. (See also Book V of his Laws.)

⁸² Aristotle, *Ethic. Nicom.*, l. 5., ch. 8, l. c.: οἷον δ' ὑπάλλαγμα τῆς χρείας τὸ νόμισμα γέγονον κατὰ συνθήκην καὶ διὰ τοῦτο τοῦνομα ἔχει νόμισμα. ὅτι οὐ φύσει ἀλλὰ νόμῳ, καὶ ἐφ' ἡμῖν μεταβαλεῖν καὶ ποιῆσαι ἄχρηστον.” (“In the satisfaction of wants money became the medium of exchange by agreement. And for that reason it bears the name νόμισμα, because it owes its existence, not to nature, but to law (νόμῳ), and it is in our power to change it and make it void.”) Aristotle had a far more comprehensive and deep view of money than Plato. In the following passage he beautifully shows how barter between different communities creates the necessity of assigning the character of money to a specific commodity, i.e., one which has itself an intrinsic value. “Ξενικωτέρας γὰρ γενομένης τῆς βοηθείας τῷ εἰσάγεσθαι ἥδ' ἐνδεεῖς καὶ ἔκπεμπειν ὧν ἐπλέοναζον, ἐξ ἀνάγκης ἢ τοῦ νομίματος ἐπορίσθη χρήσις· διὸ πρὸς τὰς ἀλλαγὰς τοιοῦτόν τι συνέθεντο πρὸς σφᾶς αὐτοὺς διδόναι καὶ λαμβάνειν, δ' ἐπὶ τῶν χρησίμων αὐτὸ ὃν εἶχε τὴν χρεῖαν εὐμεταχείριστον ... οἷον σίδηρος καὶ ἄργυρος καὶ εἴ τι τοιοῦτον ἕτερον”. (Arist. *De Republica*, l. i. page 9, [secs. 7, 8] l. c.)

(“When the inhabitants of one country became more dependent on those of another, and they imported what they needed and exported the surplus, money necessarily came into use ... and hence men agreed to employ in their dealings with each other something which was intrinsically useful and easily applicable to the purposes of life, for example, iron, silver and the like.” Trans. by B. Jowett, “*The Politics of Aristotle*, Oxford, 1885, page 16). This passage is quoted by Michel Chevalier, who either has not read Aristotle or did not understand him, to prove that in Aristotle’s opinion currency must consist of a substance having intrinsic value. On the contrary, Aristotle says expressly that money as a mere medium of circulation seems to owe its existence to agreement or law, as is shown by its name νόμισμα, and that in reality it owes its utility as coin to its function and not to any intrinsic use-value of its own. λῆρος εἶναι δοκεῖ τὸ νόμισμα καὶ νόμος παντάπασιν, φύσει δ' οὐδὲν ὅτι μεταθεμένων τε τῶν χρωμένων οὐδενὸς ἄξιον οὐδὲ χρήσιμον πρὸς οὐδὲν τῶν ἀναγκαίων ἐστὶ. (“Others maintain that coined money is a mere sham, a thing not natural, but conventional only, which would have no value or use for any of the purposes of daily life if another commodity were substituted by the users.” (l. c. sec. 11.)

⁸³ Mandeville, Sir John, “*Voyages and Travels*,” London, 1705, page 105: “This Emperor (of Cattay or China) may dispense with much as he will without estimation. For he dispenses not, nor makes any money, but of leather, copper, or of paper. And when that money lasts so long that it begins to waste, then men bring it to the Emperor’s Treasury, and then they take new Money for the old. And that money goes through all the country, and goes out all his Provinces.... They make no money neither of Gold nor of Silver,” and “therefore,” thinks Mandeville, “he may dispense anew and outrageously.”

⁸⁴ Benjamin Franklin, “Remarks and Facts Relative to the American Paper Money,” 1764, page 348, l. c. “At this very time, even the silver money in England is obliged to the legal tender for part of its value; that part which is the difference between its real weight and its denomination. Great part of the shillings and sixpences now current are by wearing become 5, 10, 20, and some of the sixpences even 50 per cent., too light. For this difference between the *real* and the *nominal* you have no intrinsic value. You have not so much as paper, you have nothing. It is the legal tender, with the knowledge that it can easily be repassed for the same value, that makes three-pennyworth of silver pass for a sixpence.”

⁸⁵ Berkeley, l. c., page 5-6. “Whether the denominations being retained, although the bullion were gone ... might not nevertheless ... a circulation of commerce (be) maintained?”

⁸⁶ “Non solo i metalli ricchi son segni delle cose ...; ma vicendevolmente le cose ... sono segni dell’oro e dell’argento.” (A. Genovesi, “Lezioni di Economia Civile,” 1765. page 281 in Custodi, Parte Mod. 1. VIII.) (“Not only are precious metals tokens of things, but vice versa, things are tokens of gold and silver.”)

⁸⁷ Petty. “Gold and silver are universal wealth.” (Political Arithmetic, l. c., page 242.)

⁸⁸ E. Misselden. “Free Trade, or the Means to Make Trade Flourish,” etc., London, 1622. “The natural matter of Commerce is Merchandise, which Merchants from the end of Trade have stiled Commodities. The Artificiall matter of Commerce is Money, which hath obtained the title of sinewes of warre and of State.... Money, though it be in nature and time after Merchandise, yet forasmuch as it is now in use become the chiefe.” (.) He compares his own treatment of merchandise and money with the manner of “Old Jacob, who, blessing his Grandchildren, crost his hands, and laide his right hand on the yonger, and his left hand on the elder.” (l. c.) Boisguillebert, “Dissert. sur la Nature Des Richesses,” etc. “Voilà donc l’esclave du commerce devenu son maître.... La misère des peuples ne vient que de ce qu’on a fait un maître, ou plutôt un tyran de ce qui était un esclave.” (, 399.)

⁸⁹ Boisguillebert, l. c. “On a fait une idole de ces métaux (l’or et l’argent) et laissant là, l’objet et l’intention pour lesquels ils avaient été appelés dans le commerce, savoir, pour y servir de gages dans l’échange et la tradition réciproque, on les a presque quittés de ce service pour en former des divinités, aux quelles on a sacrifié et sacrifie toujours plus de biens et de besoins précieux et même d’hommes, que jamais l’aveugle antiquité n’en immola à ces fausses divinités,” etc. (l. c., page 395.)

⁹⁰ In the first halt of the perpetuum mobile, *i.e.*, in the suspension of the function of money as a medium of circulation, Boisguillebert at once suspects its independent existence from commodities. Money, he says, must be “in constant motion, it can be money only by being mobile, but as soon as it

becomes motionless all is lost.” (“Dans un mouvement continuel, ce qui ne peut être que tant qu’il est meuble, mais sitôt qu’il devient immeuble tout est perdu.” (“Le Détail de la France,” page 231.) What he overlooks is that this halt constitutes the condition of its movement. What he really wants is that the value form of commodities should appear merely in the transitory form of their change of matter, but should never become an end in itself.

⁹¹ “ ... The more the stock ... is ... encreased in wares, the more it decreaseth in treasure.” (E. Misselden, l. c., page 23.)

⁹² l. c., page 11-13 passim.

⁹³ Petty, “Political Arith.,” l. c., page 196 (1899 edition, v. I, page 269. Transl.)

⁹⁴ Francois Bernier, “Voyage contenant la description des états du Grand Mogul.” (Paris edition, 1830, t. I., conf., page 312-314.

⁹⁵ Dr. Martin Luther, “Bücher vom Kaufhandel und Wucher,” 1524. In the same passage Luther says: “Gott hat uns Deutsche dahin geschleiert, dass wir unser gold und silber müssen in fremde Länder stossen, alle Welt reich machen und selbst Bettler Bleiben. England sollte wohl weniger Goldes haben, wenn Deutschland ihm sein Tuch liesse, und der König von Portugal sollte auch weniger haben, wenn wir ihm die Würze liessen. Rechne Du, wie viel eine Messe zu Frankfurt aus Deutschen Landen geführt wird, ohne Not und Ursache: so wirst Du Dich wundern, wie es zugehe, dass noch ein heller in Deutschen Landen sei. Frankfurt ist das Silber- und Goldloch, dadurch aus Deutschem Lande fleisst, was nur guillet und wächst, gemünzt oder geschlagen wird bei uns; wäre das Loch zuegestopft, so dürft man itzt der Klage nicht hören, die allethalben eitel Schuld und kein Geld, alle Land und Städte ausgewuchert sind. Aber lass gehen, es will doch also gehen; wir Deutsche müssen Deutsche bleiben! wir lassen nicht ab, wir müssen denn.”

In the work quoted above Misselden wishes to retain the gold and silver at least within the confines of Christendom: “The other forreine remote causes of the want of money, are the Trades maintained out of Christendome to Turkey, Persia and the East Indies, which trades are maintained for the most part with ready money, yet in a different manner from the trades of Christendome within itselfe. For although the trades within Christendome are driven with ready monies, yet those monies are still contained and continued within the bounds of Christendome. There is indeede a fluxus and refluxus, a flood and ebbe of the monies of Christendome traded within it selfe; for sometimes there is more in one part of Christendome, sometimes there is lesse in another, as one Country wanteth and another aboundeth: It cometh and goeth, and whirlth about the Circle of Christendome, but is still contained

within the compasse thereof. But the money that is traded out of Christendome into the parts aforesaid is continually issued out and never returneth againe.” (-20.)

⁹⁶ “A nummo prima origo avaritiae ... haec paulatim exarsit rabie quadam, non jam avaritia, sed fames auris.” (Plin., Hist. Nat., l. XXXIII., c. XIV.)

(“From money first springs avarice ... the latter gradually grows into a kind of madness, which is no more avarice, but a thirst for gold.”)

⁹⁷ Horace thus understands nothing of the philosophy of hoarding when he says (Satir. l. II., Satir. III): “Siquis emat citharas, emptas comportat in unum, Nec studio citharae nec musae deditus ulli; Si scalpra et formas non sutor; nautica vela Aversus mercaturis; delirus et amens, Undique dicatur merito. Qui discrepat istis, Qui nummos aurunque recondit nescius uti Compositis metuensque velut contingere sacrum?”

“If one buys fiddles, hoards them up when bought,

Though music’s study ne’er engaged his thought,

One lasts and awls, unversed in cobbler’s craft,

One sails for ships, not knowing fore from aft,

You’d call them mad: but tell me, if you please,

How that man’s case is different from these,

Who as he gets it, stows away his gain,

And thinks to touch a farthing were profane?”

(Transl. by John Covington, London, 1874, page 60.)

Mr. Senior understands the question much better: “L’argent paraît être la seule chose dont le désir est universel, et il en est ainsi parce que l’argent est *une richesse abstraite* et parce que les hommes, en la possédant peuvent satisfaire à tous leurs besoins de quelque nature qu’ils soient.” (“Principes Fondamentaux de l’Economie Politique, tirés de leçons éditées et inédites de N. W. Senior, par Comte Jean Arrivabene,” Paris, 1836, page 221. (The corresponding passage in the English edition of his Political Economy, London, 1863, is to be found on page 27. Translator.) So does Storch: “Since

money represents all other forms of wealth, it is only necessary to accumulate it to provide for oneself all kinds of wealth existing in the world.” (l. c., v. 2, page 134.)

⁹⁸ To what extent the inner man of the commodity owner remains unchanged, even when he has become civilized and has developed into a capitalist, is shown by the example of a London representative of a cosmopolitan banking house who adopted as a fitting coat of arms for his family a £100,000 bank note, which he had hung up in a glass frame. The point here is in the mocking contempt of the note for circulation.

⁹⁹ See the passage from Xenophon, quoted below.

¹⁰⁰ Jacob, l. c., v. 2, ch. 25 and 26.

¹⁰¹ “In times of great agitation and insecurity, especially during internal commotions or invasions, gold and silver articles are rapidly converted into money; whilst during periods of tranquility and prosperity, money is converted into plate and jewelry.” (l. c., v. 2, page 357.)

¹⁰² In the following passage Xenophon develops money in its specific forms of money and hoard: “ἐν μόνῳ τούτῳ ὧν ἐγὼ οἶδα ἔργων οὐδὲ φθονεῖ οὐδεὶς τοῖς ἐπισκευαζομένοις ... ἀργυρῖτις δὲ ὅσω ἂν πλείων φαίνεται, καὶ ἀργύριον πλείον γίγνεται, τοσούτῳ πλείονες ἐπὶ τὸ ἔργον τοῦτο ἔρχονται ... καὶ γὰρ δὴ ἐπιπλα μὲν ἐπειδὴν ἱκανὰ τις κτήσεται τῇ οἰκίᾳ, οὐ μάλα εἴτι προσωνοῦνται· ἀργύριον δὲ οὐδεὶς πω οὕτω πολὺ ἐκτήσατο ὥστε μὴ ἔτι προσθεῖσθαι, ἀλλ’ ἦν τισι γένηται παμπληθὲς, τὸ περιττεῦον κατορύττοντες οὐδὲν ἤττον ἡδονται ἢ χρώμενοι αὐτῷ· καὶ μὲν ὅταν γε εὖ πράττωσιν αἱ πόλεις ἰσχυρῶς, οἱ ἄνθρωποι ἀργυρίου δέονται. Οἱ μὲν γὰρ ἄνδρες ἀμφὶ ὅπλα τε καλὰ καὶ ἵππους ἀγαρθοὺς καὶ οἰκίας καὶ κατασκευὰς μεγαλοπρεπεῖς βούλονται δαπανᾶν, αἰδὲ γυναῖκες εἰς ἐσθήτα πολυτελῆ καὶ χρυσοῦν κόσμον τρέπονται· ὅταν δὲ αὖ νοσήσωσι πόλεις ἢ ἀφορίας καρπῶν ἢ πολέμῳ ἔτι καὶ πολὺ μᾶλλον τῆς γῆς ἀρυοῦ γιγνομένης καὶ εἰς ἐπιτήδεια καὶ εἰς ἐπικουροὺς νομίματος δέονται.” (Xen. de Vectigalibus, c. IV.) (“Of all operations with which I am acquainted, this is the only one in which no sort of jealousy is felt at a further development of the industry ... the larger the quantity of ore discovered and the greater the amount of silver extracted, the greater the number of persons ready to engage in the operation.... No one when he has got sufficient furniture for his house dreams of making further purchases on this head, but of silver no one ever yet possessed so much that he was forced to cry “Enough.” On the contrary, if ever anybody does become possessed of an immoderate amount he finds as much pleasure in digging a hole in the ground and hoarding it as an actual employment of it.... When a state is prosperous there is nothing which people so much desire as silver. The men want money to expend on beautiful armor and fine horses, and houses and sumptuous paraphernalia of all sorts. The women betake themselves to expensive apparel and ornaments of gold. Or when states are sick, either through barrenness of corn and other fruits, or

through war, the demand for current coin is even more imperative (whilst the ground lies unproductive), to pay for necessities or military aid.” (Transl. by H. G. Dakyns, London, 1892, v. 2, Revenues, page 335-336.) Aristotle develops in Book I., ch. 9 of his Politics the two opposite movements of circulation. C-M-C and M-C-M, calling them “economics” and “chrematistics” respectively. The two forms are represented by the Greek tragedian Euripides as Sikn (right) and Keodos (profit).

[103](#) Of course, capital also is advanced in the shape of money, and the money thus advanced may be advanced capital, but this point of view does not fall within the horizon of simple circulation.

[104](#) “The difference between the means of purchase and the means of payment” is emphasized by Luther.

[105](#) Mr. MacLeod, in spite of his doctrinaire conceit about definitions, fails so utterly to grasp the most elementary economic relations that he tries to deduce the very origin of money from its crowning form, viz., that of a means of payment. He says among other things that since people do not always need each other’s services at the same time, and not to the same extent, “there would remain over a certain difference or amount of service due from the first to the second — debt.” The owner of this debt needs the services of a third person, who does not directly need those of the second, and “transfers to the third the debt due to him from the first. Evidence of debts changes so hands — currency.... When a person received an obligation expressed by metallic currency, he is able to command the services not only of the original debtor, but of the whole of the industrious community.” (MacLeod, “Theory and Practice of Banking,” etc., London, 1855, v. I., ch. I.)

[106](#) Bailey, l. c., page 3. “Money is the general commodity of contracts, or that in which the majority of bargains about property, to be completed at a future time, are made.”

[107](#) Says Senior (in his Lectures, published by Comte Arrivabene, l. c., page 117): “Since the value of everything changes within a certain period of time, people select as a means of payment an article whose value changes least and which retains longest a given average ability to buy things. Thus, money becomes the expression or representative of values.” On the contrary: just because gold, silver, etc., have become money, i.e., the embodiment of independently existing exchange value, they become the universal means of payment. When the consideration as to the stability of the value of money mentioned by Mr. Senior comes into play, i.e., in periods when money asserts itself as the universal means of payment through the force of circumstances, then is just the time when fluctuations in the value of money are discovered. Such was the time of Elizabeth in England, when Lord Burleigh and Sir Thomas Smith, in view of the manifest depreciation of the precious metals, put

through an act of parliament which obliged the universities of Oxford and Cambridge to stipulate the payment of one-third of their ground rents in wheat and malt.

¹⁰⁸ Boisguillebert, who would stem the development of bourgeois relations of production and violently attacks the bourgeois personally, has a soft heart for those forms of money in which it appears only ideally or transiently. Thus he speaks first of the medium of circulation and next of the means of payment. What he does not see is the direct transition of money from its ideal to the material form, since the hard cash is latently present in the ideal measure of value. That money is but another form of commodities, he says, is shown by wholesale trade, in which exchange takes place without the intervention of money, after “les marchandises sont appréciés.” (“Le Detail de la France,” l. c. page 210.)

¹⁰⁹ Locke, l. c., page 17, 18.

¹¹⁰ “Il danaro ammassato supplisce a quella somma, che per essere attualmente in circolazione, per l’eventuale promiscuità de ‘commerci si allontana e sorte della sfera della circolazione medesima.” (“The accumulated money supplements that amount which, in order to be actually in circulation and to meet all possible perturbations of trade, retires from that sphere of circulation.” (G. R. Carli, note to Berri’s “Meditazioni sulla Economia Politica,” page 196, t. XV. of Custodi’s l. c.)

¹¹¹ Montanari, “Della Moneta,” 1683, l. c., page 40. “È così fattamente diffusa per tutto il globo terrestre la comunicazione de ‘popoli insieme, che può quasi dirsi esser il mondo tutto divenuto una sola città in cui si fa perpetua fiera d’ogni mercanzia, e dove ogni uomo di tutto ciò che la terra, gli animali e l’umana industria altrove producono, può mediante il danaro stando in sua casa provvedersi e godere. Maravigliosa invenzione.” (“The communication of nations among themselves is so widely extended all over the globe that it may be almost said that the entire world has become one city in which a perpetual fair of merchandise is held and where every man may by means of money acquire and enjoy, while staying at home, all that the earth, the animals and human industry produce elsewhere. Marvelous invention.”)

¹¹² I metalli han questo di proprio e singolare che in essi soli tutte le ragioni si riducono ad una che è la loro quantità, non avendo ricevuto della natura diversa qualità nè nell’internà loro costituzione nè nell’externa forma e fattura.” (Galvani, l. c., page 130.) (“Metals have this singular property, that everything in them is reduced to one consideration, viz., that of quantity, since they are not endowed by nature with any differences in quality either in their internal structure or in their external form and shape.”)

[113](#) De Orbe Novo. “O, happy coin, which furnishes mankind with a pleasant and useful beverage and keeps its possessors immune from the hell-born pest of avarice, since it can not be either buried or preserved long.”

[114](#) In 760 a multitude of poor people emigrated to the south of Prague to wash the gold sand found there, and three men were able to extract three marks of gold a day. As a result of that the run on the “diggings” and the number of hands taken away from agriculture became so great that the country was visited by a famine the following year. See M. G. Körner, “Abhandlung von dem Alterthum des Böhmischen Bergwerks,” Schneeberg, 1758.

[115](#) So far the Australian and other discoveries have not affected the ratio of the values of gold and silver. The assertions to the contrary of Michel Chevalier are worth as much as the Socialism of this ex-St. Simonist. The quotations of silver on the London market prove, however, that the average gold price of silver during 1850-1858 is not quite 3 per cent. higher than the price during 1830-1850. But this rise in price is accounted for simply by the Asiatic demand for silver. In the course of the years 1852-1858 the price of silver was changing in certain years and months only with a change in this demand, and in no case with the importation of gold from the newly discovered sources. The following is a summary of the gold prices of silver on the London market.

PRICE OF SILVER PER OUNCE.

Year — March. July. November.

1852 60-1/8pence 60-1/4pence 61-7/8pence

1853 61-3/8 pence 61-1/2 pence 61-7/8 pence

1854 61-7/8 pence 61-3/4 pence 61-1/2 pence

1855 60-7/8 pence 61-1/2 pence 60-7/8 pence

1856 60pence 61-1/4 pence 62-1/8 pence

1857 61-3/4 pence 61-5/8 pence 61-1/2 pence

1858 61-5/8 pence

[116](#) “Gold is a wonderful thing! Whoever possesses it, is master of all that he desires. By means of gold even admission to Heaven may be gained for souls.” (Columbus in a letter from Jamaica in 1503).

[117](#) The slowness of the process was admitted by Hume, although it but little agrees with his principle. See David Hume “Essays and Treatises on several subjects.” London, 1777, v. I, page 300.

[118](#) Conf. Stuart, l. c. v. I, page 394-400.

[119](#) David Hume, l. c. page 300.

[120](#) David Hume, l. c. page 303.

[121](#) David Hume, l. c. page 303.

[122](#) David Hume, l. c. page 307, 308, 303: “It is evident, that the prices do not so much depend on the absolute quantity of commodities, and that of money, which are in a nation, as on that of the commodities, which can or may come to market, and of the money which circulates. If the coin be locked up in chests, it is the same thing with regard to prices, as if it were annihilated; if the commodities be hoarded in magazines and granaries, a like effect follows. As the money and commodities in these cases, never meet, they cannot affect each other. The whole (of prices) at last reaches *a just proportion with the new quantity of specie which is in the kingdom.*”

[123](#) See *Law* and *Franklin* about surplus value which gold and silver are supposed to acquire from their function of money. Also *Forbonnais*.

[124](#) This fiction is literally advanced by Montesquieu. [The passage from Montesquieu is quoted by Marx in his *Capital*, v. I. Part 1, Ch. III, section 2, b, foot-note. Note by K. Kautsky to 2nd German edition].

[125](#) Steuart, l. c. v. I., page 394 seq.

[126](#) Steuart, l. c., v. 2. page 377-379 passim (not found in the 1767 London edition. Translator).

[127](#) Steuart, l. c., page 379-380 passim (London, 1767 edition, v. I. page 400. Transl.).

[128](#) “The additional coin will be locked up, or converted into plate.... As for the paper money, so soon as it has served the first purpose of supplying the demand of him who borrowed it, it will return upon the debtor in it and become realized.... Let the specie of a country, therefore, be augmented or diminished in ever so great a proportion, commodities will still rise and fall according to the principles of demand and competition, and these will constantly depend upon the inclinations of those who have property or any kind of equivalent whatsoever to give, but never upon the quantity of coin they are possessed of.... Let it (namely, the quantity of specie in a country) be ever so low, while there is real property of any denomination in the country, a competition to consume in those who possess it, prices will be high, by the means of barter, symbolical money, mutual prestations and a thousand other inventions.... If this country has a communication with other nations, there must be a proportion between the prices of many kinds of merchandize there and elsewhere, and a sudden augmentation or diminution of the specie, supposing it could of itself operate the effects of raising or sinking prices, would be restrained in its operation by foreign competition.” l. c. v. 1, page 400-402. “The circulation of every country must be in proportion to the industry of the inhabitants producing the commodities which come to market.... If the coin of a country, therefore, falls below the proportion of the price of industry offered to sale, inventions, like symbolical money, will be fallen upon, to provide for an equivalent for it. But if the specie be found above the proportion of industry, it will have no effect in raising prices, nor will it enter into circulation: it will be hoarded up in treasures.... Whatsoever be the quantity of money in a nation, in correspondence with the rest of the world, there never can remain in circulation, but the quantity nearly proportional to the consumption of the rich and to the labour and industry of the poor inhabitants,” and this proportion is not determined “by the quantity of money actually in the country” (l. c. page 403-408 passim.) “All nations will endeavor to throw their ready money, not necessary for their own circulation, into that country where the interest of money is high with respect to their own.” (l. c. v. 2. page 5). “The richest nation in Europe may be the poorest in circulating specie.” l. c., v. 2, page 6. For the polemics against Steuart see Arthur Young. [In his foot-note in *Capital*, v. 1, Part 1, ch. III., section 2, b. page 62, Humboldt ed., Marx says: The theory of Hume was defended against the attacks of J. Steuart and others, by A. Young, in his “Political Arithmetic,” London, 1774, in which work there is a special chapter entitled “Prices depend on quantity of money.” Note by K. Kautsky to 2nd German edition].

¹²⁹ Steuart, l. e., v. 2, page 370. Louis Blanc translates the expression “money of the society” which stands for home or national money, as socialist money, which is perfectly meaningless and makes a Socialist of John Law. (See the first volume of his History of the French Revolution).

¹³⁰ Maclaren, l. c. page 43 seq. Patriotism led Gustav Julius, a German writer who met with very early death, to hold up old Büsch as an authority as against the Ricardian school. Honest Büsch rendered Steuart’s elegant English into Hamburg Platt and by trying to improve upon the original spoiled it as often as he could.

¹³¹ Note to the 2nd edition: This is not an exact statement. Adam Smith expresses the law correctly on many occasions. [See Capital, Humboldt edition, page 62, ft-note 1, where writing seven years later, Marx makes the following qualification: “This statement applies only in so far as Adam Smith, *ex officio*, treats of money. Now and then, however, as in his criticism of the earlier systems of political economy, he takes the right view. ‘The quantity of coin in every country is regulated by the value of the commodities which are to be circulated by it.... The value of the goods annually bought and sold in any country requires a certain quantity of money to circulate and distribute them to their proper consumers, and can give employment to no more. The channel of circulation necessarily draws to itself a sum sufficient to fill it, and never admits any more.’ Wealth of Nations, Book iv., ch. I.”

¹³² The distinction between currency and money is therefore not found in “Wealth of Nations.” Deceived by the apparent impartiality of Adam Smith, who knew his Hume and Steuart very well, honest Maclaren remarks: “The theory of the dependence of prices on the extent of the currency had not as yet, attracted attention; and Doctor Smith, like Mr. Locke (Locke undergoes a change in his view), considers metallic money nothing but a commodity.” Maclaren, l. c. page 44.

¹³³ David Ricardo, “The High Price of Bullion, a Proof of the Depreciation of Bank-notes.” 4th edition, London, 1811. (The first edition appeared in 1809). Further, “Reply to Mr. Bosanquet’s Practical Observations on the Report of the Bullion Committee.” London, 1811.

¹³⁴ David Ricardo: “On the Principles of Political Economy, etc.” page 77. “Their value [of metals] [like that of all other commodities], depends on the total quantity of labour necessary to obtain the metal, and to bring it to market.”

¹³⁵ l. c. page 77, 180, 181.

¹³⁶ Ricardo, l. c. page 421. “The quantity of money that can be employed in a country must depend on its value: if gold alone were employed for the circulation of commodities, a quantity would be

required, one fifteenth only of what would be necessary, if silver were made use of for the same purpose.” See also Ricardo’s: “Proposals for an Economical and Secure Currency,” London, 1816, page 89, where he says: “The amount of notes in circulation depends on the amount required for the circulation of the country; which is regulated ... by the value of the standard [of money], the amount of payments, and the economy practised in effecting them.”

[137](#) Ricardo, “Principles of Political Economy”, page 432.

[138](#) David Ricardo, “Reply to Mr. Bosanquet’s Practical Observations, etc.” page 49. “That commodities would rise or fall in price, in proportion to the increase or diminution of money, *I assume as a fact which is incontrovertible.*”

[139](#) David Ricardo, “The High Price of Bullion,” etc. “Money would have the same value in all countries.” page 4. In his Political Economy Ricardo modified this statement, but not in a way to affect what has been said here.

[140](#) l. c. page 3-4.

[141](#) l. c., page 4.

[142](#) Ricardo, l. c., page 11-12.

[143](#) Ricardo, l. c., page 14.

[144](#) l. c., page 17.

[145](#) Ricardo, l. c., page 74-75. “England, in consequence of a bad harvest, would come under the case of a country having been deprived of a part of its commodities, and, therefore, requiring a diminished amount of circulating medium. The currency which was before equal to her payments would now become super-abundant and relatively cheap, in proportion ... of her diminished production; the exportation of this sum, therefore, would restore the value of her currency to the value of the currencies of other countries.” His confusion of money and commodity, and of money and coin borders on the ludicrous in the following passage: “If we can suppose that after an unfavorable harvest, when England has occasion for an unusual importation of corn, another nation is possessed of a super-abundance of that article, but has no wants for any commodity whatever, it would unquestionably follow that such nation would not export its corn in exchange for commodities: *but neither would it export corn for money*, as that is a commodity which no nation ever wants absolutely, but relatively.” l. c., page 75. Pushkin in his hero poem makes the father of his hero

incapable of comprehending that commodities are money. But that money is a commodity, the Russians have understood from times of yore as is proven not only by the English corn imports in 1838-1842, but by the entire history of their commerce.

¹⁴⁶ Conf. Thomas Tooke, “History of Prices,” and James Wilson, “Capital, Currency and Banking.” (The latter work is a reprint of a series of articles which appeared in the London Economist in 1844, 1845 and 1847.)

¹⁴⁷ James Deacon Hume: “Letters on the Corn Laws.” London, 1834, page 29-31. [Letter by H. B. T. on the Corn Laws and on the Rights of the Working Classes. Transl.]

¹⁴⁸ Thomas Tooke, “History of Prices,” etc. London, 1848, page 110.

¹⁴⁹ Conf. W. Blake’s above quoted “Observations etc.”

¹⁵⁰ James Mill: “Elements of Political Economy.” [London, 1821, page 95-101 passim. Transl.]

¹⁵¹ A few months before the outbreak of the commercial crisis of 1857, a committee of the House of Commons was in session to inquire into the effect of the bank-laws of 1844 and 1845. Lord Overstone, the theoretical father of these laws, delivered himself of this boast in his testimony before the committee: “By strict and prompt adherence to the principles of the act of 1844, everything has passed off with regularity and ease; the monetary system is safe and unshaken, the prosperity of the country is undisputed, the public confidence in the wisdom of the act of 1844 is daily gaining strength; and if the committee wish for further practical illustration of the soundness of the principles on which it rests, or of the beneficial results which it has assured, the true and sufficient answer to the committee is, look around you; look at the present state of trade of the country, look at the contentment of the people; look at the wealth and prosperity which pervades every class of the community; and then, having done so, the committee may be fairly called upon to decide whether they will interfere with the continuance of an act under which these results have been developed.” Thus did Overstone blow his own horn on the fourteenth of July, 1857; on the twelfth of November of the same year the Ministry had to suspend on its own responsibility the wonderful law of 1844.

¹⁵² Tooke was entirely ignorant of Stuart’s work, as may be seen from his “History of Prices for 1839-1847,” London, 1848. where he reviews the history of the theories of money.

¹⁵³ Tooke’s most important work besides the “History of Prices” which his co-worker Newmarch published in six volumes, is “An Inquiry into the Currency Principle, the Connection of the Currency

with Prices” etc., 2nd edition, London, 1844. Wilson’s book we have already quoted. Finally there is to be mentioned John Fullarton’s “On the Regulation of Currencies,” 2d edition, London, 1845.

[154](#) “We ought to ... distinguish ... between gold ... as merchandise, *i.e.* as capital, and gold ... as currency” (Tooke, “An Inquiry into the Currency Principle, etc.” page 10). “Gold and silver may be counted upon to realize on their arrival nearly the exact sum required to be provided ... gold and silver possess an infinite advantage over all other description of merchandize ... from the circumstance of being universally in use as money.... It is not in tea, coffee, sugar or indigo that debts, whether foreign or domestic, are usually contracted to be paid, but in coin; and the remittance, therefore, either in the identical coin designated, or in bullion which can be promptly turned into that coin through the mint or market of the country to which it is sent, must always afford to the remitter, the most certain, immediate, and accurate means of affecting this object, without risk of disappointment from the failure of demand or fluctuation of price.” (Fullerton, l. c. page 132-133.) “Any other article (except gold or silver) might in quantity or kind be beyond the usual demand of the country to which it is sent.” (Tooke: “An Inquiry, etc.”)

[155](#) The transformation of money into capital we shall consider in the third chapter which treats of capital and forms the end of the first book.

[156](#) This introduction was first published in the Neue Zeit (see Translator’s Preface, page 5) of March 7, 14 and 21, 1903, by Karl Kautsky, with the following explanation:

“This article has been found among the posthumous papers of Karl Marx. It is a fragmentary sketch of a treatise that was to have served as an introduction to his main work, which he had been writing for many years and whose outline was clearly formed in his mind. The manuscript is dated August 23, 1857.... As the idea is very often indicated only in fragmentary sentences, I have taken the liberty of introducing here and there changes in style, insertions of words, etc.... A mere reprint of the original would have made it unintelligible.... Not all the words in the manuscript are legible....

“Wherever there could be no doubt as to the necessity of corrections, I did so without indicating them in the text; in other cases I put all insertions in brackets. Wherever I am not certain as to whether I have deciphered a word correctly, I have put an interrogation point after it; other changes are specially noted. In all other respects this is an exact reprint of the original, whose fragmentary and incomplete passages serve to remind us only too painfully of the many treasures of thought which went down to the grave with Marx, treasures which would have sufficed for generations if Marx had not so anxiously avoided giving to the world any of his ideas until he had tested them repeatedly from every conceivable point of view and had given them a wording that would be incontrovertible. In spite of its fragmentary character it opens before us a wealth of new points of view.”

[157](#) The original reads “person.”

[158](#) The manuscript reads “production.”

[159](#) The manuscript reads “production.”

[160](#) The German text reads “instruktiv,” which I take to be a misprint of “instinktiv.” Translator.

[161](#) Compare this with foot-note 1, on page 34 of Capital, Humboldt edition, New York:

“Truly comical is M. Bastiat, who imagines that the ancient Greeks and Romans lived by plunder alone. But when people plunder for centuries, there must always be something at hand for them to seize; the objects of plunder must be continually reproduced.” K. Kautsky.

[162](#) The English expression is used by Marx in his German original. Transl.

[163](#) Marx evidently has in mind here a passage in Adam Smith’s Wealth of Nations (vol. 2, ch. 2) in which he speaks of the circulation of a country as consisting of two distinct parts: circulation between dealers and dealers, and that between dealers and consumers. The word dealer signifies here not only a merchant or shopkeeper, but also a producer. K. Kautsky.

[164](#) Here two words in the manuscript can not be deciphered. They look like “ausser sich” (“outside of itself”). K. Kautsky.

[165](#) Distribution (Verkehr) is used here in the sense of physical distribution of goods and not in sense of economic distribution of the shares of the products between the different factors of production. Translator.

[166](#) As the “notes” written down by Marx in the following eight paragraphs are extremely fragmentary, making translation in some cases impossible without a certain degree of interpretation, and as the original is not accessible in book-form, they are reproduced here in German for the benefit of the student who may feel interested in the original wording as it had been jotted down by Marx.

Preface to the First Edition, 1884

The following chapters are, in a sense, the execution of a bequest. No less a man than Karl Marx had made it one of his future tasks to present the results of Morgan's researches in the light of the conclusions of his own — within certain limits, I may say our — materialistic examination of history, and thus to make clear their full significance. For Morgan in his own way had discovered afresh in America the materialistic conception of history discovered by Marx forty years ago, and in his comparison of barbarism and civilization it had led him, in the main points, to the same conclusions as Marx. And just as the professional economists in Germany were for years as busy in plagiarizing Capital as they were persistent in attempting to kill it by silence, so Morgan's Ancient Society received precisely the same treatment from the spokesmen of "prehistoric" science in England. My work can only provide a slight substitute for what my departed friend no longer had the time to do. But I have the critical notes which he made to his extensive extracts from Morgan, and as far as possible I reproduce them here.

According to the materialistic conception, the determining factor in history is, in the final instance, the production and reproduction of the immediate essentials of life. This, again, is of a twofold character. On the one side, the production of the means of existence, of articles of food and clothing, dwellings, and of the tools necessary for that production; on the other side, the production of human beings themselves, the propagation of the species. The social organization under which the people of a particular historical epoch and a particular country live is determined by both kinds of production: by the stage of development of labor on the one hand and of the family on the other.

The lower the development of labor and the more limited the amount of its products, and consequently, the more limited also the wealth of the society, the more the social order is found to be dominated by kinship groups. However, within this structure of society based on kinship groups the productivity of labor increasingly develops, and with it private property and exchange, differences of wealth, the possibility of utilizing the labor power of others, and hence the basis of class antagonisms: new social

elements, which in the course of generations strive to adapt the old social order to the new conditions, until at last their incompatibility brings about a complete upheaval. In the collision of the newly-developed social classes, the old society founded on kinship groups is broken up; in its place appears a new society, with its control centered in the state, the subordinate units of which are no longer kinship associations, but local associations; a society in which the system of the family is completely dominated by the system of property, and in which there now freely develop those class antagonisms and class struggles that have hitherto formed the content of all *written* history.

It is Morgan's great merit that he has discovered and reconstructed in its main lines this prehistoric basis of our written history, and that in the kinship groups of the North American Indians he has found the key to the most important and hitherto insoluble riddles of earliest Greek, Roman and German history. His book is not the work of a day. For nearly forty years he wrestled with his material, until he was completely master of it. But that also makes his book one of the few epoch-making works of our time.

In the following presentation, the reader will in general easily distinguish what comes from Morgan and what I have added. In the historical sections on Greece and Rome I have not confined myself to Morgan's evidence, but have added what was available to me. The sections on the Celts and the Germans are in the main my work; Morgan had to rely here almost entirely on secondary sources, and for German conditions — apart from Tacitus — on the worthless and liberalistic falsifications of Mr. Freeman. The treatment of the economic aspects, which in Morgan's book was sufficient for his purpose but quite inadequate for mine, has been done afresh by myself. And, finally, I am, of course, responsible for all the conclusions drawn, in so far as Morgan is not expressly cited.

I. Stages of Prehistoric Culture

MORGAN is the first man who, with expert knowledge, has attempted to introduce a definite order into the history of primitive man; so long as no important additional material makes changes necessary, his classification will undoubtedly remain in force.

Of the three main epochs – savagery, barbarism, and civilization – he is concerned, of course, only with the first two and the transition to the third. He divides both savagery and barbarism into lower, middle, and upper stages according to the progress made in the production of food; for, he says:

Upon their skill in this direction, the whole question of human supremacy on the earth depended. Mankind are the only beings who may be said to have gained an absolute control over the production of food.... It is accordingly probable that the great epochs of human progress have been identified, more or less directly, with the enlargement of the sources of subsistence.

The development of the family takes a parallel course, but here the periods have not such striking marks of differentiation.

1. Savagery

(a.) LOWER STAGE. Childhood of the human race . Man still lived in his original habitat, in tropical or subtropical forests, and was partially at least a tree-dweller, for otherwise his survival among huge beasts of prey cannot be explained. Fruit, nuts and roots served him for food. The development of articulate speech is the main result of this period. Of all the peoples known to history none was still at this primitive level. Though this period may have lasted thousands of years, we have no direct evidence to prove its existence; but once the evolution of man from the animal kingdom is admitted, such a transitional stage must necessarily be assumed.

(b.) MIDDLE STAGE. Begins with the utilization of fish for food (including crabs, mussels, and other aquatic animals), and with the use of fire. The two are complementary, since fish becomes edible only by the use of fire. With this new source of nourishment, men now became independent of climate and locality; even as savages, they could, by following the rivers and coasts, spread over most of the earth. Proof of these migrations is the distribution over every continent of the crudely worked, unsharpened flint tools of the earlier Stone Age, known as “palaeoliths,” all or most of which date from this period. New environments, ceaseless exercise of his inventive faculty, and the ability to produce fire by friction, led man to discover new kinds of food: farinaceous roots and tubers, for instance, were baked in hot ashes or in ground ovens. With the invention of the first weapons, club and spear, game could sometimes be added to the fare. But the tribes which figure in books as living entirely, that is, exclusively, by hunting never existed in reality; the yield of the hunt was far too precarious. At this stage, owing to the continual uncertainty of food supplies, cannibalism seems to have arisen, and was practiced from now onwards for a long time. The Australian aborigines and many of the Polynesians are still in this middle stage of savagery today.

(c.) UPPER STAGE. Begins with the invention of the bow and arrow, whereby game became a regular source of food, and hunting a normal form of work. Bow, string, and arrow already constitute a very complex instrument, whose invention implies long, accumulated experience and sharpened intelligence, and therefore knowledge of many other inventions

as well. We find, in fact, that the peoples acquainted with the bow and arrow but not yet with pottery (from which Morgan dates the transition to barbarism) are already making some beginnings towards settlement in villages and have gained some control over the production of means of subsistence; we find wooden vessels and utensils, finger-weaving (without looms) with filaments of bark; plaited baskets of bast or osier; sharpened (neolithic) stone tools. With the discovery of fire and the stone ax, dug-out canoes now become common; beams and planks are also sometimes used for building houses. We find all these advances, for instance, among the Indians of northwest America, who are acquainted with the bow and arrow but not with pottery. The bow and arrow was for savagery what the iron sword was for barbarism and fire-arms for civilization – the decisive weapon.

2. Barbarism

(a.) LOWER STAGE. Dates from the introduction of pottery. In many cases it has been proved, and in all it is probable, that the first pots originated from the habit of covering baskets or wooden vessels with clay to make them fireproof; in this way it was soon discovered that the clay mold answered the purpose without any inner vessel.

Thus far we have been able to follow a general line of development applicable to all peoples at a given period without distinction of place. With the beginning of barbarism, however, we have reached a stage when the difference in the natural endowments of the two hemispheres of the earth comes into play. The characteristic feature of the period of barbarism is the domestication and breeding of animals and the cultivation of plants. Now, the Eastern Hemisphere, the so-called Old World, possessed nearly all the animals adaptable to domestication, and all the varieties of cultivable cereals except one; the Western Hemisphere, America, had no mammals that could be domesticated except the llama, which, moreover, was only found in one part of South America, and of all the cultivable cereals only one, though that was the best, namely, maize. Owing to these differences in natural conditions, the population of each hemisphere now goes on its own way, and different landmarks divide the particular stages in each of the two cases.

(b.) MIDDLE STAGE. Begins in the Eastern Hemisphere with domestication of animals; in the Western, with the cultivation, by means of irrigation, of plants for food, and with the use of adobe (sun-dried) bricks and stone for building.

We will begin with the Western Hemisphere, as here this stage was never superseded before the European conquest.

At the time when they were discovered, the Indians at the lower stage of barbarism (comprising all the tribes living east of the Mississippi) were already practicing some horticulture of maize, and possibly also of gourds, melons, and other garden plants, from which they obtained a very considerable part of their food. They lived in wooden houses in villages protected by palisades. The tribes in the northwest, particularly those in the region of the Columbia River, were still at the upper stage of savagery and

acquainted neither with pottery nor with any form of horticulture. The so-called Pueblo Indians of New Mexico, however, and the Mexicans, Central Americans, and Peruvians at the time of their conquest were at the middle stage of barbarism. They lived in houses like fortresses, made of adobe brick or of stone, and cultivated maize and other plants, varying according to locality and climate, in artificially irrigated plots of ground, which supplied their main source of food; some animals even had also been domesticated – the turkey and other birds by the Mexicans, the llama by the Peruvians. They could also work metals, but not iron; hence they were still unable to dispense with stone weapons and tools. The Spanish conquest then cut short any further independent development.

In the Eastern Hemisphere the middle stage of barbarism began with the domestication of animals providing milk and meat, but horticulture seems to have remained unknown far into this period. It was, apparently, the domestication and breeding of animals and the formation of herds of considerable size that led to the differentiation of the Aryans and Semites from the mass of barbarians. The European and Asiatic Aryans still have the same names for cattle, but those for most of the cultivated plants are already different.

In suitable localities, the keeping of herds led to a pastoral life: the Semites lived upon the grassy plains of the Euphrates and Tigris, and the Aryans upon those of India and of the Oxus and Jaxartes, of the Don and the Dnieper. It must have been on the borders of such pasture lands that animals were first domesticated. To later generations, consequently, the pastoral tribes appear to have come from regions which, so far from being the cradle of mankind, were almost uninhabitable for their savage ancestors and even for man at the lower stages of barbarism. But having once accustomed themselves to pastoral life in the grassy plains of the rivers, these barbarians of the middle period would never have dreamed of returning willingly to the native forests of their ancestors. Even when they were forced further to the north and west, the Semites and Aryans could not move into the forest regions of western Asia and of Europe until by cultivation of grain they had made it possible to pasture and especially to winter their herds on this less favorable land. It is more than probable that among these tribes the cultivation of grain originated from the need for cattle fodder and only later became important as a human food supply.

The plentiful supply of milk and meat and especially the beneficial effect of these foods on the growth of the children account perhaps for the superior development of the Aryan and Semitic races. It is a fact that the Pueblo Indians of New Mexico, who are reduced to an almost entirely vegetarian diet, have a smaller brain than the Indians at the lower stage of barbarism, who eat more meat and fish. In any case, cannibalism now gradually dies out, surviving only as a religious act or as a means of working magic, which is here almost the same thing.

(c.) UPPER STAGE. Begins with the smelting of iron ore, and passes into civilization with the invention of alphabetic writing and its use for literary records . This stage (as we have seen, only the Eastern Hemisphere passed through it independently) is richer in advances in production than all the preceding stages together. To it belong the Greeks of the heroic age, the tribes of Italy shortly before the foundation of Rome, the Germans of Tacitus and the Norsemen of the Viking age.

Above all, we now first meet the iron plowshare drawn by cattle, which made large-scale agriculture, the cultivation of fields, possible, and thus created a practically unrestricted food supply in comparison with previous conditions. This led to the clearance of forest land for tillage and pasture, which in turn was impossible on a large scale without the iron ax and the iron spade. Population rapidly increased in number, and in small areas became dense. Prior to field agriculture, conditions must have been very exceptional if they allowed half a million people to be united under a central organization; probably such a thing never occurred.

We find the upper stage of barbarism at its highest in the Homeric poems, particularly in the Iliad. Fully developed iron tools, the bellows, the hand-mill, the potter's wheel, the making of oil and wine, metal work developing almost into a fine art, the wagon and the war-chariot, ship-building with beams and planks, the beginnings of architecture as art, walled cities with towers and battlements, the Homeric epic and a complete mythology – these are the chief legacy brought by the Greeks from barbarism into civilization. When we compare the descriptions which Caesar and even Tacitus give of the Germans, who stood at the beginning of the cultural stage from which the Homeric Greeks were just preparing to make the next advance, we realize how rich was the development of production within the upper stage of barbarism.

The sketch which I have given here, following Morgan, of the development of mankind through savagery and barbarism to the beginnings of civilization, is already rich enough in new features; what is more, they cannot be disputed, since they are drawn directly from the process of production. Yet my sketch will seem flat and feeble compared with the picture to be unrolled at the end of our travels; only then will the transition from barbarism to civilization stand out in full light and in all its striking contrasts. For the time being, Morgan's division may be summarized thus:

Savagery – the period in which man's appropriation of products in their natural state predominates; the products of human art are chiefly instruments which assist this appropriation.

Barbarism – the period during which man learns to breed domestic animals and to practice agriculture, and acquires methods of increasing the supply of natural products by human activity.

Civilization – the period in which man learns a more advanced application of work to the products of nature, the period of industry proper and of art.

II. The Family

MORGAN, who spent a great part of his life among the Iroquois Indians – settled to this day in New York State – and was adopted into one of their tribes (the Senecas), found in use among them a system of consanguinity which was in contradiction to their actual family relationships. There prevailed among them a form of monogamy easily terminable on both sides, which Morgan calls the “pairing family.” The issue of the married pair was therefore known and recognized by everybody: there could be no doubt about whom to call father, mother, son, daughter, brother, sister. But these names were actually used quite differently. The Iroquois calls not only his own children his sons and daughters, but also the children of his brothers; and they call him father. The children of his sisters, however, he calls his nephews and nieces, and they call him their uncle. The Iroquois woman, on the other hand, calls her sisters’ children, as well as her own, her sons and daughters, and they call her mother. But her brothers’ children she calls her nephews and nieces, and she is known as their aunt. Similarly, the children of brothers call one another brother and sister, and so do the children of sisters. A woman’s own children and the children of her brother, on the other hand, call one another cousins. And these are not mere empty names, but expressions of actual conceptions of nearness and remoteness, of equality and difference in the degrees of consanguinity: these conceptions serve as the foundation of a fully elaborated system of consanguinity through which several hundred different relationships of one individual can be expressed. What is more, this system is not only in full force among all American Indians (no exception has been found up to the present), but also retains its validity almost unchanged among the aborigines of India, the Dravidian tribes in the Deccan and the Gaura tribes in Hindustan. To this day the Tamils of southern India and the Iroquois Seneca Indians in New York State still express more than two hundred degrees of consanguinity in the same manner. And among these tribes of India, as among all the American Indians, the actual relationships arising out of the existing form of the family contradict the system of consanguinity.

How is this to be explained? In view of the decisive part played by consanguinity in the social structure of all savage and barbarian peoples, the

importance of a system so widespread cannot be dismissed with phrases. When a system is general throughout America and also exists in Asia among peoples of a quite different race, when numerous instances of it are found with greater or less variation in every part of Africa and Australia, then that system has to be historically explained, not talked out of existence, as McLennan, for example, tried to do. The names of father, child, brother, sister are no mere complimentary forms of address; they involve quite definite and very serious mutual obligations which together make up an essential part of the social constitution of the peoples in question.

The explanation was found. In the Sandwich Islands (Hawaii) there still existed in the first half of the nineteenth century a form of family in which the fathers and mothers, brothers and sisters, sons and daughters, uncles and aunts, nephews and nieces were exactly what is required by the American and old Indian system of consanguinity. But now comes a strange thing. Once again, the system of consanguinity in force in Hawaii did not correspond to the actual form of the Hawaiian family. For according to the Hawaiian system of consanguinity all children of brothers and sisters are without exception brothers and sisters of one another and are considered to be the common children not only of their mother and her sisters or of their father and his brothers, but of all the brothers and sisters of both their parents without distinction. While, therefore, the American system of consanguinity presupposes a more primitive form of the family which has disappeared in America, but still actually exists in Hawaii, the Hawaiian system of consanguinity, on the other hand, points to a still earlier form of the family which, though we can nowhere prove it to be still in existence, nevertheless must have existed; for otherwise the corresponding system of consanguinity could never have arisen.

The family represents an active principle. It is never stationary, but advances from a lower to a higher form as society advances from a lower to a higher condition.... Systems of consanguinity, on the contrary, are passive; recording the progress made by the family at long intervals apart, and only changing radically when the family has radically changed.

“And,” adds Marx, “the same is true of the political, juridical, religious, and philosophical systems in general.” While the family undergoes living changes, the system of consanguinity ossifies; while the system survives by force of custom, the family outgrows it. But just as Cuvier could deduce

from the marsupial bone of an animal skeleton found near Paris that it belonged to a marsupial animal and that extinct marsupial animals once lived there, so with the same certainty we can deduce from the historical survival of a system of consanguinity that an extinct form of family once existed which corresponded to it.

The systems of consanguinity and the forms of the family we have just mentioned differ from those of today in the fact that every child has more than one father and mother. In the American system of consanguinity, to which the Hawaiian family corresponds, brother and sister cannot be the father and mother of the same child; but the Hawaiian system of consanguinity, on the contrary, presupposes a family in which this was the rule. Here we find ourselves among forms of family which directly contradict those hitherto generally assumed to be alone valid. The traditional view recognizes only monogamy, with, in addition, polygamy on the part of individual men, and at the very most polyandry on the part of individual women; being the view of moralizing philistines, it conceals the fact that in practice these barriers raised by official society are quietly and calmly ignored. The study of primitive history, however, reveals conditions where the men live in polygamy and their wives in polyandry at the same time, and their common children are therefore considered common to them all – and these conditions in their turn undergo a long series of changes before they finally end in monogamy. The trend of these changes is to narrow more and more the circle of people comprised within the common bond of marriage, which was originally very wide, until at last it includes only the single pair, the dominant form of marriage today.

Reconstructing thus the past history of the family, Morgan, in agreement with most of his colleagues, arrives at a primitive stage when unrestricted sexual freedom prevailed within the tribe, every woman belonging equally to every man and every man to every woman. Since the eighteenth century there had been talk of such a primitive state, but only in general phrases. Bachofen – and this is one of his great merits – was the first to take the existence of such a state seriously and to search for its traces in historical and religious survivals. Today we know that the traces he found do not lead back to a social stage of promiscuous sexual intercourse, but to a much later form – namely, group marriage. The primitive social stage of promiscuity, if it ever existed, belongs to such a remote epoch that we can hardly expect to prove its existence directly by discovering its social fossils among

backward savages. Bachofen's merit consists in having brought this question to the forefront for examination.

Lately it has become fashionable to deny the existence of this initial stage in human sexual life. Humanity must be spared this "shame." It is pointed out that all direct proof of such a stage is lacking, and particular appeal is made to the evidence from the rest of the animal world; for, even among animals, according to the numerous facts collected by Letourneau (*Evolution du manage et de la faults*, 1888), complete promiscuity in sexual intercourse marks a low stage of development. But the only conclusion I can draw from all these facts, so far as man and his primitive conditions of life are concerned, is that they prove nothing whatever. That vertebrates mate together for a considerable period is sufficiently explained by physiological causes – in the case of birds, for example, by the female's need of help during the brooding period; examples of faithful monogamy among birds prove nothing about man, for the simple reason that men are not descended from birds. And if strict monogamy is the height of all virtue, then the palm must go to the tapeworm, which has a complete set of male and female sexual organs in each of its 50-200 proglottides, or sections, and spends its whole life copulating in all its sections with itself. Confining ourselves to mammals, however, we find all forms of sexual life – promiscuity, indications of group marriage, polygyny, monogamy. Polyandry alone is lacking – it took human beings to achieve that. Even our nearest relations, the quadrumana, exhibit every possible variation in the grouping of males and females; and if we narrow it down still more and consider only the four anthropoid apes, all that Letourneau has to say about them is that they are sometimes monogamous, sometimes polygamous, while Saussure, quoted by Giraud-Teulon, maintains that they are monogamous. The more recent assertions of the monogamous habits of the anthropoid apes which are cited by Westermarck (*The History of Human Marriage*, London 1891), are also very far from proving anything. In short, our evidence is such that honest Letourneau admits: "Among mammals there is no strict relation between the degree of intellectual development and the form of sexual life." And Espinas (*Des societes animales*, 1877), says in so many words:

The herd is the highest social group which we can observe among animals. It is composed, so it appears, of families, but from the start the

family and the herd are in conflict with one another and develop in inverse proportion.

As the above shows, we know practically nothing definite about the family and other social groupings of the anthropoid apes; the evidence is flatly contradictory. Which is not to be wondered at. The evidence with regard to savage human tribes is contradictory enough, requiring very critical examination and sifting; and ape societies are far more difficult to observe than human. For the present, therefore, we must reject any conclusion drawn from such completely unreliable reports.

The sentence quoted from Espinas, however, provides a better starting point. Among the higher animals the herd and the family are not complementary to one another, but antagonistic. Espinas shows very well how the jealousy of the males during the mating season loosens the ties of every social herd or temporarily breaks it up.

When the family bond is close and exclusive, herds form only in exceptional cases. When on the other hand free sexual intercourse or polygamy prevails, the herd comes into being almost spontaneously.... Before a herd can be formed, family ties must be loosened and the individual must have become free again. This is the reason why organized flocks are so rarely found among birds.... We find more or less organized societies among mammals, however, precisely because here the individual is not merged in the family.... In its first growth, therefore, the common feeling of the herd has no greater enemy than the common feeling of the family. We state it without hesitation: only by absorbing families which had undergone a radical change could a social form higher than the family have developed; at the same time, these families were thereby enabled later to constitute themselves afresh under infinitely more favorable circumstances.

.

Here we see that animal societies are, after all, of some value for drawing conclusions about human societies; but the value is only negative. So far as our evidence goes, the higher vertebrates know only two forms of family – polygyny or separate couples; each form allows only one adult male, only one husband. The jealousy of the male, which both consolidates and isolates the family, sets the animal family in opposition to the herd. The jealousy of the males prevents the herd, the higher social form, from

coming into existence, or weakens its cohesion, or breaks it up during the mating period; at best, it attests its development. This alone is sufficient proof that animal families and primitive human society are incompatible, and that when primitive men were working their way up from the animal creation, they either had no family at all or a form that does not occur among animals. In small numbers, an animal so defenseless as evolving man might struggle along even in conditions of isolation, with no higher social grouping than the single male and female pair, such as Westermarck, following the reports of hunters, attributes to the gorillas and the chimpanzees. For man's development beyond the level of the animals, for the achievement of the greatest advance nature can show, something more was needed: the power of defense lacking to the individual had to be made good by the united strength and co-operation of the herd. To explain the transition to humanity from conditions such as those in which the anthropoid apes live today would be quite impossible; it looks much more as if these apes had strayed off the line of evolution and were gradually dying out or at least degenerating. That alone is sufficient ground for rejecting all attempts based on parallels drawn between forms of family and those of primitive man. Mutual toleration among the adult males, freedom from jealousy, was the first condition for the formation of those larger, permanent groups in which alone animals could become men. And what, in fact, do we find to be the oldest and most primitive form of family whose historical existence we can indisputably prove and which in one or two parts of the world we can still study today? Group marriage, the form of family in which whole groups of men and whole groups of women mutually possess one another, and which leaves little room for jealousy. And at a later stage of development we find the exceptional form of polyandry, which positively revolts every jealous instinct and is therefore unknown among animals. But as all known forms of group marriage are accompanied by such peculiarly complicated regulations that they necessarily point to earlier and simpler forms of sexual relations, and therefore in the last resort to a period of promiscuous intercourse corresponding to the transition from the animal to the human, the references to animal marriages only bring us back to the very point from which we were to be led away for good and all.

What, then, does promiscuous sexual intercourse really mean? It means the absence of prohibitions and restrictions which are or have been in force. We have already seen the barrier of jealousy go down. If there is one thing

certain, it is that the feeling of jealousy develops relatively late. The same is true of the conception of incest. Not only were brother and sister originally man and wife; sexual intercourse between parents and children is still permitted among many peoples today. Bancroft (*The Native Races of the Pacific States of North America*, 1875, Vol. I), testifies to it among the Kadiaks on the Behring Straits, the Kadiaks near Alaska, and the Tinneh in the interior of British North America; Letourneau compiled reports of it among the Chippewa Indians, the Cucus in Chile, the Caribs, the Karens in Burma; to say nothing of the stories told by the old Greeks and Romans about the Parthians, Persians, Scythians, Huns, and so on. Before incest was invented – for incest is an invention, and a very valuable one, too – sexual intercourse between parents and children did not arouse any more repulsion than sexual intercourse between other persons of different generations, and that occurs today even in the most philistine countries without exciting any great horror; even “old maids” of over sixty, if they are rich enough, sometimes marry young men in their thirties. But if we consider the most primitive known forms of family apart from their conceptions of incest – conceptions which are totally different from ours and frequently in direct contradiction to them – then the form of sexual intercourse can only be described as promiscuous – promiscuous in so far as the restrictions later established by custom did not yet exist. But in everyday practice that by no means necessarily implies general mixed mating. Temporary pairings of one man with one woman were not in any way excluded, just as in the cases of group marriages today the majority of relationships are of this character. And when Westermarck, the latest writer to deny the existence of such a primitive state, applies the term “marriage” to every relationship in which the two sexes remain mated until the birth of the offspring, we must point out that this kind of marriage can very well occur under the conditions of promiscuous intercourse without contradicting the principle of promiscuity – the absence of any restriction imposed by custom on sexual intercourse. Westermarck, however, takes the standpoint that promiscuity “involves a suppression of individual inclinations,” and that therefore “the most genuine form of it is prostitution.” In my opinion, any understanding of primitive society is impossible to people who only see it as a brothel. We will return to this point when discussing group marriage.

According to Morgan, from this primitive state of promiscuous intercourse there developed, probably very early:

1. The Consanguine Family, The First Stage of the Family

Here the marriage groups are separated according to generations: all the grandfathers and grandmothers within the limits of the family are all husbands and wives of one another; so are also their children, the fathers and mothers; the latter's children will form a third circle of common husbands and wives; and their children, the great-grandchildren of the first group, will form a fourth. In this form of marriage, therefore, only ancestors and progeny, and parents and children, are excluded from the rights and duties (as we should say) of marriage with one another. Brothers and sisters, male and female cousins of the first, second, and more remote degrees, are all brothers and sisters of one another, and precisely for that reason they are all husbands and wives of one another. At this stage the relationship of brother and sister also includes as a matter of course the practice of sexual intercourse with one another. In its typical form, such a family would consist of the descendants of a single pair, the descendants of these descendants in each generation being again brothers and sisters, and therefore husbands and wives, of one another.

The consanguine family is extinct. Even the most primitive peoples known to history provide no demonstrable instance of it. But that it must have existed, we are compelled to admit: for the Hawaiian system of consanguinity still prevalent today throughout the whole of Polynesia expresses degrees of consanguinity which could only arise in this form of family; and the whole subsequent development of the family presupposes the existence of the consanguine family as a necessary preparatory stage.

2. The Punaluan Family

If the first advance in organization consisted in the exclusion of parents and children from sexual intercourse with one another, the second was the exclusion of sister and brother. On account of the greater nearness in age, this second advance was infinitely more important, but also more difficult, than the first. It was effected gradually, beginning probably with the exclusion from sexual intercourse of own brothers and sisters (children of, the same mother) first in isolated cases and then by degrees as a general rule (even in this century exceptions were found in Hawaii), and ending with the prohibition of marriage even between collateral brothers and sisters, or, as we should say, between first, second, and third cousins. It affords, says Morgan, “a good illustration of the operation of the principle of natural selection.” There can be no question that the tribes among whom inbreeding was restricted by this advance were bound to develop more quickly and more fully than those among whom marriage between brothers and sisters remained the rule and the law. How powerfully the influence of this advance made itself felt is seen in the institution which arose directly out of it and went far beyond it — the gens, which forms the basis of the social order of most, if not all, barbarian peoples of the earth and from which in Greece and Rome we step directly into civilization.

After a few generations at most, every original family was bound to split up. The practice of living together in a primitive communistic household, which prevailed without exception till late in the middle stage of barbarism, set a limit, varying with the conditions but fairly definite in each locality, to the maximum size of the family community. As soon as the conception arose that sexual intercourse between children of the same mother was wrong, it was bound to exert its influence when the old households split up and new ones were founded (though these did not necessarily coincide with the family group). One or more lines of sisters would form the nucleus of the one household and their own brothers the nucleus of the other. It must have been in some such manner as this that the form which Morgan calls the punaluan family originated out of the consanguine family. According to the Hawaiian custom, a number of sisters, own or collateral (first, second or more remote cousins) were the common wives of their common husbands,

from among whom, however, their own brothers were excluded; these husbands now no longer called themselves brothers, for they were no longer necessarily brothers, but punalua – that is, intimate companion, or partner. Similarly, a line of own or collateral brothers had a number of women, not their sisters, as common wives, and these wives called one another punalua. This was the classic form of a type of family, in which later a number of variations was possible, but whose essential feature was: mutually common possession of husbands and wives within a definite family circle, from which, however, the brothers of the wives, first own and later also collateral, and conversely also the sisters of the husbands, were excluded.

This form of the family provides with the most complete exactness the degrees of consanguinity expressed in the American system. The children of my mother's sisters are still her children, just as the children of my father's brothers are also his children; and they are all my brothers and sisters. But the children of my mother's brothers are now her nephews and nieces, the children of my father's sisters are his nephews and nieces, and they are all my male and female cousins. For while the husbands of my mother's sisters are still her husbands, and the wives of my father's brothers are still his wives (in right, if not always in fact), the social ban on sexual intercourse between brothers and sisters has now divided the children of brothers and sisters, who had hitherto been treated as own brothers and sisters, into two classes: those in the one class remain brothers and sisters as before (collateral, according to our system); those in the other class, the children of my mother's brother in the one case and of my father's sister in the other, cannot be brothers and sisters any longer, they can no longer have common parents, neither father nor mother nor both, and therefore now for the first time the class of nephews and nieces, male and female cousins becomes necessary, which in the earlier composition of the family would have been senseless. The American system of consanguinity, which appears purely nonsensical in any form of family based on any variety of monogamy, finds, down to the smallest details, its rational explanation and its natural foundation in the punaluan family. The punaluan family or a form similar to it must have been at the very least as widespread as this system of consanguinity.

Evidence of this form of family, whose existence has actually been proved in Hawaii, would probably have been received from all over Polynesia if the pious missionaries, like the Spanish monks of former days

in America, had been able to see in such unchristian conditions anything more than a sheer “abomination.”

Caesar’s report of the Britons, who were at that time in the middle stage of barbarism, “every ten or twelve have wives in common, especially brothers with brothers and parents with children,” is best explained as group marriage. Barbarian mothers do not have ten or twelve sons of their own old enough to keep wives in common, but the American system of consanguinity, which corresponds to the punaluan family, provides numerous brothers, because all a man’s cousins, near and distant, are his brothers. Caesar’s mention of “parents with children” may be due to misunderstanding on his part; it is not, however, absolutely impossible under this system that father and son or mother and daughter should be included in the same marriage group, though not father and daughter or mother and son. This or a similar form of group marriage also provides the simplest explanation of the accounts in Herodotus and other ancient writers about community of wives among savages and barbarian peoples. The same applies also to the reports of Watson and Kaye in their book, *The People of India*, about the Teehurs in Oudh (north of the Ganges): “Both sexes have but a nominal tie on each other, and they change connection without compunction; living together, almost indiscriminately, in many large families.”

In the very great majority of cases the institution of the gens seems to have originated directly out of the punaluan family. It is true that the Australian classificatory system also provides an origin for it: the Australians have gentes, but not yet the punaluan family; instead, they have a cruder form of group marriage. In all forms of group family it is uncertain who is the father of a child; but it is certain who its mother is. Though she calls all the children of the whole family her children and has a mother’s duties towards them, she nevertheless knows her own children from the others. It is therefore clear that in so far as group marriage prevails, descent can only be proved on the mother’s side and that therefore only the female line is recognized. And this is in fact the case among all peoples in the period of savagery or in the lower stage of barbarism. It is the second great merit of Bachofen that he was the first to make this discovery. To denote this exclusive recognition of descent through the mother and the relations of inheritance which in time resulted from it, he uses the term “mother-right,” which for the sake of brevity I retain. The term is, however, ill-chosen,

since at this stage of society there cannot yet be any talk of “right” in the legal sense.

If we now take one of the two standard groups of the punaluan family, namely a line of own and collateral sisters (that is, own sisters’ children in the first, second or third degree), together with their children and their own collateral brothers on the mother’s side (who, according to our assumption, are not their husbands), we have the exact circle of persons whom we later find as members of a gens, in the original form of that institution. They all have a common ancestral mother, by virtue of their descent from whom the female offspring in each generation are sisters. The husbands of these sisters, however, can no longer be their brothers and therefore cannot be descended from the same ancestral mother; consequently, they do not belong to the same consanguine group, the later gens. The children of these sisters, however, do belong to this group, because descent on the mother’s side alone counts, since it alone is certain. As soon as the ban had been established on sexual intercourse between all brothers and sisters, including the most remote collateral relatives on the mother’s side, this group transformed itself into a gens – that is, it constituted itself a firm circle of blood relations in the female line, between whom marriage was prohibited; and henceforward by other common institutions of a social and religious character it increasingly consolidated and differentiated itself from the other gentes of the same tribe. More of this later. When we see, then, that the development of the gens follows, not only necessarily, but also perfectly naturally from the punaluan family, we may reasonably infer that at one time this form of family almost certainly existed among all peoples among whom the presence of gentile institutions can be proved – that is, practically all barbarians and civilized peoples.

At the time Morgan wrote his book, our knowledge of group marriage was still very limited. A little information was available about the group marriages of the Australians, who were organized in classes, and Morgan had already, in 1871, published the reports he had received concerning the punaluan family in Hawaii. The punaluan family provided, on the one hand, the complete explanation of the system of consanguinity in force among the American Indians, which had been the starting point of all Morgan’s researches; on the other hand, the origin of the matriarchal gens could be derived directly from the punaluan family; further, the punaluan family represented a much higher stage of development than the Australian

classificatory system. It is therefore comprehensible that Morgan should have regarded it as the necessary stage of development before pairing marriage and should believe it to have been general in earlier times. Since then we have become acquainted with a number of other forms of group marriage, and we now know that Morgan here went too far. However, in his punaluan family he had had the good fortune to strike the highest, the classic form of group marriage, from which the transition to a higher stage can be explained most simply.

For the most important additions to our knowledge of group marriage we are indebted to the English missionary, Lorimer Fison, who for years studied this form of the family in its classic home, Australia. He found the lowest stage of development among the Australian aborigines of Mount Gambier in South Australia. Here the whole tribe is divided into two great exogamous classes or moieties, Kroki and Kumite. Sexual intercourse within each of these moieties is strictly forbidden; on the other hand, every man in the one moiety is the husband by birth of every woman in the other moiety and she is by birth his wife. Not the individuals, but the entire groups are married, moiety with moiety. And observe that there is no exclusion on the ground of difference in age or particular degrees of affinity, except such as is entailed by the division of the tribe into two exogamous classes. A Kroki has every Kumite woman lawfully to wife; but, as his own daughter according to mother-right is also a Kumite, being the daughter of a Kumite woman, she is by birth the wife of every Kroki, including, therefore, her father. At any rate, there is no bar against this in the organization into moieties as we know it. Either, then, this organization arose at a time when, in spite of the obscure impulse towards the restriction of inbreeding, sexual intercourse between parents and children was still not felt to be particularly horrible – in which case the moiety system must have originated directly out of a state of sexual promiscuity; or else intercourse between parents and children was already forbidden by custom when the moieties arose, and in that case the present conditions point back to the consanguine family and are the first step beyond it. The latter is more probable. There are not, to my knowledge, any instances from Australia of sexual cohabitation between parents and children, and as a rule the later form of exogamy, the matriarchal gens, also tacitly presupposes the prohibition of this relationship as already in force when the gens came into being.

The system of two moieties is found, not only at Mount Gambier in South Australia, but also on the Darling River further to the east and in Queensland in the northeast; it is therefore widely distributed. It excludes marriages only between brothers and sisters, between the children of brothers and between the children of sisters on the mother's side, because these belong to the same moiety; the children of sisters and brothers, however, may marry. A further step towards the prevention of inbreeding was taken by the Kamilaroi on the Darling River in New South Wales; the two original moieties are split up into four, and again each of these four sections is married en bloc to another. The first two sections are husbands and wives of one another by birth; according to whether the mother belonged to the first or second section, the children go into the third or fourth; the children of these last two sections, which are also married to one another, come again into the first and second sections. Thus one generation always belongs to the first and second sections, the next to the third and fourth, and the generation after that to the first and second again. Under this system, first cousins (on the mother's side) cannot be man and wife, but second cousins can. This peculiarly complicated arrangement is made still more intricate by having matriarchal gentes grafted onto it (at any rate later), but we cannot go into the details of this now. What is significant is how the urge towards the prevention of inbreeding asserts itself again and again, feeling its way, however, quite instinctively, without clear consciousness of its aim.

Group marriage which in these instances from Australia is still marriage of sections, mass marriage of an entire section of men, often scattered over the whole continent, with an equally widely distributed section of women – this group marriage, seen close at hand, does not look quite so terrible as the philistines, whose minds cannot get beyond brothels, imagine it to be. On the contrary, for years its existence was not even suspected and has now quite recently been questioned again. All that the superficial observer sees in group marriage is a loose form of monogamous marriage, here and there polygyny, and occasional infidelities. It takes years, as it took Fison and Howlett, to discover beneath these marriage customs, which in their actual practice should seem almost familiar to the average European, their controlling law: the law by which the Australian aborigine, wandering hundreds of miles from his home among people whose language he does not understand, nevertheless often finds in every camp and every tribe

women who give themselves to him without resistance and without resentment; the law by which the man with several wives gives one up for the night to his guest. Where the European sees immorality and lawlessness, strict law rules in reality. The women belong to the marriage group of the stranger, and therefore they are his wives by birth; that same law of custom which gives the two to one another forbids under penalty of outlawry all intercourse outside the marriage groups that belong together. Even when wives are captured, as frequently occurs in many places, the law of the exogamous classes is still carefully observed.

Marriage by capture, it may be remarked, already shows signs of the transition to monogamous marriage, at least in the form of pairing marriage. When the young man has captured or abducted a girl, with the help of his friends, she is enjoyed by all of them in turn, but afterwards she is regarded as the wife of the young man who instigated her capture. If, on the other hand, the captured woman runs away from her husband and is caught by another man, she becomes his wife and the first husband loses his rights. Thus while group marriage continues to exist as the general form, side by side with group marriage and within it exclusive relationships begin to form, pairings for a longer or shorter period, also polygyny; thus group marriage is dying out here, too, and the only question is which will disappear first under European influence: group marriage or the Australian aborigines who practice it. Marriage between entire sections, as it prevails in Australia, is in any case a very low and primitive form of group marriage, whereas the punaluan family, so far as we know, represents its highest stage of development. The former appears to be the form corresponding to the social level of vagrant savages, while the latter already presupposes relatively permanent settlements of communistic communities and leads immediately to the successive higher phase of development. But we shall certainly find more than one intermediate stage between these two forms; here lies a newly discovered field of research which is still almost completely unexplored.

3. The Pairing Family

A certain amount of pairing, for a longer or shorter period, already occurred in group marriage or even earlier; the man had a chief wife among his many wives (one can hardly yet speak of a favorite wife), and for her he was the most important among her husbands. This fact has contributed considerably to the confusion of the missionaries, who have regarded group marriage sometimes as promiscuous community of wives, sometimes as unbridled adultery. But these customary pairings were bound to grow more stable as the gens developed and the classes of “brothers” and “sisters” between whom marriage was impossible became more numerous. The impulse given by the gens to the prevention of marriage between blood relatives extended still further. Thus among the Iroquois and most of the other Indians at the lower stage of barbarism we find that marriage is prohibited between all relatives enumerated in their system – which includes several hundred degrees of kinship. The increasing complication of these prohibitions made group marriages more and more impossible; they were displaced by the pairing family. In this stage, one man lives with one woman, but the relationship is such that polygamy and occasional infidelity remain the right of the men, even though for economic reasons polygamy is rare, while from the woman the strictest fidelity is generally demanded throughout the time she lives with the man, and adultery on her part is cruelly punished. The marriage tie can, however, be easily dissolved by either partner; after separation, the children still belong, as before, to the mother alone.

In this ever extending exclusion of blood relatives from the bond of marriage, natural selection continues its work. In Morgan’s words:

The influence of the new practice, which brought unrelated persons into the marriage relation, tended to create a more vigorous stock physically and mentally.... When two advancing tribes, with strong mental and physical characters, are brought together and blended into one people by the accidents of barbarous life, the new skull and brain would widen and lengthen to the sum of the capabilities of both.

Tribes with gentile constitution were thus bound to gain supremacy over more backward tribes, or else to carry them along by their example.

Thus the history of the family in primitive times consists in the progressive narrowing of the circle, originally embracing the whole tribe, within which the two sexes have a common conjugal relation. The continuous exclusion, first of nearer, then of more and more remote relatives, and at last even of relatives by marriage, ends by making any kind of group marriage practically impossible. Finally, there remains only the single, still loosely linked pair, the molecule with whose dissolution marriage itself ceases. This in itself shows what a small part individual sex-love, in the modern sense of the word, played in the rise of monogamy. Yet stronger proof is afforded by the practice of all peoples at this stage of development. Whereas in the earlier forms of the family men never lacked women, but, on the contrary, had too many rather than too few, women had now become scarce and highly sought after. Hence it is with the pairing marriage that there begins the capture and purchase of women – widespread symptoms, but no more than symptoms, of the much deeper change that had occurred. These symptoms, mere methods of procuring wives, the pedantic Scot, McLennan, has transmogrified into special classes of families under the names of “marriage by capture” and “marriage by purchase.” In general, whether among the American Indians or other peoples (at the same stage), the conclusion of a marriage is the affair, not of the two parties concerned, who are often not consulted at all, but of their mothers. Two persons entirely unknown to each other are often thus affianced; they only learn that the bargain has been struck when the time for marrying approaches. Before the wedding the bridegroom gives presents to the bride’s gentile relatives (to those on the mother’s side, therefore, not to the father and his relations), which are regarded as gift payments in return for the girl. The marriage is still terminable at the desire of either partner, but among many tribes, the Iroquois, for example, public opinion has gradually developed against such separations; when differences arise between husband and wife, the gens relatives of both partners act as mediators, and only if these efforts prove fruitless does a separation take place, the wife then keeping the children and each partner being free to marry again.

The pairing family, itself too weak and unstable to make an independent household necessary or even desirable, in no wise destroys the communistic household inherited from earlier times. Communistic housekeeping, however, means the supremacy of women in the house; just as the exclusive recognition of the female parent, owing to the impossibility of recognizing

the male parent with certainty, means that the women – the mothers – are held in high respect. One of the most absurd notions taken over from eighteenth-century enlightenment is that in the beginning of society woman was the slave of man. Among all savages and all barbarians of the lower and middle stages, and to a certain extent of the upper stage also, the position of women is not only free, but honorable. As to what it still is in the pairing marriage, let us hear the evidence of Ashur Wright, for many years missionary among the Iroquois Senecas:

As to their family system, when occupying the old long-houses , it is probable that some one clan predominated, the women taking in husbands, however, from the other clans Usually, the female portion ruled the house.... The stores were in common; but woe to the luckless husband or lover who was too shiftless to do his share of the providing. No matter how many children, or whatever goods he might have in the house, he might at any time be ordered to pick up his blanket and budge; and after such orders it would not be healthful for him to attempt to disobey. The house would be too hot for him; and ... he must retreat to his own clan ; or, as was often done, go and start a new matrimonial alliance in some other. The women were the great power among the clans , as everywhere else. They did not hesitate, when occasion required, “to knock off the horns,” as it was technically called, from the head of a chief, and send him back to the ranks of the warriors.

The communistic household, in which most or all of the women belong to one and the same gens, while the men come from various gentes, is the material foundation of that supremacy of the women which was general in primitive times, and which it is Bachofen’s third great merit to have discovered. The reports of travelers and missionaries, I may add, to the effect that women among savages and barbarians are overburdened with work in no way contradict what has been said. The division of labor between the two sexes is determined by quite other causes than by the position of woman in society. Among peoples where the women have to work far harder than we think suitable, there is often much more real respect for women than among our Europeans. The lady of civilization, surrounded by false homage and estranged from all real work, has an infinitely lower social position than the hard-working woman of barbarism,

who was regarded among her people as a real lady (lady, frowa, Frau – mistress) and who was also a lady in character.

Whether pairing marriage has completely supplanted group marriage in America today is a question to be decided by closer investigation among the peoples still at the upper stage of savagery in the northwest, and particularly in South America. Among the latter, so many instances of sexual license are related that one can hardly assume the old group marriage to have been completely overcome here. At any rate, all traces of it have not yet disappeared. In at least forty North American tribes the man who marries an eldest sister has the right to take all her other sisters as his wives as soon as they are old enough – a relic of the time when a whole line of sisters had husbands in common. And Bancroft reports of the Indians of the California peninsula (upper stage of savagery) that they have certain festivals when several “tribes” come together for the purpose of promiscuous sexual intercourse. These “tribes” are clearly gentes, who preserve in these feasts a dim memory of the time when the women of one gens had all the men of the other as their common husbands, and conversely. The same custom still prevails in Australia. We find among some peoples that the older men, the chieftains and the magician-priests, exploit the community of wives and monopolize most of the women for themselves; at certain festivals and great assemblies of the people, however, they have to restore the old community of women and allow their wives to enjoy themselves with the young men. Westermarck (*History of Human Marriage*, 1891, pp. 28, 29) quotes a whole series of instances of such periodic Saturnalian feasts, when for a short time the old freedom of sexual intercourse is again restored: examples are given among the Hos, the Santals, the Punjas and Kotars in India, among some African peoples, and so forth. Curiously enough, Westermarck draws the conclusion that these are survivals, not of the group marriage, which he totally rejects, but of the mating season which primitive man had in common with the other animals.

Here we come to Bachofen’s fourth great discovery – the widespread transitional form between group marriage and pairing. What Bachofen represents as a penance for the transgression of the old divine laws – the penance by which the woman purchases the right of chastity – is in fact only a mystical expression of the penance by which the woman buys herself out of the old community of husbands and acquires the right to give herself to one man only. This penance consists in a limited surrender: the

Babylonian women had to give themselves once a year in the temple of Mylitta; other peoples of Asia Minor sent their girls for years to the temple of Anaitis, where they had to practice free love with favorites of their own choosing before they were allowed to marry. Similar customs in religious disguise are common to almost all Asiatic peoples between the Mediterranean and the Ganges. The sacrifice of atonement by which the woman purchases her freedom becomes increasingly lighter in course of time, as Bachofen already noted:

Instead of being repeated annually, the offering is made once only; the hetaerism of the matrons is succeeded by the hetaerism of the maidens; hetaerism during marriage by hetaerism before marriage; surrender to all without choice by surrender to some.

(Mutterrecht, p. xix.)

Among other peoples the religious disguise is absent. In some cases – among the Thracians, Celts, and others, in classical times, many of the original inhabitants of India, and to this day among the Malayan peoples, the South Sea Islanders and many American Indians – the girls enjoy the greatest sexual freedom up to the time of their marriage. This is especially the case almost everywhere in South America, as everyone who has gone any distance into the interior can testify. Thus Agassiz (*A Journey in Brazil*, Boston and New York, 1868, p. 266) tells this story of a rich family of Indian extraction: when he was introduced to the daughter, he asked after her father, presuming him to be her mother's husband, who was fighting as an officer in the war against Paraguay; but the mother answered with a smile: "Nao tem pai, e filha da fortuna" (She has no father. She is a child of chance):

It is the way the Indian or half-breed women here always speak of their illegitimate children . . . without an intonation of sadness or of blame.... So far is this from being an unusual case, that... the opposite seems the exception. Children are frequently quite ignorant of their parentage. They know about their mother, for all the care and responsibility falls upon her, but they have no knowledge of their father; nor does it seem to occur to the woman that she or her children have any claim upon him.

What seems strange here to civilized people is simply the rule according to mother-right and in group marriage.

Among other peoples, again, the friends and relatives of the bridegroom, or the wedding guests, claim their traditional right to the bride at the

wedding itself, and the bridegroom's turn only comes last; this was the custom in the Balearic Islands and among the Augilers of Africa in ancient times; it is still observed among the Bareas of Abyssinia. In other cases, an official personage, the head of the tribe or the gens, cacique, shaman, priest, prince or whatever he may be called, represents the community and exercises the right of the first night with the bride. Despite all necromantic whitewashing, this *jus prime noctis* still persists today as a relic of group marriage among most of the natives of the Alaska region (Bancroft, *Native Races*, I, p. 81), the Tahus of North Mexico (*Ibid.*, P. 584) and other peoples; and at any rate in the countries originally Celtic, where it was handed down directly from group marriage, it existed throughout the whole of the middle ages, for example, in Aragon. While in Castile the peasants were never serfs, in Aragon there was serfdom of the most shameful kind right up till the decree of Ferdinand the Catholic in 1486. This document states:

We judge and declare that the aforementioned lords (senors, barons) ... when the peasant takes himself a wife, shall neither sleep with her on the first night; nor shall they during the wedding-night, when the wife has laid herself in her bed, step over it and the aforementioned wife as a sign of lordship; nor shall the aforementioned lords use the daughter or the son of the peasant, with payment or without payment, against their will.

(Quoted in the original Catalan by Sugenheim, *Serfdom*, Petersburg, 1861, p. 35)

Bachofen is also perfectly right when he consistently maintains that the transition from what he calls "Hetaerism" or "Sumpfzeugung" to monogamy was brought about primarily through the women. The more the traditional sexual relations lost the native primitive character of forest life, owing to the development of economic conditions with consequent undermining of the old communism and growing density of population, the more oppressive and humiliating must the women have felt them to be, and the greater their longing for the right of chastity, of temporary or permanent marriage with one man only, as a way of release. This advance could not in any case have originated with the men, if only because it has never occurred to them, even to this day, to renounce the pleasures of actual group marriage. Only when the women had brought about the transition to pairing

marriage were the men able to introduce strict monogamy – though indeed only for women.

The first beginnings of the pairing family appear on the dividing line between savagery and barbarism; they are generally to be found already at the upper stage of savagery, but occasionally not until the lower stage of barbarism. The pairing family is the form characteristic of barbarism, as group marriage is characteristic of savagery and monogamy of civilization. To develop it further, to strict monogamy, other causes were required than those we have found active hitherto. In the single pair the group was already reduced to its final unit, its two-atom molecule: one man and one woman. Natural selection, with its progressive exclusions from the marriage community, had accomplished its task; there was nothing more for it to do in this direction. Unless new, social forces came into play, there was no reason why a new form of family should arise from the single pair. But these new forces did come into play.

We now leave America, the classic soil of the pairing family. No sign allows us to conclude that a higher form of family developed here, or that there was ever permanent monogamy anywhere in America prior to its discovery and conquest. But not so in the Old World.

Here the domestication of animals and the breeding of herds had developed a hitherto unsuspected source of wealth and created entirely new social relations. Up to the lower stage of barbarism, permanent wealth had consisted almost solely of house, clothing, crude ornaments and the tools for obtaining and preparing food – boat, weapons, and domestic utensils of the simplest kind. Food had to be won afresh day by day. Now, with their herds of horses, camels, asses, cattle, sheep, goats, and pigs, the advancing pastoral peoples – the Semites on the Euphrates and the Tigris, and the Aryans in the Indian country of the Five Streams (Punjab), in the Ganges region, and in the steppes then much more abundantly watered of the Oxus and the Jaxartes – had acquired property which only needed supervision and the rudest care to reproduce itself in steadily increasing quantities and to supply the most abundant food in the form of milk and meat. All former means of procuring food now receded into the background; hunting, formerly a necessity, now became a luxury.

But to whom did this new wealth belong? Originally to the gens, without a doubt. Private property in herds must have already started at an early period, however. It is difficult to say whether the author of the so-called first

book of Moses regarded the patriarch Abraham as the owner of his herds in his own right as head of a family community or by right of his position as actual hereditary head of a gens. What is certain is that we must not think of him as a property owner in the modern sense of the word. And it is also certain that at the threshold of authentic history we already find the herds everywhere separately owned by heads of families, as are the artistic products of barbarism – metal implements, luxury articles and, finally, the human cattle – the slaves.

For now slavery had also been invented. To the barbarian of the lower stage, a slave was valueless. Hence the treatment of defeated enemies by the American Indians was quite different from that at a higher stage. The men were killed or adopted as brothers into the tribe of the victors; the women were taken as wives or otherwise adopted with their surviving children. At this stage human labor-power still does not produce any considerable surplus over and above its maintenance costs. That was no longer the case after the introduction of cattle-breeding, metalworking, weaving and, lastly, agriculture. just as the wives whom it had formerly been so easy to obtain had now acquired an exchange value and were bought, so also with the forces of labor, particularly since the herds had definitely become family possessions. The family did not multiply so rapidly as the cattle. More people were needed to look after them; for this purpose use could be made of the enemies captured in war, who could also be bred just as easily as the cattle themselves.

Once it had passed into the private possession of families and there rapidly begun to augment, this wealth dealt a severe blow to the society founded on pairing marriage and the matriarchal gens. Pairing marriage had brought a new element into the family. By the side of the natural mother of the child it placed its natural and attested father, with a better warrant of paternity, probably, than that of many a “father” today. According to the division of labor within the family at that time, it was the man’s part to obtain food and the instruments of labor necessary for the purpose. He therefore also owned the instruments of labor, and in the event of husband and wife separating, he took them with him, just as she retained her household goods. Therefore, according to the social custom of the time, the man was also the owner of the new source of subsistence, the cattle, and later of the new instruments of labor, the slaves. But according to the

custom of the same society, his children could not inherit from him. For as regards inheritance, the position was as follows:

At first, according to mother-right – so long, therefore, as descent was reckoned only in the female line – and according to the original custom of inheritance within the gens, the gentile relatives inherited from a deceased fellow member of their gens. His property had to remain within the gens. His effects being insignificant, they probably always passed in practice to his nearest gentile relations – that is, to his blood relations on the mother's side. The children of the dead man, however, did not belong to his gens, but to that of their mother; it was from her that they inherited, at first conjointly with her other blood relations, later perhaps with rights of priority; they could not inherit from their father, because they did not belong to his gens, within which his property had to remain. When the owner of the herds died, therefore, his herds would go first to his brothers and sisters and to his sister's children, or to the issue of his mother's sisters. But his own children were disinherited.

Thus, on the one hand, in proportion as wealth increased, it made the man's position in the family more important than the woman's, and on the other hand created an impulse to exploit this strengthened position in order to overthrow, in favor of his children, the traditional order of inheritance. This, however, was impossible so long as descent was reckoned according to mother-right. Mother-right, therefore, had to be overthrown, and overthrown it was. This was by no means so difficult as it looks to us today. For this revolution – one of the most decisive ever experienced by humanity – could take place without disturbing a single one of the living members of a gens. All could remain as they were. A simple decree sufficed that in the future the offspring of the male members should remain within the gens, but that of the female should be excluded by being transferred to the gens of their father. The reckoning of descent in the female line and the matriarchal law of inheritance were thereby overthrown, and the male line of descent and the paternal law of inheritance were substituted for them. As to how and when this revolution took place among civilized peoples, we have no knowledge. It falls entirely within prehistoric times. But that it did take place is more than sufficiently proved by the abundant traces of mother-right which have been collected, particularly by Bachofen. How easily it is accomplished can be seen in a whole series of American Indian tribes, where it has only recently taken place and is still taking place under the

influence, partly of increasing wealth and a changed mode of life (transference from forest to prairie), and partly of the moral pressure of civilization and missionaries. Of eight Missouri tribes, six observe the male line of descent and inheritance, two still observe the female. Among the Shawnees, Miamis and Delawares the custom has grown up of giving the children a gentile name of their father's gens in order to transfer them into it, thus enabling them to inherit from him.

Man's innate casuistry! To change things by changing their names! And to find loopholes for violating tradition while maintaining tradition, when direct interest supplied sufficient impulse. (Marx.)

The result was hopeless confusion, which could only be remedied and to a certain extent was remedied by the transition to father-right. "In general, this seems to be the most natural transition." (Marx.) For the theories proffered by comparative jurisprudence regarding the manner in which this change was effected among the civilized peoples of the Old World – though they are almost pure hypotheses see M. Kovalevsky, *Tableau des origines et de l'évolution de la famille et de la propriété*. Stockholm, 1890.

The overthrow of mother-right was the world historical defeat of the female sex. The man took command in the home also; the woman was degraded and reduced to servitude, she became the slave of his lust and a mere instrument for the production of children. This degraded position of the woman, especially conspicuous among the Greeks of the heroic and still more of the classical age, has gradually been palliated and glozed over, and sometimes clothed in a milder form; in no sense has it been abolished.

The establishment of the exclusive supremacy of the man shows its effects first in the patriarchal family, which now emerges as an intermediate form. Its essential characteristic is not polygyny, of which more later, but "the organization of a number of persons, bond and free, into a family, under paternal power, for the purpose of holding lands, and for the care of flocks and herds.... (In the Semitic form) the chiefs, at least, lived in polygamy.... Those held to servitude, and those employed as servants, lived in the marriage relation."

Its essential features are the incorporation of unfree persons, and paternal power; hence the perfect type of this form of family is the Roman. The original meaning of the word "family" (*familia*) is not that compound of sentimentality and domestic strife which forms the ideal of the present-day

philistine; among the Romans it did not at first even refer to the married pair and their children, but only to the slaves. Famulus means domestic slave, and familia is the total number of slaves belonging to one man. As late as the time of Gaius, the familia, id est patrimonium (family, that is, the patrimony, the inheritance) was bequeathed by will. The term was invented by the Romans to denote a new social organism, whose head ruled over wife and children and a number of slaves, and was invested under Roman paternal power with rights of life and death over them all.

This term, therefore, is no older than the iron-clad family system of the Latin tribes, which came in after field agriculture and after legalized servitude, as well as after the separation of Greeks and Latins.

Marx adds:

The modern family contains in germ not only slavery (servitus), but also serfdom, since from the beginning it is related to agricultural services. It contains in miniature all the contradictions which later extend throughout society and its state.

Such a form of family shows the transition of the pairing family to monogamy. In order to make certain of the wife's fidelity and therefore of the paternity of the children, she is delivered over unconditionally into the power of the husband; if he kills her, he is only exercising his rights.

With the patriarchal family, we enter the field of written history a field where comparative jurisprudence can give valuable help. And it has in fact brought an important advance in our knowledge. We owe to Maxim Kovalevsky (*Tableau etc. de la mine et de propriete*, Stockholm, 1890, pp. 60-100), the proof that the patriarchal household community, as we still find it today among the Serbs and the Bulgars under the name of zadruga (which may be roughly translated "bond of friendship") or bratstvo (brotherhood), and in a modified form among the Oriental peoples, formed the transitional stage between the matriarchal family deriving from group marriage and the single family of the modern world. For the civilized peoples of the Old World, for the Aryans and Semites at any rate, this seems to be established.

The Southern Slav zadruga provides the best instance of such a family community still in actual existence. It comprises several generations of the descendants of one father, together with their wives, who all live together in one homestead, cultivate their fields in common, feed and clothe themselves from a common stock, and possess in common the surplus from their labor.

The community is under the supreme direction of the head of the house (domacin), who acts as its representative outside, has the right to sell minor objects, and controls the funds, for which, as for the regular organization of business, he is responsible. He is elected, and it is not at all necessary that he should be the oldest in the community. The women and their work are under the control of the mistress of the house (domacica), who is generally the wife of the domacin. She also has an important and often a decisive voice in the choice of husbands for the girls. Supreme power rests, however, with the family council, the assembly of all the adult members of the household, women as well as men. To this assembly the master of the house renders account; it takes all important decisions, exercises jurisdiction over the members, decides on sales and purchases of any importance, especially of land and so on.

It is only within the last ten years or so that such great family communities have been proved to be still in existence in Russia; it is now generally recognized that they are as firmly rooted in the customs of the Russian people as the obshchina or village community. They appear in the oldest Russian code of laws, the Pravda of Yaroslav, under the same name as in the Dalmatian laws (vervji), and references to them can also be traced in Polish and Czech historical sources.

Among the Germans also, according to Heusler (*Institutionen des deutschen Rechts*), the economic unit was originally not the single family in the modern sense, but the "house community," which consisted of several generations or several single families, and often enough included unfree persons as well. The Roman family is now also considered to have originated from this type, and consequently the absolute power of the father of the house, and the complete absence of rights among the other members of the family in relation to him, have recently been strongly questioned. It is supposed that similar family communities also existed among the Celts in Ireland; in France, under the name of parconneries, they survived in Nivernais until the French Revolution, and in the Franche Comte they have not completely died out even today. In the district of Louhans (Saone et Loire) large peasant houses can be seen in which live several generations of the same family; the house has a lofty common hall reaching to the roof, and surrounding it the sleeping-rooms, to which stairs of six or eight steps give access.

In India, the household community with common cultivation of the land is already mentioned by Nearchus in the time of Alexander the Great, and it still exists today in the same region, in the Punjab and the whole of northwest India. Kovalevsky was himself able to prove its existence in the Caucasus. In Algeria it survives among the Kabyles. It is supposed to have occurred even in America, and the *calpullis* which Zurita describes in old Mexico have been identified with it; on the other hand, Cunow has proved fairly clearly (in the journal *Ausland*, 1890, Nos. 42-44) that in Peru at the time of the conquest there was a form of constitution based on marks (called, curiously enough, *marca*), with periodical allotment of arable land and consequently with individual tillage. In any case, the patriarchal household community with common ownership and common cultivation of the land now assumes an entirely different significance than hitherto. We can no longer doubt the important part it played, as a transitional form between the matriarchal family and the single family, among civilized and other peoples of the Old World. Later we will return to the further conclusion drawn by Kovalevsky that it was also the transitional form out of which developed the village, or mark, community with individual tillage and the allotment, first periodical and then permanent, of arable and pasture land.

With regard to the family life within these communities, it must be observed that at any rate in Russia the master of the house has a reputation for violently abusing his position towards the younger women of the community, especially his daughters-in-law, whom he often converts into his harem; the Russian folk-songs have more than a little to say about this.

Before we go on to monogamy, which developed rapidly with the overthrow of mother-right, a few words about polygyny and polyandry. Both forms can only be exceptions, historical luxury products, as it were, unless they occur side by side in the same country, which is, of course, not the case. As the men excluded from polygyny cannot console themselves with the women left over from polyandry, and as hitherto, regardless of social institutions, the number of men and women has been fairly equal, it is obviously impossible for either of these forms of marriage to be elevated to the general form. Polygyny on the part of one individual man was, in fact, obviously a product of slavery and confined to a few people in exceptional positions. In the Semitic patriarchal family it was only the patriarch himself, and a few of his sons at most, who lived in polygyny; the rest had to content

themselves with one wife. This still holds throughout the whole of the Orient; polygyny is the privilege of the wealthy and of the nobility, the women being recruited chiefly through purchase as slaves; the mass of the people live in monogamy.

A similar exception is the polyandry of India and Tibet, the origin of which in group marriage requires closer examination and would certainly prove interesting. It seems to be much more easy-going in practice than the jealous harems of the Mohammedans. At any rate, among the Nairs in India, where three or four men have a wife in common, each of them can have a second wife in common with another three or more men, and similarly a third and a fourth and so on. It is a wonder that McLennan did not discover in these marriage clubs, to several of which one could belong and which he himself describes, a new class of club marriage! This marriage-club system, however, is not real polyandry at all; on the contrary, as Giraud-Teulon has already pointed out, it is a specialized form of group marriage; the men live in polygyny, the women in polyandry.

4. The Monogamous Family

It develops out of the pairing family, as previously shown, in the transitional period between the upper and middle stages of barbarism; its decisive victory is one of the signs that civilization is beginning. It is based on the supremacy of the man, the express purpose being to produce children of undisputed paternity; such paternity is demanded because these children are later to come into their father's property as his natural heirs. It is distinguished from pairing marriage by the much greater strength of the marriage tie, which can no longer be dissolved at either partner's wish. As a rule, it is now only the man who can dissolve it, and put away his wife. The right of conjugal infidelity also remains secured to him, at any rate by custom (the Code Napoleon explicitly accords it to the husband as long as he does not bring his concubine into the house), and as social life develops he exercises his right more and more; should the wife recall the old form of sexual life and attempt to revive it, she is punished more severely than ever.

We meet this new form of the family in all its severity among the Greeks. While the position of the goddesses in their mythology, as Marx points out, brings before us an earlier period when the position of women was freer and more respected, in the heroic age we find the woman already being humiliated by the domination of the man and by competition from girl slaves. Note how Telemachus in the *Odyssey* silences his mother. In Homer young women are booty and are handed over to the pleasure of the conquerors, the handsomest being picked by the commanders in order of rank; the entire *Iliad*, it will be remembered, turns on the quarrel of Achilles and Agamemnon over one of these slaves. If a hero is of any importance, Homer also mentions the captive girl with whom he shares his tent and his bed. These girls were also taken back to Greece and brought under the same roof as the wife, as Cassandra was brought by Agamemnon in AEschylus; the sons begotten of them received a small share of the paternal inheritance and had the full status of freemen. Teucer, for instance, is a natural son of Telamon by one of these slaves and has the right to use his father's name. The legitimate wife was expected to put up with all this, but herself to remain strictly chaste and faithful. In the heroic age a Greek woman is, indeed, more respected than in the period of civilization, but to her husband

she is after all nothing but the mother of his legitimate children and heirs, his chief housekeeper and the supervisor of his female slaves, whom he can and does take as concubines if he so fancies. It is the existence of slavery side by side with monogamy, the presence of young, beautiful slaves belonging unreservedly to the man, that stamps monogamy from the very beginning with its specific character of monogamy for the woman only, but not for the man. And that is the character it still has today.

Coming to the later Greeks, we must distinguish between Dorians and Ionians. Among the former – Sparta is the classic example – marriage relations are in some ways still more archaic than even in Homer. The recognized form of marriage in Sparta was a pairing marriage, modified according to the Spartan conceptions of the state, in which there still survived vestiges of group marriage. Childless marriages were dissolved; King Anaxandridas (about 650 B.C.), whose first wife was childless, took a second and kept two households; about the same time, King Ariston, who had two unfruitful wives, took a third, but dismissed one of the other two. On the other hand, several brothers could have a wife in common; a friend who preferred his friend's wife could share her with him; and it was considered quite proper to place one's wife at the disposal of a sturdy "stallion," as Bismarck would say, even if he was not a citizen. A passage in Plutarch, where a Spartan woman refers an importunate wooer to her husband, seems to indicate, according to Schamann, even greater freedom. Real adultery, secret infidelity by the woman without the husband's knowledge, was therefore unheard of. On the other hand, domestic slavery was unknown in Sparta, at least during its best period; the unfree helots were segregated on the estates and the Spartans were therefore less tempted to take the helots' wives. Inevitably in these conditions women held a much more honored position in Sparta than anywhere else in Greece. The Spartan women and the elite of the Athenian hetairai are the only Greek women of whom the ancients speak with respect and whose words they thought it worth while to record.

The position is quite different among the Ionians; here Athens is typical. Girls only learned spinning, weaving, and sewing, and at most a little reading and writing. They lived more or less behind locked doors and had no company except other women. The women's apartments formed a separate part of the house, on the upper floor or at the back, where men, especially strangers, could not easily enter, and to which the women retired

when men visited the house. They never went out without being accompanied by a female slave; indoors they were kept under regular guard. Aristophanes speaks of Molossian dogs kept to frighten away adulterers, and, at any rate in the Asiatic towns, eunuchs were employed to keep watch over the women-making and exporting eunuchs was an industry in Chios as early as Herodotus' time, and, according to Wachsmuth, it was not only the barbarians who bought the supply. In Euripides a woman is called an *oikourema*, a thing (the word is neuter) for looking after the house, and, apart from her business of bearing children, that was all she was for the Athenian – his chief female domestic servant. The man had his athletics and his public business, from which women were barred; in addition, he often had female slaves at his disposal and during the most flourishing days of Athens an extensive system of prostitution which the state at least favored. It was precisely through this system of prostitution that the only Greek women of personality were able to develop, and to acquire that intellectual and artistic culture by which they stand out as high above the general level of classical womanhood as the Spartan women by their qualities of character. But that a woman had to be a hetaira before she could be a woman is the worst condemnation of the Athenian family.

This Athenian family became in time the accepted model for domestic relations, not only among the Ionians, but to an increasing extent among all the Greeks of the mainland and colonies also. But, in spite of locks and guards, Greek women found plenty of opportunity for deceiving their husbands. The men, who would have been ashamed to show any love for their wives, amused themselves by all sorts of love affairs with hetairai; but this degradation of the women was avenged on the men and degraded them also, till they fell into the abominable practice of sodomy and degraded alike their gods and themselves with the myth of Ganymede.

This is the origin of monogamy as far as we can trace it back among the most civilized and highly developed people of antiquity. It was not in any way the fruit of individual sex-love, with which it had nothing whatever to do; marriages remained as before marriages of convenience. It was the first form of the family to be based, not on natural, but on economic conditions – on the victory of private property over primitive, natural communal property. The Greeks themselves put the matter quite frankly: the sole exclusive aims of monogamous marriage were to make the man supreme in the family, and to propagate, as the future heirs to his wealth, children

indisputably his own. Otherwise, marriage was a burden, a duty which had to be performed, whether one liked it or not, to gods, state, and one's ancestors. In Athens the law exacted from the man not only marriage but also the performance of a minimum of so-called conjugal duties.

Thus when monogamous marriage first makes its appearance in history, it is not as the reconciliation of man and woman, still less as the highest form of such a reconciliation. Quite the contrary. Monogamous marriage comes on the scene as the subjugation of the one sex by the other; it announces a struggle between the sexes unknown throughout the whole previous prehistoric period. In an old unpublished manuscript, written by Marx and myself in 1846, I find the words: "The first division of labor is that between man and woman for the propagation of children." And today I can add: The first class opposition that appears in history coincides with the development of the antagonism between man and woman in monogamous marriage, and the first class oppression coincides with that of the female sex by the male. Monogamous marriage was a great historical step forward; nevertheless, together with slavery and private wealth, it opens the period that has lasted until today in which every step forward is also relatively a step backward, in which prosperity and development for some is won through the misery and frustration of others. It is the cellular form of civilized society, in which the nature of the oppositions and contradictions fully active in that society can be already studied.

The old comparative freedom of sexual intercourse by no means disappeared with the victory of pairing marriage or even of monogamous marriage:

The old conjugal system, now reduced to narrower limits by the gradual disappearance of the punaluan groups, still environed the advancing family, which it was to follow to the verge of civilization.... It finally disappeared in the new form of hetaerism, which still follows mankind in civilization as a dark shadow upon the family.

By "hetaerism" Morgan understands the practice, co-existent with monogamous marriage, of sexual intercourse between men and unmarried women outside marriage, which, as we know, flourishes in the most varied forms throughout the whole period of civilization and develops more and more into open prostitution. This hetaerism derives quite directly from group marriage, from the ceremonial surrender by which women purchased

the right of chastity. Surrender for money was at first a religious act; it took place in the temple of the goddess of love, and the money originally went into the temple treasury. The temple slaves of Anaitis in Armenia and of Aphrodite in Corinth, like the sacred dancing-girls attached to the temples of India, the so-called bayaderes (the word is a corruption of the Portuguese word *bailadeira*, meaning female dancer), were the first prostitutes. Originally the duty of every woman, this surrender was later performed by these priestesses alone as representatives of all other women. Among other peoples, hetaerism derives from the sexual freedom allowed to girls before marriage – again, therefore, a relic of group marriage, but handed down in a different way. With the rise of the inequality of property – already at the upper stage of barbarism, therefore – wage-labor appears sporadically side by side with slave labor, and at the same time, as its necessary correlate, the professional prostitution of free women side by side with the forced surrender of the slave. Thus the heritage which group marriage has bequeathed to civilization is double-edged, just as everything civilization brings forth is double-edged, double-tongued, divided against itself, contradictory: here monogamy, there hetaerism, with its most extreme form, prostitution. For hetaerism is as much a social institution as any other; it continues the old sexual freedom – to the advantage of the men. Actually not merely tolerated, but gaily practiced, by the ruling classes particularly, it is condemned in words. But in reality this condemnation never falls on the men concerned, but only on the women; they are despised and outcast, in order that the unconditional supremacy of men over the female sex may be once more proclaimed as a fundamental law of society.

But a second contradiction thus develops within monogamous marriage itself. At the side of the husband who embellishes his existence with hetaerism stands the neglected wife. And one cannot have one side of this contradiction without the other, any more than a man has a whole apple in his hand after eating half. But that seems to have been the husbands' notion, until their wives taught them better. With monogamous marriage, two constant social types, unknown hitherto, make their appearance on the scene – the wife's attendant lover and the cuckold husband. The husbands had won the victory over the wives, but the vanquished magnanimously provided the crown. Together with monogamous marriage and hetaerism, adultery became an unavoidable social institution – denounced, severely penalized, but impossible to suppress. At best, the certain paternity of the

children rested on moral conviction as before, and to solve the insoluble contradiction the Code Napoleon, Art- 312, decreed: “L’enfant confu pendant le mariage a pour pere le mari,” the father of a child conceived during marriage is-the husband. Such is the final result of three thousand years of monogamous marriage.

Thus, wherever the monogamous family remains true to its historical origin and clearly reveals the antagonism between the man and the woman expressed in the man’s exclusive supremacy, it exhibits in miniature the same oppositions and contradictions as those in which society has been moving, without power to resolve or overcome them, ever since it split into classes at the beginning of civilization. I am speaking here, of course, only of those cases of monogamous marriage where matrimonial life actually proceeds according to the original character of the whole institution, but where the wife rebels against the husband’s supremacy. Not all marriages turn out thus, as nobody knows better than the German philistine, who can no more assert his rule in the home than he can in the state, and whose wife, with every right, wears the trousers he is unworthy of. But, to make up for it, he considers himself far above his French companion in misfortune, to whom, oftener than to him, something much worse happens.

However, monogamous marriage did not by any means appear always and everywhere in the classically harsh form it took among the Greeks. Among the Romans, who, as future world-conquerors, had a larger, if a less fine, vision than the Greeks, women were freer and more respected. A Roman considered that his power of life and death over his wife sufficiently guaranteed her conjugal fidelity. Here, moreover, the wife equally with the husband could dissolve the marriage at will. But the greatest progress in the development of individual marriage certainly came with the entry of the Germans into history, and for the reason that the German – on account of their poverty, very probably – were still at a stage where monogamy seems not yet to have become perfectly distinct from pairing marriage. We infer this from three facts mentioned by Tacitus. First, though marriage was held in great reverence – “they content themselves with one wife, the women live hedged round with chastity” – polygamy was the rule for the distinguished members and the leaders of the tribe, a condition of things similar to that among the Americans, where pairing marriage was the rule. Secondly, the transition from mother-right to father-right could only have been made a short time previously, for the brother on the mother’s side -the

nearest gentile male relation according to mother-right –was still considered almost closer of kin than the father, corresponding again to the standpoint of the American Indians, among whom Marx, as he often said, found the key to the understanding of our own primitive age. And, thirdly, women were greatly respected among the Germans, and also influential in public affairs, which is in direct contradiction to the supremacy of men in monogamy. In almost all these points the Germans agree with the Spartans, among whom also, as we saw, pairing marriage had not yet been completely overcome. Thus, here again an entirely new influence came to power in the world with the Germans. The new monogamy, which now developed from the mingling of peoples amid the ruins of the Roman world, clothed the supremacy of the men in milder forms and gave women a position which, outwardly at any rate, was much more free and respected than it had ever been in classical antiquity. Only now were the conditions realized in which through monogamy-within it, parallel to it, or in opposition to it, as the case might be-the greatest moral advance we owe to it could be achieved: modern individual sex-love, which had hitherto been unknown to the entire world.

This advance, however, undoubtedly sprang from the fact that the Germans still lived in pairing families and grafted the corresponding position of women onto the monogamous system, so far as that was possible. It most decidedly did not spring from the legendary virtue and wonderful moral purity of the German character, which was nothing more than the freedom of the pairing family from the crying moral contradictions of monogamy. On the contrary, in the course of their migrations the Germans had morally much deteriorated, particularly during their southeasterly wanderings among the nomads of the Black Sea steppes, from whom they acquired, not only equestrian skill, but also gross, unnatural vices, as Ammianus expressly states of the Taifalians and Procopius of the Herulians.

But if monogamy was the only one of all the known forms of the family through which modern sex-love could develop, that does not mean that within monogamy modern sexual love developed exclusively or even chiefly as the love of husband and wife for each other. That was precluded by the very nature of strictly monogamous marriage under the rule of the man. Among all historically active classes-that is, among all ruling classes-matrimony remained what it had been since the pairing marriage, a matter of convenience which was arranged by the parents. The first historical form

of sexual love as passion, a passion recognized as natural to all human beings (at least if they belonged to the ruling classes), and as the highest form of the sexual impulse-and that is what constitutes its specific character-this first form of individual sexual love, the chivalrous love of the middle ages, was by no means conjugal. Quite the contrary. In its classic form among the Provençals, it heads straight for adultery, and the poets of love celebrated adultery. The flower of Provençal love poetry are the Albas (aubades, songs of dawn). They describe in glowing colors how the knight lies in bed beside his love-the wife of another man-while outside stands the watchman who calls to him as soon as the first gray of dawn (alba) appears, so that he can get away unobserved; the parting scene then forms the climax of the poem. The northern French and also the worthy Germans adopted this kind of poetry together with the corresponding fashion of chivalrous love; old Wolfram of Eschenbach has left us three wonderfully beautiful songs of dawn on this same improper subject, which I like better than his three long heroic poems.

Nowadays there are two ways of concluding a bourgeois marriage. In Catholic countries the parents, as before, procure a suitable wife for their young bourgeois son, and the consequence is, of course, the fullest development of the contradiction inherent in monogamy: the husband abandons himself to hetaerism and the wife to adultery. Probably the only reason why the Catholic Church abolished divorce was because it had convinced itself that there is no more a cure for adultery than there is for death. In Protestant countries, on the other hand, the rule is that the son of a bourgeois family is allowed to choose a wife from his own class with more or less freedom; hence there may be a certain element of love in the marriage, as, indeed, in accordance with Protestant hypocrisy, is always assumed, for decency's sake. Here the husband's hetaerism is a more sleepy kind of business, and adultery by the wife is less the rule. But since, in every kind of marriage, people remain what they were before, and since the bourgeois of Protestant countries are mostly philistines, all that this Protestant monogamy achieves, taking the average of the best cases, is a conjugal partnership of leaden boredom, known as "domestic bliss." The best mirror of these two methods of marrying is the novel-the French novel for the Catholic manner, the German for the Protestant. In both, the hero "gets" them: in the German, the young man gets the girl; in the French, the husband gets the horns. Which of them is worse off is sometimes

questionable. This is why the French bourgeois is as much horrified by the dullness of the German novel as the German philistine is by the “immorality” of the French. However, now that “Berlin is a world capital,” the German novel is beginning with a little less timidity to use as part of its regular stock-in-trade the hetaerism and adultery long familiar to that town.

In both cases, however, the marriage is conditioned by the class position of the parties and is to that extent always a marriage of convenience. In both cases this marriage of convenience turns often enough into crassest prostitution-sometimes of both partners, but far more commonly of the woman, who only differs from the ordinary courtesan in that she does not let out her body on piece-work as a wage-worker, but sells it once and for all into slavery. And of all marriages of convenience Fourier’s words hold true: “As in grammar two negatives make an affirmative, so in matrimonial morality two prostitutions pass for a virtue.” Sex-love in the relationship with a woman becomes, and can only become, the real rule among the oppressed classes, which means today among the proletariat-whether this relation is officially sanctioned or not. But here all the foundations of typical monogamy are cleared away. Here there is no property, for the preservation and inheritance of which monogamy and male supremacy were established; hence there is no incentive to make this male supremacy effective. What is more, there are no means of making it so. Bourgeois law, which protects this supremacy, exists only for the possessing class and their dealings with the proletarians. The law costs money and, on account of the worker’s poverty, it has no validity for his relation to his wife. Here quite other personal and social conditions decide. And now that large-scale industry has taken the wife out of the home onto the labor market and into the factory, and made her often the bread-winner of the family, no basis for any kind of male supremacy is left in the proletarian household – except, perhaps, for something of the brutality towards women that has spread since the introduction of monogamy. The proletarian family is therefore no longer monogamous in the strict sense, even where there is passionate love and firmest loyalty on both sides, and maybe all the blessings of religious and civil authority. Here, therefore, the eternal attendants of monogamy, hetaerism and adultery, play only an almost vanishing part. The wife has in fact regained the right to dissolve the marriage, and if two people cannot get on with one another, they prefer to separate. In short, proletarian marriage is

monogamous in the etymological sense of the word, but not at all in its historical sense.

Our jurists, of course, find that progress in legislation is leaving women with no further ground of complaint. Modern civilized systems of law increasingly acknowledge, first, that for a marriage to be legal, it must be a contract freely entered into by both partners, and, secondly, that also in the married state both partners must stand on a common footing of equal rights and duties. If both these demands are consistently carried out, say the jurists, women have all they can ask.

This typically legalist method of argument is exactly the same as that which the radical republican bourgeois uses to put the proletarian in his place. The labor contract is to be freely entered into by both partners. But it is considered to have been freely entered into as soon as the law makes both parties equal on paper. The power conferred on the one party by the difference of class position, the pressure thereby brought to bear on the other party – the real economic position of both – that is not the law's business. Again, for the duration of the labor contract both parties are to have equal rights, in so far as one or the other does not expressly surrender them. That economic relations compel the worker to surrender even the last semblance of equal rights – here again, that is no concern of the law.

In regard to marriage, the law, even the most advanced, is fully satisfied as soon as the partners have formally recorded that they are entering into the marriage of their own free consent. What goes on in real life behind the juridical scenes, how this free consent comes about – that is not the business of the law and the jurist. And yet the most elementary comparative jurisprudence should show the jurist what this free consent really amounts to. In the countries where an obligatory share of the paternal inheritance is secured to the children by law and they cannot therefore be disinherited – in Germany, in the countries with French law and elsewhere – the children are obliged to obtain their parents' consent to their marriage. In the countries with English law, where parental consent to a marriage is not legally required, the parents on their side have full freedom in the testamentary disposal of their property and can disinherit their children at their pleasure. It is obvious that, in spite and precisely because of this fact, freedom of marriage among the classes with something to inherit is in reality not a whit greater in England and America than it is in France and Germany.

As regards the legal equality of husband and wife in marriage, the position is no better. The legal inequality of the two partners, bequeathed to us from earlier social conditions, is not the cause but the effect of the economic oppression of the woman. In the old communistic household, which comprised many couples and their children, the task entrusted to the women of managing the household was as much a public and socially necessary industry as the procuring of food by the men. With the patriarchal family, and still more with the single monogamous family, a change came. Household management lost its public character. It no longer concerned society. It became a private service; the wife became the head servant, excluded from all participation in social production. Not until the coming of modern large-scale industry was the road to social production opened to her again – and then only to the proletarian wife. But it was opened in such a manner that, if she carries out her duties in the private service of her family, she remains excluded from public production and unable to earn; and if she wants to take part in public production and earn independently, she cannot carry out family duties. And the wife's position in the factory is the position of women in all branches of business, right up to medicine and the law. The modern individual family is founded on the open or concealed domestic slavery of the wife, and modern society is a mass composed of these individual families as its molecules.

In the great majority of cases today, at least in the possessing classes, the husband is obliged to earn a living and support his family, and that in itself gives him a position of supremacy, without any need for special legal titles and privileges. Within the family he is the bourgeois and the wife represents the proletariat. In the industrial world, the specific character of the economic oppression burdening the proletariat is visible in all its sharpness only when all special legal privileges of the capitalist class have been abolished and complete legal equality of both classes established. The democratic republic does not do away with the opposition of the two classes; on the contrary, it provides the clear field on which the fight can be fought out. And in the same way, the peculiar character of the supremacy of the husband over the wife in the modern family, the necessity of creating real social equality between them, and the way to do it, will only be seen in the clear light of day when both possess legally complete equality of rights. Then it will be plain that the first condition for the liberation of the wife is to bring the whole female sex back into public industry, and that this in turn

demands the abolition of the monogamous family as the economic unit of society.

We thus have three principal forms of marriage which correspond broadly to the three principal stages of human development. For the period of savagery, group marriage; for barbarism, pairing marriage; for civilization, monogamy, supplemented by adultery and prostitution. Between pairing marriage and monogamy intervenes a period in the upper stage of barbarism when men have female slaves at their command and polygamy is practiced.

As our whole presentation has shown, the progress which manifests itself in these successive forms is connected with the peculiarity that women, but not men, are increasingly deprived of the sexual freedom of group marriage. In fact, for men group marriage actually still exists even to this day. What for the woman is a crime, entailing grave legal and social consequences, is considered honorable in a man or, at the worse, a slight moral blemish which he cheerfully bears. But the more the heterism of the past is changed in our time by capitalist commodity production and brought into conformity with it, the more, that is to say, it is transformed into undisguised prostitution, the more demoralizing are its effects. And it demoralizes men far more than women. Among women, prostitution degrades only the unfortunate ones who become its victims, and even these by no means to the extent commonly believed. But it degrades the character of the whole male world. A long engagement, particularly, is in nine cases out of ten a regular preparatory school for conjugal infidelity.

We are now approaching a social revolution in which the economic foundations of monogamy as they have existed hitherto will disappear just as surely as those of its complement-prostitution. Monogamy arose from the concentration of considerable wealth in the hands of a single individual man and from the need to bequeath this wealth to the children of that man and of no other. For this purpose, the monogamy of the woman was required, not that of the man, so this monogamy of the woman did not in any way interfere with open or concealed polygamy on the part of the man. But by transforming by far the greater portion, at any rate, of permanent, heritable wealth – the means of production – into social property, the

coming social revolution will reduce to a minimum all this anxiety about bequeathing and inheriting. Having arisen from economic causes, will monogamy then disappear when these causes disappear?

One might answer, not without reason: far from disappearing, it will, on the contrary, be realized completely. For with the transformation of the means of production into social property there will disappear also wage-labor, the proletariat, and therefore the necessity for a certain – statistically calculable – number of women to surrender themselves for money. Prostitution disappears; monogamy, instead of collapsing, at last becomes a reality – also for men.

In any case, therefore, the position of men will be very much altered. But the position of women, of all women, also undergoes significant change. With the transfer of the means of production into common ownership, the single family ceases to be the economic unit of society. Private housekeeping is transformed into a social industry. The care and education of the children becomes a public affair; society looks after all children alike, whether they are legitimate or not. This removes all the anxiety about the “consequences,” which today is the most essential social – moral as well as economic – factor that prevents a girl from giving herself completely to the man she loves. Will not that suffice to bring about the gradual growth of unconstrained sexual intercourse and with it a more tolerant public opinion in regard to a maiden’s honor and a woman’s shame? And, finally, have we not seen that in the modern world monogamy and prostitution are indeed contradictions, but inseparable contradictions, poles of the same state of society? Can prostitution disappear without dragging monogamy with it into the abyss?

Here a new element comes into play, an element which, at the time when monogamy was developing, existed at most in germ: individual sex-love.

Before the Middle Ages we cannot speak of individual sex-love. That personal beauty, close intimacy, similarity of tastes and so forth awakened in people of opposite sex the desire for sexual intercourse, that men and women were not totally indifferent regarding the partner with whom they entered into this most intimate relationship – that goes without saying. But it is still a very long way to our sexual love. Throughout the whole of antiquity, marriages were arranged by the parents, and the partners calmly accepted their choice. What little love there was between husband and wife in antiquity is not so much subjective inclination as objective duty, not the

cause of the marriage, but its corollary. Love relationships in the modern sense only occur in antiquity outside official society. The shepherds of whose joys and sorrows in love Theocratus and Moschus sing, the Daphnis and Chloe of Longus are all slaves who have no part in the state, the free citizen's sphere of life. Except among slaves, we find love affairs only as products of the disintegration of the old world and carried on with women who also stand outside official society, with hetairai – that is, with foreigners or freed slaves: in Athens from the eve of its decline, in Rome under the Caesars. If there were any real love affairs between free men and free women, these occurred only in the course of adultery. And to the classical love poet of antiquity, old Anacreon, sexual love in our sense mattered so little that it did not even matter to him which sex his beloved was.

Our sexual love differs essentially from the simple sexual desire, the Eros, of the ancients. In the first place, it assumes that the person loved returns the love; to this extent the woman is on an equal footing with the man, whereas in the Eros of antiquity she was often not even asked. Secondly, our sexual love has a degree of intensity and duration which makes both lovers feel that non-possession and separation are a great, if not the greatest, calamity; to possess one another, they risk high stakes, even life itself. In the ancient world this happened only, if at all, in adultery. And, finally, there arises a new moral standard in the judgment of a sexual relationship. We do not only ask, was it within or outside marriage? But also, did it spring from love and reciprocated love or not? Of course, this new standard has fared no better in feudal or bourgeois practice than all the other standards of morality – it is ignored. But neither does it fare any worse. It is recognized just as much as they are – in theory, on paper. And for the present it cannot ask anything more.

At the point where antiquity broke off its advance to sexual love, the Middle Ages took it up again: in adultery. We have already described the knightly love which gave rise to the songs of dawn. From the love which strives to break up marriage to the love which is to be its foundation there is still a long road, which chivalry never fully traversed. Even when we pass from the frivolous Latins to the virtuous Germans, we find in the Nibelungenlied that, although in her heart Kriemhild is as much in love with Siegfried as he is with her, yet when Gunther announces that he has promised her to a knight he does not name, she simply replies: "You have

no need to ask me; as you bid me, so will I ever be; whom you, lord, give me as husband, him will I gladly take in troth.” It never enters her head that her love can be even considered. Gunther asks for Brunhild in marriage, and Etzel for Kriemhild, though they have never seen them. Similarly, in Gutrun, Sigebant of Ireland asks for the Norwegian Ute, whom he has never seen, Hetel of Hegelingen for Hilde of Ireland, and, finally, Siegfried of Moorland, Hartmut of Ormany and Herwig of Seeland for Gutrun, and here Gutrun’s acceptance of Herwig is for the first time voluntary. As a rule, the young prince’s bride is selected by his parents, if they are still living, or, if not, by the prince himself, with the advice of the great feudal lords, who have a weighty word to say in all these cases. Nor can it be otherwise. For the knight or baron, as for the prince of the land himself, marriage is a political act, an opportunity to increase power by new alliances; the interest of the house must be decisive, not the wishes of an individual. What chance then is there for love to have the final word in the making of a marriage?

The same thing holds for the guild member in the medieval towns. The very privileges protecting him, the guild charters with all their clauses and rubrics, the intricate distinctions legally separating him from other guilds, from the members of his own guild or from his journeymen and apprentices, already made the circle narrow enough within which he could look for a suitable wife. And who in the circle was the most suitable was decided under this complicated system most certainly not by his individual preference but by the family interests.

In the vast majority of cases, therefore, marriage remained, up to the close of the middle ages, what it had been from the start – a matter which was not decided by the partners. In the beginning, people were already born married – married to an entire group of the opposite sex. In the later forms of group marriage similar relations probably existed, but with the group continually contracting. In the pairing marriage it was customary for the mothers to settle the marriages of their children; here, too, the decisive considerations are the new ties of kinship, which are to give the young pair a stronger position in the gens and tribe. And when, with the preponderance of private over communal property and the interest in its bequeathal, father-right and monogamy gained supremacy, the dependence of marriages on economic considerations became complete. The form of marriage by purchase disappears, the actual practice is steadily extended until not only the woman but also the man acquires a price – not according to his personal

qualities, but according to his property. That the mutual affection of the people concerned should be the one paramount reason for marriage, outweighing everything else, was and always had been absolutely unheard of in the practice of the ruling classes; that sort of thing only happened in romance – or among the oppressed classes, who did not count.

Such was the state of things encountered by capitalist production when it began to prepare itself, after the epoch of geographical discoveries, to win world power by world trade and manufacture. One would suppose that this manner of marriage exactly suited it, and so it did. And yet – there are no limits to the irony of history – capitalist production itself was to make the decisive breach in it. By changing all things into commodities, it dissolved all inherited and traditional relationships, and, in place of time-honored custom and historic right, it set up purchase and sale, “free” contract. And the English jurist, H. S. Maine, thought he had made a tremendous discovery when he said that our whole progress in comparison with former epochs consisted in the fact that we had passed “from status to contract,” from inherited to freely contracted conditions – which, in so far as it is correct, was already in *The Communist Manifesto* .

But a contract requires people who can dispose freely of their persons, actions, and possessions, and meet each other on the footing of equal rights. To create these “free” and “equal” people was one of the main tasks of capitalist production. Even though at the start it was carried out only half-consciously, and under a religious disguise at that, from the time of the Lutheran and Calvinist Reformation the principle was established that man is only fully responsible for his actions when he acts with complete freedom of will, and that it is a moral duty to resist all coercion to an immoral act. But how did this fit in with the hitherto existing practice in the arrangement of marriages? Marriage, according to the bourgeois conception, was a contract, a legal transaction, and the most important one of all, because it disposed of two human beings, body and mind, for life. Formally, it is true, the contract at that time was entered into voluntarily: without the assent of the persons concerned, nothing could be done. But everyone knew only too well how this assent was obtained and who were the real contracting parties in the marriage. But if real freedom of decision was required for all other contracts, then why not for this? Had not the two young people to be coupled also the right to dispose freely of themselves, of their bodies and organs? Had not chivalry brought sex-love into fashion, and was not its

proper bourgeois form, in contrast to chivalry's adulterous love, the love of husband and wife? And if it was the duty of married people to love each other, was it not equally the duty of lovers to marry each other and nobody else? Did not this right of the lovers stand higher than the right of parents, relations, and other traditional marriage-brokers and matchmakers? If the right of free, personal discrimination broke boldly into the Church and religion, how should it halt before the intolerable claim of the older generation to dispose of the body, soul, property, happiness, and unhappiness of the younger generation?

These questions inevitably arose at a time which was loosening all the old ties of society and undermining all traditional conceptions. The world had suddenly grown almost ten times bigger; instead of one quadrant of a hemisphere, the whole globe lay before the gaze of the West Europeans, who hastened to take the other seven quadrants into their possession. And with the old narrow barriers of their homeland fell also the thousand-year-old barriers of the prescribed medieval way of thought. To the outward and the inward eye of man opened an infinitely wider horizon. What did a young man care about the approval of respectability, or honorable guild privileges handed down for generations, when the wealth of India beckoned to him, the gold and the silver mines of Mexico and Potosi? For the bourgeoisie, it was the time of knight-errantry; they, too, had their romance and their raptures of love, but on a bourgeois footing and, in the last analysis, with bourgeois aims.

So it came about that the rising bourgeoisie, especially in Protestant countries, where existing conditions had been most severely shaken, increasingly recognized freedom of contract also in marriage, and carried it into effect in the manner described. Marriage remained class marriage, but within the class the partners were conceded a certain degree of freedom of choice. And on paper, in ethical theory and in poetic description, nothing was more immutably established than that every marriage is immoral which does not rest on mutual sexual love and really free agreement of husband and wife. In short, the love marriage was proclaimed as a human right, and indeed not only as a *droit de l'homme*, one of the rights of man, but also, for once in a way, as *droit de la femme*”, one of the rights of woman.

This human right, however, differed in one respect from all other so-called human rights. While the latter, in practice, remain restricted to the ruling class (the bourgeoisie), and are directly or indirectly curtailed for the

oppressed class (the proletariat), in the case of the former the irony of history plays another of its tricks. The ruling class remains dominated by the familiar economic influences and therefore only in exceptional cases does it provide instances of really freely contracted marriages, while among the oppressed class, as we have seen, these marriages are the rule.

Full freedom of marriage can therefore only be generally established when the abolition of capitalist production and of the property relations created by it has removed all the accompanying economic considerations which still exert such a powerful influence on the choice of a marriage partner. For then there is no other motive left except mutual inclination.

And as sexual love is by its nature exclusive – although at present this exclusiveness is fully realized only in the woman – the marriage based on sexual love is by its nature individual marriage. We have seen how right Bachofen was in regarding the advance from group marriage to individual marriage as primarily due to the women. Only the step from pairing marriage to monogamy can be put down to the credit of the men, and historically the essence of this was to make the position of the women worse and the infidelities of the men easier. If now the economic considerations also disappear which made women put up with the habitual infidelity of their husbands – concern for their own means of existence and still more for their children's future – then, according to all previous experience, the equality of woman thereby achieved will tend infinitely more to make men really monogamous than to make women polyandrous.

But what will quite certainly disappear from monogamy are all the features stamped upon it through its origin in property relations; these are, in the first place, supremacy of the man, and, secondly, indissolubility. The supremacy of the man in marriage is the simple consequence of his economic supremacy, and with the abolition of the latter will disappear of itself. The indissolubility of marriage is partly a consequence of the economic situation in which monogamy arose, partly tradition from the period when the connection between this economic situation and monogamy was not yet fully understood and was carried to extremes under a religious form. Today it is already broken through at a thousand points. If only the marriage based on love is moral, then also only the marriage in which love continues. But the intense emotion of individual sex-love varies very much in duration from one individual to another, especially among men, and if affection definitely comes to an end or is supplanted by a new

passionate love, separation is a benefit for both partners as well as for society – only people will then be spared having to wade through the useless mire of a divorce case.

What we can now conjecture about the way in which sexual relations will be ordered after the impending overthrow of capitalist production is mainly of a negative character, limited for the most part to what will disappear. But what will there be new? That will be answered when a new generation has grown up: a generation of men who never in their lives have known what it is to buy a woman's surrender with money or any other social instrument of power; a generation of women who have never known what it is to give themselves to a man from any other considerations than real love, or to refuse to give themselves to their lover from fear of the economic consequences. When these people are in the world, they will care precious little what anybody today thinks they ought to do; they will make their own practice and their corresponding public opinion about the practice of each individual – and that will be the end of it.

Let us, however, return to Morgan, from whom we have moved a considerable distance. The historical investigation of the social institutions developed during the period of civilization goes beyond the limits of his book. How monogamy fares during this epoch, therefore, only occupies him very briefly. He, too, sees in the further development of the monogamous family a step forward, an approach to complete equality of the sexes, though he does not regard this goal as attained. But, he says:

When the fact is accepted that the family has passed through four successive forms, and is now in a fifth, the question at once arises whether this form can be permanent in the future. The only answer that can be given is that it must advance as society advances, and change as society changes, even as it has done in the past. It is the creature of the social system, and will reflect its culture. As the monogamian family has improved greatly since the commencement of civilization, and very sensibly in modern times, it is at least supposable that it is capable of still further improvement until the equality of the sexes is attained. Should the monogamian family in the distant future fail to answer the requirements of society ... it is impossible to predict the nature of its successor.

III.

The Iroquois Gens

We now come to another discovery made by Morgan, which is at least as important as the reconstruction of the family in its primitive form from the systems of consanguinity. The proof that the kinship organizations designated by animal names in a tribe of American Indians are essentially identical with the *genea* of the Greeks and the *gentes* of the Romans; that the American is the original form and the Greek and Roman forms are later and derivative; that the whole social organization of the primitive Greeks and Romans into gens, phratry, and tribe finds its faithful parallel in that of the American Indians; that the gens is an institution common to all barbarians until their entry into civilization and even afterwards (so far as our sources go up to the present) – this proof has cleared up at one stroke the most difficult questions in the most ancient periods of Greek and Roman history, providing us at the same time with an unsuspected wealth of information about the fundamental features of social constitution in primitive times – before the introduction of the state. Simple as the matter seems once it is understood, Morgan only made his discovery quite recently. In his previous work, published in 1871, he had not yet penetrated this secret, at whose subsequent revelation the English anthropologists, usually so self-confident, became for a time as quiet as mice.

The Latin word *gens*, which Morgan uses as a general term for such kinship organizations, comes, like its Greek equivalent, *genos*, from the common Aryan root *gan* (in German, where, following the law Aryan *g* is regularly replaced by *k*, *kan*), which means to beget. *Gens*, *Genos*, Sanscrit *janas*, Gothic *kuni* (following the same law as above), Old Norse and Anglo-Saxon *kyn*, English *kin*, Middle High German *kunne*., all signify lineage, descent. *Gens* in Latin and *genos* in Greek are, however, used specifically to denote the form of kinship organization which prides itself on its common descent (in this case from a common ancestral father) and is bound together by social and religious institutions into a distinct

community, though to all our historians its origin and character have hitherto remained obscure.

We have already seen, in connection with the punaluan family, what is the composition of a gens in its original form. It consists of all the persons who in punaluan marriage, according to the conceptions necessarily prevailing under it, form the recognized descendants of one particular ancestral mother, the founder of the gens. In this form of family, as paternity is uncertain, only the female line counts. Since brothers may not marry their sisters but only women of different descent, the children begotten by them with these alien women cannot, according to mother-right, belong to the father's gens. Therefore only the offspring of the daughters in each generation remain within the kinship organization; the offspring of the sons go into the gentes of their mothers. What becomes of this consanguine group when it has constituted itself a separate group, distinct from similar groups within the tribe?

As the classic form of this original gens, Morgan takes the gens among the Iroquois, and especially in the Seneca tribe. In this tribe there are eight gentes, named after animals: (1) Wolf, (2) Bear, (3) Turtle, (4) Beaver, (5) Deer, (6) Snipe, (7) Heron, (8) Hawk. In every gens the following customs are observed:

1. The gens elects its sachem (head of the gens in peace) and its chief (leader in war). The sachem had to be chosen from among the members of the gens, and his office was hereditary within the gens, in the sense that it had to be filled immediately as often as a vacancy occurred; the military leader could be chosen from outside the gens, and for a time the office might even be vacant. A son was never chosen to succeed his father as sachem, since mother-right prevailed among the Iroquois and the son consequently belonged to a different gens; but the office might and often did pass to a brother of the previous sachem or to his sister's son. All voted in the elections, both men and women. The election, however, still required the confirmation of the seven remaining gentes, and only then was the new sachem ceremonially invested with his office by the common council of the whole Iroquois confederacy. The significance of this will appear later. The authority of the sachem within the gens was paternal, and purely moral in character; he had no means of coercion. By virtue of his office he was also a member of the tribal council of the Senecas and also of the federal council

of all the Iroquois. The war-chief could only give orders on military expeditions.

2. The gens deposes the sachem and war-chief at will. This also is done by men and women jointly. After a sachem or chief had been deposed, they became simple braves, private persons, like the other members. The tribal council also had the power to depose sachems, even against the will of the gens.

3. No member is permitted to marry within the gens. This is the fundamental law of the gens, the bond which holds it together. It is the negative expression of the very positive blood relationship, by virtue of which the individuals it comprises become a gens. By his discovery of this simple fact Morgan has revealed for the first time the nature of the gens. How little the gens was understood before is obvious from the earlier reports about savages and barbarians, in which the various bodies out of which the gentile organization is composed are ignorantly and indiscriminately referred to as tribe, clan, thum, and so forth, and then sometimes designated as bodies within which marriage is prohibited. Thus was created the hopeless confusion which gave Mr. McLennan his chance to appear as Napoleon, establishing order by his decree: All tribes are divided into those within which marriage is prohibited (exogamous) and those within which it is permitted (endogamous). Having now made the muddle complete, he could give himself up to the profoundest inquiries as to which of his two absurd classes was the older exogamy or endogamy. All this nonsense promptly stopped of itself with the discovery of the gens and of its basis in consanguinity, involving the exclusion of its members from intermarriage with one another. It goes without saying that at the stage at which we find the Iroquois the prohibition of marriage within the gens was stringently observed.

4. The property of deceased persons passed to the other members of the gens; it had to remain in the gens. As an Iroquois had only things of little value to leave, the inheritance was shared by his nearest gentile relations; in the case of a man, by his own brothers and sisters and maternal uncle; in the case of a woman, by her children and own sisters, but not by her brothers. For this reason man and wife could not inherit from one another, nor children from their father.

5. The members of the gens owed each other help, protection, and especially assistance in avenging injury by strangers. The individual looked

for his security to the protection of the gens, and could rely upon receiving it; to wrong him was to wrong his whole gens. From the bonds of blood uniting the gens sprang the obligation of blood revenge, which the Iroquois unconditionally recognized. If any person from outside the gens killed a gentile member, the obligation of blood revenge rested on the entire gens of the slain man. First, mediation was tried; the gens of the slayer sat in council, and made proposals of settlement to the council of the gens of the slain, usually offering expressions of regret and presents of considerable value. If these were accepted, the matter was disposed of. In the contrary case, the wronged gens appointed one or more avengers, whose duty it was to pursue and kill the slayer. If this was accomplished, the gens of the slayer had no ground of complaint; accounts were even and closed.

6. The gens has special names or classes of names, which may not be used by any other gens in the whole tribe, so that the name of the individual indicates the gens to which he belongs. A gentile name confers of itself gentile rights.

7. The gens can adopt strangers and thereby admit them into the whole tribe. Thus among the Senecas the prisoners of war who were not killed became through adoption into a gens members of the tribe, receiving full gentile and tribal rights. The adoption took place on the proposal of individual members of the gens; if a man adopted, he accepted the stranger as brother or sister; if a woman, as son or daughter. The adoption had to be confirmed by ceremonial acceptance into the tribe. Frequently a gens which was exceptionally reduced in numbers was replenished by mass adoption from another gens, with its consent. Among the Iroquois the ceremony of adoption into the gens was performed at a public council of the tribe, and therefore was actually a religious rite.

8. Special religious ceremonies can hardly be found among the Indian gentes; the religious rites of the Indians are, however, more or less connected with the gens. At the six yearly religious festivals of the Iroquois the sachems and war-chiefs of the different gentes were included ex officio among the "Keepers of the Faith" and had priestly functions.

9. The gens has a common burial place. Among the Iroquois of New York State, who are hedged in on all sides by white people, this has disappeared, but it existed formerly. It exists still among other Indians - for example, among the Tuscaroras, who are closely related to the Iroquois; although they are Christians, each gens has a separate row in the cemetery;

the mother is therefore buried in the same row as her children, but not the father. And among the Iroquois also the whole gens of the deceased attends the burial, prepares the grave, the funeral addresses, etc.

10. The gens has a council: the democratic assembly of all male and female adult gentiles, all with equal votes. This council elected sachems, war-chiefs and also the other “Keepers of the Faith,” and deposed them; it took decisions regarding blood revenge or payment of atonement for murdered gentiles; it adopted strangers into the gens. In short, it was the sovereign power in the gens. Such were the rights and privileges of a typical Indian gens.

All the members of an Iroquois gens were personally free, and they were bound to defend each other’s freedom; they were equal in privileges and in personal rights, the sachem and chiefs claiming no superiority; and they were a brotherhood bound together by the ties of kin. Liberty, equality, and fraternity, though never formulated, were cardinal principles of the gens. These facts are material, because the gens was the unit of a social and governmental system, the foundation upon which Indian society was organized.... It serves to explain that sense of independence and personal dignity universally an attribute of Indian character.

The Indians of the whole of North America at the time of its discovery were organized in gentes under mother-right. The gentes had disappeared only in some tribes, as among the Dakotas; in others, as among the Ojibwas and the Omahas, they were organized according to father-right.

Among very many Indian tribes with more than five or six gentes, we find every three, four, or more gentes united in a special group, which Morgan, rendering the Indian name faithfully by its Greek equivalent, calls a “phratry” (brotherhood). Thus the Senecas have two phratries: the first comprises gentes 1 to 4, the second gentes 5 to 8. Closer investigation shows that these phratries generally represent the original gentes into which the tribe first split up; for since marriage was prohibited within the gens, there had to be at least two gentes in any tribe to enable it to exist independently.

In the measure in which the tribe increased, each gens divided again into two or more gentes, each of which now appears as a separate gens, while the original gens, which includes all the daughter gentes, continues as the phratry. Among the Senecas and most other Indians, the gentes within one phratry are brother gentes to one another, while those in the other phratry

are their cousin gentes-terms which in the American system of consanguinity have, as we have seen, a very real and expressive meaning. Originally no Seneca was allowed to marry within his phratry, but this restriction has long since become obsolete and is now confined to the gens. According to Senecan tradition, the Bear and the Deer were the two original gentes, from which the others branched off. After this new institution had once taken firm root, it was modified as required; if the gentes in one phratry died out, entire gentes were sometimes transferred into it from other phratries to make the numbers even. Hence we find gentes of the same name grouped in different phratries in different tribes.

Among the Iroquois, the functions of the phratry are partly social, partly religious.

(1) In the ball game one phratry plays against another. Each phratry puts forward its best players, while the other members, grouped according to phratries, look on and bet against one another on the victory of their players.

(2) In the tribal council the sachems and the war-chiefs of each phratry sit together, the two groups facing one another; each speaker addresses the representatives of each phratry as a separate body.

(3) If a murder had been committed in the tribe, and the slayer and the slain belonged to different phratries, the injured gens often appealed to its brother gentes; these held a council of the phratry and appealed in a body to the other phratry that it also should assemble its council to effect a settlement. Here the phratry reappears as the original gens, and with greater prospect of success than the weaker single gens, its offspring.

(4) At the death of prominent persons the opposite phratry saw to the interment and the burial ceremonies, while the phratry of the dead person attended as mourners. If a sachem died, the opposite phratry reported to the federal council of the Iroquois that the office was vacant.

(5) The council of the phratry also played a part in the election of a sachem. That the election would be confirmed by the brother gentes was more or less taken for granted, but the gentes of the opposite phratry might raise an objection. In this case the council of the opposite phratry was assembled; if it maintained the objection, the election was void.

(6) The Iroquois formerly had special religious mysteries, called medicine lodges by the white men. Among the Senecas, these mysteries were celebrated by two religious brotherhoods, into which new members

were admitted by formal initiation; there was one such brotherhood in each of the two phratries.

(7) If, as is almost certain, the four lineages occupying the four quarters of Tlascalala at the time of the conquest were four phratries, we here have proof that the phratries were also military units, like the phratries among the Greeks and similar kinship organizations among the Germans; these four lineages went into battle as separate groups, each with its own uniform and flag, and under its own leader.

As several gentes make up a phratry, so in the classic form several phratries make up a tribe; in some cases, when tribes have been much weakened, the intermediate form, the phratry, is absent. What distinguishes an Indian tribe in America?

1. Its own territory and name. In addition to its actual place of settlement, every tribe further possessed considerable territory for hunting and lashing. Beyond that lay a broad strip of neutral land reaching to the territory of the neighboring tribe; it was smaller between tribes related in language, larger between tribes not so related. It is the same as the boundary forest of the Germans, the waste made by Caesar's Suevi around their territory, the isarnholt (in Danish, jarnved, limes Danicus) between Danes and Germans, the Sachsenwald (Saxon wood) and branibor (Slav, "protecting wood") between Germans and Slavs, from which Brandenburg takes its name. The territory delimited by these uncertain boundaries was the common land of the tribe, recognized as such by neighboring tribes and defended by the tribe itself against attacks. In most cases the uncertainty of the boundaries only became a practical disadvantage when there had been a great increase in population. The names of the tribes seem generally to have arisen by chance rather than to have been deliberately chosen; in the course of time it often happened that a tribe was called by another name among the neighboring tribes than that which it used itself, just as the Germans were first called Germans by the Celts.

2. A distinct dialect peculiar to the tribe alone. Tribe and dialect are substantially coextensive; the formation through segmentation of new tribes and dialects was still proceeding in America until quite recently, and most probably has not entirely stopped even today. When two weakened tribes have merged into one, the exceptional case occurs of two closely related dialects being spoken in the same tribe. The average strength of American tribes is under 2,000 members; the Cherokees, however, number about

26,000, the greatest number of Indians in the United States speaking the same dialect.

3. The right to install into office the Sachems and war-chiefs elected by the Gentes and the right to depose them, even against the will of their gens. As these sachems and war-chiefs are members of the council of the tribe, these rights of the tribe in regard to them explain themselves. Where a confederacy of tribes had been formed, with all the tribes represented in a federal council, these rights were transferred to the latter.

4. The possession of common religious conceptions (Mythology) and ceremonies. "After the fashion of barbarians the American Indians were a religious people." Their mythology has not yet been studied at all critically. They already embodied their religious ideas-spirits of every kind-in human form; but the lower stage of barbarism, which they had reached, still knows no plastic representations, so-called idols. Their religion is a cult of nature and of elemental forces, in process of development to polytheism. The various tribes had their regular festivals, with definite rites, especially dances and games. Dancing particularly was an essential part of all religious ceremonies; each tribe held its own celebration separately.

5. A tribal council for the common affairs of the tribe. It was composed of all the sachems and war-chiefs of the different gentes, who were genuinely representative because they could be deposed at any time. It held its deliberations in public, surrounded by the other members of the tribe, who had the right to join freely in the discussion and to make their views heard. The decision rested with the council. As a rule, everyone was given a hearing who asked for it; the women could also have their views expressed by a speaker of their own choice. Among the Iroquois the final decision had to be unanimous, as was also the case in regard to many decisions of the German mark communities. The tribal council was responsible especially for the handling of relations with other tribes; it received and sent embassies, declared war and made peace. If war broke out, it was generally carried on by volunteers. In principle, every tribe was considered to be in a state of war with every other tribe with which it had not expressly concluded a treaty of peace. Military expeditions against such enemies were generally organized by prominent individual warriors; they held a war-dance, and whoever joined in the dance announced thereby his participation in the expedition. The column was at once formed, and started off. The defense of the tribal territory when attacked was also generally carried out

by volunteers. The departure and return of such columns were always an occasion of public festivities. The consent of the tribal council was not required for such expeditions, and was neither asked nor given. They find their exact counterpart in the private war expeditions of the German retinues described by Tacitus, only with the difference that among the Germans the retinues have already acquired a more permanent character, forming a firm core already organized in peacetime to which the other volunteers are attached in event of war. These war parties are seldom large; the most important expeditions of the Indians, even to great distances, were undertaken with insignificant forces. If several such parties united for operations on a large scale, each was under the orders only of its own leader. Unity in the plan of campaign was secured well or ill by a council of these leaders. It is the same manner of warfare as we find described by Ammianus Marcellinus among the Alemanni on the Upper Rhine in the fourth century.

6. Among some tribes we find a head chief, whose powers, however, are very slight. He is one of the sachems, and in situations demanding swift action he has to take provisional measures, until the council can assemble and make a definite decision. His function represents the first feeble attempt at the creation of an official with executive power, though generally nothing more came of it; as we shall see, the executive official developed in most cases, if not in all, out of the chief military commander.

The great majority of the American Indians did not advance to any higher form of association than the tribe. Living in small tribes, separated from one another by wide tracts between their frontiers, weakened by incessant wars, they occupied an immense territory with few people. Here and there alliances between related tribes came into being in the emergency of the moment and broke up when the emergency had passed. But in certain districts tribes which were originally related and had then been dispersed, joined together again in permanent federations, thus taking the first step towards the formation of nations. In the United States we find the most developed form of such a federation among the Iroquois. Emigrating from their homes west of the Mississippi, where they probably formed a branch of the great Dakota family, they settled after long wanderings in what is now the State of New York. They were divided into five tribes: Senecas, Cayugas, Onondagas, Oneidas and Mohawks. They subsisted on fish, game, and the products of a crude horticulture, and lived in villages, which were

generally protected by a stockade. Never more than twenty thousand strong, they had a number of gentes common to all the five tribes, spoke closely related dialects of the same language, and occupied a continuous stretch of territory which was divided up among the five tribes. As they had newly conquered this territory, these tribes were naturally accustomed to stand together against the Inhabitants they had driven out. From this developed, at the beginning of the fifteenth century at latest, a regular “everlasting league,” a sworn confederacy, which in the consciousness of its new strength immediately assumed an aggressive character, and at the height of its power, about 1675, conquered wide stretches of the surrounding country, either expelling the inhabitants or making them pay tribute. The Iroquois confederacy represents the most advanced social organization achieved by any Indians still at the lower stage of barbarism (excluding, therefore, the Mexicans, New Mexicans and Peruvians).

The main provisions of the confederacy were as follows:

1. Perpetual federation of the five consanguineous tribes on the basis of complete equality and independence in all internal matters of the tribe. This bond of kin represented the real basis of the confederacy. Of the five tribes, three were known as father tribes and were brother tribes to one another; the other two were known as son tribes, and were likewise brother tribes to one another. Three gentes, the oldest, still had their living representatives in all five tribes, and another three in three tribes; the members of each of these gentes were all brothers of one another throughout all the five tribes. Their common language, in which there were only variations of dialect, was the expression and the proof of their common descent.

2. The organ of the confederacy was federal council of fifty sachems, all equal in rank and authority; the decisions of this council were final in all matters relating to the confederacy.

3. The fifty sachems were distributed among the tribes and gentes at the foundation of the confederacy to hold the new offices specially created for federal purposes. They were elected by the respective gentes whenever a vacancy occurred and could be deposed by the gentes at any time; but the right of investing them with their office belonged to the federal council.

4. These federal sachems were also sachems in their respective tribes, and had a seat and a vote in the tribal council.

5. All decisions of the federal council had to be unanimous.

6. Voting was by tribes, so that for a decision to be valid every tribe and all members of the council in every tribe had to signify their agreement.

7. Each of the five tribal councils could convene the federal council, but it could not convene itself.

8. The meetings of the council were held in the presence of the assembled people; every Iroquois could speak; the council alone decided.

9. The confederacy had no official head or chief executive officer.

10. On the other hand, the council had two principal war-chiefs, with equal powers and equal authority (the two “kings” of the Spartans, the two consuls in Rome).

That was the whole public constitution under which the Iroquois lived for over four hundred years and are still living today. I have described it fully, following Morgan, because here we have the opportunity of studying the organization of a society which still has no state. The state presupposes a special public power separated from the body of the people, and Maurer, who with a true instinct recognizes that the constitution of the German mark is a purely social institution, differing essentially from the state, though later providing a great part of its basis, consequently investigates in all his writings the gradual growth of the public power out of, and side by side with, the primitive constitutions of marks, villages, homesteads, and towns. Among the North American Indians we see how an originally homogeneous tribe gradually spreads over a huge continent; how through division tribes become nations, entire groups of tribes; how the languages change until they not only become unintelligible to other tribes, but also lose almost every trace of their original identity; how at the same time within the tribes each gens splits up into several gentes, how the old mother gentes are preserved as phratries, while the names of these oldest gentes nevertheless remain the same in widely distant tribes that have long been separated-the Wolf and the Bear are still gentile names among a majority of all Indian tribes. And the constitution described above applies in the main to them all, except that many of them never advanced as far as the confederacy of related tribes.

But once the gens is given as the social unit, we also see how the whole constitution of gentes, phratries, and tribes is almost necessarily bound to develop from this unit, because the development is natural. Gens, phratry,

and tribe are all groups of different degrees of consanguinity, each self-contained and ordering its own affairs, but each supplementing the other. And the affairs which fall within their sphere comprise all the public affairs of barbarians of the lower stage. When we find a people with the gens as their social unit, we may therefore also look for an organization of the tribe similar to that here described; and when there are adequate sources, as in the case of the Greeks and the Romans, we shall not only find it, but we shall also be able to convince ourselves that where the sources fail us, comparison with the American social constitution helps us over the most difficult doubts and riddles.

And a wonderful constitution it is, this gentile constitution, in all its childlike simplicity! No soldiers, no gendarmes or police, no nobles, kings, regents, prefects, or judges, no prisons, no lawsuits - and everything takes its orderly course. All quarrels and disputes are settled by the whole of the community affected, by the gens or the tribe, or by the gentes among themselves; only as an extreme and exceptional measure is blood revenge threatened-and our capital punishment is nothing but blood revenge in a civilized form, with all the advantages and drawbacks of civilization. Although there were many more matters to be settled in common than today - the household is maintained by a number of families in common, and is communistic, the land belongs to the tribe, only the small gardens are allotted provisionally to the households - yet there is no need for even a trace of our complicated administrative apparatus with all its ramifications. The decisions are taken by those concerned, and in most cases everything has been already settled by the custom of centuries. There cannot be any poor or needy - the communal household and the gens know their responsibilities towards the old, the sick, and those disabled in war. All are equal and free - the women included. There is no place yet for slaves, nor, as a rule, for the subjugation of other tribes. When, about the year 1651, the Iroquois had conquered the Eries and the "Neutral Nation," they offered to accept them into the confederacy on equal terms; it was only after the defeated tribes had refused that they were driven from their territory. And what men and women such a society breeds is proved by the admiration inspired in all white people who have come into contact with unspoiled Indians, by the personal dignity, uprightness, strength of character, and courage of these barbarians.

We have seen examples of this courage quite recently in Africa. The Zulus a few years ago and the Nubians a few months ago – both of them tribes in which gentile institutions have not yet died out – did what no European army can do. Armed only with lances and spears, without firearms, under a hail of bullets from the breech-loaders of the English infantry - acknowledged the best in the world at fighting in close order – they advanced right up to the bayonets and more than once threw the lines into disorder and even broke them, in spite of the enormous inequality of weapons and in spite of the fact that they have no military service and know nothing of drill. Their powers of endurance and performance are shown by the complaint of the English that a Kaffir travels farther and faster in twenty-four hours than a horse. His smallest muscle stands out hard and firm like whipcord, says an English painter.

That is what men and society were before the division into classes. And when we compare their position with that of the overwhelming majority of civilized men today, an enormous gulf separates the present-day proletarian and small peasant from the free member of the old gentile society.

That is the one side. But we must not forget that this organization was doomed. It did not go beyond the tribe. The confederacy of tribes already marks the beginning of its collapse, as will soon be apparent, and was already apparent in the attempts at subjugation by the Iroquois. Outside the tribe was outside the law. Wherever there was not an explicit treaty of peace, tribe was at war with tribe, and wars were waged with the cruelty which distinguishes man from other animals, and which was only mitigated later by self-interest. The gentile constitution in its best days, as we saw it in America, presupposed an extremely undeveloped state of production and therefore an extremely sparse population over a wide area. Man's attitude to nature was therefore one of almost complete subjection to a strange incomprehensible power, as is reflected in his childish religious conceptions. Man was bounded by his tribe, both in relation to strangers from outside the tribe and to himself; the tribe, the gens, and their institutions were sacred and inviolable, a higher power established by nature, to which the individual subjected himself unconditionally in feeling, thought, and action. However impressive the people of this epoch appear to us, they are completely undifferentiated from one another; as Marx says, they are still attached to the navel string of the primitive community. The power of this primitive community had to be broken, and it was broken. But

it was broken by influences which from the very start appear as a degradation, a fall from the simple moral greatness of the old gentile society. The lowest interests – base greed, brutal appetites, sordid avarice, selfish robbery of the common wealth – inaugurate the new, civilized, class society. It is by the vilest means – theft, violence, fraud, treason – that the old classless gentile society is undermined and overthrown. And the new society itself, during all the two and a half thousand years of its existence, has never been anything else but the development of the small minority at the expense of the great exploited and oppressed majority; today it is so more than ever before.

IV. The Greek Gens

From prehistoric times Greeks and Pelasgians alike, and other peoples of kindred stock, had been organized in the same organic series as the Americans: gens, phratry, tribe, confederacy of tribes. The phratry might be absent, as among the Dorians, and the confederacy of tribes was not necessarily fully developed everywhere as yet; but in every case the gens was the unit. At the time of their entry into history, the Greeks are on the threshold of civilization; between them and the American tribes, of whom we spoke above, lie almost two entire great periods of development, by which the Greeks of the heroic age are ahead of the Iroquois. The gens of the Greeks is therefore no longer the archaic gens of the Iroquois; the impress of group marriage is beginning to be a good deal blurred. Mother-right has given way to father-right; increasing private wealth has thus made its first breach in the gentile constitution. A second breach followed naturally from the first. After the introduction of father-right the property of a rich heiress would have passed to her husband and thus into another gens on her marriage, but the foundation of all gentile law was now violated and in such a case the girl was not only permitted but ordered to marry within the gens, in order that her property should be retained for the gens.

According to Grote's History of Greece, the Athenian gens, in particular, was held together by the following institutions and customs:

1. Common religious rites, and the exclusive privilege of priesthood in honor of a particular god, the supposed ancestral father of the gens, who in this attribute was designated by a special surname.
2. A common burial place (cf. Demosthenes' Eubulides).
3. Mutual right of inheritance.
4. Mutual obligations of help, protection, and assistance in case of violence.
5. Mutual right and obligation to marry within the gens in certain cases, especially for orphan girls and heiresses.
6. Possession, at least in some cases, of common property, with a special archon (head man or president) and treasurer.

Next, several gentes were united in the phratry, but less closely; though here also we find mutual rights and obligations of a similar kind,

particularly the common celebration of certain religious ceremonies and the right to avenge the death of a phratrator. Similarly, all the phratries of a tribe held regularly recurring religious festivals in common, at which a leader of the tribe (phylobasileus), elected from the nobility (Eupatridai), officiated.

Thus far Grote. And Marx adds:

“In the Greek gens, the savage (e.g. Iroquois) shows through unmistakably.” He becomes still more unmistakable when we investigate further.

For the Greek gens has also the following characteristics:

7. Descent in the male line.

8. Prohibition of marriage within the gens except in the case of heiresses. This exception, and its formulation as an ordinance, prove the old rule to be valid. This is further substantiated by the universally accepted principle that at her marriage the woman renounced the religious rites of her gens and went over to those of her husband, being also inscribed in his phratry. This custom and a famous passage in Diccarchus both show that marriage outside the gens was the rule, and Becker in Charicles directly assumes that nobody might marry within his own gens.

9. The right of adoption into the gens. This was exercised through adoption into the family, but required public formalities and was exceptional.

10. The right to elect chieftains and to depose them. We know that every gens had its archon; but it is nowhere stated that the office was hereditary in certain families. Until the end of barbarism the probability is always against strict heredity, which is quite incompatible with conditions in which rich and poor had completely equal rights within the gens.

Not only Grote, but also Niebuhr, Mommsen and all the other historians of classical antiquity, have come to grief over the gens. Though they correctly noted many of its characteristics, they always took it to be a group of families, thus making it impossible for themselves to understand the nature and origin of the gens. Under the gentile constitution, the family was never an organizational unit, and could not be so, for man and wife necessarily belonged to two different gentes. The whole gens was incorporated within the phratry, and the whole phratry within the tribe; but the family belonged half to the gens of the man and half to the gens of the woman. In public law the state also does not recognize the family; up to this day, the family only exists for private law. And yet all our histories have

hitherto started from the absurd assumption, which, since the eighteenth century in particular, has become inviolable, that the monogamous single family, which is hardly older than civilization, is the core around which society and state have gradually crystallized.

Mr. Grote will also please note that though the Greeks derive their gentes from mythology, the gentes are older than the mythology which *they themselves* created with all its gods and demigods.

Morgan prefers to quote Grote because he is not only an impressive but also a trustworthy witness. Grote goes on to say that every Athenian gens had a name derived from its supposed ancestor; that it was the general custom before Solon, and even after Solon, in the absence of a will, for the property of a deceased person to pass to the members of his gens (gennetai), and that in the case of a murder it was the light and the duty, first of the relatives of the murdered man, then of the members of his gens, and lastly of his phratry, to prosecute the criminal before the tribunals: "All that we hear of the most ancient Athenian laws is based upon the gentile and phratric divisions." (Grote.)

The descent of the gentes from common ancestors has caused the "pedantic philistines," as Marx calls them, a lot of brain-racking. As they of course declare the common ancestors to be pure myths, they are at an utter loss to explain how the gens originated out of a number of separate and originally quite unrelated families; yet they have to perform this feat in order to explain how the gentes exist at all. So they argue in circles, with floods of words, never getting any further than the statement: the ancestral tree is a fairy tale, but the gens is a reality. And finally Grote declares (interpolations by Marx):

We hear of this genealogy but rarely, because it is only brought before the public in certain cases pre-eminent and venerable. But the humbler gentes had their common rites, and common superhuman ancestor and genealogy, as well as the more celebrated: the scheme and ideal basis was the same in all.

Marx summarizes Morgan's reply to this as follows:

"The system of consanguinity corresponding to the original form of the gens and the Greeks, like other mortals, once possessed such a gens - preserved the knowledge of the mutual relations between all members of a gens to each other. They learned this, for them decisively important, fact by practice from early childhood. This fell into desuetude with the rise of the

monogamian family. The gentile name created a pedigree beside which that of the individual family was insignificant. This name was now to preserve the fact of the common descent of those who bore it; but the lineage of the gens went so far that its members could no longer prove the actual relationship existing between them, except in a limited number of cases through recent common ancestors. The name itself was the evidence of a common descent, and conclusive proof, except in cases of adoption. The actual denial of all kinship between gentiles à la Grote and Neibuhr, which transforms the gens into a purely fictitious, fanciful creation of the brain, is, on the other hand, worthy of 'ideal' scientists, that is, of cloistered bookworms. Because concatenation of the generations, especially with the incipience of monogamy, is removed into the distance, and the reality of the past seems reflected in mythological fantasy, the good old Philistines concluded, and still conclude, that the fancied genealogy created real gentes!"

As among the Americans, the *phratry* was a mother gens, split up into several daughter gentes, and uniting them, often tracing them all to a common ancestor. Thus, according to Grote,

"all the contemporary members of the phratry of Hekataeus had a common god for their ancestor at the sixteenth degree."

Hence, all the gentes of this phratry were literally brother gentes. The phratry still occurs in Homer as a military unit in that famous passage where Nestor advises Agamemnon: Draw up people by tribes and by phratries so that phratry may support phratry, and tribe tribe. The phratry has further the right and the duty of prosecuting for blood-guilt incurred against a phrator; hence in earlier times it also had the obligation of blood revenge. Further, it had common shrines and festivals; in fact the elaboration of the whole Greek mythology out of the traditional old Aryan nature-cult was essentially conditioned by the phratries and gentes, and took place within them. The phratry also had a chief (the phratriarchos) and, according to de Coulanges, assemblies. It could pass binding resolutions, and act as a judicial and administrative body. Even the later state, while it ignored the gens, left certain public offices in the hands of the phratry.

Several related phratries form a tribe. In Attica there were four tribes, each consisting of three phratries, each phratry numbering thirty gentes. Such a rounded symmetry of groups presupposes conscious, purposeful interference with the naturally developed order. As to how, when, and why

this occurred,. Greek history is silent; the historical memory of the Greeks only went back to the heroic age.

As the Greeks were crowded together in a relatively small territory, differences of dialect were less developed than in the wide American forests; yet in Greece also it was only tribes of the same main dialect that united in a larger organization, and even Attica, small as it was, had a dialect of its own, which later, through its general use as the language of prose, became the dominant dialect.

In the Homeric poems we find most of the Greek tribes already united into small nations, within which, however, gentes, phratries, and tribes retained their full independence. They already lived in towns fortified with walls; the population increased with the increase of the herds, the extension of agriculture and the beginnings of handicraft. The differences in wealth thus became more pronounced, and with them the aristocratic element within the old primitive democracy. The various small nations waged incessant wars for the possession of the best land and doubtless also for booty; the use of prisoners of war as slaves was already a recognized institution.

The constitution of these tribes and small nations was as follows:

(1) The permanent authority was the council (boule), probably composed originally of all the chiefs of the gentes; later, when their number became too large, of a selection, whose choice provided an opportunity of extending and strengthening the aristocratic element. Dionysius actually speaks of the council in the heroic age as composed of nobles (kratistoi). The ultimate decision in important matters rested with the council. Thus in Æschylus the council of Thebes makes what is in the circumstances the vital decision to give Eteocles an honorable burial, but to throw out the corpse of Polynices to be devoured by dogs. When the state was established, this council was merged into the senate.

(2) The assembly of the people (agora). We saw among the Iroquois how the people, men and women, stood round the council when it was holding its meetings, intervening in an orderly manner in its deliberations and thus influencing its decisions. Among the Homeric Greeks, this Umstand (standing round), to use an old German legal expression, had already developed into a regular assembly of the people, as was also the case among the Germans in primitive times. It was convened by the council to decide important questions; every man had the right to speak. The decision was

given by a show of hands (Aeschylus, *The Suppliants*) or by acclamation. The decision of the assembly was supreme and final, for, says Schomann, in *Griechische Altertumer*,

“if the matter was one requiring the co-operation of the people for its execution, Homer does not indicate any means by which the people could be forced to co-operate against their will.”

For at this time, when every adult male member of the tribe was a warrior, there was as yet no public power separate from the people which could have been used against the people. Primitive democracy was still in its full strength, and it is in relation to that fact that the power and the position both of the council and of the basileus must first be judged.

(3) The leader of the army (basileus). Marx makes the following comment:

European scholars, born lackeys most of them, make the *basileus* into a monarch in the modern sense. Morgan, the Yankee republican, protests. Very ironically, but truly, he says of the oily-tongued Gladstone and his *Juventus Mundi*:

“Mr. Gladstone, who presents to his readers the Grecian chiefs of the heroic age as kings and princes, with the superadded qualities of gentlemen, is forced to admit that ‘on the whole we seem to have the custom or law of primogeniture sufficiently, but not oversharply defined.’”

Mr. Gladstone will probably agree that such an ambiguous law of primogeniture may be “sufficiently, but not oversharply defined” as being just as good as none at all.

In what sense the offices of sachem and chieftain were hereditary among the Iroquois and other Indians, we have already seen. All offices were elective, generally within a gens, and to that extent hereditary to the gens. In the course of time, preference when filling vacancies was given to the nearest gentile relation-brother or sister’s son - unless there were reasons for passing him over. The fact that among the Greeks, under father-right, the office of basileus generally passed to the son, or one of the sons, only proves that the probabilities were in favor of the sons succeeding to the office by popular election; it is no proof at all of legal hereditary succession without popular election. All that we have here is the first beginnings among the Iroquois and Greeks of distinct noble families within the gentes and, in the case of the Greeks, the first beginnings also of a future

hereditary leadership or monarchy. The probability is, therefore, that among the Greeks the basileus had either to be elected by the people or at least confirmed in his office by the recognized organs of the people, the council or agora, as was the case with the Roman “king” (rex).

In the Iliad, Agamemnon, the ruler of men, does not appear as the supreme king of the Greeks, but as supreme commander of a federal army before a besieged town. It is to this supremacy of command that Odysseus, after disputes had broken out among the Greeks, refers in a famous passage: “Evil is the rule of many; let one be commander,” etc. (The favorite line about the scepter is a later addition.)

Odysseus is here not giving a lecture on a form of government, but demanding obedience to the supreme commander in war. Since they are appearing before Troy only as an army, the proceedings in the agora secure to the Greeks all necessary democracy. When Achilles speaks of presents – that is, the division of the booty – he always leaves the division, not to Agamemnon or any other basileus, but to the “sons of the Achacans,” that is, the people. Such epithets as “descended from Zeus,” “nourished by Zeus,” prove nothing, for every gens is descended from a god, that of the leader of the tribe being already descended from a “superior” god, in this case Zeus. Even those without personal freedom, such as the swineherd Eumaeus and others, are “divine” (dioi and theioi), and that too in the Odyssey, which is much later than the Iliad; and again in the Odyssey the name Heros is given to the herald Menelaus as well as to the blind bard Demodocus. Since, in short, council and assembly of the people function together with the basileus, the word basileia, which Greek writers employ to denote the so-called Homeric kingship (chief command in the army being the principal characteristic of the office), only means – military democracy. (Marx.)

In addition to his military functions, the basileus also held those of priest and judge, the latter not clearly defined, the former exercised in his capacity as supreme representative of the tribe or confederacy of tribes. There is never any mention of civil administrative powers; he seems, however, to be a member of the council ex officio. It is therefore quite correct etymologically to translate basileus as king, since king (kuning) is derived from kuni, kunne, and means head of a gens. But the old Greek basileus does not correspond in any way to the present meaning of the word “king.” Thucydides expressly refers to the old basileia as patrike, i.e. derived from

gentes, and says it had strictly defined, and therefore limited, functions. And Aristotle says that the basileia of the heroic age was a leadership over free men and that the basileus was military leader, judge and high priest; he thus had no governmental power in the later sense.

Thus in the Greek constitution of the heroic age we see the old gentile order as still a living force. But we also see the beginnings of its disintegration: father-right, with transmission of the property to the children, by which accumulation of wealth within the family was favored and the family itself became a power as against the gens; reaction of the inequality of wealth on the constitution by the formation of the first rudiments of hereditary nobility and monarchy; slavery, at first only of prisoners of war, but already preparing the way for the enslavement of fellow-members of the tribe and even of the gens; the old wars between tribe and tribe already degenerating into systematic pillage by land and sea for the acquisition of cattle, slaves and treasure, and becoming a regular source of wealth; in short, riches praised and respected as the highest good and the old gentile order misused to justify the violent seizure of riches. Only one thing was wanting: an institution which not only secured the newly acquired riches of individuals against the communistic traditions of the gentile order, which not only sanctified the private property formerly so little valued, and declared this sanctification to be the highest purpose of all human society; but an institution which set the seal of general social recognition on each new method of acquiring property and thus amassing wealth at continually increasing speed; an institution which perpetuated, not only this growing cleavage of society into classes, but also the right of the possessing class to exploit the non-possessing, and the rule of the former over the latter.

And this institution came. The state was invented.

V. The Rise of the Athenian State

How the state developed, how the organs of the gentile constitution were partly transformed in this development, partly pushed aside by the introduction of new organs, and at last superseded entirely by real state authorities, while the true “people in arms,” organized for its self-defense in its gentes, phratries, and tribes, was replaced by an armed “public force” in the service of these state authorities and therefore at their command for use also against the people – this process, at least in its first stages, can be followed nowhere better than in ancient Athens. The changes in form have been outlined by Morgan, but their economic content and cause must largely be added by myself.

In the Heroic age the four tribes of the Athenians were still settled in Attica in separate territories; even the twelve phratries composing them seem still to have had distinct seats in the twelve towns of Cecrops. The constitution was that of the heroic age: assembly of the people, council of the people, basileus. As far as written history takes us back, we find the land already divided up and privately owned, which is in accordance with the relatively advanced commodity production and the corresponding trade in commodities developed towards the end of the upper stage of barbarism. In addition to grain, wine and oil were produced; to a continually increasing extent, the sea trade in the Aegean was captured from the Phoenicians, and most of it passed into Athenian hands. Through the sale and purchase of land, and the progressive division of labor between agriculture and handicraft, trade, and shipping, it was inevitable that the members of the different gentes, phratries, and tribes very soon became intermixed, and that into the districts of the phratry and tribe moved inhabitants, who, although fellow countrymen, did not belong to these bodies and were therefore strangers in their own place of domicile. For when times were quiet, each tribe and each phratry administered its own affairs without sending to Athens to consult the council of the people or the basileus. But anyone not a member of the phratry or tribe was, of course, excluded from taking any part in this administration, even though living in the district.

The smooth functioning of the organs of the gentile constitution was thus thrown so much out of gear that even in the heroic age remedies had to be

found. The constitution ascribed to Theseus was introduced. The principal change which it made was to set up a central authority in Athens – that is, part of the affairs hitherto administered by the tribes independently were declared common affairs and entrusted to the common council sitting in Athens. In taking this step, the Athenians went further than any native people of America had ever done: instead of neighboring tribes forming a simple confederacy, they fused together into one single nation. Hence arose a common Athenian civil law, which stood above the legal customs of the tribes and gentes.

The Athenian citizen, as such, acquired definite rights and new protection in law even on territory which was not that of his tribe. The first step had been taken towards undermining the gentile constitution; for this was the first step to the later admission of citizens who did not belong to any tribe in all Attica, but were, and remained, completely outside the Athenian gentile constitution. By a second measure ascribed to Theseus, the entire people, regardless of gens, phratry or tribe, was divided into three classes: eupatridai, or nobles, geomoroi, or farmers, and demiourgoi, or artisans, and the right to hold office was vested exclusively in the nobility. Apart from the tenure of offices by the nobility, this division remained inoperative, as it did not create any other legal distinctions between the classes. It is, however, important because it reveals the new social elements which had been developing unobserved. It shows that the customary appointment of members of certain families to the offices of the gens had already grown into an almost uncontested right of these families to office; it shows that these families, already powerful through their wealth, were beginning to form groupings outside their gentes as a separate, privileged class, and that the state now taking form sanctioned this presumption. It shows further that the division of labor between peasants and artisans was now firmly enough established in its social importance to challenge the old grouping of gentes and tribes. And, finally, it proclaims the irreconcilable opposition between gentile society and the state; the first attempt at forming a state consists in breaking up the gentes by dividing their members into those with privileges and those with none, and by further separating the latter into two productive classes and thus setting them one against the other.

The further political history of Athens up to the time of Solon is only imperfectly known. The office of basileus fell into disuse; the positions at

the head of the state were occupied by archons elected from the nobility. The power of the nobility continuously increased, until about the year 600 B.C. it became insupportable. And the principal means for suppressing the common liberty were – money and usury. The nobility had their chief seat in and around Athens, whose maritime trade, with occasional piracy still thrown in, enriched them and concentrated in their hands the wealth existing in the form of money. From here the growing money economy penetrated like corrosive acid into the old traditional life of the rural communities founded on natural economy. The gentile constitution is absolutely irreconcilable with money economy; the ruin of the Attic small farmers coincided with the loosening of the old gentile bonds which embraced and protected them. The debtor's bond and the lien on property (for already the Athenians had invented the mortgage also) respected neither gens nor phratry, while the old gentile constitution, for its part, knew neither money nor advances of money nor debts in money. Hence the money rule of the aristocracy now in full flood of expansion also created a new customary law to secure the creditor against the debtor and to sanction the exploitation of the small peasant by the possessor of money. All the fields of Attica were thick with mortgage columns bearing inscriptions stating that the land on which they stood was mortgaged to such and such for so and so much. The fields not so marked had for the most part already been sold on account of unpaid mortgages or interest, and had passed into the ownership of the noble usurer; the peasant could count himself lucky if he was allowed to remain on the land as a tenant and live on one-sixth of the produce of his labor, while he paid five-sixths to his new master as rent. And that was not all. If the sale of the land did not cover the debt, or if the debt had been contracted without any security, the debtor, in order to meet his creditor's claims, had to sell his children into slavery abroad. Children sold by their father – such was the first fruit of father-right and monogamy! And if the blood-sucker was still not satisfied, he could sell the debtor himself as a slave. Thus the pleasant dawn of civilization began for the Athenian people.

Formerly, when the conditions of the people still corresponded to the gentile constitution, such an upheaval was impossible; now it had happened – nobody knew how. Let us go back for a moment to our Iroquois, amongst whom the situation now confronting the Athenians, without their own doing, so to speak, and certainly against their will, was inconceivable. Their

mode of producing the necessities of life, unvarying from year to year, could never generate such conflicts as were apparently forced on the Athenians from without; it could never create an opposition of rich and poor, of exploiters and exploited. The Iroquois were still very far from controlling nature, but within the limits imposed on them by natural forces they did control their own production. Apart from bad harvests in their small gardens, the exhaustion of the stocks of fish in their lakes and rivers or of the game in their woods, they knew what results they could expect, making their living as they did. The certain result was a livelihood, plentiful or scanty; but one result there could never be – social upheavals that no one had ever intended, sundering of the gentile bonds, division of gens and tribe into two opposing and warring classes. Production was limited in the extreme, but – the producers controlled their product. That was the immense advantage of barbarian production, which was lost with the coming of civilization; to reconquer it, but on the basis of the gigantic control of nature now achieved by man and of the free association now made possible, will be the task of the next generations.

Not so among the Greeks. The rise of private property in herds and articles of luxury led to exchange between individuals, to the transformation of products into commodities. And here lie the seeds of the whole subsequent upheaval. When the producers no longer directly consumed their product themselves, but let it pass out of their hands in the act of exchange, they lost control of it. They no longer knew what became of it; the possibility was there that one day it would be used against the producer to exploit and oppress him. For this reason no society can permanently retain the mastery of its own production and the control over the social effects of its process of production unless it abolishes exchange between individuals.

But the Athenians were soon to learn how rapidly the product asserts its mastery over the producer when once exchange between individuals has begun and products have been transformed into commodities. With the coming of commodity production, individuals began to cultivate the soil on their own account, which soon led to individual ownership of land. Money followed, the general commodity with which all others were exchangeable. But when men invented money, they did not think that they were again creating a new social power, the one general power before which the whole of society must bow. And it was this new power, suddenly

sprung to life without knowledge or will of its creators, which now, in all the brutality of its youth, gave the Athenians the first taste of its might.

What was to be done? The old gentile constitution had not only shown itself powerless before the triumphal march of money; it was absolutely incapable of finding any place within its framework for such things as money, creditors, debtors, and forcible collection of debts. But the new social power was there; pious wishes, and yearning for the return of the good old days would not drive money and usury out of the world. Further, a number of minor breaches had also been made in the gentile constitution. All over Attica, and especially in Athens itself, the members of the different gentes and phratries became still more indiscriminately mixed with every generation, although even now an Athenian was only allowed to sell land outside his gens, not the house in which he lived. The division of labor between the different branches of production – agriculture, handicrafts (in which there were again innumerable subdivisions), trade, shipping, and so forth – had been carried further with every advance of industry and commerce; the population was now divided according to occupation into fairly permanent groups, each with its new common interests; and since the gens and the phratry made no provision for dealing with them, new offices had to be created. The number of slaves had increased considerably, and even at that time must have far exceeded the number of free Athenians; the gentile constitution originally knew nothing of slavery and therefore had no means of keeping these masses of bondsmen in order. Finally, trade had brought to Athens a number of foreigners who settled there on account of the greater facilities of making money; they also could claim no rights or protection under the old constitution; and, though they were received with traditional tolerance, they remained a disturbing and alien body among the people.

In short, the end of the gentile constitution was approaching. Society was outgrowing it more every day; even the worst evils that had grown up under its eyes were beyond its power to check or remove. But in the meantime the state had quietly been developing. The new groups formed by the division of labor, first between town and country, then between the different branches of town labor, had created new organs to look after their interests; official posts of all kinds had been set up. And above everything else the young state needed a power of its own, which in the case of the seafaring Athenians could at first only be a naval power, for the purpose of carrying

on small wars and protecting its merchant ships. At some unknown date before Solon, the naukrariai were set up, small territorial districts, twelve to each tribe; each naukratia had to provide, equip and man a warship and also contribute two horsemen. This institution was a twofold attack on the gentile constitution. In the first place, it created a public force which was now no longer simply identical with the whole body of the armed people; secondly, for the first time it divided the people for public purposes, not by groups of kinship, but by common place of residence. We shall see the significance of this.

The gentile constitution being incapable of bringing help to the exploited people, there remained only the growing state. And the state brought them its help in the form of the constitution of Solon, thereby strengthening itself again at the expense of the old constitution. Solon – the manner in which his reform, which belongs to the year 594 B.C., was carried through does not concern us here – opened the series of so-called political revolutions; and he did so with an attack on property. All revolutions hitherto have been revolutions to protect one kind of property against another kind of property. They cannot protect the one without violating the other. In the great French Revolution feudal property was sacrificed to save bourgeois property; in that of Solon, the property of the creditors had to suffer for the benefit of the property of the debtors. The debts were simply declared void. We do not know the exact details, but in his poems Solon boasts of having removed the mortgage columns from the fields and brought back all the people who had fled or been sold abroad on account of debt. This was only possible by open violation of property. And, in fact, from the first to the last, all so-called political revolutions have been made to protect property – of one kind; and they have been carried out by confiscating, also called stealing, property – of another kind. The plain truth is that for two and a half thousand years it has been possible to preserve private property only by violating property.

But now the need was to protect the free Athenians against the return of such slavery. The first step was the introduction of general measures – for example, the prohibition of debt contracts pledging the person of the debtor. Further, in order to place at least some check on the nobles' ravening hunger for the land of the peasants, a maximum limit was fixed for the amount of land that could be owned by one individual. Then changes were

made in the constitution, of which the most important for us are the following:

The council was raised to four hundred members, one hundred for each tribe; here, therefore, the tribe was still taken as basis. But that was the one and only feature of the new state incorporating anything from the old constitution. For all other purposes Solon divided the citizens into four classes according to their property in land and the amount of its yield: five hundred, three hundred and one hundred fifty medimni of grain (one medimnus equals about 1.16 bushels) were the minimum yields for the first three classes; those who owned less land or none at all were placed in the fourth class. All offices could be filled only from the three upper classes, and the highest offices only from the first. The fourth class only had the right to speak and vote in the assembly of the people; but it was in this assembly that all officers were elected, here they had to render their account, here all laws were made; and here the fourth class formed the majority. The privileges of the aristocracy were partially renewed in the form of privileges of wealth, but the people retained the decisive power. Further, the four classes formed the basis of a new military organization. The first two classes provided the cavalry; the third had to serve as heavy infantry; the fourth served either as light infantry without armor or in the fleet, for which they probably received wages.

A completely new element is thus introduced into the constitution: private ownership. According to the size of their property in land, the rights and duties of the citizens of the state are now assessed, and in the same degree to which the classes based on property gain influence, the old groups of blood relationship lose it; the gentile constitution had suffered a new defeat.

However, the assessment of political rights on a property basis was not an institution indispensable to the existence of the state. In spite of the great part it has played in the constitutional history of states, very many states, and precisely those most highly developed, have not required it. In Athens also its role was only temporary; from the time of Aristides all offices were open to every citizen.

During the next eighty years Athenian society gradually shaped the course along which it developed in the following centuries. Usury on the security of mortgaged land, which had been rampant in the period before Solon, had been curbed, as had also the inordinate concentration of property

in land. Commerce and handicrafts, including artistic handicrafts, which were being increasingly developed on a large scale by the use of slave labor, became the main occupations. Athenians were growing more enlightened. Instead of exploiting their fellow citizens in the old brutal way, they exploited chiefly the slaves and the non-Athenian customers. Movable property, wealth in the form of money, of slaves and ships, continually increased, but it was no longer a mere means to the acquisition of landed property, as in the old slow days: it had become an end in itself. On the one hand the old power of the aristocracy now had to contend with successful competition from the new class of rich industrialists and merchants; but, on the other hand, the ground was also cut away from beneath the last remains of the old gentile constitution. The gentes, phratries, and tribes, whose members were now scattered over all Attica and thoroughly intermixed, had thus become useless as political bodies; numbers of Athenian citizens did not belong to any gens at all; they were immigrants, who had indeed acquired rights of citizenship, but had not been adopted into any of the old kinship organizations; in addition, there was the steadily increasing number of foreign immigrants who only had rights of protection.

Meanwhile, the fights went on between parties; the nobility tried to win back their former privileges and for a moment regained the upper hand, until the revolution of Cleisthenes (509 B.C.) overthrew them finally, but with them also the last remnants of the gentile constitution.

In his new constitution, Cleisthenes ignored the four old tribes founded on gentes and phratries. In their place appeared a completely new organization on the basis of division of the citizens merely according to their place of residence, such as had been already attempted in the *naukrariai*. Only domicile was now decisive, not membership of a kinship group. Not the people, but the territory was now divided: the inhabitants became a mere political appendage of the territory.

The whole of Attica was divided into one hundred communal districts, called "demes," each of which was self-governing. The citizens resident in each deme (demotes) elected their president (demarch) and treasurer, as well as thirty judges with jurisdiction in minor disputes. They were also given their own temple and patron divinity or hero, whose priests they elected. Supreme power in the deme was vested in the assembly of the demotes. As Morgan rightly observes, here is the prototype of the self-governing American township. The modern state, in its highest

development, ends in the same unit with which the rising state in Athens began.

Ten of these units (demes) formed a tribe, which, however, is now known as a local tribe to distinguish it from the old tribe of kinship. The local tribe was not only a self-governing political body, but also a military body; it elected its phylarch, or tribal chief, who commanded the cavalry, the taxiarch commanding the infantry, and the strategos, who was in command over all the forces raised in the tribal area. It further provided five warships with their crews and commanders, and received as patron deity an Attic hero, after whom it was named. Lastly, it elected fifty councilors to the Athenian council.

At the summit was the Athenian state, governed by the council composed of the five hundred councilors elected by the ten tribes, and in the last instance by the assembly of the people, at which every Athenian citizen had the right to attend and to vote; archons and other officials managed the various departments of administration and justice. In Athens there was no supreme official with executive power.

Through this new constitution and the admission to civil rights of a very large number of protected persons, partly immigrants, partly freed slaves, the organs of the gentile constitution were forced out of public affairs; they sank to the level of private associations and religious bodies. But the moral influence of the old gentile period and its traditional ways of thought were still handed down for a long time to come, and only died out gradually. We find evidence of this in another state institution.

We saw that an essential characteristic of the state is the existence of a public force differentiated from the mass of the people. At this time, Athens still had only a people's army and a fleet provided directly by the people; army and fleet gave protection against external enemies and kept in check the slaves, who already formed the great majority of the population. In relation to the citizens, the public power at first existed only in the form of the police force, which is as old as the state itself; for which reason the naive French of the eighteenth century did not speak of civilized peoples, but of policed peoples (nations policees). The Athenians then instituted a police force simultaneously with their state, a veritable gendarmerie of bowmen, foot and mounted Landjäger as they call them in South Germany and Switzerland. But this gendarmerie consisted of slaves. The free Athenian considered police duty so degrading that he would rather be

arrested by an armed slave than himself have any hand in such despicable work. That was still the old gentile spirit. The state could not exist without police, but the state was still young and could not yet inspire enough moral respect to make honorable an occupation which, to the older members of the gens, necessarily appeared infamous.

Now complete in its main features, the state was perfectly adapted to the new social conditions of the Athenians, as is shown by the rapid growth of wealth, commerce, and industry. The class opposition on which the social and political institutions rested was no longer that of nobility and common people, but of slaves and free men, of protected persons and citizens. At the time of their greatest prosperity, the entire free-citizen population of Athens, women and children included, numbered about ninety thousand; besides them there were three hundred and sixty-five thousand slaves of both sexes and forty-five thousand protected persons - aliens and freedmen. There were therefore at least eighteen slaves and more than two protected persons to every adult male citizen. The reason for the large number of slaves was that many of them worked together in manufactories, in large rooms, under overseers. But with the development of commerce and industry wealth was accumulated and concentrated in a few hands, and the mass of the free citizens were impoverished. Their only alternatives were to compete against slave labor with their own labor as handicraftsman, which was considered base and vulgar and also offered very little prospect of success, or to become social scrap. Necessarily, in the circumstances, they did the latter, and, as they formed the majority, they thereby brought about the downfall of the whole Athenian state. The downfall of Athens was not caused by democracy, as the European lickspittle historians assert to flatter their princes, but by slavery, which banned the labor of free citizens.

The rise of the state among the Athenians is a particularly typical example of the formation of a state; first, the process takes place in a pure form, without any interference through use of violent force, either from without or from within (the usurpation by Pisistratus left no trace of its short duration); second, it shows a very highly developed form of state, the democratic republic, arising directly out of gentile society; and lastly we are sufficiently acquainted with all the essential details.

VI. The Gens and the State in Rome

According to the legendary account of the foundation of Rome, the first settlement was established by a number of Latin *gentes* (one hundred, says the legend), who were united in a tribe; these were soon joined by a Sabellian tribe, also said to have numbered a hundred *gentes*, and lastly by a third tribe of mixed elements, again said to have been composed of a hundred *gentes*. The whole account reveals at the first glance that very little was still primitive here except the gens, and that even it was in some cases only an offshoot from a mother gens still existing in its original home. The tribes clearly bear the mark of their artificial composition, even though they are generally composed out of related elements and after the pattern of the old tribe, which was not made but grew; it is, however, not an impossibility that the core of each of the three tribes was a genuine old tribe. The intermediate group, the phratry, consisted of ten *gentes* and was called a *curia*; there were therefore thirty *curiae*.

The Roman gens is recognized to be the same institution as the Greek gens; and since the Greek gens is a further development of the social unit whose original form is found among the American Indians, this, of course, holds true of the Roman gens also. Here therefore we can be more brief.

The Roman gens, at least in the earliest times of Rome, had the following constitution:

1. Mutual right of inheritance among gentile members; the property remained within the gens. Since father-right already prevailed in the Roman gens as in the Greek, descendants in the female line were excluded. According to the Law of the Twelve Tables, the oldest written Roman law known to us, the children, as natural heirs, had the first title to the estate; in default of children, then the agnates (descendants in the male line); in default of agnates, the gentiles. In all cases the property remained within the gens. Here we see gentile custom gradually being penetrated by the new legal provisions springing from increased wealth and monogamy: the original equal right of inheritance of all members of the gens is first restricted in practice to the agnates—probably very early, as already mentioned — finally, to the children and their issue in the male line; in the Twelve Tables this appears, of course, in the reverse order.

2. Possession of a common burial place. On their immigration to Rome from Regilli, the patrician gens of the Claudii received a piece of land for their own use and also a common burial place in the town. Even in the time of Augustus, the head of Varus, who had fallen in the battle of the Teutoburg Forest, was brought to Rome and interred in the gentilitius tumulusi the gens (Quinctilia) therefore still had its own burial mound.

3. Common religious rites. These, the sacra gentilitia, are well known.

4. Obligation not to marry within the gens. This seems never to have become written law in Rome, but the custom persisted. Of all the countless Roman married couples whose names have been preserved, there is not one where husband and wife have the same gentile name. The law of inheritance also proves the observance of this rule. The woman loses her agnatic rights on marriage and leaves her gens; neither she nor her children can inherit from her father or his brothers, because otherwise the inheritance would be lost to the father's gens. There is no sense in this rule unless a woman may not marry a member of her own gens.

5. Common land. In primitive times the gens had always owned common land, ever since the tribal land began to be divided up. Among the Latin tribes, we find the land partly in the possession of the tribe, partly of the gens, and partly of the households, which at that time can hardly have been single families. Romulus is said to have made the first allotments of land to individuals, about two and one-half acres (two jugera) to a person. But later we still find land owned by the gentes, to say nothing of the state land, round which the whole internal history of the republic centers.

6. Obligation of mutual protection and help among members of the gens. Only vestiges remain in written history; from the very start the Roman state made its superior power so manifest that the right of protection against injury passed into its hands. When Appius Claudius was arrested, the whole of his gens, even those who were his personal enemies, put on mourning. At the time of the second Punic war the gentes joined together to ransom their members who had been taken prisoner; the senate prohibited them from doing so.

7. Right to bear the gentile name. Persisted till the time of the emperors; freedmen were allowed to use the gentile name of their former master, but without gentile rights.

8. Right to adopt strangers into the gens. This was done through adoption into a family (as among the Indians), which carried with it acceptance into

the gens.

9. The right to elect the chief and to depose him is nowhere mentioned. But since in the earliest days of Rome all offices were filled by election or nomination, from the elected king downwards, and since the priests of the curiae were also elected by the curiae themselves, we may assume the same procedure for the presidents (Incises) of the gentes however firmly established the election from one and the same family within the gens may have already become.

Such were the rights of a Roman gens. Apart from the already completed transition to father-right, they are the perfect counterpart of the rights and duties in an Iroquois gens; here again “the Iroquois shows through unmistakably” (p. 90).

The confusion that still exists today, even among our leading historians, on the subject of the Roman gens, may be illustrated by one example. In his paper on Roman family names in the period of the Republic and of Augustus (*Romische Forschungen*, Berlin, 1864, Vol. I, pp. 8-11) Mommsen writes:

The gentile name belongs to all the male members of the gens, excluding, of course, the slaves, but including adopted and protected persons; it belongs also to the women.... The tribe is... a communal entity, derived from common lineage (real, supposed or even pretended) and united by communal festivities, burial rites and laws of inheritance; to it all personally free individuals, and therefore all women also, may and must belong. But it is difficult to determine what gentile name was borne by married women. So long as the woman may only marry a member of her own gens, this problem does not arise; and there is evidence that for a long period it was more difficult for women to marry outside than inside the gens; for instance, so late as the sixth century the right of *gentis enuptio* (marriage outside the gens) was a personal privilege, conceded as a reward.... But when such marriages outside the tribe took place, the wife, in earliest times, must thereby have gone over to her husband's tribe. Nothing is more certain than that the woman, in the old religious marriage, enters completely into the legal and sacramental bonds of her husband's community and leaves her own. Everyone knows that the married woman forfeits the right of inheritance and bequest in relation to members of her own gens but shares rights of inheritance with her husband and children and

the members of their gens. And if she is adopted by her husband and taken into his family, how can she remain apart from his gens?

Mommsen therefore maintains that the Roman women who belonged to a gens had originally been permitted to marry only within the gens, that the gens had therefore been endogamous, not exogamous. This view, which is in contradiction to all the evidence from other peoples, rests chiefly, if not exclusively, on one much disputed passage from Livy (Book XXXIX, Ch. 19), according to which the senate in the year 568 after the foundation of the city, or 186 B.C., decreed: “*Uti Feceniae Hispalae datio deminutio gentis enuptio tutoris optio item esset, quasi ei vir testamentis dedisset; utique ei ingenuo nubere liceret, neu quid ei qui eam duxisset ob id fraudi ignominiave essee*” – that Fecenia Hispala shall have the right to dispose of her property, to decrease it, to marry outside the gens, and to choose for herself a guardian, exactly as if her (deceased) husband had conferred this right on her by testament; that she may marry a freeman, and that the man who takes her to wife shall not be considered to have committed a wrongful or shameful act thereby.

Without a doubt, Fecenia, a freedwoman, is here granted the right to marry outside the gens. And equally without a doubt the husband possessed the right, according to this passage, to bequeath to his wife by will the right to marry outside the gens after his death. But outside which gens?

If the woman had to marry within her gens, as Mommsen assumes, she remained within this gens also after her marriage. But in the first place the endogamous character of the gens which is here asserted is precisely what has to be proved. And, secondly, if the wife had to marry within the gens, then, of course, so had the man, for otherwise he could not get a wife. So we reach the position that the man could bequeath to his wife by will a right which he himself, and for himself, did not possess; we arrive at a legal absurdity. Mommsen also feels this, and hence makes the assumption: “For a lawful marriage outside the gens, it was probably necessary to have the consent, not only of the chief, but of all members of the gens.” That is a very bold assumption in the first place, and, secondly, it contradicts the clear wording of the passage. The senate grants her this right in the place of her husband; it grants her expressly neither more nor less than her husband could have granted her, but what it grants her is an absolute right, conditional upon no other restriction. Thus it is provided that if she makes use of this right, her new husband also shall not suffer any disability. The

senate even directs the present and future consuls and praetors to see to it that no injurious consequences to her follow. Mommsen's assumption therefore seems to be completely inadmissible.

Or assume that the woman married a man from another gens, but herself remained in the gens into which she had been born. Then, according to the above passage, the man would have had the right to allow his wife to marry outside her own gens. That is, he would have had the right to make dispositions in the affairs of a gens to which he did not even belong. The thing is so patently absurd that we need waste no more words on it.

Hence there only remains the assumption that in her first marriage the woman married a man from another gens, and thereby immediately entered the gens of her husband, which Mommsen himself actually admits to have been the practice when the woman married outside her gens. Then everything at once becomes clear. Severed from her old gens by her marriage and accepted into the gentile group of her husband, the woman occupies a peculiar position in her new gens. She is, indeed, a member of the gens, but not related by blood. By the mere manner of her acceptance as a gentile member, she is entirely excluded from the prohibition against marrying within the gens, for she has just married into it; further, she is accepted as one of the married members of the gens, and on her husband's death inherits from his property, the property of a gentile member. What is more natural than that this property should remain within the gens and that she should therefore be obliged to marry a member of her husband's gens and nobody else? And if an exception is to be made, who is so competent to give her the necessary authorization as the man who has bequeathed her this property, her first husband? At the moment when he bequeaths to her a part of his property and at the same time allows her to transfer it into another gens through marriage or in consequence of marriage, this property still belongs to him and he is therefore literally disposing of his own property. As regards the woman herself and her relation to her husband's gens, it was he who brought her into the gens by a free act of will - the marriage; hence it also seems natural that he should be the proper person to authorize her to leave this gens by a second marriage. In a word, the matter appears simple and natural as soon as we abandon the extraordinary conception of the endogamous Roman gens and regard it, with Morgan, as originally exogamous.

There still remains one last assumption which has also found adherents, and probably the most numerous. On this view, the passage only means that “freed servants (liberty) could not without special permission *e gente enubere* (marry out of the gens) or perform any of the acts, which, involving loss of rights (*capitis deminutio minima*), would have resulted in the *liberta* leaving the gens.” (Lange, *Römische Altertümer*, Berlin 1856, I, 195, where Huschke is cited in connection with our passage from Livy.) If this supposition is correct, the passage then proves nothing at all about the position of free Roman women, and there can be even less question of any obligation resting on them to marry within the gens.

The expression *enuptio gentis* only occurs in this one passage and nowhere else in the whole of Latin literature; the word *enubere*, to marry outside, only occurs three times, also in Livy, and then not in reference to the gens. The fantastic notion that Roman women were only allowed to marry within their gens owes its existence solely to this one passage. But it cannot possibly be maintained. For either the passage refers to special restrictions for freedwomen, in which case it proves nothing about free women (*ingenue*); or it applies also to free women; and then it proves, on the contrary, that the woman married as a rule outside her gens, but on her marriage entered into the gens of her husband; which contradicts Mommsen and supports Morgan.

Almost three centuries after the foundation of Rome, the gentile groups were still so strong that a patrician gens, that of the Fabii, was able to undertake an independent campaign, with the permission of the senate, against the neighboring town of Veii; three hundred and six Fabii are said to have set out and to have been killed to a man, in an ambush; according to the story, only one boy who had remained behind survived to propagate the gens.

As we have said, ten gentes formed a phratry, which among the Romans was called a curia and had more important public functions than the Greek phratry. Every curia had its own religious rites, shrines and priests; the latter, as a body, formed one of the Roman priestly colleges. Ten curiae formed a tribe, which probably, like the rest of the Latin tribes, originally had an elected president-military leader and high priest. The three tribes together formed the Roman people, the *Populus Romanus*.

Thus no one could belong to the Roman people unless he was a member of a gens and through it of a curia and a tribe. The first constitution of the

Roman people was as follows: Public affairs were managed in the first instance by the senate, which, as Niebuhr first rightly saw, was composed of the presidents of the three hundred gentes; it was because they were the elders of the gens that they were called fathers, patres, and their body, the senate (council of the elders, from senex, old). Here again the custom of electing always from the same family in the gens brought into being the first hereditary nobility; these families called themselves "patricians," and claimed for themselves exclusive right of entry into the senate and tenure of all other offices. The acquiescence of the people in this claim, in course of time, and its transformation into an actual right, appear in legend as the story that Romulus conferred the patriciate and its privileges on the first senators and their descendants. The senate, like the Athenian boule, made final decisions in many matters and held preparatory discussions on those of greater importance, particularly new laws. With regard to these, the decision rested with the assembly of the people, called the comitia curiata (assembly of the curiae). The people assembled together, grouped in curiae, each curia probably grouped in gentes; each of the thirty curiae, had one vote in the final decision. The assembly of the curiae accepted or rejected all laws, elected all higher officials, including the rex (so-called king), declared war (the senate, however, concluded peace), and, as supreme court, decided, on the appeal of the parties concerned, all cases involving death sentence on a Roman citizen. Lastly, besides the senate and the assembly of the people, there was the rex, who corresponded exactly to the Greek basileus and was not at all the almost absolute king which Mommsen made him out to be. He also was military leader, high priest, and president of certain courts. He had no civil authority whatever, nor any power over the life, liberty, or property of citizens, except such as derived from his disciplinary powers as military leader or his executive powers as president of a court. The office of rex was not hereditary; on the contrary, he was first elected by the assembly of the curiae, probably on the nomination of his predecessor, and then at a second meeting solemnly installed in office. That he could also be deposed is shown by the fate of Tarquinius Superbus.

Like the Greeks of the heroic age, the Romans in the age of the so-called kings lived in a military democracy founded on gentes, phratries, and tribes and developed out of them. Even if the curiae and tribes were to a certain extent artificial groups, they were formed after the genuine, primitive models of the society out of which they had arisen and by which they were

still surrounded on all sides. Even if the primitive patrician nobility had already gained ground, even if the reges were endeavoring gradually to extend their power, it does not change the original, fundamental character of the constitution, and that alone matters.

Meanwhile, Rome and the Roman territory, which had been enlarged by conquest, increased in population, partly through immigration, partly through the addition of inhabitants of the subjugated, chiefly Latin, districts. All these new citizens of the state (we leave aside the question of the clients) stood outside the old gentes, curiae, and tribes, and therefore formed no part of the *populus Romanus*, the real Roman people. They were personally free, could own property in land, and had to pay taxes and do military service. But they could not hold any office, nor take part in the assembly of the curiae, nor share in the allotment of conquered state lands. They formed the class that was excluded from all public rights, the plebs. Owing to their continually increasing numbers, their military training and their possession of arms, they became a powerful threat to the old *populus*, which now rigidly barred any addition to its own ranks from outside. Further, landed property seems to have been fairly equally divided between *populus* and plebs, while the commercial and industrial wealth, though not as yet much developed, was probably for the most part in the hands of the plebs.

The great obscurity which envelops the completely legendary primitive history of Rome - an obscurity considerably deepened by the rationalistically pragmatical interpretations and accounts given of the subject by later authors with legalistic minds - makes it impossible to say anything definite about the time, course, or occasion of the revolution which made an end of the old gentile constitution. All that is certain is that its cause lay in the struggles between plebs and *populus*.

The new constitution, which was attributed to the rex Servius Tullius and followed the Greek model, particularly that of Solon, created a new assembly of the people, in which *populus* and plebeian without distinction were included or excluded according to whether they performed military service or not. The whole male population liable to bear arms was divided on a property basis into six classes. The lower limit in each of the five classes was: (1) 100,000 asses; (2) 75,000 asses; (3) 50,000 asses; (4) 25,000 asses; (5) 11,000 asses; according to Dureau de la Malle, the equivalent to about 14,000; 10,500; 7,000; 3,600; and 1,570 marks

respectively. The sixth class, the proletarians, consisted of those with less property than the lower class and those exempt from military service and taxes. In the new popular assembly of the centuries (*comitia centuriata*) the citizens appeared in military formation, arranged by companies in their centuries of a hundred men, each century having one vote. Now the first class put eighty centuries in the field, the second twenty-two, the third twenty, the fourth twenty-two, the fifth thirty, and the sixth also on century for the sake of appearances. In addition, there was the cavalry, drawn from the wealthiest men, with eighteen centuries; total, 193; ninety-seven votes were thus required for a clear majority. But the cavalry and the first class alone had together ninety-eight votes, and therefore the majority; if they were agreed, they did not ask the others; they made their decision, and it stood.

This new assembly of the centuries now took over all political rights of the former assembly of the *curiae*, with the exception of a few nominal privileges. The *curiae* and the *gentes* of which they were composed were thus degraded, as in Athens, to mere private and religious associations and continued to vegetate as such for a long period while the assembly of the *curiae* soon became completely dormant. In order that the three old tribes of kinship should also be excluded from the state, four local tribes were instituted, each of which inhabited one quarter of the city and possessed a number of political rights.

Thus in Rome also, even before the abolition of the so-called monarchy, the old order of society based on personal ties of blood was destroyed and in its place was set up a new and complete state constitution based on territorial division and difference of wealth. Here the public power consisted of the body of citizens liable to military service, in opposition not only to the slaves, but also to those excluded from service in the army and from possession of arms, the so-called proletarians.

The banishment of the last rex, Tarquinius Superbus, who usurped real monarchic power, and the replacement of the office of rex by two military leaders (consuls) with equal powers (as among the Iroquois) was simply a further development of this new constitution. Within this new constitution, the whole history of the Roman Republic runs its course, with all the struggles between patricians and plebeians for admission to office and share in the state lands, and the final merging of the patrician nobility in the new class of the great land and money owners, who, gradually swallowing up all the land of the peasants ruined by military service, employed slave labor to

cultivate the enormous estates thus formed, depopulated Italy and so threw open the door, not only to the emperors, but also to their successors, the German barbarians.

VII. The Gens among Celts and Germans

Space does not allow us to consider the gentile institutions still existing in greater or lesser degree of purity among the most various savage and barbarian peoples, nor the traces of these institutions in the ancient history of the civilized peoples of Asia. The institutions or their traces are found everywhere. A few examples will be enough. Before the gens had been recognized, the man who took the greatest pains to misunderstand it, McLennan himself, proved its existence, and in the main accurately described it, among the Kalmucks, Circassians, Samoyeds and three Indian peoples: the Warali, Magars and Munniporees. Recently it has been discovered and described by M. Kovalevsky among the Pshavs, Shevsurs, Svanets and other Caucasian tribes. Here we will only give some short notes on the occurrence of the gens among Celts and Germans.

The oldest Celtic laws which have been preserved show the gens still fully alive: in Ireland, after being forcibly broken up by the English, it still lives today in the consciousness of the people, as an instinct at any rate; in Scotland it was still in full strength in the middle of the eighteenth century, and here again it succumbed only to the weapons, laws, and courts of the English.

The old Welsh laws, which were recorded in writing several centuries before the English conquest, at the latest in the eleventh century, still show common tillage of the soil by whole villages, even if only as an exceptional relic of a once general custom; each family had five acres for its own cultivation; a piece of land was cultivated collectively as well and the yield shared. In view of the analogy of Ireland and Scotland, it cannot be doubted that these village communities represent gentes or subdivisions of gentes, even though further examination of the Welsh laws, which I cannot undertake for lack of time (my notes date from 1869), should not provide direct proof. But what is directly proved by the Welsh sources and by the Irish is that among the Celts in the eleventh century pairing marriage had not by any means been displaced by monogamy.

In Wales a marriage only became indissoluble, or rather it only ceased to be terminable by notification, after seven years had elapsed. If the time was short of seven years by only three nights, husband and wife could separate.

They then shared out their property between them; the woman divided and the man chose. The furniture was divided according to fixed and very humorous rules. If it was the man who dissolved the marriage, he had to give the woman back her dowry and some other things; if it was the woman, she received less. Of the children the man took two and the woman one, the middle child. If after the separation the woman took another husband and the first husband came to fetch her back again, she had to follow him even if she had already one foot in her new marriage bed. If, on the other hand, the man and woman had been together for seven years, they were husband and wife, even without any previous formal marriage. Chastity of girls before marriage was not at all strictly observed, nor was it demanded; the provisions in this respect are of an extremely frivolous character and not at all in keeping with bourgeois morality. If a woman committed adultery, the husband had the right to beat her (this was one of the three occasions when he was allowed to do so; otherwise he was punished), but not then to demand any other satisfaction, since “for the one offense there shall be either atonement or vengeance, but not both.” The grounds on which the wife could demand divorce without losing any of her claims in the subsequent settlement were very comprehensive; if the husband had bad breath, it was enough. The money which had to be paid to the chief of the tribe or king to buy off his right of the first night (*gobr merch*, whence the medieval name, *marcheta*; French *Marquette*), plays a large part in the code of laws. The women had the right to vote in the assemblies of the people. When we add that the evidence shows similar conditions in Ireland; that there, also, temporary marriages were quite usual and that at the separation very favorable and exactly defined conditions were assured to the woman, including even compensation for her domestic services; that in Ireland there was a “first wife” as well as other wives, and that in the division of an inheritance no distinction was made between children born in wedlock or outside it — we then have a picture of pairing marriage in comparison with which the form of marriage observed in North America appears strict. This is not surprising in the eleventh century among a people who even so late as Caesar’s time were still living in group marriage.

The existence of the Irish gens (*sept*; the tribe was called *clann*, *clan*) is confirmed and described not only by the old legal codes, but also by the English jurists of the seventeenth century who were sent over to transform

the clan lands into domains of the English crown. Until then, the land had been the common property of the clan or gens, in so far as the chieftains had not already converted it into their private domains. When a member of the gens died and a household consequently came to an end, the gentile chief (the English jurists called him *caput cognationis*) made a new division of the whole territory among the remaining households. This must have been done, broadly speaking, according to the rules in force in Germany. Forty or fifty years ago village fields were very numerous, and even today a few of these rundales, as they are called, may still be found. The peasants of a rundale, now individual tenants on the soil that had been the common property of the gens till it was seized by the English conquerors, pay rent for their respective piece of land, but put all their shares in arable and meadowland together, which they then divide according to position and quality into Gewanne, as they are called on the Moselle, each receiving a share in each Gewinn; moorland and pasture-land are used in common. Only fifty years ago new divisions were still made from time to time, sometimes annually. The field-map of such a village looks exactly like that of a German Gehöferschaft on the Moselle or in the Mittelwald. The gens also lives on in the "factions." The Irish peasants often divide themselves into parties based apparently on perfectly absurd or meaningless distinctions; to the English they are quite incomprehensible and seem to have no other purpose than the favorite ceremony of two factions hammering one another. They are artificial revivals, modern substitutes for the dispersed gentes, manifesting in their own peculiar manner the persistence of the inherited gentile instinct. In some districts the members of the gens still live pretty much together on the old territory; in the 'thirties the great majority of the inhabitants of County Monaghan still had only four family names, that is, they were descended from four gentes or clans.

In Scotland the decay of the gentile organization dates from the suppression of the rising of 1745. The precise function of the Scottish clan in this organization still awaits investigation; but that the clan is a gentile body is beyond doubt. In Walter Scott's novels the Highland clan lives before our eyes. It is, says Morgan:

... an excellent type of the gens in organization and in spirit, and an extraordinary illustration of the power of the gentile life over its members.... We find in their feuds and blood revenge, in their localization by gentes, in their use of lands in common, in the fidelity of the clansman to his chief and

of the members of the clan to each other, the usual and persistent features of gentile society.... Descent was in the male line, the children of the males remaining members of the clan, while the children of its female members belonged to the clans of their respective fathers.”

But that formerly mother-right prevailed in Scotland is proved by the fact that, according to Bede, in the royal family of the Picts succession was in the female line. Among the Scots, as among the Welsh, a relic even of the punaluan family persisted into the Middle Ages in the form of the right of the first night, which the head of the clan or the king, as last representative of the former community of husbands, had the right to exercise with every bride, unless it was compounded for money.

That the Germans were organized in gentes until the time of the migrations is beyond all doubt. They can have occupied the territory between the Danube, Rhine, Vistula, and the northern seas only a few centuries before our era; the Cimbri and Teutons were then still in full migration, and the Suevi did not find any permanent habitation until Caesar's time. Caesar expressly states of them that they had settled in gentes and kindreds (*gentibus cognationibusque*), and in the mouth of a Roman of the Julian gens the word *gentibus* has a definite meaning which cannot be argued away. The same was true of all the Germans; they seem still to have settled by gentes even in the provinces they conquered from the Romans. The code of laws of the Alemanni confirms that the people settled by kindreds (*genealogiae*) in the conquered territory south of the Danube; *genealogia* is used in exactly the same sense as *Markgenossenschaft* or *Dorfgenossenschaft* later. Kovalevsky has recently put forward the view that these *genealogia*- are the large household communities among which the land was divided, and from which the village community only developed later. This would then probably also apply to the *fara*, with which expression the Burgundians and the Lombards – that is, a Gothic and a Herminonian or High German tribe – designated nearly, if not exactly, the same thing as the *genealogiae* in the Alemannian code of laws. Whether it is really a gens or a household community must be settled by further research.

The records of language leave us in doubt whether all the Germans had a common expression for gens, and what that expression was. Etymologically, the Gothic *kuni*, Middle High German *kunne*, corresponds

to the Greek *genos* and the Latin *gens*, and is used in the same sense. The fact that the term for woman comes from the same root – Greek *gyne*, Slav *zena*, Gothic *qvino*, Old Norse *kona*, *kuna* – points back to the time of mother-right. Among the Lombards and Burgundians we find, as already mentioned, the term *fara*, which Grimm derives from an imaginary root *fisan*, to beget. I should prefer to go back to the more obvious derivation from *faran* (*fahren*), to travel or wander; *fara* would then denote a section of the migrating people which remained permanently together and almost as a matter of course would be composed of relatives. In the several centuries of migration, first to the east and then to the west, the expression came to be transferred to the kinship group itself. There are, further, the Gothic *sibia*, Anglo-Saxon *sib*, Old High German *sippia*, *sima*, kindred. Old Norse only has the plural *sifiar*, relatives; the singular only occurs as the name of a goddess, *Sif*. Lastly, still another expression occurs in the *Hildebrandslied*, where Hildebrand asks Hadubrand: “Who is thy father among the men of the people... or of what kin art thou?” (*eddo huêlihhes cnuosles du sîs*). In as far as there was a common German name for the *gens*, it was probably the Gothic *huni* that was used; this is rendered probable, not only by its identity with the corresponding expression in the related languages, but also by the fact that from it is derived the word *kuning*, *König* (king), which originally denotes the head of a *gens* or of a tribe. *Sibia*, kindred, does not seem to call for consideration; at any rate, *sifiar* in Old Norse denotes not only blood relations, but also relations by marriage; thus it includes the members of at least two *gentes*, and hence *sif* itself cannot have been the term for the *gens*.

As among the Mexicans and Greeks, so also among the Germans, the order of battle, both the cavalry squadrons and the wedge formations of the infantry, was drawn up by *gentes*. Tacitus’ use of the vague expression “by families and kindreds” is to be explained through the fact that in his time the *gens* in Rome had long ceased to be a living body.

A further passage in Tacitus is decisive. It states that the maternal uncle looks upon his nephew as his own son, and that some even regard the bond of blood between the maternal uncle and the nephew as more sacred and close than that between father and son, so that when hostages are demanded the sister’s son is considered a better security than the natural son of the man whom it is desired to bind. Here we have living evidence, described as particularly characteristic of the Germans, of the matriarchal, and therefore

primitive, gens. If a member of such a gens gave his own son as a pledge of his oath and the son then paid the penalty of death for his father's breach of faith, the father had to answer for that to himself. But if it was a sister's son who was sacrificed, then the most sacred law of the gens was violated. The member of the gens who was nearest of kin to the boy or youth, and more than all others was bound to protect him, was guilty of his death; either he should not have pledged him or he should have kept the agreement. Even if we had no other trace of gentile organization among the Germans, this one passage would suffice.

Still more decisive, because it comes about eight hundred years later, is a passage from the Old Norse poem of the twilight of the gods and the end of the world, the *Voluspa*. In this "vision of the seeress," into which Christian elements are also interwoven, as Bang and Bugge have now proved, the description of the period of universal degeneration and corruption leading up to the great catastrophe contains the following passage:

Broedhr munu berjask ok at bonum verdask,
munu systrungar sifjum spilla.

"Brothers will make war upon one another and become one another's murderers, the children of sisters will break kinship." *Systrungar* means the son of the mother's sister, and that these sisters' sons should betray the blood-bond between them is regarded by the poet as an even greater crime than that of fratricide. The force of the climax is in the word *systrungar*, which emphasizes the kinship on the mother's side; if the word had been *syskina-born*, brothers' or sisters' children, or *syskinasynir*, brothers' or sisters' sons, the second line would not have been a climax to the first, but would merely have weakened the effect. Hence even in the time of the Vikings, when the *Voluspa* was composed, the memory of mother-right had not yet been obliterated in Scandinavia.

In the time of Tacitus, however, mother-right had already given way to father-right, at least among the Germans with whose customs he was more familiar. The children inherited from the father; if there were no children, the brothers, and the uncles on the father's and the mother's side. The fact that the mother's brother was allowed to inherit is connected with the survivals of mother-right already mentioned, and again proves how new father-right still was among the Germans at that time. Traces of mother-

right are also found until late in the Middle Ages. Apparently even at that time people still did not have any great trust in fatherhood, especially in the case of serfs. When, therefore, a feudal lord demanded from a town the return of a fugitive serf, it was required – for example, in Augsburg, Basle and Kaiserslautern – that the accused person's status as serf should be sworn to by six of his nearest blood relations, and that they should all be relations on the mother's side. (Maurer, *Städteverfassung*, I, p. 381.)

Another relic of mother-right, which was still only in process of dying out, was the respect of the Germans for the female sex, which to the Romans was almost incomprehensible. Young girls of noble family were considered the most binding hostages in treaties with the Germans. The thought that their wives and daughters might be taken captive and carried into slavery was terrible to them and more than anything else fired their courage in battle; they saw in a woman something holy and prophetic, and listened to her advice even in the most important matters. Veleda, the priestess of the Bructerians on the River Lippe, was the very soul of the whole Batavian rising in which Civilis, at the head of the Germans and Belgae, shook the foundations of Roman rule in Gaul. In the home, the woman seems to have held undisputed sway, though, together with the old people and the children, she also had to do all the work, while the man hunted, drank, or idled about. That, at least, is what Tacitus says; but as he does not say who tilled the fields, and definitely declares that the serfs only paid tribute, but did not have to render labor dues, the bulk of the adult men must have had to do what little work the cultivation of the land required. The form of marriage, as already said, was a pairing marriage which was gradually approaching monogamy. It was not yet strict monogamy, as polygamy was permitted for the leading members of the tribe. In general, strict chastity was required of the girls (in contrast to the Celts), and Tacitus also speaks with special warmth of the sacredness of the marriage tie among the Germans. Adultery by the woman is the only ground for divorce mentioned by him. But there are many gaps here in his report, and it is also only too apparent that he is holding up a mirror of virtue before the dissipated Romans. One thing is certain: if the Germans were such paragons of virtue in their forests, it only required slight contact with the outside world to bring them down to the level of the average man in the rest of Europe. Amidst the Roman world, the last trace of moral austerity disappeared far more rapidly even than the German language. For proof, it

is enough to read Gregory of Tours. That in the German primeval forests there could be no such voluptuous abandonment to all the refinements of sensuality as in Rome is obvious; the superiority of the Germans to the Roman world in this respect also is sufficiently great, and there is no need to endow them with an ideal continence in things of the flesh, such as has never yet been practiced by an entire nation.

Also derived from the gentile organization is the obligation to inherit the enmities as well as the friendships of the father or the relatives; likewise the *Wergeld*, the fine for idling or injuring, in place of blood revenge. The *Wergeld*, which only a generation ago was regarded as a specifically German institution, has now been shown to be general among hundreds of peoples as a milder form of the blood revenge originating out of the gentile organization. We find it, for example, among the American Indians, who also regard hospitality as an obligation. Tacitus' description of hospitality as practiced among the Germans (Germania, Ch. XXI) is identical almost to the details with that given by Morgan of his Indians.

The endless, burning controversy as to whether the Germans of Tacitus' time had already definitely divided the land or not, and how the relevant passages are to be interpreted, now belongs to the past. No more words need be wasted in this dispute, since it has been established that among almost all peoples the cultivated land was tilled collectively by the gens, and later by communistic household communities such as were still found by Caesar among the Suevi, and that after this stage the land was allotted to individual families with periodical repartitions, which are shown to have survived as a local custom in Germany down to our day. If in the one hundred and fifty years between Caesar and Tacitus the Germans had changed from the collective cultivation of the land expressly attributed by Caesar to the Suevi (they had no divided or private fields whatever, he says) to individual cultivation with annual repartition of the land, that is surely progress enough. The transition from that stage to complete private property in land during such a short period and without any outside interference is a sheer impossibility. What I read in Tacitus is simply what he says in his own dry words: they change (or divide afresh) the cultivated land every year, and there is enough common land left over. It is the stage of agriculture and property relations in regard to the land which exactly corresponds to the gentile constitution of the Germans at that time.

I leave the preceding paragraph unchanged as it stood in the former editions. Meanwhile the question has taken another turn. Since Kovalevsky has shown (cf. pages 51-52) that the patriarchal household community was a very common, if not universal, intermediate form between the matriarchal communistic family and the modern isolated family, it is no longer a question of whether property in land is communal or private, which was the point at issue between Maurer and Waitz, but a question of the form of the communal property. There is no doubt at all that the Suevi in Caesar's time not only owned the land in common, but also cultivated it in common for the common benefit. Whether the economic unit was the gens or the household community or a communistic kinship group intermediate between the two; or whether all three groups occurred according to the conditions of the soil – these questions will be in dispute for a long time to come. Kovalevsky maintains, however, that the conditions described by Tacitus presuppose the existence, not of the mark or village community, but of the household community and that the village community only develops out of the latter much later, as a result of the increase in population.

According to this view, the settlements of the Germans in the territory of which they were already in possession at the time of the Romans, and also in the territory which they later took from the Romans, were not composed of villages but of large household communities, which included several generations, cultivated an amount of land proportionate to the number of their members, and had common use with their neighbors of the surrounding waste. The passage in Tacitus about changing the cultivated land would then have to be taken in an agronomic sense: the community cultivated a different piece of land every year, and allowed the land cultivated the previous year to lie fallow or run completely to waste; the population being scanty, there was always enough waste left over to make any disputes about land unnecessary. Only in the course of centuries, when the number of members in the household communities had increased so much that a common economy was no longer possible under the existing conditions of production did the communities dissolve. The arable and meadow lands which had hitherto been common were divided in the manner familiar to us, first temporarily and then permanently, among the single households which were now coming into being, while forest, pasture land, and water remained common.

In the case of Russia this development seems to be a proved historical fact. With regard to Germany, and, secondarily, the other Germanic countries, it cannot be denied that in many ways this view provides a better explanation of the sources and an easier solution to difficulties than that held hitherto, which takes the village community back to the time of Tacitus. On the whole, the oldest documents, such as the Codex Laureshamensis, can be explained much better in terms of the household community than of the village community. On the other hand, this view raises new difficulties and new questions, which have still to be solved. They can only be settled by new investigations; but I cannot deny that in the case also of Germany, Scandinavia and England there is very great probability in favor of the intermediate form of the household community.

While in Caesar's time the Germans had only just taken up or were still looking for settled abodes, in Tacitus' time they already had a full century of settled life behind them; correspondingly, the progress in the production of the necessities of life is unmistakable. They live in log-houses; their clothing is still very much that of primitive people of the forests: coarse woollen mantles, skins; for women and notable people underclothing of linen. Their food is milk, meat, wild fruits, and, as Pliny adds, oatmeal porridge (still the Celtic national food in Ireland and Scotland). Their wealth consists in cattle and horses, but of inferior breed; the cows are small, poor in build and without horns; the horses are ponies, with very little speed. Money was used rarely and in small amounts; it was exclusively Roman. They did not work gold or silver, nor did they value it. Iron was rare, and, at least, among the tribes on the Rhine and the Danube, seems to have been almost entirely imported, not mined. Runic writing (imitated from the Greek or Latin letters) was a purely secret form of writing, used only for religious magic. Human sacrifices were still offered. In short, we here see a people which had just raised itself from the middle to the upper stage of barbarism. But whereas the tribes living immediately on the Roman frontiers were hindered in the development of an independent metal and textile industry by the facility with which Roman products could be imported, such industry undoubtedly did develop in the northeast, on the Baltic. The fragments of weapons found in the Schleswig marshes – long iron sword, coat of mail, silver helmet, and so forth, together with Roman coins of the end of the second century – and the German metal objects distributed by the migrations, show quite a pronounced character of their

own, even when they derive from an originally Roman model. Emigration into the civilized Roman world put an end to this native industry everywhere except in England. With what uniformity this industry arose and developed, can be seen, for example, in the bronze brooches; those found in Burgundy, Rumania and on the Sea of Azov might have come out of the same workshop as those found in England and Sweden, and are just as certainly of Germanic origin.

The constitution also corresponds to the upper stage of barbarism. According to Tacitus, there was generally a council of chiefs (*principes*), which decided minor matters, but prepared more important questions for decision by the assembly of the people; at the lower stage of barbarism, so far as we have knowledge of it, as among the Americans, this assembly of the people still comprises only the members of the gens, not yet of the tribe or of the confederacy of tribes. The chiefs (*principes*) are still sharply distinguished from the military leaders (*duces*) just as they are among the Iroquois; they already subsist partially on gifts of cattle, corn, etc., from the members of the tribe; as in America, they are generally elected from the same family. The transition to father-right favored, as in Greece and Rome, the gradual transformation of election into hereditary succession, and hence the rise of a noble family in each gens. This old so-called tribal nobility disappeared for the most part during the migrations or soon afterwards. The military leaders were chosen without regard to their descent, solely according to their ability. They had little power and had to rely on the force of example. Tacitus expressly states that the actual disciplinary authority in the army lay with the priests. The real power was in the hands of the assembly of the people. The king or the chief of the tribe presides; the people decide: "No" by murmurs; "Yes" by acclamation and clash of weapons. The assembly of the people is at the same time an assembly of justice; here complaints are brought forward and decided and sentences of death passed, the only capital crimes being cowardice, treason against the people, and unnatural lust. Also in the gentes and other subdivisions of the tribe all the members sit in judgment under the presidency of the chief, who, as in all the early German courts, can only have guided the proceedings and put questions; the actual verdict was always given among Germans everywhere by the whole community.

Confederacies of tribes had grown up since the time of Caesar; some of them already had kings; the supreme military commander was already

aiming at the position of tyrant, as among the Greeks and Romans, and sometimes secured it. But these fortunate usurpers were not by any means absolute rulers; they were, however, already beginning to break the fetters of the gentile constitution. Whereas freed slaves usually occupied a subordinate position, since they could not belong to any gens, as favorites of the new kings they often won rank, riches and honors. The same thing happened after the conquest of the Roman Empire by these military leaders, who now became kings of great countries. Among the Franks, slaves and freedmen of the king played a leading part first at the court and then in the state; the new nobility was to a great extent descended from them.

One institution particularly favored the rise of kingship: the retinues. We have already seen among the American Indians how, side by side with the gentile constitution, private associations were formed to carry on wars independently. Among the Germans, these private associations had already become permanent. A military leader who had made himself a name gathered around him a band of young men eager for booty, whom he pledged to personal loyalty, giving the same pledge to them. The leader provided their keep, gave them gifts, and organized them on a hierarchic basis; a bodyguard and a standing troop for smaller expeditions and a regular corps of officers for operations on a larger scale. Weak as these retinues must have been, and as we in fact find them to be later – for example, under Odoacer in Italy – they were nevertheless the beginnings of the decay of the old freedom of the people and showed themselves to be such during and after the migrations. For in the first place they favored the rise of monarchic power. In the second place, as Tacitus already notes, they could only be kept together by continual wars and plundering expeditions. Plunder became an end in itself. If the leader of the retinue found nothing to do in the neighborhood, he set out with his men to other peoples where there was war and the prospect of booty. The German mercenaries who fought in great numbers under the Roman standard even against Germans were partly mobilized through these retinues. They already represent the first form of the system of Landsknechte, the shame and curse of the Germans. When the Roman Empire had been conquered, these retinues of the kings formed the second main stock, after the unfree and the Roman courtiers, from which the later nobility was drawn.

In general, then, the constitution of those German tribes which had combined into peoples was the same as had developed among the Greeks of

the Heroic Age and the Romans of the so-called time of the kings: assembly of the people, council of the chiefs of the gentes, military leader, who is already striving for real monarchic power. It was the highest form of constitution which the gentile order could achieve; it was the model constitution of the upper stage of barbarism. If society passed beyond the limits within which this constitution was adequate, that meant the end of the gentile order; it was broken up and the state took its place.

VIII. The Formation of the State among Germans

According to Tacitus, the Germans were a very numerous people. Caesar gives us an approximate idea of the strength of the separate German peoples; he places the number of the Usipetans and the Tencterans who appeared on the left bank of the Rhine at 180,000, women and children included. That is about 100,000 to one people, already considerably more than, for instance, the total number of the Iroquois in their prime, when, no more than 20,000 strong, they were the terror of the whole country from the Great Lakes to the Ohio and the Potomac. On the map, if we try to group the better known peoples settled near the Rhine according to the evidence of the reports, a single people occupies the space of a Prussian government district that is, about 10,000 square kilometers or 182 geographical square miles. Now, the Germania Magna of the Romans, which reached as far as the Vistula, had an area of 500,000 square kilometers in round figures. Reckoning the average number of each people at 100,000, the total population of Germania Magna would work out at 5,000,000 - a considerable figure for a barbarian group of peoples, but, compared with our conditions ten persons to the square kilometer, or about 550 to the geographical square mile - extremely low. But that by no means exhausts the number of the Germans then living. We know that all along the Carpathians and down to the south of the Danube there were German peoples descended from Gothic tribes, such as the Bastarnians, Peucinians and others, who were so numerous that Pliny classes them together as the fifth main tribe of the Germans. As early as 180 B.C. they make their appearance as mercenaries in the service of the Macedonian King Perseus, and in the first years of Augustus, still advancing, they almost reached Adrianople. If we estimate these at only 1,000,000, the probable total number of the Germans at the beginning of our era must have been at least 6,000,000.

After permanent settlements had been founded in Germany, the population must have grown with increasing rapidity; the advances in industry we mentioned are in themselves proof of this. The objects found in the Schleswig marshes date from the third century, according to the Roman

coins discovered with them. At this time, therefore, there was already a developed metal and textile industry on the Baltic, brisk traffic with the Roman Empire and a certain degree of luxury among the more wealthy – all signs of denser population. But also at this time begins the general attack by the Germans along the whole line of the Rhine, the Roman wall and the Danube, from the North Sea to the Black Sea – direct proof of the continual growth and outward thrust of the population. For three centuries the fight went on, during which the whole main body of the Gothic peoples (with the exception of the Scandinavian Goths and the Burgundians) thrust south-east, forming the left wing on the long front of attack, while in the center the High Germans (Hermionians) pushed forward down the upper Danube, and on the right wing the Ischovonians, now called Franks, advanced along the Rhine; the Ingoevonians carried out the conquest of Britain. By the end of the fifth century an exhausted and bleeding Roman Empire lay helpless before the invading Germans.

In earlier chapters we were standing at the cradle of ancient Greek and Roman civilization. Now we stand at its grave. Rome had driven the leveling plane of its world rule over all the countries of the Mediterranean basin, and that for centuries. Except when Greek offered resistance, all natural languages had been forced to yield to a debased Latin; there were no more national differences, no more Gauls, Iberians, Ligurians, Noricans; all had become Romans. Roman administration and Roman law had everywhere broken up the old kinship groups, and with them the last vestige of local and national independence. The half-baked culture of Rome provided no substitute; it expressed no nationality, only the lack of nationality. The elements of new nations were present everywhere; the Latin dialects of the various provinces were becoming increasingly differentiated; the natural boundaries which once had made Italy, Gaul, Spain, Africa independent territories, were still there and still made themselves felt. But the strength was not there to fuse these elements into new nations; there was no longer a sign anywhere of capacity for development, or power of resistance, to say nothing of creative energy. The enormous mass of humanity in the whole enormous territory was held together by one bond only: the Roman state; and the Roman state had become in the course of time their worst enemy and oppressor. The provinces had annihilated Rome; Rome itself had become a provincial town like the rest – privileged, but no longer the ruler, no longer the hub of the

world empire, not even the seat of the emperors or sub-emperors, who now lived in Constantinople, Treves, Milan. The Roman state had become a huge, complicated machine, exclusively for bleeding its subjects, Taxes, state imposts and tributes of every kind pressed the mass of the people always deeper into poverty; the pressure was intensified until the exactions of governors, tax-collectors, and armies made it unbearable. That was what the Roman state had achieved with its world rule. It gave as the justification of its existence that it maintained order within the empire and protected it against the barbarians without. But its order was worse than the worst disorder, and the citizens whom it claimed to protect against the barbarians longed for the barbarians to deliver them.

Social conditions were no less desperate. Already in the last years of the republic the policy of Roman rule had been ruthlessly to exploit the provinces; the empire, far from abolishing this exploitation, had organized it. The more the empire declined, the higher rose the taxes and levies, the more shamelessly the officials robbed and extorted. The Romans had always been too occupied in ruling other nations to become proficient in trade and industry; it was only as usurers that they beat all who came before or after. What commerce had already existed and still survived was now ruined by official extortion; it struggled on only in the eastern, Greek part of the empire, which lies outside the present study. General impoverishment; decline of commerce, handicrafts and art; fall in the population; decay of the towns; relapse of agriculture to a lower level-such was the final result of Roman world rule.

Agriculture, always the decisive branch of production throughout the ancient world, was now more so than ever. In Italy, the enormous estates (latifundia) which, since the end of the republic, occupied almost the whole country, had been exploited in two different ways. They had been used either as pastures, the population being displaced by sheep and cattle, which could be tended by a few slaves, or as country estates (villae), where large-scale horticulture was carried on with masses of slaves, partly as a luxury for the owner, partly for sale in the town markets. The great grazing farms had kept going and had probably even extended; the country estates and their gardens had been ruined through the impoverishment of their owners and the decay of the towns. The system of latifundia run by slave labor no longer paid; but at that time no other form of large-scale agriculture was possible. Small production had again become the only profitable form. One

country estate after another was cut up into small lots, which were handed over either to tenants, who paid a fixed sum and had hereditary rights, or to *partiarii*, stewards rather than tenants, who received a sixth or even only a ninth of the year's product in return for their labor. For the most part, however, these small lots of land were given out to *coloni*, who paid for them a definite yearly amount, were tied to the soil and could be sold together with their lot. True, they were not slaves, but neither were they free; they could not marry free persons, and their marriages with one another were not regarded as full marriages, but, like those of slaves, as mere concubinage (*contubernium*). They were the forerunners of the medieval serfs.

The slavery of classical times had outlived itself. Whether employed on the land in large-scale agriculture or in manufacture in the towns, it no longer yielded any satisfactory return – the market for its products was no longer there. But the small-scale agriculture and the small handicraft production to which the enormous production of the empire in its prosperous days was now shrunk had no room for numbers of slaves. Only for the domestic and luxury slaves of the wealthy was there still a place in society. But though it was dying out, slavery was still common enough to make all productive labor appear to be work for slaves, unworthy of free Romans – and everybody was a free Roman now. Hence, on the one side, increasing manumissions of the superfluous slaves who were now a burden; on the other hand, a growth in some parts in the numbers of the *coloni*, and in other parts of the declassed freemen (like the “poor whites” in the ex-slave states of America). Christianity is completely innocent of the gradual dying out of ancient slavery; it was itself actively involved in the system for centuries under the Roman Empire, and never interfered later with slave-trading by Christians: not with the Germans in the north, or with the Venetians in the Mediterranean, or with the later trade in Negroes. Slavery no longer paid; it was for that reason it died out. But in dying it left behind its poisoned sting – the stigma attaching to the productive labor of freemen. This was the blind alley from which the Roman world had no way out: slavery was economically impossible, the labor of freemen was morally ostracized. The one could be the basic form of social production no longer; the other, not yet. Nothing could help here except a complete revolution.

Things were no better in the provinces. We have most material about Gaul. Here there was still a free small peasantry in addition to *coloni*;. In

order to be secured against oppression by officials, judges, and usurers, these peasants often placed themselves under the protection, the patronage, of a powerful person; and it was not only individuals who did so, but whole communities, so that in the fourth century the emperors frequently prohibited the practice. But what help was this protection to those who sought it? Their patron made it a condition that they should transfer to him the rights of ownership in their pieces of land, in return for which he guaranteed them the use of the land for their lifetime – a trick which the Holy Church took note of and in the ninth and tenth centuries lustily imitated, to the increase of God's glory and its own lands. At this time, it is true, about the year 475, Bishop Salvianus of Marseilles still inveighs indignantly against such theft. He relates that oppression by Roman officials and great landlords had become so heavy that many "Romans" fled into districts already occupied by the barbarians, and that the Roman citizens settled there feared nothing so much as a return to Roman rule. That parents owing to their poverty often sold their children into slavery at this time is proved by a decree prohibiting the practice.

In return for liberating the Romans from their own state, the German barbarians took from them two-thirds of all the land and divided it among themselves. The division was made according to the gentile constitution. The conquerors being relatively few in number, large tracts of land were left undivided, as the property partly of the whole people, partly of the individual tribes and gentes. Within each gens the arable and meadow land was distributed by lot in equal portions among the individual households. We do not know whether reallocations of the land were repeatedly carried out at this time, but in any event they were soon discontinued in the Roman provinces and the individual lots became alienable private property, *allodium*. Woods and pastures remained undivided for common use; the provisions regulating their common use, and the manner in which the divided land was to be cultivated, were settled in accordance with ancient custom and by the decision of the whole community. The longer the gens remained settled in its village and the more the Germans and the Romans gradually merged, the more the bond of union lost its character of kinship and became territorial. The gens was lost in the mark community, in which, however, traces of its origin in the kinship of its members are often enough still visible. Thus, at least in those countries where the mark community maintained itself - northern France, England, Germany and Scandinavia -

the gentile constitution changed imperceptibly into a local constitution and thus became capable of incorporation into the state. But it nevertheless retained that primitive democratic character which distinguishes the whole gentile constitution, and thus even in its later enforced degeneration and up to the most recent times it kept something of the gentile constitution alive, to be a weapon in the hands of the oppressed.

This weakening of the bond of blood in the gens followed from the degeneration of the organs of kinship also in the tribe and in the entire people as a result of their conquests. As we know, rule over subjugated peoples is incompatible with the gentile constitution. Here we can see this on a large scale. The German peoples, now masters of the Roman provinces, had to organize what they had conquered. But they could neither absorb the mass of Romans into the gentile bodies nor govern them through these bodies. At the head of the Roman local governing bodies, many of which continued for the time being to function, had to be placed a substitute for the Roman state, and this substitute could only be another state. The organs of the gentile constitution had to be transformed into state organs, and that very idly, for the situation was urgent. But the immediate representative of the conquering people was their military leader. To secure the conquered territory against attack from within and without, it was necessary to strengthen his power. The moment had come to transform the military leadership into kinship: the transformation was made.

Let us take the country of the Franks. Here the victorious Salian people had come into complete possession, not only of the extensive Roman state domains, but also of the very large tracts of land which had not been distributed among the larger and smaller district and mark communities, in particular all the larger forest areas. On his transformation from a plain military chief into the real sovereign of a country, the first thing which the king of the Franks did was to transform this property of the people into crown lands, to steal it from the people and to give it, outright or in fief, to his retainers. This retinue, which originally consisted of his personal following of warriors and of the other lesser military leaders, was presently increased not only by Romans – Romanized Gauls, whose education, knowledge of writing, familiarity with the spoken Romance language of the country and the written Latin language, as well as with the country's laws, soon made them indispensable to him, but also by slaves, serfs and freedmen, who composed his court and from whom he chose his favorites.

All these received their portions of the people's land, at first generally in the form of gifts, later of benefices, usually conferred, to begin with, for the king's lifetime. Thus, at the expense of the people the foundation of a new nobility was laid.

And that was not all. The wide extent of the kingdom could not be governed with the means provided by the old gentile constitution; the council of chiefs, even if it had not long since become obsolete, would have been unable to meet, and it was soon displaced by the permanent retinue of the king; the old assembly of the people continued to exist in name, but it also increasingly became a mere assembly of military leaders subordinate to the king, and of the new rising nobility. By the incessant civil wars and wars of conquest (the latter were particularly frequent under Charlemagne), the free land-owning peasants, the mass of the Frankish people, were reduced to the same state of exhaustion and penury as the Roman peasants in the last years of the Republic. Though they had originally constituted the whole army and still remained its backbone after the conquest of France, by the beginning of the ninth century they were so impoverished that hardly one man in five could go to the wars. The army of free peasants raised directly by the king was replaced by an army composed of the serving-men of the new nobles, including bondsmen, descendants of men who in earlier times had known no master save the king and still earlier no master at all, not even a king. The internal wars under Charlemagne's successors, the weakness of the authority of the crown, and the corresponding excesses of the nobles (including the counts instituted by Charlemagne, who were now striving to make their office hereditary), had already brought ruin on the Frankish peasantry, and the ruin was finally completed by the invasions of the Norsemen. Fifty years after the death of Charlemagne, the Empire of the Franks lay as defenseless at the feet of the Norsemen as the Roman Empire, four hundred years earlier, had lain at the feet of the Franks.

Not only was there the same impotence against enemies from without, but there was almost the same social order or rather disorder within. The free Frankish peasants were in a plight similar to their predecessors, the Roman coloni. Plundered, and ruined by wars, they had been forced to put themselves under the protection of the new nobles or of the Church, the crown being too weak to protect them. But they had to pay dearly for it. Like the Gallic peasants earlier, they had to transfer their rights of property in land to their protecting lord and received the land back from him in

tenancies of various and changing forms, but always only in return for services and dues. Once in this position of dependence, they gradually lost their personal freedom also; after a few generations most of them were already serfs. How rapid was the disappearance of the free peasantry is shown by Irminon's records of the monastic possessions of the Abbey of Saint Germain des Prés, at that time near, now in, Paris. On the huge holdings of this Abbey, which were scattered in the surrounding country, there lived in Charlemagne's time 2,788 households, whose members were almost without exception Franks with German names. They included 2,080 coloni, 35 lites, 220 slaves, and only eight freehold tenants! The godless practice, as Salvianus had called it, by which the protecting lord had the peasant's land transferred to himself as his own property, and only gave it back to the peasant for use during life, was now commonly employed by the Church against the peasants. The forced services now imposed with increasing frequency had had their prototype as much in the Roman *angariae*, compulsory labor for the state, as in the services provided by members of the German marks for bridge and road-making and other common purposes. To all appearances, therefore, after four hundred years, the mass of the people were back again where they had started.

But that only proved two things: first, that the social stratification and the distribution of property in the declining Roman Empire completely correspond to the level of agricultural and industrial production at that time, and had therefore been inevitable; secondly, that this level of production had neither risen nor fallen significantly during the following four centuries and had therefore with equal necessity again produced the same distribution of property and the same classes in the population. In the last centuries of the Roman Empire the town had lost its former supremacy over the country, and in the first centuries of German rule it had not regained it. This implies a low level of development both in agriculture and industry. This general situation necessarily produces big ruling landowners and a dependent small peasantry. How impossible it was to graft onto such a society either the Roman system of *latifundia* worked by slave-labor or the newer large-scale agriculture worked by forced services is proved by Charlemagne's experiments with the famous imperial country estates (*villae*). These experiments were gigantic in scope, but they left scarcely a trace. They were continued only by the monasteries, and only for them were they fruitful. But the monasteries were abnormal social bodies, founded on

celibacy; they could produce exceptional results, but for that very reason necessarily continued to be exceptional themselves.

And yet progress was made during these four hundred years. Though at the end we find almost the same main classes as at the beginning, the human beings who formed these classes were different. Ancient slavery had gone, and so had the pauper freemen who despised work as only fit for slaves. Between the Roman colonus and the new bondsman had stood the free Frankish peasant. The “useless memories and aimless strife” of decadent Roman culture were dead and buried. The social classes of the ninth century had been formed, not in the rottenness of a decaying civilization, but in the birth-pangs of a new civilization. Compared with their Roman predecessors, the new breed, whether masters or servants, was a breed of men. The relation of powerful landowners and subject peasants which had meant for the ancient world the final ruin, from which there was no escape, was for them the starting-point of a new development. And, further, however unproductive these four centuries appear, one great product they did leave: the modern nationalities, the new forms and structures through which west European humanity was to make coming history. The Germans had, in fact, given Europe new life, and therefore the break-up of the states in the Germanic period ended, not in subjugation by the Norsemen and Saracens, but in the further development of the system of benefices and protection into feudalism, and in such an enormous increase of the population that scarcely two centuries later the severe blood-letting of the Crusades was borne without injury.

But what was the mysterious magic by which the Germans breathed new life into a dying Europe? Was it some miraculous power innate in the Germanic race, such as our chauvinist historians romance about? Not a bit of it. The Germans, especially at that time, were a highly gifted Aryan tribe, and in the full vigor of development. It was not, however, their specific national qualities which rejuvenated Europe, but simply – their barbarism, their gentile constitution.

Their individual ability and courage, their sense of freedom, their democratic instinct which in everything of public concern felt itself concerned; in a word, all the qualities which had been lost to the Romans and were alone capable of forming new states and making new nationalities grow out of the slime of the Roman world-what else were they than the

characteristics of the barbarian of the upper stage, fruits of his gentile constitution?

If they recast the ancient form of monogamy, moderated the supremacy of the man in the family, and gave the woman a higher position than the classical world had ever known, what made them capable of doing so if not their barbarism, their gentile customs, their living heritage from the time of mother-right?

If in at least three of the most important countries, Germany, northern France and England, they carried over into the feudal state a genuine piece of gentile constitution, in the form of mark communities, thus giving the oppressed class, the peasants, even under the harshest medieval serfdom, a local center of solidarity and a means of resistance such as neither the slaves of classical times nor the modern proletariat found ready to their hand - to what was this due, if not to their barbarism, their purely barbarian method of settlement in kinship groups?

Lastly: they were able to develop and make universal the milder form of servitude they had practiced in their own country, which even in the Roman Empire increasingly displaced slavery; a form of servitude which, as Fourier first stressed, gives to the bondsmen the means of their gradual liberation as a class ("fournit aux cultivateurs des moyens d'affranchissement collectif et Progressif"); a form of servitude which thus stands high above slavery, where the only possibility is the immediate release, without any transitional stage, of individual slaves (abolition of slavery by successful rebellion is unknown to antiquity), whereas the medieval serfs gradually won their liberation as a class. And to what do we owe this if not to their barbarism, thanks to which they had not yet reached the stage of fully developed slavery, neither the labor slavery of the classical world nor the domestic slavery of the Orient?

All the vigorous and creative life which the Germans infused into the Roman world was barbarism. Only barbarians are able to rejuvenate a world in the throes of collapsing civilization. And precisely the highest stage of barbarism, to which and in which the Germans worked their way upwards before the migrations, was the most favorable for this process. That explains everything.

IX. Barbarism and Civilization

We have now traced the dissolution of the gentile constitution in the three great instances of the Greeks, the Romans, and the Germans. In conclusion, let us examine the general economic conditions which already undermined the gentile organization of society at the upper stage of barbarism and with the coming of civilization overthrew it completely. Here we shall need Marx's *Capital* as much as Morgan's book.

Arising in the middle stage of savagery, further developed during its upper stage, the gens reaches its most flourishing period, so far as our sources enable us to judge, during the lower stage of barbarism. We begin therefore with this stage.

Here – the American Indians must serve as our example – we find the gentile constitution fully formed. The tribe is now grouped in several gentes, generally two. With the increase in population, each of these original gentes splits up into several daughter gentes, their mother gens now appearing as the phratry. The tribe itself breaks up into several tribes, in each of which we find again, for the most part, the old gentes. The related tribes, at least in some cases, are united in a confederacy. This simple organization suffices completely for the social conditions out of which it sprang. It is nothing more than the grouping natural to those conditions, and it is capable of settling all conflicts that can arise within a society so organized. War settles external conflicts; it may end with the annihilation of the tribe, but never with its subjugation. It is the greatness, but also the limitation, of the gentile constitution that it has no place for ruler and ruled. Within the tribe there is as yet no difference between rights and duties; the question whether participation in public affairs, in blood revenge or atonement, is a right or a duty, does not exist for the Indian; it would seem to him just as absurd as the question whether it was a right or a duty to sleep, eat, or hunt. A division of the tribe or of the gens into different classes was equally impossible. And that brings us to the examination of the economic basis of these conditions.

The population is extremely sparse; it is dense only at the tribe's place of settlement, around which lie in a wide circle first the hunting grounds and then the protective belt of neutral forest, which separates the tribe from

others. The division of labor is purely primitive, between the sexes only. The man fights in the wars, goes hunting and fishing, procures the raw materials of food and the tools necessary for doing so. The woman looks after the house and the preparation of food and clothing, cooks, weaves, sews. They are each master in their own sphere: the man in the forest, the woman in the house. Each is owner of the instruments which he or she makes and uses: the man of the weapons, the hunting and fishing implements, the woman of the household gear. The housekeeping is communal among several and often many families. What is made and used in common is common property - the house, the garden, the long-boat. Here therefore, and here alone, there still exists in actual fact that "property created by the owner's labor" which in civilized society is an ideal fiction of the jurists and economists, the last lying legal pretense by which modern capitalist property still bolsters itself up.

But humanity did not everywhere remain at this stage. In Asia they found animals which could be tamed and, when once tamed, bred. The wild buffalo-cow had to be hunted; the tame buffalo-cow gave a calf yearly and milk as well. A number of the most advanced tribes – the Aryans, Semites, perhaps already also the Turanians – now made their chief work first the taming of cattle, later their breeding and tending only. Pastoral tribes separated themselves from the mass of the rest of the barbarians: the first great social division of labor. The pastoral tribes produced not only more necessities of life than the other barbarians, but different ones. They possessed the advantage over them of having not only milk, milk products and greater supplies of meat, but also skins, wool, goat-hair, and spun and woven fabrics, which became more common as the amount of raw material increased. Thus for the first time regular exchange became possible. At the earlier stages only occasional exchanges can take place; particular skill in the making of weapons and tools may lead to a temporary division of labor. Thus in many places undoubted remains of workshops for the making of stone tools have been found, dating from the later Stone Age. The artists who here perfected their skill probably worked for the whole community, as each special handicraftsman still does in the gentile communities in India. In no case could exchange arise at this stage except within the tribe itself, and then only as an exceptional event. But now, with the differentiation of pastoral tribes, we find all the conditions ripe for exchange between branches of different tribes and its development into a regular established

institution. Originally tribes exchanged with tribe through the respective chiefs of the gentes; but as the herds began to pass into private ownership, exchange between individuals became more common, and, finally, the only form. Now the chief article which the pastoral tribes exchanged with their neighbors was cattle; cattle became the commodity by which all other commodities were valued and which was everywhere willingly taken in exchange for them – in short, cattle acquired a money function and already at this stage did the work of money. With such necessity and speed, even at the very beginning of commodity exchange, did the need for a money commodity develop.

Horticulture, probably unknown to Asiatic barbarians of the lower stage, was being practiced by them in the middle stage at the latest, as the forerunner of agriculture. In the climate of the Turanian plateau, pastoral life is impossible without supplies of fodder for the long and severe winter. Here, therefore, it was essential that land should be put under grass and corn cultivated. The same is true of the steppes north of the Black Sea. But when once corn had been grown for the cattle, it also soon became food for men. The cultivated land still remained tribal property; at first it was allotted to the gens, later by the gens to the household communities and finally to individuals for use. The users may have had certain rights of possession, but nothing more.

Of the industrial achievements of this stage, two are particularly important. The first is the loom, the second the smelting of metal ores and the working of metals. Copper and tin and their alloy, bronze, were by far the most important. Bronze provided serviceable tools and weapons, though it could not displace stone tools; only iron could do that, and the method of obtaining iron was not yet understood. Gold and silver were beginning to be used for ornament and decoration, and must already have acquired a high value as compared with copper and bronze.

The increase of production in all branches – cattle-raising, agriculture, domestic handicrafts – gave human labor-power the capacity to produce a larger product than was necessary for its maintenance. At the same time it increased the daily amount of work to be done by each member of the gens, household community or single family. It was now desirable to bring in new labor forces. War provided them; prisoners of war were turned into slaves. With its increase of the productivity of labor, and therefore of wealth, and its extension of the field of production, the first great social division of

labor was bound, in the general historical conditions prevailing, to bring slavery in its train. From the first great social division of labor arose the first great cleavage of society into two classes: masters and slaves, exploiters and exploited.

As to how and when the herds passed out of the common possession of the tribe or the gens into the ownership of individual heads of families, we know nothing at present. But in the main it must have occurred during this stage. With the herds and the other new riches, a revolution came over the family. To procure the necessities of life had always been the business of the man; he produced and owned the means of doing so. The herds were the new means of producing these necessities; the taming of the animals in the first instance and their later tending were the man's work. To him, therefore, belonged the cattle, and to him the commodities and the slaves received in exchange for cattle. All the surplus which the acquisition of the necessities of life now yielded fell to the man; the woman shared in its enjoyment, but had no part in its ownership. The "savage" warrior and hunter had been content to take second place in the house, after the woman; the "gentler" shepherd, in the arrogance of his wealth, pushed himself forward into the first place and the woman down into the second. And she could not complain. The division of labor within the family had regulated the division of property between the man and the woman. That division of labor had remained the same; and yet it now turned the previous domestic relation upside down, simply because the division of labor outside the family had changed. The same cause which had ensured to the woman her previous supremacy in the house – that her activity was confined to domestic labor – this same cause now ensured the man's supremacy in the house: the domestic labor of the woman no longer counted beside the acquisition of the necessities of life by the man; the latter was everything, the former an unimportant extra. We can already see from this that to emancipate woman and make her the equal of the man is and remains an impossibility so long as the woman is shut out from social productive labor and restricted to private domestic labor. The emancipation of woman will only be possible when woman can take part in production on a large, social scale, and domestic work no longer claims anything but an insignificant amount of her time. And only now has that become possible through modern large-scale industry, which does not merely permit of the employment of female labor over a wide range, but positively demands it, while it also tends towards

ending private domestic labor by changing it more and more into a public industry.

The man now being actually supreme in the house, the last barrier to his absolute supremacy had fallen. This autocracy was confirmed and perpetuated by the overthrow of mother-right, the introduction of father-right, and the gradual transition of the pairing marriage into monogamy. But this tore a breach in the old gentile order; the single family became a power, and its rise was a menace to the gens.

The next step leads us to the upper stage of barbarism, the period when all civilized peoples have their Heroic Age: the age of the iron sword, but also of the iron plowshare and ax. Iron was now at the service of man, the last and most important of all the raw materials which played a historically revolutionary role – until the potato. Iron brought the tillage of large areas, the clearing of wide tracts of virgin forest; iron gave to the handicraftsman tools so hard and sharp that no stone, no other known metal could resist them. All this came gradually; the first iron was often even softer than bronze. Hence stone weapons only disappeared slowly; not merely in the Hildebrandslied, but even as late as Hastings in 1066, stone axes were still used for fighting. But progress could not now be stopped; it went forward with fewer checks and greater speed. The town, with its houses of stone or brick, encircled by stone walls, towers and ramparts, became the central seat of the tribe or the confederacy of tribes – an enormous architectural advance, but also a sign of growing danger and need for protection. Wealth increased rapidly, but as the wealth of individuals. The products of weaving, metal-work and the other handicrafts, which were becoming more and more differentiated, displayed growing variety and skill. In addition to corn, leguminous plants and fruit, agriculture now provided wine and oil, the preparation of which had been learned. Such manifold activities were no longer within the scope of one and the same individual; the second great division of labor took place: handicraft separated from agriculture. The continuous increase of production and simultaneously of the productivity of labor heightened the value of human labor-power. Slavery, which during the preceding period was still in its beginnings and sporadic, now becomes an essential constituent part of the social system; slaves no longer merely help with production – they are driven by dozens to work in the fields and the workshops. With the splitting up of production into the two great main branches, agriculture and handicrafts, arises production directly for

exchange, commodity production; with it came commerce, not only in the interior and on the tribal boundaries, but also already overseas. All this, however, was still very undeveloped; the precious metals were beginning to be the predominant and general money commodity, but still uncoined, exchanging simply by their naked weight.

The distinction of rich and poor appears beside that of freemen and slaves - with the new division of labor, a new cleavage of society into classes. The inequalities of property among the individual heads of families break up the old communal household communities wherever they had still managed to survive, and with them the common cultivation of the soil by and for these communities. The cultivated land is allotted for use to single families, at first temporarily, later permanently. The transition to full private property is gradually accomplished, parallel with the transition of the pairing marriage into monogamy. The single family is becoming the economic unit of society.

The denser population necessitates closer consolidation both for internal and external action. The confederacy of related tribes becomes everywhere a necessity, and soon also their fusion, involving the fusion of the separate tribal territories into one territory of the nation. The military leader of the people, *res*, *basileus*, *thiudans* – becomes an indispensable, permanent official. The assembly of the people takes form, wherever it did not already exist. Military leader, council, assembly of the people are the organs of gentile society developed into military democracy – military, since war and organization for war have now become regular functions of national life. Their neighbors' wealth excites the greed of peoples who already see in the acquisition of wealth one of the main aims of life. They are barbarians: they think it more easy and in fact more honorable to get riches by pillage than by work. War, formerly waged only in revenge for injuries or to extend territory that had grown too small, is now waged simply for plunder and becomes a regular industry. Not without reason the bristling battlements stand menacingly about the new fortified towns; in the moat at their foot yawns the grave of the gentile constitution, and already they rear their towers into civilization. Similarly in the interior. The wars of plunder increase the power of the supreme military leader and the subordinate commanders; the customary election of their successors from the same families is gradually transformed, especially after the introduction of father-right, into a right of hereditary succession, first tolerated, then claimed,

finally usurped; the foundation of the hereditary monarchy and the hereditary nobility is laid. Thus the organs of the gentile constitution gradually tear themselves loose from their roots in the people, in gens, phratry, tribe, and the whole gentile constitution changes into its opposite: from an organization of tribes for the free ordering of their own affairs it becomes an organization for the plundering and oppression of their neighbors; and correspondingly its organs change from instruments of the will of the people into independent organs for the domination and oppression of the people. That, however, would never have been possible if the greed for riches had not split the members of the gens into rich and poor, if “the property differences within one and the same gens had not transformed its unity of interest into antagonism between its members” (Marx), if the extension of slavery had not already begun to make working for a living seem fit only for slaves and more dishonorable than pillage.

We have now reached the threshold of civilization. Civilization opens with a new advance in the division of labor. At the lowest stage of barbarism men produced only directly for their own needs; any acts of exchange were isolated occurrences, the object of exchange merely some fortuitous surplus. In the middle stage of barbarism we already find among the pastoral peoples a possession in the form of cattle which, once the herd has attained a certain size, regularly produces a surplus over and above the tribe’s own requirements, leading to a division of labor between pastoral peoples and backward tribes without herds, and hence to the existence of two different levels of production side by side with one another and the conditions necessary for regular exchange. The upper stage of barbarism brings us the further division of labor between agriculture and handicrafts, hence the production of a continually increasing portion of the products of labor directly for exchange, so that exchange between individual producers assumes the importance of a vital social function. Civilization consolidates and intensifies all these existing divisions of labor, particularly by sharpening the opposition between town and country (the town may economically dominate the country, as in antiquity, or the country the town, as in the middle ages), and it adds a third division of labor, peculiar to itself and of decisive importance: it creates a class which no longer concerns itself with production, but only with the exchange of the products—the merchants. Hitherto whenever classes had begun to form, it had always

been exclusively in the field of production; the persons engaged in production were separated into those who directed and those who executed, or else into large-scale and small-scale producers. Now for the first time a class appears which, without in any way participating in production, captures the direction of production as a whole and economically subjugates the producers; which makes itself into an indispensable middleman between any two producers and exploits them both. Under the pretext that they save the producers the trouble and risk of exchange, extend the sale of their products to distant markets and are therefore the most useful class of the population, a class of parasites comes into being, “genuine social ichneumons,” who, as a reward for their actually very insignificant services, skim all the cream off production at home and abroad, rapidly amass enormous wealth and correspondingly social influence, and for that reason receive under civilization ever higher honors and ever greater control of production, until at last they also bring forth a product of their own – the periodical trade crises.

At our stage of development, however, the young merchants had not even begun to dream of the great destiny awaiting them. But they were growing and making themselves indispensable, which was quite sufficient. And with the formation of the merchant class came also the development of metallic money, the minted coin, a new instrument for the domination of the non-producer over the producer and his production. The commodity of commodities had been discovered, that which holds all other commodities hidden in itself, the magic power which can change at will into everything desirable and desired. The man who had it ruled the world of production—and who had more of it than anybody else? The merchant. The worship of money was safe in his hands. He took good care to make it clear that, in face of money, all commodities, and hence all producers of commodities, must prostrate themselves in adoration in the dust. He proved practically that all other forms of wealth fade into mere semblance beside this incarnation of wealth as such. Never again has the power of money shown itself in such primitive brutality and violence as during these days of its youth. After commodities had begun to sell for money, loans and advances in money came also, and with them interest and usury. No legislation of later times so utterly and ruthlessly delivers over the debtor to the usurious creditor as the legislation of ancient Athens and ancient Rome—and in both

cities it arose spontaneously, as customary law, without any compulsion other than the economic.

Alongside wealth in commodities and slaves, alongside wealth in money, there now appeared wealth in land also. The individuals' rights of possession in the pieces of land originally allotted to them by gens or tribe had now become so established that the land was their hereditary property. Recently they had striven above all to secure their freedom against the rights of the gentile community over these lands, since these rights had become for them a fetter. They got rid of the fetter – but soon afterwards of their new landed property also. Full, free ownership of the land meant not only power, uncurtailed and unlimited, to possess the land; it meant also the power to alienate it. As long as the land belonged to the gens, no such power could exist. But when the new landed proprietor shook off once and for all the fetters laid upon him by the prior right of gens and tribe, he also cut the ties which had hitherto inseparably attached him to the land. Money, invented at the same time as private property in land, showed him what that meant. Land could now become a commodity; it could be sold and pledged. Scarcely had private property in land been introduced than the mortgage was already invented (see Athens). As hetaerism and prostitution dog the heels of monogamy, so from now onwards mortgage dogs the heels of private land ownership. You asked for full, free alienable ownership of the land and now you have got it – “tu l’as voulu, Georges Dandin.” It’s your fault, Georges Dandin, from Molière’s play.

With trade expansion, money and usury, private property in land and mortgages, the concentration and centralization of wealth in the hands of a small class rapidly advanced, accompanied by an increasing impoverishment of the masses and an increasing mass of impoverishment. The new aristocracy of wealth, in so far as it had not been identical from the outset with the old hereditary aristocracy, pushed it permanently into the background (in Athens, in Rome, among the Germans). And simultaneous with this division of the citizens into classes according to wealth there was an enormous increase, particularly in Greece, in the number of slaves, whose forced labor was the foundation on which the superstructure of the entire society was reared.

Let us now see what had become of the gentile constitution in this social upheaval. Confronted by the new forces in whose growth it had had no share, the gentile constitution was helpless. The necessary condition for its

existence was that the members of a gens or at least of a tribe were settled together in the same territory and were its sole inhabitants. That had long ceased to be the case. Every territory now had a heterogeneous population belonging to the most varied gentes and tribes; everywhere slaves, protected persons and aliens lived side by side with citizens. The settled conditions of life which had only been achieved towards the end of the middle stage of barbarism were broken up by the repeated shifting and changing of residence under the pressure of trade, alteration of occupation and changes in the ownership of the land. The members of the gentile bodies could no longer meet to look after their common concerns; only unimportant matters, like the religious festivals, were still perfunctorily attended to. In addition to the needs and interests with which the gentile bodies were intended and fitted to deal, the upheaval in productive relations and the resulting change in the social structure had given rise to new needs and interests, which were not only alien to the old gentile order, but ran directly counter to it at every point. The interests of the groups of handicraftsmen which had arisen with the division of labor, the special needs of the town as opposed to the country, called for new organs. But each of these groups was composed of people of the most diverse gentes, phratries, and tribes, and even included aliens. Such organs had therefore to be formed outside the gentile constitution, alongside of it, and hence in opposition to it. And this conflict of interests was at work within every gentile body, appearing in its most extreme form in the association of rich and poor, usurers and debtors, in the same gens and the same tribe. Further, there was the new mass of population outside the gentile bodies, which, as in Rome, was able to become a power in the land and at the same time was too numerous to be gradually absorbed into the kinship groups and tribes. In relation to this mass, the gentile bodies stood opposed as closed, privileged corporations; the primitive natural democracy had changed into a malign aristocracy. Lastly, the gentile constitution had grown out of a society which knew no internal contradictions, and it was only adapted to such a society. It possessed no means of coercion except public opinion. But here was a society which by all its economic conditions of life had been forced to split itself into freemen and slaves, into the exploiting rich and the exploited poor; a society which not only could never again reconcile these contradictions, but was compelled always to intensify them. Such a society could only exist either in the continuous open fight of these classes against

one another, or else under the rule of a third power, which, apparently standing above the warring classes, suppressed their open conflict and allowed the class struggle to be fought out at most in the economic field, in so-called legal form. The gentile constitution was finished. It had been shattered by the division of labor and its result, the cleavage of society into classes. It was replaced by the state.

The three main forms in which the state arises on the ruins of the gentile constitution have been examined in detail above. Athens provides the purest, classic form; here the state springs directly and mainly out of the class oppositions which develop within gentile society itself. In Rome, gentile society becomes a closed aristocracy in the midst of the numerous plebs who stand outside it, and have duties but no rights; the victory of plebs breaks up the old constitution based on kinship, and erects on its ruins the state, into which both the gentile aristocracy and the plebs are soon completely absorbed. Lastly, in the case of the German conquerors of the Roman Empire, the state springs directly out of the conquest of large foreign territories, which the gentile constitution provides no means of governing. But because this conquest involves neither a serious struggle with the original population nor a more advanced division of labor; because conquerors and conquered are almost on the same level of economic development, and the economic basis of society remains therefore as before—for these reasons the gentile constitution is able to survive for many centuries in the altered, territorial form of the mark constitution and even for a time to rejuvenate itself in a feebler shape in the later noble and patrician families, and indeed in peasant families, as in Ditmarschen.

The state is therefore by no means a power imposed on society from without; just as little is it “the reality of the moral idea,” “the image and the reality of reason,” as Hegel maintains. Rather, it is a product of society at a particular stage of development; it is the admission that this society has involved itself in insoluble self-contradiction and is cleft into irreconcilable antagonisms which it is powerless to exorcise. But in order that these antagonisms, classes with conflicting economic interests, shall not consume themselves and society in fruitless struggle, a power, apparently standing above society, has become necessary to moderate the conflict and keep it within the bounds of “order”; and this power, arisen out of society, but placing itself above it and increasingly alienating itself from it, is the state.

In contrast to the old gentile organization, the state is distinguished firstly by the grouping of its members on a territorial basis. The old gentile bodies, formed and held together by ties of blood, had, as we have seen, become inadequate largely because they presupposed that the gentile members were bound to one particular locality, whereas this had long ago ceased to be the case. The territory was still there, but the people had become mobile. The territorial division was therefore taken as the starting point and the system introduced by which citizens exercised their public rights and duties where they took up residence, without regard to gens or tribe. This organization of the citizens of the state according to domicile is common to all states. To us, therefore, this organization seems natural; but, as we have seen, hard and protracted struggles were necessary before it was able in Athens and Rome to displace the old organization founded on kinship.

The second distinguishing characteristic is the institution of a public force which is no longer immediately identical with the people's own organization of themselves as an armed power. This special public force is needed because a self-acting armed organization of the people has become impossible since their cleavage into classes. The slaves also belong to the population: as against the 365,000 slaves, the 90,000 Athenian citizens constitute only a privileged class. The people's army of the Athenian democracy confronted the slaves as an aristocratic public force, and kept them in check; but to keep the citizens in check as well, a police-force was needed, as described above. This public force exists in every state; it consists not merely of armed men, but also of material appendages, prisons and coercive institutions of all kinds, of which gentile society knew nothing. It may be very insignificant, practically negligible, in societies with still undeveloped class antagonisms and living in remote areas, as at times and in places in the United States of America. But it becomes stronger in proportion as the class antagonisms within the state become sharper and as adjoining states grow larger and more populous. It is enough to look at Europe today, where class struggle and rivalry in conquest have brought the public power to a pitch that it threatens to devour the whole of society and even the state itself.

In order to maintain this public power, contributions from the state citizens are necessary – taxes. These were completely unknown to gentile society. We know more than enough about them today. With advancing

civilization, even taxes are not sufficient; the state draws drafts on the future, contracts loans, state debts. Our old Europe can tell a tale about these, too.

In possession of the public power and the right of taxation, the officials now present themselves as organs of society standing above society. The free, willing respect accorded to the organs of the gentile constitution is not enough for them, even if they could have it. Representatives of a power which estranges them from society, they have to be given prestige by means of special decrees, which invest them with a peculiar sanctity and inviolability. The lowest police officer of the civilized state has more “authority” than all the organs of gentile society put together; but the mightiest prince and the greatest statesman or general of civilization might envy the humblest of the gentile chiefs the unforced and unquestioned respect accorded to him. For the one stands in the midst of society; the other is forced to pose as something outside and above it.

As the state arose from the need to keep class antagonisms in check, but also arose in the thick of the fight between the classes, it is normally the state of the most powerful, economically ruling class, which by its means becomes also the politically ruling class, and so acquires new means of holding down and exploiting the oppressed class. The ancient state was, above all, the state of the slave-owners for holding down the slaves, just as the feudal state was the organ of the nobility for holding down the peasant serfs and bondsmen, and the modern representative state is the instrument for exploiting wage-labor by capital. Exceptional periods, however, occur when the warring classes are so nearly equal in forces that the state power, as apparent mediator, acquires for the moment a certain independence in relation to both. This applies to the absolute monarchy of the seventeenth and eighteenth centuries, which balances the nobility and the bourgeoisie against one another; and to the Bonapartism of the First and particularly of the Second French Empire, which played off the proletariat against the bourgeoisie and the bourgeoisie against the proletariat. The latest achievement in this line, in which ruler and ruled look equally comic, is the new German Empire of the Bismarckian nation; here the capitalists and the workers are balanced against one another and both of them fleeced for the benefit of the decayed Prussian cabbage Junkers.

Further, in most historical states the rights conceded to citizens are graded on a property basis, whereby it is directly admitted that the state is

an organization for the protection of the possessing class against the non-possessing class. This is already the case in the Athenian and Roman property classes. Similarly in the medieval feudal state, in which the extent of political power was determined by the extent of landownership. Similarly, also, in the electoral qualifications in modern parliamentary states. This political recognition of property differences is, however, by no means essential. On the contrary, it marks a low stage in the development of the state. The highest form of the state, the democratic republic, which in our modern social conditions becomes more and more an unavoidable necessity and is the form of state in which alone the last decisive battle between proletariat and bourgeoisie can be fought out – the democratic republic no longer officially recognizes differences of property. Wealth here employs its power indirectly, but all the more surely. It does this in two ways: by plain corruption of officials, of which America is the classic example, and by an alliance between the government and the stock exchange, which is effected all the more easily the higher the state debt mounts and the more the joint-stock companies concentrate in their hands not only transport but also production itself, and themselves have their own center in the stock exchange. In addition to America, the latest French republic illustrates this strikingly, and honest little Switzerland has also given a creditable performance in this field. But that a democratic republic is not essential to this brotherly bond between government and stock exchange is proved not only by England, but also by the new German Empire, where it is difficult to say who scored most by the introduction of universal suffrage, Bismarck or the Bleichroder bank. And lastly the possessing class rules directly by means of universal suffrage. As long as the oppressed class – in our case, therefore, the proletariat – is not yet ripe for its self-liberation, so long will it, in its majority, recognize the existing order of society as the only possible one and remain politically the tail of the capitalist class, its extreme left wing. But in the measure in which it matures towards its self-emancipation, in the same measure it constitutes itself as its own party and votes for its own representatives, not those of the capitalists. Universal suffrage is thus the gauge of the maturity of the working class. It cannot and never will be anything more in the modern state; but that is enough. On the day when the thermometer of universal suffrage shows boiling-point among the workers, they as well as the capitalists will know where they stand.

The state, therefore, has not existed from all eternity. There have been societies which have managed without it, which had no notion of the state or state power. At a definite stage of economic development, which necessarily involved the cleavage of society into classes, the state became a necessity because of this cleavage. We are now rapidly approaching a stage in the development of production at which the existence of these classes has not only ceased to be a necessity, but becomes a positive hindrance to production. They will fall as inevitably as they once arose. The state inevitably falls with them. The society which organizes production anew on the basis of free and equal association of the producers will put the whole state machinery where it will then belong—into the museum of antiquities, next to the spinning wheel and the bronze ax.

Civilization is, therefore, according to the above analysis, the stage of development in society at which the division of labor, the exchange between individuals arising from it, and the commodity production which combines them both, come to their full growth and revolutionizes the whole of previous society.

At all earlier stages of society production was essentially collective, just as consumption proceeded by direct distribution of the products within larger or smaller communistic communities. This collective production was very limited; but inherent in it was the producers' control over their process of production and their product. They knew what became of their product: they consumed it; it did not leave their hands. And so long as production remains on this basis, it cannot grow above the heads of the producers nor raise up incorporeal alien powers against them, as in civilization is always and inevitably the case.

But the division of labor slowly insinuates itself into this process of production. It undermines the collectivity of production and appropriation, elevates appropriation by individuals into the general rule, and thus creates exchange between individuals – how it does so, we have examined above. Gradually commodity production becomes the dominating form.

With commodity production, production no longer for use by the producers but for exchange, the products necessarily change hands. In exchanging his product, the producer surrenders it; he no longer knows what becomes of it. When money, and with money the merchant, steps in as intermediary between the producers, the process of exchange becomes still

more complicated, the final fate of the products still more uncertain. The merchants are numerous, and none of them knows what the other is doing. The commodities already pass not only from hand to hand; they also pass from market to market; the producers have lost control over the total production within their own spheres, and the merchants have not gained it. Products and production become subjects of chance.

But chance is only the one pole of a relation whose other pole is named “necessity.” In the world of nature, where chance also seems to rule, we have long since demonstrated in each separate field the inner necessity and law asserting itself in this chance. But what is true of the natural world is true also of society. The more a social activity, a series of social processes, becomes too powerful for men’s conscious control and grows above their heads, and the more it appears a matter of pure chance, then all the more surely within this chance the laws peculiar to it and inherent in it assert themselves as if by natural necessity. Such laws also govern the chances of commodity production and exchange. To the individuals producing or exchanging, they appear as alien, at first often unrecognized, powers, whose nature must first be laboriously investigated and established. These economic laws of commodity production are modified with the various stages of this form of production; but in general the whole period of civilization is dominated by them. And still to this day the product rules the producer; still to this day the total production of society is regulated, not by a jointly devised plan, but by blind laws, which manifest themselves with elemental violence, in the final instance in the storms of the periodical trade crises.

We saw above how at a fairly early stage in the development of production, human labor-power obtains the capacity of producing a considerably greater product than is required for the maintenance of the producers, and how this stage of development was in the main the same as that in which division of labor and exchange between individuals arise. It was not long then before the great “truth” was discovered that man also can be a commodity; that human energy can be exchanged and put to use by making a man into a slave. Hardly had men begun to exchange than already they themselves were being exchanged. The active became the passive, whether the men liked it or not.

With slavery, which attained its fullest development under civilization, came the first great cleavage of society into an exploiting and an exploited

class. This cleavage persisted during the whole civilized period. Slavery is the first form of exploitation, the form peculiar to the ancient world; it is succeeded by serfdom in the middle ages, and wage-labor in the more recent period. These are the three great forms of servitude, characteristic of the three great epochs of civilization; open, and in recent times disguised, slavery always accompanies them.

The stage of commodity production with which civilization begins is distinguished economically by the introduction of (1) metal money, and with it money capital, interest and usury; (2) merchants, as the class of intermediaries between the producers; (3) private ownership of land, and the mortgage system; (4) slave labor as the dominant form of production. The form of family corresponding to civilization and coming to definite supremacy with it is monogamy, the domination of the man over the woman, and the single family as the economic unit of society. The central link in civilized society is the state, which in all typical periods is without exception the state of the ruling class, and in all cases continues to be essentially a machine for holding down the oppressed, exploited class. Also characteristic of civilization is the establishment of a permanent opposition between town and country as basis of the whole social division of labor; and, further, the introduction of wills, whereby the owner of property is still able to dispose over it even when he is dead. This institution, which is a direct affront to the old gentile constitution, was unknown in Athens until the time of Solon; in Rome it was introduced early, though we do not know the date; among the Germans it was the clerics who introduced it, in order that there might be nothing to stop the pious German from leaving his legacy to the Church.

With this as its basic constitution, civilization achieved things of which gentile society was not even remotely capable. But it achieved them by setting in motion the lowest instincts and passions in man and developing them at the expense of all his other abilities. From its first day to this, sheer greed was the driving spirit of civilization; wealth and again wealth and once more wealth, wealth, not of society, but of the single scurvy individual—here was its one and final aim. If at the same time the progressive development of science and a repeated flowering of supreme art dropped into its lap, it was only because without them modern wealth could not have completely realized its achievements.

Since civilization is founded on the exploitation of one class by another class, its whole development proceeds in a constant contradiction. Every step forward in production is at the same time a step backwards in the position of the oppressed class, that is, of the great majority. Whatever benefits some necessarily injures the others; every fresh emancipation of one class is necessarily a new oppression for another class. The most striking proof of this is provided by the introduction of machinery, the effects of which are now known to the whole world. And if among the barbarians, as we saw, the distinction between rights and duties could hardly be drawn, civilization makes the difference and antagonism between them clear even to the dumbest intelligence by giving one class practically all the rights and the other class practically all the duties.

But that should not be: what is good for the ruling class must also be good for the whole of society, with which the ruling-class identifies itself. Therefore the more civilization advances, the more it is compelled to cover the evils it necessarily creates with the cloak of love and charity, to palliate them or to deny them—in short, to introduce a conventional hypocrisy which was unknown to earlier forms of society and even to the first stages of civilization, and which culminates in the pronouncement: the exploitation of the oppressed class is carried on by the exploiting class simply and solely in the interests of the exploited class itself; and if the exploited class cannot see it and even grows rebellious, that is the basest ingratitude to its benefactors, the exploiters.

And now, in conclusion, Morgan's judgment of civilization:

Since the advent of civilization, the outgrowth of property has been so immense, its forms so diversified, its uses so expanding and its management so intelligent in the interests of its owners, that it has become, on the part of the people, an unmanageable power. The human mind stands bewildered in the presence of its own creation. The time will come, nevertheless, when human intelligence will rise to the mastery over property, and define the relations of the state to the property it protects, as well as the obligations and the limits of the rights of its owners. The interests of society are paramount to individual interests, and the two must be brought into just and harmonious relations. A mere property career is not the final destiny of mankind, if progress is to be the law of the future as it has been of the past. The time which has passed away since civilization began is but a fragment of the past duration of man's existence; and but a fragment of the ages yet

to come. The dissolution of society bids fair to become the termination of a career of which property is the end and aim; because such a career contains the elements of self-destruction. Democracy in government, brotherhood in society, equality in rights and privileges, and universal education, foreshadow the next higher plane of society to which experience, intelligence and knowledge are steadily tending. It will be a revival, in a higher form, of the liberty, equality and fraternity of the ancient gentes.

Appendix. A Recently Discovered Case of Group Marriage

1892

From Die Neue Zeit

Vol. XI, No. I, pp. 373-75

Since it has recently become fashionable among certain rationalistic ethnographers to deny the existence of group marriage, the following report is of interest; I translate it from the *Russkiye Vyedomosti*, Moscow, October 14, 1892 (Old Style). Not only group marriage, i.e., the right of mutual sexual intercourse between a number of men and a number of women, is expressly affirmed to be in full force, but a form of group marriage which closely follows the punaluan marriage of the Hawaiians, the most developed and classic phase of group marriage. While the typical punaluan family consists of a number of brothers (own and collateral), who are married to a number of own and collateral sisters, we here find on the island of Sakhalin that a man is married to all the wives of his brothers and to all the sisters of his wife, which means, seen from the woman's side, that his wife may freely practice sexual intercourse with the brothers of her husband and the husbands of her sisters. It therefore differs from the typical form of punaluan marriage only in the fact that the brothers of the husband and the husbands of the sisters are not necessarily the same persons.

It should further be observed that this report again confirms what I said in *The Origin of the Family*, 4th edition, pp. 28-29: that group marriage does not look at all like what our brother-obsessed philistine imagines; that the partners in group marriage do not lead in public the same kind of lascivious life as he practices in secret, but that this form of marriage, at least in the instances still known to occur today, differs in practice from a loose pairing marriage or from polygamy only in the fact that custom permits sexual intercourse in a number of cases where otherwise it would be severely punished. That the actual exercise of these rights is gradually dying out only proves that this form of marriage is itself destined to die out, which is further confirmed by its infrequency.

The whole description, moreover, is interesting because it again demonstrates the similarity, even the identity in their main characteristics, of the social institutions of primitive peoples at approximately the same stage of development. Most of what the report states about these Mongoloids on the island of Sakhalin also holds for the Dravidian tribes of India, the South Sea Islanders at the time of their discovery, and the American Indians. The report runs:

“At the session of October 10 (Old Style; October 22, New Style) of the Anthropological Section of the Society of the Friends of Natural Science, N. A. Yanchuk read an interesting communication from Mr. Sternberg on the Gilyaks, a little-studied tribe on the island of Sakhalin, who are at the cultural level of savagery. The Gilyaks are acquainted neither with agriculture nor with pottery; they procure their food chiefly by hunting and fishing; they warm water in wooden vessels by throwing in heated stones, etc. Of particular interest are their institutions relating to the family and to the gens. The Gilyak addresses as father, not only his own natural father, but also all the brothers of his father; all the wives of these brothers, as well as all the sisters of his mother, he addresses as his mothers; the children of all these ‘fathers’ and ‘mothers’ he addresses as his brothers and sisters. This system of address also exists, as is well known, among the Iroquois and other Indian tribes of North America, as also among some tribes of India. But whereas in these cases it has long since ceased to correspond to the actual conditions, among the Gilyaks it serves to designate a state still valid today. To this day every Gilyak has the rights of a husband in regard to the wives of his brothers and to the sisters of his wife; at any rate, the exercise of these rights is not regarded as impermissible. These survivals of group marriage on the basis of the gens are reminiscent of the well-known punaluan marriage, which still existed in the Sandwich Islands in the first half of this century. Family and gens relations of this type form the basis of the whole gentile order and social constitution of the Gilyaks.

“The gens of a Gilyak consists of all-nearer and more remote, real and nominal-brothers of his father, of their fathers and mothers of the children of his brothers, and of his own children.

One can readily understand that a gens so constituted may comprise an enormous number of people. Life within the gens proceeds according to the following principles. Marriage within the gens is unconditionally prohibited. When a Gilyak dies, his wife passes by decision of the gens to

one of his brothers, own or nominal. The gens provides for the maintenance of all of its members who are unable to work. 'We have no poor,' said a Gilyak to the writer. 'Whoever is in need, is fed by the khal .' The members of the gens are further united by common sacrificial ceremonies and festivals, a common burial place, etc.

"The gens guarantees the life and security of its members against attacks by non-gentiles; the means of repression used is blood-revenge, though under Russian rule the practice has very much declined. Women are completely excepted from gentile blood-revenge. In some very rare cases the gens adopts members of other gentes. It is a general rule that the property of a deceased member may not pass out of the gens; in this respect the famous provision of the Twelve Tables holds literally among the Gilyaks: *si suos heredes non habet, gentiles familiam habento* — if he has no heirs of his own, the members of the gens shall inherit. No important event takes place in the life of a Gilyak without participation by the gens. Not very long ago, about one or two generations, the oldest gentile member was the head of the community, the starosta of the gens; today the functions of the chief elder of the gens are restricted almost solely to presiding over religious ceremonies. The gentes are often dispersed among widely distant places, but even when separated the members of a gens still remember one another and continue to give one another hospitality, and to provide mutual assistance and protection, etc. Except under the most extreme necessity, the Gilyak never leaves the fellow-members of his gens or the graves of his gens. Gentile society has impressed a very definite stamp on the whole mental life of the Gilyaks, on their character, their customs and institutions. The habit of common discussion and decision on all matters, the necessity of continually taking an active part in all questions affecting the members of the gens, the solidarity of blood-revenge, the fact of being compelled and accustomed to live together with ten or more like himself in great tents (*yurtas*), and to be, in short, always with other people—all this has given the Gilyak a sociable and open character. The Gilyak is extraordinarily hospitable; he loves to entertain guests and to come himself as a guest. This admirable habit of hospitality is especially prominent in times of distress. In a bad year, when a Gilyak has nothing for himself or for his dogs to eat, he does not stretch out his hand for alms, but confidently seeks hospitality, and is fed, often for a considerable time.

“Among the Gilyaks of Sakhalin crimes from motives of personal gain practically never occur. The Gilyak keeps his valuables in a storehouse, which is never locked. He has such a keen sense of shame that if he is convicted of a disgraceful act, he immediately goes into the forest and hangs himself. Murder is very rare, and is hardly ever committed except in anger, never from intentions of gain. In his dealings with other people, the Gilyak shows himself honest, reliable, and conscientious.

“Despite their long subjection to the Manchurians, now become Chinese, and despite the corrupting influence of the settlement of the Amur district, the Gilyaks still preserve in their moral character many of the virtues of a primitive tribe. But the fate awaiting their social order cannot be averted. One or two more generations, and the Gilyaks on the mainland will have been completely Russianized, and together with the benefits of culture they will also acquire its defects. The Gilyaks on the island of Sakhalin, being more or less remote from the centers of Russian settlement, have some prospect of preserving their way of life unspoiled rather longer. But among them, too, the influence of their Russian neighbors is beginning to make itself felt. The Gilyaks come into the villages to trade, they go to Nikolaievsk to look for work; and every Gilyak who returns from such work to his home brings with him the same atmosphere which the Russian worker takes back from the town into his village. And at the same time, working in the town, with its chances and changes of fortune, destroys more and more that primitive equality which is such a prominent feature of the artlessly simple economic life of these peoples.

“Mr. Sternberg’s article, which also contains information about their religious views and customs and their legal institutions, will appear unabridged in the *Etnograficheskoye Obozrenie* (Ethnographical Review).

CAPITAL

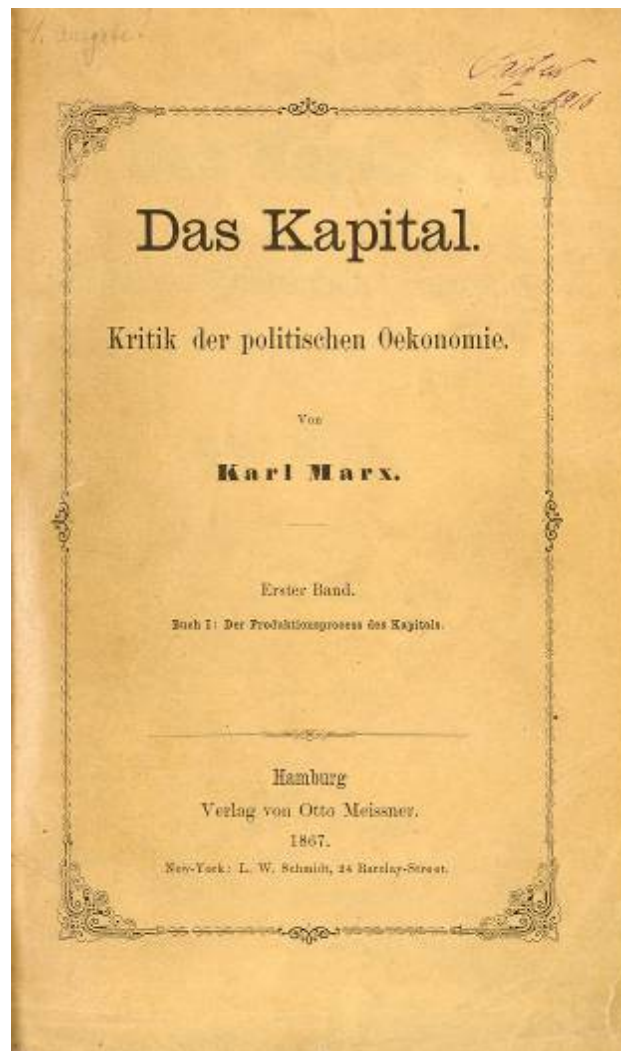

Translated by Ernest Untermann

During the time that he lived at 38 Rue Vanneau in Paris (October 1843 to January 1845), Marx engaged in an intensive study of “political economy” (chiefly the works of Adam Smith and David Ricardo), the French socialists (Claude Henri St. Simon and Charles Fourier) and the history of France.” This study of political economy Marx would pursue for the rest of his life, resulting in his major economic work — the three-volume series titled *Capital*. Marxism is based in large part on three influences: Hegel’s dialectics, French utopian socialism and English economics. Together with his earlier study of Hegel’s dialectics, the work that Marx produced during this time in Paris meant that all major components of “Marxism” were in place by the autumn of 1844. Although he was constantly being distracted from his study of political economy by the usual daily demands on his time, and the additional special demands of editing a radical newspaper, Marx was always drawn back to his economic studies.

The first volume of *Capital*, given the subtitle *The Process of Production of Capital*, was published in 1867. It was the only volume of *Capital* to be published during his lifetime. The text critiques capitalism primarily from the standpoint of its production processes. After Marx’s death, Friedrich Engels compiled and expanded his friend’s notes into volumes II (1885) and III (1894). Since its publication, *Capital* has come to be considered as a major work of modern economic thought and remains the central text of the field of Marxian economics.

Part One concerns Commodities and Money, with the first three chapters introducing a theoretical discussion of the commodity, value, exchange and genesis of money. As Marx writes, “Beginnings are always difficult in all sciences ... the section that contains the analysis of commodities, will therefore present the greatest difficulty.” A “commodity” according to Marx is a use-value and also an exchange-value. Marx explains that, as a use-value, the commodity is something that meets a human want or need of any kind; it is a useful thing. The use-value of the commodity is determined by

how useful the commodity is. The actual use-value, however, is immeasurable. He explains that use-value can only be determined “in use or consumption”. After determining the commodity as being a use-value, he explains that a commodity is also an “exchange-value”. He explains this as the quantity of other commodities that it will exchange for. Marx gives the example of corn and iron. No matter their relationship, there will always be an equation where a certain amount of corn will exchange for a certain amount of iron. He sets up this example to say that all commodities are in essence parallel in that they can always be exchanged for certain quantities of other commodities. He also explains that one cannot determine the exchange-value of the commodity simply by looking at it or examining its natural qualities. The exchange-value is not material but a measure made by humans. In order to determine the exchange-value, one must see the commodity being exchanged with other commodities. Marx explains that these two aspects of commodities are at the same time separate but also connected in that one cannot be discussed without the other. Marx explains that while the use-value of something can only change in quality, the exchange-value can only change in quantity.

The first edition

CONTENTS

VOLUME I. THE PROCESS OF CAPITALIST PRODUCTION.

Book I. Capitalist Production.

PART I. COMMODITIES AND MONEY.

PART II. THE TRANSFORMATION OF MONEY INTO CAPITAL.

PART III. THE PRODUCTION OF ABSOLUTE SURPLUS-VALUE.

PART IV. PRODUCTION OF RELATIVE SURPLUS-VALUE.

PART V. THE PRODUCTION OF ABSOLUTE AND OF RELATIVE SURPLUS-VALUE.

PART VI. WAGES.

PART VII. THE ACCUMULATION OF CAPITAL.

PART VIII. THE SO-CALLED PRIMITIVE ACCUMULATION.

VOLUME II. THE PROCESS OF CIRCULATION OF CAPITAL.

Book II. The Circulation of Capital.

PART I The Metamorphoses of Capital and Their Cycles.

PART II The Turn-Over of Capital.

PART III. The Reproduction and Circulation of the Aggregate Social Capital.

VOLUME III. THE PROCESS OF CAPITALIST PRODUCTION AS A WHOLE.

PART I. THE CONVERSION OF SURPLUS-VALUE INTO PROFIT AND OF THE RATE OF SURPLUS-VALUE INTO THE RATE OF PROFIT.

PART II. CONVERSION OF PROFIT INTO AVERAGE PROFIT.

PART III. THE LAW OF THE FALLING TENDENCY OF THE RATE OF PROFIT.

PART IV. TRANSFORMATION OF COMMODITY-CAPITAL AND MONEY-CAPITAL INTO COMMERCIAL CAPITAL AND FINANCIAL CAPITAL (MERCHANT'S CAPITAL).

PART V. DIVISION OF PROFIT INTO INTEREST AND PROFITS OF ENTERPRISE. THE INTEREST-BEARING CAPITAL.

PART VI. TRANSFORMATION OF SURPLUS PROFIT INTO GROUND-RENT.

PART VII. THE REVENUES AND THEIR SOURCES.

Detailed table of contents

Friedrich Engels in 1868

VOLUME I. THE PROCESS OF CAPITALIST PRODUCTION.

EDITOR'S NOTE TO THE FIRST AMERICAN EDITION by Ernest Untermann

The original plan of Marx, as outlined in his preface to the first German edition of *Capital*, in 1867, was to divide his work into three volumes. Volume I was to contain Book I, *The Process of Capitalist Production*. Volume II was scheduled to comprise both Book II, *The Process of Capitalist Circulation*, and Book III, *The Process of Capitalist Production as a Whole*. The work was to close with volume III, containing Book IV, *A History of Theories of Surplus-Value*.

When Marx proceeded to elaborate his work for publication, he had the essential portions of all three volumes, with a few exceptions, worked out in their main analyses and conclusions, but in a very loose and unfinished form. Owing to ill health, he completed only volume I. He died on March 14, 1883, just when a third German edition of this volume was being prepared for the printer.

Frederick Engels, the intimate friend and co-operator of Marx, stepped into the place of his dead comrade and proceeded to complete the work. In the course of the elaboration of volume II it was found that it would be wholly taken up with Book II, *The Process of Capitalist Circulation*. Its first German edition did not appear until May, 1885, almost 18 years after the first volume.

The publication of the third volume was delayed still longer. When the second German edition of volume II appeared, in July, 1893, Engels was still working on volume III. It was not until October, 1894, that the first German edition of volume III was published, in two separate parts, containing the subject matter of what had been originally planned as Book III of volume II, and treating of *The Capitalist Process of Production as a whole*.

The reasons for the delay in the publication of volumes II and III, and the difficulties encountered in solving the problem of elaborating the copious notes of Marx into a finished and connected presentation of his theories, have been fully explained by Engels in his various prefaces to these two volumes. His great modesty led him to belittle his own share in this fundamental work. As a matter of fact, a large portion of the contents of

Capital is as much a creation of Engels as though he had written it independently of Marx.

Engels intended to issue the contents of the manuscripts for Book IV, originally planned as volume III, in the form of a fourth volume of Capital. But on the 6th of August, 1895, less than one year after the publication of volume III, he followed his co-worker into the grave, still leaving this work incomplete.

However, some years previous to his demise, and in anticipation of such a eventuality, he had appointed Karl Kautsky, the editor of *Die Neue Zeit*, the scientific organ of the German Socialist Party, as his successor and familiarized him personally with the subject matter intended for volume IV of this work. The material proved to be so voluminous, that Kautsky, instead of making a fourth volume of Capital out of it, abandoned the original plan and issued his elaboration as a separate work in three volumes under the title *Theories of Surplus-value*.

The first English translation of the first volume of Capital was edited by Engels and published in 1886. Marx had in the meantime made some changes in the text of the second German edition and of the French translation, both of which appeared in 1873, and he had intended to superintend personally the edition of an English version. But the state of his health interfered with this plan. Engels utilised his notes and the text of the French edition of 1873 in the preparation of a third German edition, and this served as a basis for the first edition of the English translation.

Owing to the fact that the title page of this English translation (published by Swan Sonnenschein & Co.) did not distinctly specify that this was but volume I, it has often been mistaken for the complete work, in spite of the fact that the prefaces of Marx and Engels clearly pointed to the actual condition of the matter.

In 1890, four years after the publication of the first English edition, Engels edited the proofs for a fourth German edition of volume I and enlarged it still more after repeated comparison with the French edition and with manuscript notes of Marx. But the Swan Sonnenschein edition did not adopt this new version in its subsequent English issues.

This first American edition will be the first complete English edition of the entire Marxian theories of Capitalist Production. It will contain all three volumes of Capital in full. The present volume, I, deals with The Process of Capitalist Production in the strict meaning of the term "production."

Volume II will treat of The Process of Capitalist Circulation in the strict meaning of the term “circulation.” Volume III will contain the final analysis of The Process of Capitalist Production as a Whole, that is of Production and Circulation in their mutual interrelations.

The Theories of Surplus-Value, Kautsky’s elaboration of the posthumous notes of Marx and Engels, will in due time be published in an English translation as a separate work.

This first American edition of volume I is based on the revised fourth German edition. The text of the English version of the Swan Sonnenschein edition has been compared page for page with this improved German edition, and about ten pages of new text hitherto not rendered in English are thus presented to American readers. All the footnotes have likewise been revised and brought up to date.

For all further information concerning the technical particulars of this work I refer the reader to the prefaces of Marx and Engels.

ERNEST UNTERMANN.

Orlando, Fla.,

July 18, 1906.

AUTHOR'S PREFACES TO THE FIRST AND SECOND EDITIONS

I. — TO THE FIRST EDITION.

THE work, the first volume of which I now submit to the public, forms the continuation of my “Zur Kritik der Politischen Oekonomie” (A Contribution to the Critique of Political Economy) published in 1859. The long pause between the first part and the continuation is due to an illness of many years’ duration that again and again interrupted my work.

The substance of that earlier work is summarised in the first three chapters of this volume. This is done not merely for the sake of connection and completeness. The presentation of the subject-matter is improved. As far as circumstances in any way permit, many points only hinted at in the earlier book are here worked out more fully, whilst, conversely, points worked out fully there are only touched upon in this volume. The section on the history of the theories of value and of money are now, of course, left out altogether. The reader of the earlier work will find, however, in the notes to the first chapter additional sources of reference relative to the history of those theories.

Every beginning is difficult, holds in all sciences. To understand the first chapter, especially the section that contains the analysis of commodities, will, therefore, present the greatest difficulty. That which concerns more especially the analysis of the substance of value and the magnitude of value, I have, much as it was possible, popularised. The value-form, whose fully developed shape is the money-form, is very elementary and simple. Nevertheless, the human mind has for more than 2000 years sought in vain to get to the bottom of it, whilst on the other hand, to the successful analysis of much more composite and complex forms, there has been at least an approximation. Why? Because the body, as an organic whole, is more easy of study than are the cells of that body. In the analysis of economic forms, moreover, neither microscopes nor chemical reagents are of use. The force of abstraction must replace both. But in bourgeois society the commodity-form of the product of labor — or the value-form of the commodity — is the economic cell-form. To the superficial observer, the analysis of these

forms seems to turn upon minutiae. It does in fact deal with minutiae, but they are of the same order as those dealt with in microscopic anatomy.

With the exception of the section on value-form, therefore, this volume cannot stand accused on the score of difficulty. I pre-suppose, of course, a reader who is willing to learn something new and therefore to think for himself.

The physicist either observes physical phenomena where they occur in their most typical form and most free from disturbing influence, or, wherever possible, he makes experiments under conditions that assure the occurrence of the phenomenon in its normality. In this work I have to examine the capitalist mode of production, and the conditions of production and exchange corresponding to that mode. Up to the present time, their classic ground is England. That is the reason why England is used as the chief illustration in the development of my theoretical ideas. If, however, the German reader shrugs his shoulders at the condition of the English industrial and agricultural laborers, or in optimistic fashion comforts himself with the thought that in Germany things are not nearly so bad, I must plainly tell him, "De te fabula narratur!"

Intrinsically, it is not a question of the higher or lower degree of development of the social antagonisms that result from the natural laws of capitalist production. It is a question of these laws themselves, of these tendencies working with iron necessity towards inevitable results. The country that is more developed industrially only shows, to the less developed, the image of its own future.

But apart from this. Where capitalist production is fully naturalised among the Germans (for instance, in the factories proper) the condition of things is much worse than in England, because the counterpoise of the Factory Acts is wanting. In all other spheres, we, like all the rest of Continental Western Europe, suffer not only from the development of capitalist production, but also from the incompleteness of that development. Alongside of modern evils, a whole series of inherited evils oppress us, arising from the passive survival of antiquated modes of production, with their inevitable train of social and political anachronisms. We suffer not only from the living, but from the dead. *Le mort saisit le vif!*

The social statistics of Germany and the rest of Continental Western Europe are, in comparison with those of England, wretchedly compiled. But they raise the veil just enough to let us catch a glimpse of the Medusa head

behind it. We should be appalled at the state of things at home, if, as in England, our governments and parliaments appointed periodically commissions of enquiry into economic conditions; if these commissions were armed with the same plenary powers to get at the truth; if it was possible to find for this purpose men as competent, as free from partisanship and respect of persons as are the English factory-inspectors, her medical reporters on public health, her commissioners of enquiry into the exploitation of women and children, into housing and food. Perseus wore a magic cap that the monsters he hunted down might not see him. We draw the magic cap down over eyes and ears as a make-believe that there are no monsters. Let us not deceive ourselves on this. As in the 18th century, the American war of independence sounded the tocsin for the European middle-class, so in the 19th century, the American civil war sounded it for the European working-class. In England the progress of social disintegration is palpable. When it has reached a certain point, it must re-act on the continent. There it will take a form more brutal or more humane, according to the degree of development of the working-class itself. Apart from higher motives, therefore, their own most important interests dictate to the classes that are for the nonce the ruling ones, the removal of all legally removable hindrances to the free development of the working-class. For this reason, as well as others, I have given so large a space in this volume to the history, the details, and the results of English factory legislation. One nation can and should learn from others. And even when a society has got upon the right track for the discovery of the natural laws of its movement — and it is the ultimate aim of this work, to lay bare the economic law of motion of modern society — it can neither clear by bold leaps; nor remove by legal enactments, the obstacles offered by the successive phases of its normal development. But it can shorten and lessen the birth-pangs.

To prevent possible misunderstanding, a word. I paint the capitalist and the landlord in no sense *couleur de rose*. But here individuals are dealt with only in so far as they are the personifications of economic categories, embodiments of particular class-relations and class-interests. My standpoint, from which the evolution of the economic formation of society is viewed as a process of natural history, can less than any other make the individual responsible for relations whose creature he socially remains, however much he may subjectively raise himself above them.

In the domain of Political Economy, free scientific enquiry meets not merely the same enemies as in all other domains. The peculiar nature of the material it deals with, summons as foes into the field of battle the most violent, mean and malignant passions of the human breast, the Furies of private interest. The English Established Church, e.g., will more readily pardon an attack on 38 of its 39 articles than on 1/39 of its income. Now-a-days atheism itself is *culpa levis*, as compared with criticism of existing property relations. Nevertheless, there is an unmistakable advance. I refer, e.g., to the bluebook published within the last few weeks: "Correspondence with Her Majesty's Missions Abroad, regarding Industrial Questions and Trades' Unions." The representatives of the English Crown in foreign countries there declare in so many words that in Germany, in France, to be brief, in all the civilised states of the European continent, a radical change in the existing relations between capital and labor is as evident and inevitable as in England. At the same time, on the other side of the Atlantic Ocean, Mr. Wade, vice-president of the United States, declared in public meetings that, after the abolition of slavery, a radical change of the relations of capital and of property in land is next upon the order of the day. These are signs of the times, not to be hidden by purple mantles or black cassocks. They do not signify that to-morrow a miracle will happen. They show that, within the ruling-classes themselves, a foreboding is dawning, that the present society is no solid crystal, but an organism capable of change, and is constantly changing.

The second volume of this work will treat of the process of the circulation of capital (Book II.), and of the varied forms assumed by capital in the course of its development (Book III.), the third and last volume (Book IV.), the history of the theory.

Every opinion based on scientific criticism I welcome. As to the prejudices of so-called public opinion, to which I have never made concessions, now as aforetime the maxim of the great Florentine is mine:

"Segui il tuo corso, e lascia dir le genti."

KARL MARX.

LONDON,

July 25, 1867.

II. — TO THE SECOND EDITION.

To the present moment Political Economy, in Germany, is a foreign science. Gustav von Gülich in his “Historical description of Commerce, Industry,” 8c., especially in the two first volumes published in 1830, has examined at length the historical circumstances that prevented, in Germany, the development of the capitalist mode of production, and consequently the development, in that country, of modern bourgeois society. Thus the soil whence Political Economy springs was wanting. This “science” had to be imported from England and France as a ready-made article; its German professors remained schoolboys. The theoretical expression of a foreign reality was turned, in their hands, into a collection of dogmas, interpreted by them in terms of the petty trading world around them, and therefore misinterpreted. The feeling of scientific impotence, a feeling not wholly to be repressed, and the uneasy consciousness of having to touch a subject in reality foreign to them, was but imperfectly concealed, either under a parade of literary and historical erudition, or by an admixture of extraneous material, borrowed from the so-called “Kameral” sciences, a medley of smatterings, through whose purgatory the hopeless candidate for the German bureaucracy has to pass.

Since 1848 capitalist production has developed rapidly in Germany, and at the present time it is in the full bloom of speculation and swindling. But fate is still unpropitious to our professional economists. At the time when they were able to deal with Political Economy in a straightforward fashion, modern economic conditions did not actually exist in Germany. And as soon as these conditions did come into existence, they did so under circumstances that no longer allowed of their being really and impartially investigated within the bounds of the bourgeois horizon. In so far as Political Economy remains within that horizon, in so far, i.e., as the capitalist régime is looked upon as the absolutely final form of social production, instead of as a passing historical phase of its evolution, Political Economy can remain a science only so long as the class-struggle is latent or manifests itself only in isolated and sporadic phenomena.

Let us take England. Its political economy belongs to the period in which the class-struggle was as yet undeveloped. Its last great representative, Ricardo, in the end, consciously makes the antagonism of class-interests, of

wages and profits, of profits and rent, the starting-point of his investigations, naïvely taking this antagonism for a social law of nature. But by this start the science of bourgeois economy had reached the limits beyond which it should not pass. Already in the lifetime of Ricardo, and in opposition to him, it was met by criticism, in the person of Sismondi.

The succeeding period, from 1820 to 1830, was notable in England for scientific activity in the domain of Political Economy. It was the time as well of the vulgarising and extending of Ricardo's theory, as of the contest of that theory with the old school. Splendid tournaments were held. What was done then, is little known to the Continent generally, because the polemic is for the most part scattered through articles in reviews, occasional literature and pamphlets. The unprejudiced character of this polemic — although the theory of Ricardo already serves, in exceptional cases, as a weapon of attack upon bourgeois economy — is explained by the circumstances of the time. On the one hand, modern industry itself was only just emerging from the age of childhood, as is shown by the fact that with the crisis of 1825 it for the first time opens the periodic cycle of its modern life. On the other hand, the class-struggle between capital and labor is forced into the background, politically by the discord between the governments and the feudal aristocracy gathered around the Holy Alliance on the one hand, and the popular masses, led by the bourgeoisie on the other; economically by the quarrel between industrial capital and aristocratic landed property — a quarrel that in France was concealed by the opposition between small and large landed property, and that in England broke out openly after Corn Laws. The literature of Political Economy in England at this time calls to mind the stormy forward movement in France after Dr. Quesnay's death, but only as a Saint Martin's summer reminds us of spring. With the year 1830 came the decisive crisis.

In France and in England and bourgeoisie had conquered political power. Thenceforth, the class-struggle, practically as well as theoretically, took on more and more outspoken and threatening forms. It sounded the knell of scientific bourgeois economy. It was thenceforth no longer a question, whether this theorem or that was true, but whether it was useful to capital or harmful, expedient or inexpedient, politically dangerous or not. In place of disinterested enquirers, there were hired prize-fighters; in place of genuine scientific research, the bad conscience and the evil intent of apologetic. Still, even the obtrusive pamphlets with which the Anti-Corn Law League,

led by the manufacturers Cobden and Bright, deluged the world, have a historic interest, if no scientific one, on account of their polemic against the landed aristocracy. But since then the Free Trade legislation, inaugurated by Sir Robert Peel, has deprived vulgar economy of this its last sting.

The Continental revolution of 1848-9 also had its reaction in England. Men who still claimed some scientific standing and aspired to be something more than mere sophists and sycophants of the ruling-classes, tried to harmonise the Political Economy of capital with the claims, no longer to be ignored, of the proletariat. Hence a shallow syncretism, of which John Stuart Mill is the best representative. It is a declaration of bankruptcy by bourgeois economy, an event on which the great Russian scholar and critic, N. Tschernyschewsky, has thrown the light of a master mind in his "Outlines of Political Economy according to Mill."

In Germany, therefore, the capitalist mode of production came to a head, after its antagonistic character had already, in France and England, shown itself in a fierce strife of classes. And meanwhile, moreover, the German proletariat had attained a much more clear class-consciousness than the German bourgeoisie. Thus, at the very moment when a bourgeois science of political economy seemed at last possible in Germany, it had in reality again become impossible.

Under these circumstances its professors fell into two groups. The one set, prudent, practical business fold, flocked to the banner of Bastiat, the most superficial and therefore the most adequate representative of the apologetic of vulgar economy; the other, proud of the professorial dignity of their science, followed John Stuart Mill in his attempt to reconcile irreconcilables. Just as in the classical time of bourgeois economy, so also in the time of its decline, the Germans remained mere schoolboys, imitators and followers, petty retailers and hawkers in the service of the great foreign wholesale concern.

The peculiar historic development of German society therefore forbids, in that country, all original work in bourgeois economy; but not the criticism of that economy. So far as such criticism represents a class, it can only represent the class whose vocation in history is the overthrow of the capitalist mode of production and the final abolition of all classes — the proletariat.

The learned and unlearned spokesmen of the German bourgeoisie tried at first to kill "Das Kapital" by silence, as they had managed to do with my

earlier writings. As soon as they found that these tactics no longer fitted in with the conditions of the time, they wrote, under pretence of criticising my book, prescriptions “for the tranquillisation of the bourgeois mind.” But they found in the workers’ press — see, e.g., Joseph Dietzgen’s articles in the “Volksstaat” — antagonists stronger than themselves, to whom (down to this very day) they owe a reply.

An excellent Russian translation of “Das Kapital” appeared in the spring of 1872. The edition of 3000 copies is already nearly exhausted. As early as 1871, A. Sieber, Professor of Political Economy in the University of Kiev, in his work “David Ricardo’s Theory of Value and of Capital,” referred to my theory of value, of money and of capital, as in its fundamentals a necessary sequel to the teaching of Smith and Ricardo. That which astonishes the Western European in the reading of this excellent work, is the author’s consistent and firm grasp of the purely theoretical position.

That the method employed in “Das Kapital” has been little understood, is shown by the various conceptions, contradictory one to another, that have been formed of it.

Thus the Paris Revue Positiviste reproaches me in that, on the one hand, I treat economics metaphysically, and on the other hand — imagine! — confine myself to the mere critical analysis of actual facts, instead of writing recipes (Comtist ones?) for the cook-shops of the future. In answer to the reproach in re metaphysics, Professor Sieber has it: “In so far as it deals with actual theory, the method of Marx is the reductive method of the whole English school, a school whose failings and virtues are common to the best theoretic economists.” M. Block — “Les théoriciens du socialisme en Allemagne, Extrait du Journal des Economistes, Juillet et Aout 1872” — makes the discovery that my method is analytic and says: “Par cet ouvrage M. Marx se classe parmi les esprits analytiques les plus éminents.” German reviews, of course, shriek out at “Hegelian sophistics.” The European Messenger of St. Petersburg, in an article dealing exclusively with the method of “Das Kapital” (May number, 1872, p-436), finds my method of inquiry severely realistic, but my method of presentation, unfortunately, German-dialectical. It says: “At first sight, if the judgment is based on the external form of the presentation of the subject, Marx is the most ideal of ideal philosophers, always in the German, i.e., the bad sense of the word. But in point of fact he is infinitely more realistic than all his fore-runners in

the work of economic criticism. He can in no sense be called an idealist.” I cannot answer the writer better than by aid of a few extracts from his own criticism, which may interest some of my readers to whom the Russian original is inaccessible.

After a quotation from the preface to my “Critique of Political Economy,” Berlin, 1859, p-13, where I discuss the materialistic basis of my method, the writer goes on: “The one thing which is of moment to Marx is to find the law of the phenomena with whose investigation he is concerned; and not only is that law of moment to him, which governs these phenomena, in so far as they have a definite form and mutual connection within a given historical period. Of still greater moment to him is the law of their variation, of their development, i.e., of their transition from one form into another, from one series of connections into a different one. This law once discovered, he investigates in detail the effects in which it manifests itself in social life. Consequently, Marx only troubles himself about one thing; to show, by rigid scientific investigation, the necessity of successive determinate orders of social conditions, and to establish, as impartially as possible, the facts that serve him for fundamental starting points. For this it is quite enough, if he proves, at the same time, both the necessity of the present order of things, and the necessity of another order into which the first must inevitably pass over; and this all the same, whether men believe or do not believe it, whether they are conscious or unconscious of it. Marx treats the social movement as a process of natural history, governed by laws not only independent of human will, consciousness and intelligence, but rather, on the contrary, determining that will, consciousness and intelligence.... If in the history of civilisation the conscious element plays a part so subordinate, then it is self-evident that a critical inquiry whose subject-matter is civilisation, can, less than anything else, have for its basis any form of, or any result of, consciousness. That is to say, that not the idea, but the material phenomenon alone can serve as its starting-point. Such an inquiry will confine itself to the confrontation and the comparison of a fact, not with ideas, but with another fact. For this inquiry, the one thing of moment is, that both facts be investigated as accurately as possible, and that they actually form, each with respect to the other, different momenta of an evolution; but most important of all is the rigid analysis of the series of successions, of the sequences and concatenations in which the different stages of such an evolution present themselves. But it will be said, the

general laws of economic life are one and the same, no matter whether they are applied to the present or the past. This Marx directly denies. According to him, such abstract laws do not exist. On the contrary, in his opinion every historical period has laws of its own...As soon as society has outlived a given period of development, and is passing over from one given stage to another, it begins to be subject also to other laws. In a word, economic life offers us a phenomenon analogous to the history of evolution in other branches of biology. The old economists misunderstood the nature of economic laws when they likened them to the laws of physics and chemistry. A more thorough analysis of phenomena shows that social organisms differ among themselves as fundamentally as plants or animals. Nay, one and the same phenomenon falls under quite different laws in consequence of the different structure of those organisms as a whole, of the variations of their individual organs, of the different conditions in which those organs function, 8c. Marx, e.g., denies that the law of population is the same at all times and in all places. He asserts, on the contrary, that every stage of development has its own law of population...With the varying degree of development of productive power, social conditions and the laws governing them vary too. Whilst Marx sets himself the task of following and explaining from this point of view the economic system established by the sway of capital, he is only formulating, in a strictly scientific manner, the aim that every accurate investigation into economic life must have. The scientific value of such an inquiry lies in the disclosing of the special laws that regulate the origin, existence, development, and death a given social organism and its replacement by another and higher one. And it is this value that, in point of fact, Marx's book has."

Whilst the writer pictures what he takes to be actually my method, in this striking and [as far as concerns my own application of it] generous way, what else is he picturing but the dialectic method?

Of course the method of presentation must differ in form from that of inquiry. The latter has to appropriate the material in detail, to analyse its different forms of development, to trace out their inner connection. Only after this work is done, can the actual movement be adequately described. If this is done successfully, if the life of the subject-matter is ideally reflected as in a mirror, then it may appear as if we had before us a mere a priori construction.

My dialectic method is not only different from the Hegelian, but is its direct opposite. To Hegel, the life-process of the human brain, i.e., the process of thinking, which, under the name of “the Idea,” he even transforms into an independent subject, is the demiurgos of the real world, and the real world is only the external, phenomenal form of “the Idea.” With me, on the contrary, the ideal is nothing else than the material world reflected by the human mind, and translated into forms of thought.

The mystifying side of Hegelian dialectic I criticised nearly thirty years ago, at a time when it was still the fashion. But just as I was working at the first volume of “Das Kapital,” it was the good pleasure of the peevish, arrogant, mediocre ‘epignonois’ who now talk large in cultured Germany, to treat Hegel in the same way as the brave Moses Mendelssohn in Lessing’s time treated Spinoza, i.e., as a “dead dog.” I therefore openly avowed myself the pupil of the mighty thinker, and even here and there, in the chapter on the theory of value, coquetted with the modes of expression peculiar to him. The mystification which dialectic suffers in Hegel’s hands, by no means prevents him from being the first to present its general form of working in a comprehensive and conscious manner. With him it is standing on its head. It must be turned right side up again, if you would discover the rational kernel within the mystical shell.

In its mystified form, dialectic became the fashion in Germany, because it seemed to transfigure and to glorify the existing state of things. In its rational form it is a scandal and abomination to bourgeoisdom and its doctrinaire professors, because it includes in its comprehension and affirmative recognition of the existing state of things, at the same time also, the recognition of the negation of that state, of its inevitable breaking up; because it regards every historically developed social form as in fluid movement, and therefore takes into account its transient nature not less than its momentary existence; because it lets nothing impose upon it, and is in its essence critical and revolutionary.

The contradictions inherent in the movement of capitalist society impress themselves upon the practical bourgeois most strikingly in the changes of the periodic cycle, through which modern industry runs, and whose crowning point is the universal crisis. That crisis is once again approaching, although as yet but in its preliminary stage; and by the universality of its theatre and the intensity of its action it will drum dialectics even into the heads of the mushroom-upstarts of the new, holy Prusso-German empire.

KARL MARX
LONDON,
January 24, 1873.

EDITOR'S PREFACE TO THE FIRST ENGLISH TRANSLATION.

THE publication of an English version of "Das Kapital" needs no apology. On the contrary, an explanation might be expected why this English version has been delayed until now, seeing that for some years past the theories advocated in this book have been constantly referred to, attacked and defended, interpreted and mis-interpreted, in the periodical press and the current literature of both England and America.

When, soon after the author's death in 1883, it became evident that an English edition of the work was really required, Mr. Samuel Moore, for many years a friend of Marx and of the present writer, and than whom, perhaps, no one is more conversant with the book itself, consented to undertake the translation which the literary executors of Marx were anxious to lay before the public. It was understood that I should compare the MS. with the original work, and suggest such alterations as I might deem advisable. When, by and by, it was found that Mr. Moore's professional occupations prevented him from finishing the translation as quickly as we all desired, we gladly accepted Dr. Aveling's offer to undertake a portion of the work; at the same time Mrs. Aveling, Marx's youngest daughter, offered to check the quotations and to restore the original text of the numerous passages taken from English authors and Bluebooks and translated by Marx into German. This has been done throughout, with but few unavoidable exceptions.

The following portions of the book have been translated by Dr. Aveling: (1) Chapters X. (The Working Day), and XI. (Rate and Mass of Surplus-Value); (2) Part VI. (Wages, comprising Chapters XIX. to XXII.); (3) from Chapter XXIV, Section 4 (Circumstances that 8c.) to the end of the book, comprising the latter part of Chapter XXIV., Chapter XXV., and the whole of Part VIII. (Chapters XXVI. to XXXIII.); (4) the two Author's prefaces. All the rest of the book has been done by Mr. Moore. While, thus, each of the translators is responsible for his share of the work only, I bear a joint responsibility for the whole.

The third German edition, which has been made the basis of our work throughout, was prepared by me, in 1883, with the assistance of notes left by the author, indicating the passages of the second edition to be replaced by designated passages, from the French text published in 1873. The alterations thus effected in the text of the second edition generally coincided with changes prescribed by Marx in a set of MS. instructions for an English translation that was planned, about ten years ago, in America, but abandoned chiefly for want of a fit and proper translator. This MS. was placed at our disposal by our old friend Mr. F. A. Sorge of Hoboken N.J. It designates some further interpolations from the French edition; but, being so many years older than the final instructions for the third edition, I did not consider myself at liberty to make use of it otherwise than sparingly, and chiefly in cases where it helped us over difficulties. In the same way, the French text has been referred to in most of the difficult passages, as an indicator of what the author himself was prepared to sacrifice wherever something of the full-import of the original had to be sacrificed in the rendering.

There is, however, one difficulty we could not spare the reader: the use of certain terms in a sense different from what they have, not only in common life, but in ordinary political economy. But this was unavoidable. Every new aspect of a science involves a revolution in the technical terms of that science. This is best shown by chemistry, where the whole of the terminology is radically changed about once in twenty years, and where you will hardly find a single organic compound that has not gone through a whole series of different names. Political Economy has generally been content to take, just as they were, the terms of commercial and industrial life, and to operate with them, entirely failing to see that by so doing, it confined itself within the narrow circle of ideas expressed by those terms. Thus, though perfectly aware that both profits and rent are but subdivisions, fragments of that unpaid part of the product which the laborer has to supply to his employer (its first appropriator, though not its ultimate exclusive owner), yet even classical Political Economy never went beyond the received notions of profits and rent, never examined this unpaid part of the product (called by Marx surplus-product) in its integrity as a whole, and therefore never arrived at a clear comprehension, either of its origin and nature, or of the laws that regulate the subsequent distribution of its value. Similarly all industry, not agricultural or handicraft, is indiscriminately

comprised in the term of manufacture, and thereby the distinction is obliterated between two great and essentially different periods of economic history: the period of manufacture proper, based on the division of manual labor, and the period of modern industry based on machinery. It is, however, self-evident that a theory which views modern capitalist production as a mere passing stage in the economic history of mankind, must make use of terms different from those habitual to writers who look upon that form of production as imperishable and final.

A word respecting the author's method of quoting may not be out of place. In the majority of cases, the quotations serve, in the usual way, as documentary evidence in support of assertions made in the text. But in many instances, passages from economic writers are quoted in order to indicate when, where, and by whom a certain proposition was for the first time clearly enunciated. This is done in cases where the proposition quoted is of importance as being a more or less adequate expression of the conditions of social production and exchange prevalent at the time, and quite irrespective of Marx's recognition, or otherwise, of its general validity. These quotations, therefore, supplement the text by a running commentary taken from the history of the science.

Our translation comprises the first book of the work only. But this first book is in a great measure a whole in itself, and has for twenty years ranked as an independent work. The second book, edited in German by me, in 1885, is decidedly incomplete without the third, which cannot be published before the end of 1887. When Book III. has been brought out in the original German, it will then be soon enough to think about preparing an English edition of both.

“Das Kapital” is often called, on the Continent, “the Bible of the working class.” That the conclusions arrived at in this work are daily more and more becoming the fundamental principles of the great working class movement, not only in Germany and Switzerland, but in France, in Holland and Belgium, in America, and even in Italy and Spain; that everywhere the working class more and more recognises, in these conclusions, the most adequate expression of its condition and of its aspirations, nobody acquainted with that movement will deny. And in England, too, the theories of Marx, even at this moment, exercise a powerful influence upon the socialist movement which is spreading in the ranks of “cultured” people no less than in those of the working class. But that is not all. The time is

rapidly approaching when a thorough examination of England's economic position will impose itself as an irresistible national necessity. The working of the industrial system of this country, impossible without a constant and rapid extension of production, and therefore of markets, is coming to a dead stop. Free trade has exhausted its resources; even Manchester doubts this its quondam economic gospel. Foreign industry, rapidly developing, stares English production in the face everywhere, not only in protected, but also in neutral markets, and even on this side of the Channel. While the productive power increases in a geometric, the extension of markets proceeds at best in an arithmetic ratio. The decennial cycle of stagnation, prosperity, overproduction and crisis, ever recurrent from 1825 to 1867, seems indeed to have run its course; but only to land us in the slough of despond of a permanent and chronic depression. The sighed-for period of prosperity will not come; as often as we seem to perceive its heralding symptoms, so often do they again vanish into air. Meanwhile, each succeeding winter brings up afresh the great question, "what to do with the unemployed;" but while the number of the unemployed keeps swelling from year to year, there is nobody to answer that question; and we can almost calculate the moment when the unemployed, losing patience, will take their own fate into their own hands. Surely, at such a moment, the voice ought to be heard of a man whose whole theory is the result of a life-long study of the economic history and condition of England, and whom that study led to the conclusion that, at least in Europe, England is the only country where the inevitable social revolution might be effected entirely by peaceful and legal means. He certainly never forgot to add that he hardly expected the English ruling classes to submit, without a "pro-slavery rebellion," to this peaceful and legal revolution.

EDITOR'S PREFACE TO THE FOURTH GERMAN EDITION.

The fourth edition of this work required of me a revision, which should give to the text and foot notes their final form, so far as possible. The following brief hints will indicate the way in which I performed this task.

After referring once more to the French edition and to the manuscript notes of Marx, I transferred a few additional passages from the French to the German text.

I have also placed the long foot note concerning the mine workers, on pages 461-67, into the text, just as had already been done in the French and English editions. Other small changes are merely of a technical nature.

Furthermore I added a few explanatory notes, especially in places where changed historical conditions seemed to require it. All these additional notes are placed between brackets and marked with my initials.

A complete revision of the numerous quotations had become necessary, because the English edition had been published in the mean time. Marx's youngest daughter, Eleanor, had undertaken the tedious task of comparing, for this edition, all the quotations with the original works, so that the quotations from English authors, which are the overwhelming majority, are not retranslated from the German, but taken from the original texts. I had to consult the English edition for this fourth German edition. In so doing I found many small inaccuracies. There were references to wrong pages, due either to mistakes in copying, or to accumulated typographical errors of three editions. There were quotation marks, or periods indicating omissions, in wrong places, such as would easily occur in making copious quotations from notes. Now and then I came across a somewhat inappropriate choice of terms made in translating. Some passages were taken from Marx's old manuscripts written in Paris, 1843-45, when he did not yet understand English and read the works of English economists in French translations. This twofold translation carried with it a slight change of expression, for instance in the case of Steuart, Ure, and others. Now I used the English text. Such and similar little inaccuracies and inadvertences were corrected. And if this fourth edition is now compared with former editions, it will be found

that this whole tedious process of verification did not change in the least any essential statement of this work. There is but one single quotation which could not be located, namely that from Richard Jones, in section 3 of chapter XXIV. Marx probably made a mistake in the title of the book. All other quotations retain their corroborative power, or even increase it in their present exact form.

In this connection I must revert to an old story.

I have heard of only one case, in which the genuineness of a quotation by Marx was questioned. Since this case was continued beyond Marx's death, I cannot well afford to ignore it.

The Berlin Concordia, the organ of the German Manufacturer's Association, published on March 7, 1872, an anonymous article, entitled: "How Marx Quotes." In it the writer asserted with a superabundant display of moral indignation and unparliamentarian expressions that the quotation from Gladstone's budget speech of April 16, 1863, (cited in the Inaugural Address of the International Workingmen's Association, 1864, and republished in Capital, volume I, chapter XXV, section 5 a) was a falsification. It was denied that the statement: "This intoxicating augmentation of wealth and power...entirely confined to classes of property," was contained in the stenographical report of Hansard, which was as good as an official report. "This statement is not found anywhere in Gladstone's speech. It says just the reverse. Marx has formally and materially lied in adding that sentence."

Marx, who received this issue of the Concordia in May of the same year, replied to the anonymous writer in the Volksstaat of June 1. As he did not remember the particular newspaper from which he had clipped this report, he contented himself with pointing out that the same quotation was contained in two English papers. Then he quoted the report of the Times, according to which Gladstone had said: "That is the state of the case as regards the wealth of this country. I must say for one, I should look almost with apprehension and with pain upon this intoxicating augmentation of wealth and power, if it were my belief that it was confined to classes who are in easy circumstances. This takes no cognizance at all of the condition of the labouring population. The augmentation I have described and which is founded, I think, upon accurate terms, is an augmentation entirely confined to classes of property."

In other words, Gladstone says here that he would be sorry if things were that way, but they are. This intoxicating augmentation of wealth and power is entirely confined to classes of property. And so far as the quasi official Hansard is concerned, Marx continues: "In the subsequent manipulation of his speech for publication Mr. Gladstone was wise enough to eliminate a passage, which was so compromising in the mouth of an English Lord of the Exchequer as that one. By the way, this is an established custom in English parliament, and not by any means a discovery made by Lasker to cheat Bebel."

The anonymous writer then became still madder. Pushing aside his second-hand sources in his reply in the Concordia, July 4, he modestly hints, that it is the "custom" to quote parliamentary speeches from the official reports; that the report of the Times (which contained the added lie) "was materially identical" with that of Hansard (which did not contain it); that the report of the Times even said "just the reverse of what that notorious passage of the Inaugural Address implied." Of course, our anonymous friend keeps still about the fact that the report of the Times does not only contain "just the reverse" but also "that notorious passage"! Nevertheless he feels that he has been nailed down, and that only a new trick can save him. Hence he decorates his article, full of "insolent mendacity," until it bristles with pretty epithets, such as "bad faith," "dishonesty," "mendacious assertion," "that lying quotation," "insolent mendacity," "a completely spurious quotation," "this falsification," "simply infamous," etc., and he finds himself compelled to shift the discussion to another ground, promising "to explain in a second article, what interpretation we [the "veracious" anonymous] place upon the meaning of Gladstone's words." As though his individual opinion had anything to do with the matter! This second article is published in the Concordia of July 11.

Marx replied once more in the Volksstaat of August 7, quoting also the reports of this passage in the Morning Star and Morning Advertiser of April 17, 1863. Both of them agree in quoting Gladstone to the effect that he would look with apprehension, etc., upon this intoxicating augmentation of wealth and power, if it were confined to classes in easy circumstances. But this augmentation was entirely confined to classes possessed of property. Both of these papers also contain the "added lie" word for word. Marx furthermore showed, by comparing these three independent, yet identical

reports of newspapers, all of them containing the actually spoken words of Gladstone, with Hansard's report, that Gladstone, in keeping with the "established custom," had "subsequently eliminated" this sentence, as Marx had said. And Marx closes with the statement, that he has no time for further controversy with the anonymous writer. It seems that this worthy had gotten all he wanted, for Marx received no more issues of the Concordia.

Thus the matter seemed to be settled. It is true, people who were in touch with the university at Cambridge once or twice dropped hints as to mysterious rumors about some unspeakable literary crime, which Marx was supposed to have committed in Capital. But nothing definite could be ascertained in spite of all inquiries. Suddenly, on November 29, 1883, eight months after the death of Marx, a letter appeared in the Times, dated at Trinity College, Cambridge, and signed by Sedley Taylor, in which this mannikin, a dabbler in the tamest of coöperative enterprises, at last took occasion to give us some light, not only on the gossip of Cambridge, but also on the anonymous of the Concordia.

"What seems very queer," says the mannikin of Trinity College, "is that it remained for professor Brentano (then in Breslau, now in Strasburg)...to lay bare the bad faith, which had apparently dictated that quotation from Gladstone's speech in the Inaugural Address. Mr. Karl Marx, who...tried to justify his quotation, had the temerity, in the deadly shifts to which Brentano's masterly attacks quickly reduced him, to claim that Mr. Gladstone tampered with the report of his speech in the Times of April 17, 1863, before it was published in Hansard, in order to eliminate a passage which was, indeed, compromising for the British Chancellor of the Exchequer. When Brentano demonstrated by a detailed comparison of the texts, that the reports of the Times and of Hansard agreed to the absolute exclusion of the meaning, impugned to Gladstone's words by a craftily isolated quotation, Marx retreated under the excuse of having no time."

This, then, was the kernel of the walnut! And such was the glorious reflex of Brentano's anonymous campaign, in the Concordia, in the coöperative imagination of Cambridge! Thus he lay, and thus he handled his blade in his "masterly attack," this Saint George of the German Manufacturers' Association, while the fiery dragon Marx quickly expired under his feet "in deadly shifts!"

However, this Ariostian description of the struggle serves only to cover up the shifts of our Saint George. There is no longer any mention of “added lies,” of “falsification,” but merely of “a craftily isolated quotation.” The whole question had been shifted, and Saint George and his Cambridge Knight knew very well the reason.

Eleanor Marx replied in the monthly magazine *To-day*, February, 1884, because the *Times* refused to print her statements. She reduced the discussion to the only point, which was in question, namely: Was that sentence a lie added by Marx, or not? Whereupon Mr. Sedley Taylor retorted: “The question whether a certain sentence had occurred in Mr. Gladstone’s speech or not” was, in his opinion, “of a very inferior importance” in the controversy between Marx and Brentano, “compared with the question, whether the quotation had been made with the intention of reproducing the meaning of Mr. Gladstone or distorting it.” And then he admits that the report of the *Times* “contains indeed a contradiction in words”; but, but, interpreting the context correctly, that is, in a liberal Gladstonian sense, it is evident what Mr. Gladstone intended to say. (*To-Day*, March, 1884.) The comic thing about this retort is that our mannikin of Cambridge now insists on not quoting this speech from Hansard, as is the “custom” according to the anonymous Mr. Brentano, but from the report of the *Times*, which the same Brentano had designated as “necessarily bungling.” Of course, Hansard does not contain that fatal sentence!

It was easy for Eleanor Marx to dissolve this argumentation into thin air in the same number of *To-Day*. Either Mr. Taylor had read the controversy of 1872. In that case he had now “lied,” not only “adding,” but also “subtracting.” Or, he had not read it. Then it was his business to keep his mouth shut. At any rate, it was evident that he did not dare for a moment to maintain the charge of his friend Brentano to the effect that Marx had “added a lie.” On the contrary, it was now claimed, that Marx, instead of adding a lie, had suppressed an important sentence. But this same sentence is quoted on page 5 of the Inaugural Address, a few lines before the alleged “added lie.” And as for the “contradiction” in Gladstone’s speech, isn’t it precisely Marx who speaks in another foot note of that chapter in *Capital* of the “continual crying contradictions in Gladstone’s budget speeches of 1863 and 1864”? Of course, he does not undertake to reconcile them by liberal hot air, like Sedley Taylor. And the final summing up in Eleanor Marx’s reply is this: “On the contrary, Marx has neither suppressed anything

essential nor added any lies. He rather has restored and rescued from oblivion a certain sentence of a Gladstonian speech, which had undoubtedly been pronounced, but which somehow found its way out of Hansard.”

This was enough for Mr. Sedley Taylor. The result of this whole professorial gossip during ten years and in two great countries was that no one dared henceforth to question Marx’s literary conscientiousness. In the future Mr. Sedley Taylor will probably have as little confidence in the literary fighting bulletins of Mr. Brentano, as Mr. Brentano in the papal infallibility of Hansard.

Book I. Capitalist Production.

PART I. COMMODITIES AND MONEY.

CHAPTER I. COMMODITIES.

SECTION 1. — THE TWO FACTORS OF A COMMODITY: USE-VALUE AND VALUE (THE SUBSTANCE OF VALUE AND THE MAGNITUDE OF VALUE).

THE wealth of those societies in which the capitalist mode of production prevails, presents itself as “an immense accumulation of commodities,” its unit being a single commodity. Our investigation must therefore begin with the analysis of a commodity.

A commodity is, in the first place, an object outside us, a thing that by its properties satisfies human wants of some sort or another. The nature of such wants, whether, for instance, they spring from the stomach or from fancy, makes no difference. Neither are we here concerned to know how the object satisfies these wants, whether directly as means of subsistence, or indirectly as means of production.

Every useful thing, as iron, paper, &c., may be looked at from the two points of view of quality and quantity. It is an assemblage of many properties, and may therefore be of use in various ways. To discover the various use of things is the work of history. So also is the establishment of socially-recognised standards of measure for the quantities of these useful objects. The diversity of these measures has its origin partly in the diverse nature of the objects to be measured, partly in convention.

The utility of a thing makes it a use-value. But this utility is not a thing of air. Being limited by the physical properties of the commodity, it has no existence apart from that commodity. A commodity, such as iron, corn, or a diamond, is therefore, so far as it is a material thing, a use-value, something useful. This property of a commodity is independent of the amount of labour required to appropriate its useful qualities. When treating of use-value, we always assume to be dealing with definite quantities, such as dozens of watches, yards of linen, or tons of iron. The use-values of commodities furnish the material for a special study, that of the commercial knowledge of commodities. Use-values become a reality only by use or consumption: they also constitute the substance of all wealth, whatever may be the social form of that wealth. In the form of society we are about to consider, they are, in addition, the material depositories of exchange value.

Exchange value, at first sight, presents itself as a quantitative relation, as the proportion in which values in use of one sort are exchanged for those of another sort, a relation constantly changing with time and place. Hence exchange value appears to be something accidental and purely relative, and consequently an intrinsic value, i.e., an exchange value that is inseparably connected with, inherent in commodities, seems a contradiction in terms. Let us consider the matter a little more closely.

A given commodity, e.g., a quarter of wheat is exchanged for x blacking, y silk, or z gold, 8c. — in short, for other commodities in the most different proportions. Instead of one exchange value, the wheat has, therefore, a great many. But since x blacking, y silk, or z gold, 8c., each represent the exchange value of one quarter of wheat, x blacking, y silk, z gold, 8c., must as exchange values be replaceable by each other, or equal to each other. Therefore, first: the valid exchange values of a given commodity express something equal; secondly, exchange value, generally, is only the mode of expression, the phenomenal form, of something contained in it, yet distinguishable from it.

Let us take two commodities, e.g. corn and iron. The proportions in which they are exchangeable, whatever those proportions may be, can always be represented by an equation in which a given quantity of corn is equated to some quantity of iron: e.g., 1 quarter corn = x cwt. iron. What does this equation tell us? It tells us that in two different things — in 1 quarter of corn and x cwt. of iron, there exists in equal quantities something common to both. The two things must therefore be equal to a third, which in itself is neither the one nor the other. Each of them, so far as it is exchange value, must therefore be reducible to this third.

A simple geometrical illustration will make this clear. In order to calculate and compare the areas of rectilinear figures, we decompose them into triangles. But the area of the triangle itself is expressed by something totally different from its visible figure, namely, by half the product of the base into the altitude. In the same way the exchange values of commodities must be capable of being expressed in terms of something common to them all, of which thing they represent a greater or less quantity.

This common “something” cannot be either a geometrical, a chemical, or any other natural property of commodities. Such properties claim our attention only in so far as they affect the utility of those commodities, make them use-values. But the exchange of commodities is evidently an act

characterised by a total abstraction from use-value. Then one use-value is just as good as another, provided only it be present in sufficient quantity. Or, as old Barbon says, “one sort of wares are as good as another, if the values be equal. There is no difference or distinction in things of equal value.... An hundred pounds’ worth of lead or iron, is of as great value as one hundred pounds’ worth of silver or gold.” As use-values, commodities are, above all, of different qualities, but as exchange values they are merely different quantities, and consequently do not contain an atom of use-value.

If then we leave out of consideration the use-value of commodities, they have only one common property left, that of being products of labour. But even the product of labour itself has undergone a change in our hands. If we make abstraction from its use-value, we make abstraction at the same time from the material elements and shapes that make the product a use-value; we see in it no longer a table, a house, yarn, or any other useful thing. Its existence as a material thing is put out of sight. Neither can it any longer be regarded as the product of the labour of the joiner, the mason, the spinner, or of any other definite kind of productive labour. Along with the useful qualities of the products themselves, we put out of sight both the useful character of the various kinds of labour embodied in them, and the concrete forms of that labour; there is nothing left but what is common to them all; all are reduced to one and the same sort of labour, human labour in the abstract.

Let us now consider the residue of each of these products; it consists of the same unsubstantial reality in each, a mere congelation of homogeneous human labour, of labour-power expended without regard to the mode of its expenditure. All that these things now tell us is, that human labour-power has been expended in their production, that human labor is embodied in them. When looked at as crystals of this social substance, common to them all, they are — Values.

We have seen that when commodities are exchanged, their exchange value manifests itself as something totally independent of their use-value. But if we abstract from their use-value, there remains their Value as defined above. Therefore, the common substance that manifests itself in the exchange value of commodities, whenever they are exchanged, is their value. The progress of our investigation will show that exchange value is the only form in which the value of commodities can manifest itself or be

expressed. For the present, however, we have to consider the nature of value independently of this, its form.

A use-value, or useful article, therefore, has value only because human labour in the abstract has been embodied or materialised in it. How, then, is the magnitude of this value to be measured? Plainly, by the quantity of the value-creating substance, the labour, contained in the article. The quantity of labour, however, is measured by its duration, and labour-time in its turn finds its standard in weeks, days, and hours.

Some people might think that if the value of a commodity is determined by the quantity of labour spent on it, the more idle and unskilful the labourer, the more valuable would his commodity be, because more time would be required in its production. The labour, however, that forms the substance of value, is homogeneous human labour, expenditure of one uniform labour-power. The total labour-power of society, which is embodied in the sum total of the values of all commodities produced by that society, counts here as one homogeneous mass of human labour-power, composed though it be of innumerable individual units. Each of these units is the same as any other, so far as it has the character of the average labour-power of society, and takes effect as such; that is, so far as it requires for producing a commodity, no more time than is needed on an average, no more than is socially necessary. The labour-time socially necessary is that required to produce an article under the normal conditions of production, and with the average degree of skill and intensity prevalent at the time. The introduction of power looms into England probably reduced by one half the labour required to weave a given quantity of yarn into cloth. The hand-loom weavers, as a matter of fact, continued to require the same time as before; but for all that, the product of one hour of their labour represented after the change only half an hour's social labor, and consequently fell to one-half its former value.

We see then that that which determines the magnitude of the value of any article is the amount of labour socially necessary, or the labour-time socially necessary for its production. Each individual commodity, in this connexion, is to be considered as an average sample of its class. Commodities, therefore, in which equal quantities of labour are embodied, or which can be produced in the same time, have the same value. The value of one commodity is to the value of any other, as the labour-time necessary for the production of the one is to that necessary for the production of the other.

“As values, all commodities are only definite masses of congealed labour-time.

The value of a commodity would therefore remain constant, if the labour-time required for its production also remained constant. But the latter changes with every variation in the productiveness of labour. This productiveness is determined by various circumstances, amongst others, by the average amount of skill of the workmen, the state of science, and the degree of its practical application, the social organisation of production, the extent and capabilities of the means of production, and by physical conditions. For example, the same amount of labour in favourable seasons is embodied in 8 bushels of corn, and in unfavourable, only in four. The same labour extracts from rich mines more metal than from poor mines. Diamonds are of very rare occurrence on the earth's surface, and hence their discovery costs, on an average, a great deal of labour-time. Consequently much labour is represented in a small compass. Jacob doubts whether gold has ever been paid for at its full value. This applies still more to diamonds. According to Eschwege, the total produce of the Brazilian diamond mines for the eighty years, ending in 1823, had not realised the price of one-and-a-half years ' average produce of the sugar and coffee plantations of the same country, although the diamonds cost much more labour, and therefore represented more value. With richer mines, the same quantity of labour would embody itself in more diamonds and their value would fall. If we could succeed at a small expenditure of labour, in converting carbon into diamonds, their value might fall below that of bricks. In general, the greater the productiveness of labour, the less is the labour-time required for the production of an article, the less is the amount of labour crystallised in that article, and the less is its value; and *visè versâ*, the less the productiveness of labour, the greater is the labour-time required for the production of an article, and the greater is its value. The value of a commodity, therefore, varies directly as the quantity, and inversely as the productiveness, of the labour incorporated in it.

A thing can be a use-value, without having value. This is the case whenever its utility to man is not due to labour. Such are air, virgin soil, natural meadows, &c. A thing can be useful, and the product of human labour, without being a commodity. Whoever directly satisfies his wants with the produce of his own labour, creates, indeed, use-values, but not

commodities. In order to produce the latter, he must not only produce use-values, but use-values for others, social use-values. Lastly, nothing can have value, without being an object of utility. If the thing is useless, so is the labour contained in it; the labour does not count as labour, and therefore creates no value.

SECTION 2. — THE TWOFOLD CHARACTER OF THE LABOUR EMBODIED IN COMMODITIES.

At first sight a commodity presented itself to us as a complex of two things — use-value and exchange-value. Later on, we saw also that labour, too, possesses the same two-fold nature; for, so far as it finds expression in value, it does not possess the same characteristics that belong to it as a creator of use-values. I was the first to point out and to examine critically this two fold nature of the labour contained in commodities. As this point is the pivot on which a clear comprehension of political economy turns, we must go more into detail.

Let us take two commodities such as a coat and 10 yards of linen, and let the former be double the value of the latter, so that, if 10 yards of linen= W , the coat= $2W$.

The coat is a use-value that satisfies a particular want. Its existence is the result of a special sort of productive activity, the nature of which is determined by its aim, mode of operation, subject, means, and result. The labour, whose utility is thus represented by the value in use of its product, or which manifests itself by making its product a use-value, we call useful labour. In this connexion we consider only its useful effect.

As the coat and the linen are two qualitatively different use-values, so also are the two forms of labour that produce them, tailoring and weaving. Were these two objects not qualitatively different, not produced respectively by labour of different quality, they could not stand to each other in the relation of commodities. Coats are not exchanged for coats, one use-value is not exchanged for another of the same kind.

To all the different varieties of values in use there correspond as many different kinds of useful labour, classified according to the order, genus, species, and variety to which they belong in the social division of labour. This division of labour is a necessary condition for the production of commodities, but it does not follow conversely, that the production of

commodities is a necessary condition for the division of labour. In the primitive Indian community there is social division of labour, without production of commodities. Or, to take an example nearer home, in every factory the labour is divided according to a system, but this division is not brought about by the operatives mutually exchanging their individual products. Only such products can become commodities with regard to each other, as result from different kinds of labour, each kind being carried on independently and for the account of private individuals.

To resume, then: In the use-value of each commodity there is contained useful labour, i.e., productive activity of a definite kind and exercised with a definite aim. Use-values cannot confront each other as commodities, unless the useful labour embodied in them is qualitatively different in each of them. In a community, the produce of which in general takes the form of commodities, i.e., in a community of commodity producers, this qualitative difference between the useful forms of labour that are carried on independently by individual producers, each on their own account, develops into a complex system, a social division of labour.

Anyhow, whether the coat be worn by the tailor or by his customer, in either case it operates as a use-value. Nor is the relation between the coat and the labour that produced it altered by the circumstance that tailoring may have become a special trade, an independent branch of the social division of labour. Wherever the want of clothing forced them to it, the human race made clothes for thousands of years, without a single man becoming a tailor. But coats and linen, like every other element of material wealth that is not the spontaneous produce of nature, must invariably owe their existence to a special productive activity, exercised with a definite aim, an activity that appropriates particular nature-given materials to particular human wants. So far therefore as labour is a creator of use-value, is useful labour, it is a necessary condition, independent of all forms of society, for the existence of the human race; it is an eternal nature-imposed necessity, without which there can be no material exchanges between man and Nature, and therefore no life.

The use-values, coat, linen, &c., i.e., the bodies of commodities, are combinations of two elements — matter and labour. If we take away the useful labour expended upon them, a material substratum is always left, which is furnished by Nature without the help of man. The latter can work only as Nature does, that is by changing the form of matter. Nay more, in

this work of changing the form he is constantly helped by natural forces. We see, then, that labour is not the only source of material wealth, of use-values produced by labour. As William Petty puts it, labour is its father and the earth its mother.

Let us now pass from the commodity considered as a use-value to the value of commodities.

By our assumption, the coat is worth twice as much as the linen. But this is a mere quantitative difference, which for the present does not concern us. We bear in mind, however, that if the value of the coat is double that of 10 yds. of linen, 20 yds. of linen must have the same value as one coat. So far as they are values, the coat and the linen are things of a like substance, objective expressions of essentially identical labour. But tailoring and weaving are, qualitatively, different kinds of labour. There are, however, states of society in which one and the same man does tailoring and weaving alternately, in which case these two forms of labour are mere modifications of the labour of the same individual, and not special and fixed functions of different persons; just as the coat which our tailor makes one day, and the trousers which he makes another day, imply only a variation in the labour of one and the same individual. Moreover, we see at a glance that, in our capitalist society, a given portion of human labour is, in accordance with the varying demand, at one time supplied in the form of tailoring, at another in the form of weaving. This change may possibly not take place without friction, but take place it must.

Productive activity, if we leave out of sight its special form, viz., the useful character of the labour, is nothing but the expenditure of human labour-power. Tailoring and weaving though qualitatively different productive activities, are each a productive expenditure of human brains, nerves, and muscles, and in this sense are human labour. They are but two different modes of expending human labour-power. Of course, this labour-power, which remains the same under all its modifications, must have attained a certain pitch of development before it can be expended in a multiplicity of modes. But the value of a commodity represents human labour in the abstract, the expenditure of human labour in general. And just as in society, a general or a banker plays a great part, but mere man, on the other hand, a very shabby part, so here with mere human labour. It is the expenditure of simple labour-power, i.e., of the labour-power which, on an average, apart from any special development, exists in the organism of

every ordinary individual. Simple average labour, it is true, varies in character in different countries and at different times, but in a particular society it is given. Skilled labour counts only as simple labour intensified, or rather, as multiplied simple labour, a given quantity of skilled being considered equal to a greater quantity of simple labour. Experience shows that this reduction is constantly being made. A commodity may be the product of the most skilled labour, but its value, by equating it to the product of simple unskilled labour, represents a definite quantity of the latter labour alone. The different proportions in which different sorts of labour are reduced to unskilled labour as their standard, are established by a social process that goes on behind the backs of the producers, and, consequently, appear to be fixed by custom. For simplicity's sake we shall henceforth account every kind of labour to be unskilled, simple labour; by this we do no more than save ourselves the trouble of making the reduction.

Just as, therefore, in viewing the coat and linen as values, we abstract from their different use-values, so it is with the labour represented by those values: we disregard the difference between its useful forms, weaving and tailoring. As the use-values, coat and linen, are combinations of special productive activities with cloth and yarn, while the values, coat and linen, are, on the other hand, mere homogeneous congelations of indifferentiated labour, so the labour embodied in these latter values does not count by virtue of its productive relation to cloth and yarn, but only as being expenditure of human labour-power. Tailoring and weaving are necessary factors in the creation of the use-values, coat and linen, precisely because these two kinds of labour are of different qualities; but only in so far as abstraction is made from their special qualities, only in so far as both possess the same quality of being human labour, do tailoring and weaving form the substance of the values of the same articles.

Coats and linen, however, are not merely values, but values of definite magnitude, and according to our assumption, the coat is worth twice as much as the ten yards of linen. Whence this difference in their values? It is owing to the fact that the linen contains only half as much labour as the coat, and consequently, that in the production of the latter, labour-power must have been expended during twice the time necessary for the production of the former.

While, therefore, with reference to use-value, the labour contained in a commodity counts only qualitatively, with reference to value it counts only

quantitatively, and must first be reduced to human labour pure and simple. In the former case, it is a question of How and What, in the latter of How much? How long a time? Since the magnitude of the value of a commodity represents only the quantity of labour embodied in it, it follows that all commodities, when taken in certain proportions, must be equal in value.

If the productive power of all the different sorts of useful labour required for the production of a coat remains unchanged, the sum of the values of the coat produced increases with their number. If one coat represents x days' labour, two coats represent $2x$ days' labour, and so on. But assume that the duration of the labour necessary for the production of a coat becomes doubled or halved. In the first case, one coat is worth as much as two coats were before; in the second case, two coats are only worth as much as one was before, although in both cases one coat renders the same service as before, and the useful labour embodied in it remains of the same quality. But the quantity of labour spent on its production has altered.

An increase in the quantity of use-values is an increase of material wealth. With two coats two men can be clothed, with one coat only one man. Nevertheless, an increased quantity of material wealth may correspond to a simultaneous fall in the magnitude of its value. This antagonistic movement has its origin in the two-fold character of labour. Productive power has reference, of course, only to labour of some useful concrete form; the efficacy of any special productive activity during a given time being dependent on its productiveness. Useful labour becomes, therefore, a more or less abundant source of products, in proportion to the rise or fall of its productiveness. On the other hand, no change in this productiveness affects the labour represented by value. Since productive power is an attribute of the concrete useful forms of labour, of course it can no longer have any bearing on that labour, so soon as we make abstraction from those concrete useful forms. However then productive power may vary, the same labour, exercised during equal periods of time, always yields equal amounts of value. But it will yield, during equal periods of time, different quantities of values in use; more, if the productive power rise, fewer, if it fall. The same change in productive power, which increases the fruitfulness of labour, and, in consequence, the quantity of use-values produced by that labour, will diminish the total value of this increased quantity of use-values, provided such change shorten the total labour-time necessary for their production; and vice versa.

On the one hand all labour is, speaking physiologically, an expenditure of human labour-power, and in its character of identical abstract human labour, it creates and forms the value of commodities. On the other hand, all labour is the expenditure of human labour-power in a special form and with a definite aim, and in this, its character of concrete useful labour, it produces use-values.

SECTION 3. — THE FORM OF VALUE OR EXCHANGE VALUE.

Commodities come into the world in the shape of use-values, articles, or goods, such as iron, linen, corn, &c. This is their plain, homely, bodily form. They are, however, commodities, only because they are something twofold, both objects of utility, and, at the same, time, depositories of value. They manifest themselves therefore as commodities, or have the form of commodities, only in so far as they have two forms, a physical or natural form, and a value form.

The reality of the value of commodities differs in this respect from the value of use-values. Quickly, that we don't know "where to have it." The value of commodities is the very opposite of the coarse materiality of their substance, not an atom of matter enters into its composition. Turn and examine a single commodity, by itself, as we will. Yet in so far as it remains an object of value, it seems impossible to grasp it. If, however, we bear in mind that the value of commodities has a purely social reality, and that they acquire this reality only in so far as they are expressions or embodiments of one identical social substance, viz., human labour, it follows as a matter of course, that value can only manifest itself in the social relation of commodity to commodity. In fact we started from exchange value, or the exchange relation of commodities, in order to get at the value that lies hidden behind it. We must now return to this form under which value first appeared to us.

Every one knows, if he knows nothing else, that commodities have a value form common to them all, and presenting a marked contrast with the varied bodily forms of their use-values. I mean their money form. Here, however, a task is set us, the performance of which has never yet even been attempted by bourgeois economy, the task of tracing the genesis of this money form, of developing the expression of value implied in the value relation of commodities, from its simplest, almost imperceptible outline, to

the dazzling money form. By doing this we shall, at the same time, solve the riddle presented by money.

The simplest value relation is evidently that of one commodity to some one other commodity of a different kind. Hence the relation between the values of two commodities supplies us with the simplest expression of the value of a single commodity.

Elementary or Accidental Form of Value.

x commodity A=y commodity B, or
x commodity A is worth y commodity B.
20 yards of linen=1 coat, or
20 yards of linen are worth 1 coat.

The two poles of the expression of value: Relative form and Equivalent form.

The whole mystery of the form of value lies hidden in this elementary form. Its analysis, therefore, is our real difficulty.

Here two different kinds of commodities (in our example the linen and the coat), evidently play two different parts. The linen expresses its value in the coat; the coat serves as the material in which that value is expressed. The former plays an active, the latter a passive, part. The value of the linen is represented as relative value, or appears in relative form. The coat officiates as equivalent, or appears in equivalent form.

The relative form and the equivalent form are two intimately connected, mutually dependent and inseparable elements of the expression of value; but, at the same time, are mutually exclusive, antagonistic extremes — i.e., poles of the same expression. They are allotted respectively to the two different commodities brought into relation by that expression. It is not possible to express the value of linen in linen. 20 yards of linen=20 yards of linen is no expression of value. On the contrary, such an equation merely says that 20 yards of linen are nothing else than 20 yards of linen, a definite quantity of the use-value linen. The value of the linen can therefore be expressed only relatively — i.e., in some other commodity. The relative form of the value of the linen pre-supposes, therefore, the presence of some other commodity — here the coat — under the form of an equivalent. On the other hand, the commodity that figures as the equivalent cannot at the

same time assume the relative form. That second commodity is not the one whose value is expressed. Its function is merely to serve as the material in which the value of the first commodity is expressed.

No doubt, the expression 20 yards of linen=1 coat, or 20 yards of linen are worth 1 coat, implies the opposite relation: 1 coat=20 yards of linen, or 1 coat is worth 20 yards of linen. But, in that case, I must reverse the equation, in order to express the value of the coat relatively; and, so soon as I do that the linen becomes the equivalent instead of the coat. A single commodity cannot, therefore, simultaneously assume, in the same expression of value, both forms. The very polarity of these forms makes them mutually exclusive.

Whether, then, a commodity assumes the relative form, or the opposite equivalent form, depends entirely upon its accidental position in the expression of value — that is, upon whether it is the commodity whose value is being expressed.

The Relative form of value.

The nature and import of this form.

In order to discover how the elementary expression of the value of a commodity lies hidden in the value relation of two commodities, we must, in the first place, consider the latter entirely apart from its quantitative aspect. The usual mode of procedure is generally the reverse, and in the value relation nothing is seen but the proportion between definite quantities of two different sorts of commodities that are considered equal to each other. It is apt to be forgotten that the magnitudes of different things can be compared quantitatively, only when those magnitudes are expressed in terms of the same unit. It is only as expressions of such a unit that they are of the same denomination, and therefore commensurable.

Whether 20 yards of linen=1 coat or=20 coats or=x coats — that is, whether a given quantity of linen is worth few or many coats, every such statement implies that the linen and coats, as magnitudes of value, are expressions of the same unit, things of the same kind. Linen=coat is the basis of the equation.

But the two commodities whose identity of quality is thus assumed, do not play the same part. It is only the value of the linen that is expressed. And how? By its reference to the coat as its equivalent, as something that can be exchanged for it. In this relation the coat is the mode of existence of value, is value embodied, for only as such is it the same as the linen. On the

other hand, the linen's own value comes to the front, receives independent expression, for it is only as being value that it is comparable with the coat as a thing of equal value, or exchangeable with the coat. To borrow an illustration from chemistry, butyric acid is a different substance from propyl formate. Yet both are made up of the same chemical substances, carbon (C), hydrogen (H), and oxygen (O), and that, too, in like proportions — namely, $C_4H_8O_2$. If now we equate butyric acid to propyl formate, then, in the first place, propyl formate would be, in this relation, merely a form of existence of $C_4H_8O_2$; and in the second place, we should be stating that butyric acid also consists of $C_4H_8O_2$. Therefore, by thus equating the two substances, expression would be given to their chemical composition, while their different physical forms would be neglected.

If we say that, as values, commodities are mere congelations of human labour, we reduce them by our analysis, it is true, to the abstraction, value; but we ascribe to this value no form apart from their bodily form. It is otherwise in the value relation of one commodity to another. Here, the one stands forth in its character of value by reason of its relation to the other.

By making the coat the equivalent of the linen, we equate the labour embodied in the former to that in the latter. Now it is true that the tailoring, which makes the coat, is concrete labour of a different sort from the weaving which makes the linen. But the act of equating it to the weaving, reduces the tailoring to that which is really equal in the two kinds of labour, to their common character of human labour. In this roundabout way, then, the fact is expressed, that weaving also, in so far as it weaves value, has nothing to distinguish it from tailoring, and, consequently, is abstract human labour. It is the expression of equivalence between different sorts of commodities that alone brings into relief the specific character of value-creating labour, and this it does by actually reducing the different varieties of labour embodied in the different kinds of commodities to their common quality of human labour in the abstract.

There is, however, something else required beyond the expression of the specific character of the labour of which the value of the linen consists. Human labour-power motion, or human labour, creates value, but is not itself value. It becomes value only in its congealed state, when embodied in the form of some object. In order to express the value of the linen as a congelation of human labour, that value must be expressed as having objective existence, as being a something materially different from the linen

itself, and yet a something common to the linen and all other commodities. The problem is already solved.

When occupying the position of equivalent in the equation of value, the coat ranks qualitatively as the equal of the linen, as something of the same kind, because it is value. In this position it is a thing in which we see nothing but value, or whose palpable bodily form represents value. Yet the coat itself, the body of the commodity, coat, is a mere use-value. A coat as such no more tells us it is value, than does the first piece of linen we take hold of. This shows that when placed in value relation to the linen, the coat signifies more than when out of that relation, just as many a man strutting about in a gorgeous uniform counts for more than when in mufti.

In the production of the coat, human labour-power, in the shape of tailoring, must have been actually expended. Human labour is therefore accumulated in it. In this aspect the coat is a depository of value, but though worn to a thread, it does not let this fact show through. And as equivalent of the linen in the value equation, it exists under this aspect alone, counts therefore as embodied value, as a body that is value. A, for instance, cannot be “your majesty” to B, unless at the same time majesty in B’s eyes assumes the bodily form of A, and, what is more, with every new father of the people, changes its features, hair, and many other things besides.

Hence, in the value equation, in which the coat is the equivalent of the linen, the coat officiates as the form of value. The value of the commodity linen is expressed by the bodily form of the commodity coat, the value of one by the use-value of the other. As a use-value, the linen is something palpably different from the coat; as value, it is the same as the coat, and now has the appearance of a coat. Thus the linen acquires a value form different from its physical form. The fact that it is value, is made manifest by its equality with the coat, just as the sheep’s nature of a Christian is shown in his resemblance to the Lamb of God.

We see then, all that our analysis of the value of commodities has already told us, is told us by the linen itself, so soon as it comes into communication with another commodity, the coat. Only it betrays its thoughts in that language with which alone it is familiar, the language of commodities. In order to tell us that its own value is created by labour in its abstract character of human labour, it says that the coat, in so far as it is worth as much as the linen, and therefore is value, consists of the same labour as the linen. In order to inform us that its sublime reality as value is not the same

as its buckram body, it says that value has the appearance of a coat, and consequently that so far as the linen is value, it and the coat are as like as two peas. We may here remark, that the language of commodities has, besides Hebrew, many other more or less correct dialects. The German “werthsein,” to be worth, for instance, expresses in a less striking manner than the Romance verbs “valere,” “valer,” “valoir,” that the equating of commodity B to commodity A, is commodity A’s own mode of expressing its value. *Paris vaut bien une messe*.

By means, therefore, of the value relation expressed in our equation, the bodily form of commodity B becomes the value form of commodity A, or the body of commodity B acts as a mirror to the value of commodity A. By putting itself in relation with commodity B, as value in propriâ personâ, as the matter of which human labour is made up, the commodity A converts the value in use, B into the substance in which to express its, A’s own value. The value of A, thus expressed in the use-value of B, has taken the form of relative value.

Quantitative determination of Relative value.

Every commodity, whose value it is intended to express, is a useful object of given quantity, as 15 bushels of corn, or 100 lbs. of coffee. And a given quantity of any commodity contains a definite quantity of human labor. The value-form must therefore not only express value generally, but also value in definite quantity. Therefore, in the value relation of commodity A to commodity B, of the linen to the coat, not only is the latter, as value in general, made the equal in quality of the linen, but a definite quantity of coat (1 coat) is made the equivalent of a definite quantity (20 yards) of linen.

The equation, 20 yards of linen=1coat, or 20 yards of linen are worth one coat, implies that the same quantity of value-substance (congealed labour) is embodied in both; that the two commodities have each cost the same amount of labour or the same quantity of labour time. But the labour time necessary for the production 20 yards of linen or 1 coat varies with every change in the productiveness of weaving or tailoring. We have now to consider the influence of such changed on the quantitative aspect of the relative expression of value.

Let the value of the linen vary, that of the coat remaining constant. If, say in consequence of the exhaustion of flax-growing soil, the labour time necessary for the production of the linen be doubled, the value of the linen

will also be doubled. Instead of the equation, 20 yards of linen=1 coat, we should have 20 yards of linen=2 coats, since 1 coat would now contain only half the labour time embodied in 20 yards of linen. If, on the other hand, in consequence, say, of improved looms, this labour time be reduced by one half, the value of the linen would fall by one half. Consequently, we should have 20 yards of linen= $\frac{1}{2}$ coat. The relative value of commodity A, i.e., its value expressed in commodity B, raises and falls directly as the value of A, the value of B being supposed constant.

Let the value of the linen remain constant, while the value of the coat varies. If, under these circumstances, in consequence, for instance, of a poor crop of wool, the labour time necessary for the production of a coat becomes doubled, we have instead of 20 yards of linen=1 coat, 20 yards of linen= $\frac{1}{2}$ coat. If, on the other hand, the value of the coat sinks by one half, then 20 yards of linen=2 coats. Hence, if the value of commodity A remain constant, its relative value expressed in commodity B rises and falls inversely as the value of B.

If we compare the different cases in I. and II., we see that the same change of magnitude in relative value may arise from totally opposite causes. Thus, the equation, 20 yards of linen=1 coat, becomes 20 yards of linen=2 coats, either, because, the value of the linen has doubled, or because the value of the coat has fallen by one half; and it becomes 20 yards of linen= $\frac{1}{2}$ coat, either, because the value of the linen has fallen by one half, or because the value of the coat has doubled.

Let the quantities of labour time respectively necessary for the production of the linen and coat vary simultaneously in the same direction and in the same proportion. In this case 20 yards of linen continue equal to 1 coat, however much their values may have altered. Their change of value is seen as soon as they are compared with a third commodity, whose value has remained constant. If the values of all commodities rose or fell simultaneously, and in the same proportion, their relative value would remain unaltered. Their real change of value would appear from the diminished or increased quantity of commodities produced in a given time.

The labour time respectively necessary for the production of the linen and the coat, and therefore the value of these commodities may simultaneously vary in the same direction, but at unequal rates, or in opposite directions, or in other ways. The effect of all these possible

different variations, on the relative value of a commodity, may be deduced from the results of I., II., and III.

Thus real changes in the magnitude of value are neither unequivocally nor exhaustively reflected in their relative expression, that is in the equation expressing the magnitude of relative value. The relative value of a commodity may vary, although its value remains constant. Its relative value may remain constant, although its value varies; and finally, simultaneous variations in the magnitude of value and in that of its relative expression by no means necessarily correspond in amount.

The Equivalent form of value.

We have seen that commodity A (the linen), by expressing its value in the use-value of a commodity differing in kind (the coat), at the same time impresses upon the latter a specific form of value, namely that of the equivalent. The commodity linen manifests its quality of having a value by the fact that the coat, without having assumed a value form different from its bodily form, is equated to the linen. The fact that the latter therefore has a value is expressed by saying that the coat is directly exchangeable with it. Therefore, when we say that a commodity is in the equivalent form, we express the fact that it is directly exchangeable with other commodities.

When one commodity, such as a coat, serves as the equivalent of another, such as linen, and coats consequently acquire the characteristic property of being directly exchangeable with linen, we are far from knowing in what proportion the two are exchangeable. The value of the linen being given in magnitude, that proportion depends on the value of the coat. Whether the coat serves as the equivalent and the linen as relative value, or the linen as the equivalent and coat as relative value, the magnitude of the coat's value is determined, independently of its value form, by the labour time necessary for its production. But whenever the coat assumes in the equation of value, the position of equivalent, its value acquires no quantitative expression; on the contrary, the commodity coat now figures only as a definite quantity of some article.

For instance, 40 yards of linen are worth — what? 2 coats. Because the commodity coat here plays the part of equivalent, because the use-value coat, as opposed to the linen, figures as an embodiment of value, therefore a definite number of coats suffices to express the definite quantity of value in the linen. Two coats may therefore express the quantity of value of 40 yards

of linen, but they can never express the quantity of their own value. A superficial observation of this fact, namely, that in the equation of value, the equivalent figures exclusively as a simple quantity of some article, of some use-value, has misled Bailey, as also many others, both before and after him, into seeing, in the expression of value, merely a quantitative relation. The truth being, that when a commodity acts as equivalent, no quantitative determination of its value is expressed.

The first peculiarity that strikes us, in considering the form of the equivalent, is this; use-value becomes the form of manifestation, the phenomenal form of its opposite, value.

The bodily form of the commodity becomes its value form. But, mark well, that this quid pro quo exists in the case of any commodity B, only when some other commodity A enters into a value relation with it, and then only within the limits of this relation. Since no commodity can stand in the relation of equivalent to itself, and thus turn its own bodily shape into the expression of its own value, every commodity is compelled to choose some other commodity for its equivalent, and to accept the use-value, that is to say, the bodily shape of that other commodity as the form of its own value.

One of the measures that we apply to commodities as material substances, as use-values, will serve to illustrate this point. A sugar-loaf being a body, is heavy, therefore has weight: but we can neither see nor touch this weight. We then take various pieces of iron, whose weight has been determined beforehand. The iron, as iron, is no more the form of manifestation of weight, than is the sugar-loaf. Nevertheless, in order to express the sugar-loaf as so much weight, we put it into a weight-relation with the iron. In this relation, the iron officiates as a body representing nothing but weight. A certain quantity of iron therefore serves as a measure of the weight of the sugar, and represents, in relation to the sugar-loaf, weight embodied, the form of manifestation of weight. This part is played by the iron only within this relation, into which the sugar or any other body, whose weight has to be determined, enters with the iron. Were they not both heavy, they could not enter into this relation, and the one could therefore not serve as the expression of the weight of the other. When we throw both into the scales, we see in reality, that as weight they are both the same, and that, therefore, when taken in proper proportions, they have the same weight. Just as the substance iron, as a measure of weight, represents in

relation to the sugar-loaf weight alone, so, in our expression of value, the material object, coat, in relation to be linen represents value alone.

Here, however, the analogy ceases. The iron, in the expression of the weight of the sugar-loaf, represents a natural property common to both bodies, namely their weight; but the coat in the expression of value of the linen, represents a non-natural property of both, something purely social, namely, their value.

Since the relative form of value of a commodity — the linen, for example — expresses the value of that commodity, as being something wholly different from its substance and properties, as being, for instance, coat-like, we see that this expression itself indicates that some social relation lies at the bottom of it. With the equivalent form it is just the contrary. The very essence of this form is that the material commodity itself — the coat — just as it is, expresses value, and is endowed with the form of value by Nature itself. Of course this holds good only so long as the value relation exists, in which the coat stands in the position of equivalent to the linen. Since, however, the properties of a thing are not the result of its relations to other things, but only manifest themselves in such relations, the coat seems to be endowed with its equivalent form, its property of being directly exchangeable, just as much by Nature as it is endowed with the property of being heavy, or the capacity to keep us warm. Hence the enigmatical character of the equivalent form which escapes the notice of the bourgeois political economist, until this form, completely developed, confronts him in the shape of money. He then seeks to explain away the mystical character of gold and silver, by substituting for them less dazzling commodities, and by reciting, with ever renewed satisfaction, the catalogue of all possible commodities which at one time or another have played the part of equivalent. He has not the least suspicion that the most simple expression of value, such as 20 yds. of linen=1 coat, already propounds the riddle of the equivalent form for our solution.

The body of the commodity that serves as the equivalent, figures as the materialism of human labour in the abstract and is at the same time the product of some specifically useful concrete labour. The concrete labour becomes, therefore, the medium for expressing abstract human labour. If on the one hand the coat ranks as nothing but the embodiment of abstract human labour, so, on the other hand, the tailoring which is actually embodied in it, counts as nothing but the form under which that abstract

labour is realised. In the expression of value of the linen, the utility of the tailoring consists, not in making clothes, but in making an object, which we at once recognise to be Value, and therefore to be a congelation of labour, but of labour indistinguishable from that realised in the value of the linen. In order to act as such a mirror of value, the labour of tailoring must reflect nothing besides its own abstract quality of being human labour generally.

In tailoring, as well as in weaving, human labour-power is expended. Both, therefore, possess the general property of being human labour, and may, therefore, in certain cases, such as in the production of value, have to be considered under this aspect alone. There is nothing mysterious in this. But in the expression of value there is a complete turn of the tables. For instance, how is the fact to be expressed that weaving creates the value of the linen, not by virtue of being weaving, as such, but by reason of its general property of being human labour? Simply by opposing to weaving that other particular form of concrete labour (in this instance tailoring), which produces the equivalent of the product of weaving. Just as the coat in its bodily form became a direct expression of value, so now does tailoring, a concrete form of labour, appear as the direct and palpable embodiment of human labour generally.

Hence, the second peculiarity of the equivalent form is that concrete labour becomes the form under which its opposite, abstract human labour, manifests itself.

But because this concrete labour, tailoring in our case, ranks as, and is directly identified with, undifferentiated human labour, it also ranks as identical with any other sort of labor, and therefore with that embodied in linen. Consequently, although, like all other commodity-producing labour, it is the labour of private individuals, yet, at the same time, it ranks as labour directly social in its character. This is the reason why it results in a product directly exchangeable with other commodities. We have then a third peculiarity of the Equivalent form, namely, that the labour of private individuals takes the form of its opposite, labour directly social in its form.

The two latter peculiarities of the Equivalent form will become more intelligible if we go back to the great thinker who was the first to analyse so many forms, whether of thought, society, or nature, and amongst them also the form of value. I mean Aristotle.

In the first place, he clearly enunciates that the money form of commodities is only the further development of the simple form of value — i.e., of the expression of the value of one commodity in some other commodity taken at random; for he says

5 beds=1 house

is not to be distinguished from
5 beds=so much money.

He further sees that the value relation which gives rise to this expression makes it necessary that the house should qualitatively be made the equal of the bed, and that, without such an equalization, these two clearly different things could not be compared with each other as commensurable quantities. “Exchange,” he says, “cannot take place without equality, and equality not without commensurability” . Here, however, he comes to a stop, and gives up the further analysis of the form of value. “It is, however, in reality, impossible , that such unlike things can be commensurable” — i.e., qualitatively equal. Such an equalisation can only be something foreign to their real nature, consequently only “a make-shift for practical purposes.”

Aristotle therefore, himself, tells us, what barred the way to his further analysis; it was the absence of any concept of value. What is that equal something, that common substance, which admits of the value of the beds being expressed by a house? Such a thing, in truth, cannot exist, says Aristotle. And why not? Compared with the beds, the house does represent something equal to them, in so far as it represents what is really equal, both in the beds and the house. And that is — human labour.

There was, however, an important fact which prevented Aristotle from seeing that, to attribute value to commodities, is merely a mode of expressing all labour as equal human labour, and consequently as labour of equal quality. Greek society was founded upon slavery, and had, therefore, for its natural basis, the inequality of men and of their labour powers. The secret of the expression of value, namely, that all kinds of labour are equal and equivalent, because, and so far as they are human labour in general, cannot be deciphered, until the notion of human equality has already

acquired the fixity of a popular prejudice. This, however, is possible only in a society in which the great mass of the produce of labour takes the form of commodities, in which, consequently, the dominant relation between man and man, is that of owners of commodities. The brilliancy of Aristotle's genius is shown by this alone, that he discovered, in the expression of the value of commodities, a relation of equality. The peculiar conditions of the society in which he lived, alone prevented him from discovering what, "in truth," was at the bottom of this equality.

The Elementary form of value considered as a whole.

The elementary form of value of a commodity is contained in the equation, expressing its value relation to another commodity of a different kind, or in its exchange relation to the same. The value of commodity A is qualitatively expressed by the fact that commodity B is directly exchangeable with it. Its value is quantitatively expressed by the fact, that a definite quantity of B is exchangeable with a definite quantity of A. In other words, the value of a commodity obtains independent and definite expression, by taking the form of exchange value. When, at the beginning of this chapter, we said, in common parlance, that a commodity is both a use-value and an exchange value, we were, accurately speaking, wrong. A commodity is a use-value or object of utility, and a value. It manifests itself as this two-fold thing, that it is, as soon as its value assumes an independent form — viz., the form exchange value. It never assumes this form when isolated, but only when placed in a value or exchange relation with another commodity of a different kind. When once we know this, such a mode of expression does no harm; it simply serves as an abbreviation.

Our analysis has shown, that the form or expression of the value of a commodity originates in the nature of value, and not that value and its magnitude originate in the mode of their expression as exchange value. This, however, is the delusion as well of the mercantilists and their recent revivors, Ferrier, Ganih, and others, as also of their antipodes, the modern bagmen of Free Trade, such as Bastiat. The mercantilists lay special stress on the qualitative aspect of the expression of value, and consequently on the equivalent form of commodities, which attains its full perfection in money. The modern hawkers of Free Trade, who must get rid of their article at any price, on the other hand, lay most stress on the quantitative aspect of the relative form of value. For them there consequently exists neither value, nor magnitude of value, anywhere except in its expression by means of the

exchange relation of commodities, that is, in the daily list of prices current. MacLeod, who has taken upon himself to dress up the confused ideas of Lombard Street in the most learned finery, is a successful cross between the superstitious mercantilists, and the enlightened Free Trade bagmen.

A close scrutiny of the expression of the value of A in terms of B, contained in the equation expressing the value relation of A to B, has shown us that, within that relation, the bodily form of A figures only as a use-value, the bodily form of B only as the form or aspect of value. The opposition or contrast existing internally in each commodity between use-value and value, is, therefore, made evident externally by two commodities being placed in such relation to each other, that the commodity whose value it is sought to express, figures directly as a mere use-value, while the commodity in which that value is to be expressed, figures directly as mere exchange value. Hence the elementary form of value of a commodity is the elementary form in which the contrast contained in that commodity, between use-value and value, becomes apparent.

Every product of labour is, in all states of society, a use-value; but it is only at a definite historical epoch in a society's development that such product becomes a commodity, viz., at the epoch when the labour spent on the production of a useful article becomes expressed as one of the objective qualities of that article, i.e., as its value. It therefore follows that the elementary value-form is also the primitive form under which a product of labour appears historically as a commodity, and that the gradual transformation of such products into commodities, proceeds *pari passu* with the development of the value-form.

We perceive, at first sight, the deficiencies of the elementary form of value: it is a mere germ, which must undergo a series of metamorphoses before it can ripen into the Price-form.

The expression of the value of commodity A in terms of any other commodity B, merely distinguishes the value from the use-value of A, and therefore places A merely in a relation of exchange with a single different commodity, B; but it is still far from expressing A's qualitative equality, and quantitative proportionality, to all commodities. To the elementary relative value-form of a commodity, there corresponds the single equivalent form of one other commodity. Thus, in the relative expression of value of the linen, the coat assumes the form of equivalent, or of being directly exchangeable, only in relation to a single commodity, the linen.

Nevertheless, the elementary form of value passes by an easy transition into a more complete form. It is true that by means of the elementary form, the value of a commodity A, becomes expressed in terms of one, and only one, other commodity. But that one may be a commodity of any kind, coat, iron, corn, or anything else. Therefore, according as A is placed in relation with one or the other, we get for one and the same commodity, different elementary expressions of value. The number of such possible expressions is limited only by the number of the different kinds of commodities distinct from it. The isolated expression of A's value, is therefore convertible into a series, prolonged to any length, of the different elementary expressions of that value.

Total or Expanded form of value.

z Com. A=u Com. B or=v Com. C or=w Com. D or=x Com. E or=8c.
(20 yards of linen=1 coat or=10 lb tea or=40 lb coffee or=1 quarter corn or=2 ounces gold or= $\frac{1}{2}$ ton iron or=8c.)

The Expanded Relative form of value.

The value of a single commodity, the linen, for example, is now expressed in terms of numberless other elements of the world of commodities. Every other commodity now becomes a mirror of the linen's value. It is thus, that for the first time this value shows itself in its true light as a congelation of undifferentiated human labour. For the labour that creates it, now stands expressly revealed, as labour that ranks equally with every other sort of human labour, no matter what its form, whether tailoring, ploughing, mining, &c. and no matter, therefore, whether it is realised in coats, corn, iron, or gold. The linen, by virtue of the form of its value, now stands in a social relation, no longer with only one other kind of commodity, but with the whole world of commodities. As a commodity, it is a citizen of that world. At the same time, the interminable series of value equations implies, that as regards the value of a commodity, it is a matter of indifference under what particular form, or kind, of use-value it appears.

In the first form, 20 yds. of linen=1 coat, it might for ought that otherwise appears be pure accident, that these two commodities are exchangeable in definite quantities. In the second form, on the contrary, we perceive at once the background that determines, and is essentially different from, this accidental appearance. The value of the linen remains unaltered

in magnitude, whether expressed in coats, coffee, or iron, or in numberless different commodities, the property of as many different owners. The accidental relation between two individual commodity-owners disappears. It becomes plain, that it is not the exchange of commodities which regulates the magnitude of their value; but, on the contrary, that it is the magnitude of their value which controls their exchange proportions.

The particular Equivalent form.

Each commodity, such as coat, tea, corn, iron, &c., figures in the expression of value of the linen, as an equivalent, and consequently as a thing that is value. The bodily form of each of these commodities figures now as a particular equivalent form, one out of many. In the same way the manifold concrete form, one out of many. In the same way the manifold concrete useful kinds of labour, embodied in these different commodities, rank now as so many different forms of the realisation, or manifestation, of indifferenced human labour.

Defects of the Total or Expanded form of value.

In the first place, the relative expression of value is incomplete because the series representing it is interminable. The chain of which each equation of value is a link, is liable at any moment to be lengthened by each new kind of commodity that comes into existence and furnishes the material for a fresh expression of value. In the second place, it is a many-coloured mosaic of disparate and independent expressions of value. And lastly, if, as must be the case, the relative value of each commodity in turn, becomes expressed in this expanded form, we get for each of them a relative value-form, different in every case, and consisting of an interminable series of expressions of value. The defects of the expanded relative-value form are reflected in the corresponding equivalent form. Since the bodily form of each single commodity is one particular equivalent form amongst numberless others, we have, on the whole, nothing but fragmentary equivalent forms, each excluding the others. In the same way, also, the special, concrete, useful kind of labour embodied in each particular equivalent, is presented only as a particular kind of labour, and therefore not as an exhaustive representative of human labour generally. The latter, indeed, gains adequate manifestation in the totality of its manifold, particular, concrete forms. But, in that case, its expression in an infinite series is ever incomplete and deficient in unity.

The expanded relative value form is, however, nothing but the sum of the elementary relative expressions or equations of the first kind, such as

20 yards of linen=1 coat
 20 yards of linen=10 lbs. of tea, etc.

Each of these implies the corresponding inverted equation,

1=coat=20 yards of linen
 10 lbs. of tea=20 yards of linen, etc.

In fact, when a person exchanges his linen for many other commodities, and thus expresses its value in a series of other commodities, it necessarily follows, that the various owners of the latter exchange them for the linen, and consequently express the value of their various commodities in one and the same third commodity, the linen. If then, we reverse the series, 20 yards of linen=1 coat or=10 lbs. of tea, etc., that is to say, if we give expression to the converse relation already implied in the series, we get,

The General form of value.

1 coat	10 lbs. of tea	40 lbs. of coffee	1 quarter of corn	2	=20
ounces of gold	½ a ton of iron	x com. A., etc.			} yards of linen

The altered character of the form of value.

All commodities now express their value (1) in an elementary form, because in a single commodity; (2) with unity, because in one and the same commodity. This form of value is elementary and the same for all, therefore general.

The forms A and B were fit only to express the value of a commodity as something distinct from its use-value or material form.

The first form, A, furnishes such equations as the following: — 1 coat=20 yards of linen, 10 lbs. of tea=½ ton of iron. The value of the coat is equated to linen, that of the tea to iron. But to be equated to linen, and again to iron, is to be as different as are linen and iron. This form, it is plain, occurs practically only in the first beginning, when the products of labour are converted into commodities by accidental and occasional exchanges.

The second form, B, distinguishes, in a more adequate manner than the first, the value of a commodity from its use-value; for the value of the coat is there placed in contrast under all possible shapes with the bodily form of

the coat; it is equated to linen, to iron, to tea, in short, to everything else, only not to itself, the coat. On the other hand, any general expression of value common to all is directly excluded; for, in the equation of value of each commodity, all other commodities now appear only under the form of equivalents. The expanded form of value comes into actual existence for the first time so soon as a particular product of labour, such as cattle, is no longer exceptionally, but habitually, exchanged for various other commodities.

The third and lastly developed form expresses the values of the whole world of commodities in terms of a single commodity set apart for the purpose, namely, the linen, and thus represents to us their values by means of their equality with linen. The value of every commodity is now, by being equated to linen, not only differentiated from its own use-value, but from all other use-values generally, and is, by that very fact, expressed as that which is common to all commodities. By this form, commodities are, for the first time, effectively brought into relation with one another as values, or made to appear as exchange values.

The two earlier forms either express the value of each commodity in terms of a single commodity of a different kind, or in a series of many such commodities. In both cases, it is, so to say, the special business of each single commodity to find an expression for its value, and this it does without the help of the others. These others, with respect to the former, play the passive parts of equivalents. The general form of value C, results from the joint action of the whole world of commodities, and from that alone. A commodity can acquire a general expression of its value only by all other commodities, simultaneously with it, expressing their values in the same equivalent; and every new commodity must follow suit. It thus becomes evident that, since the existence of commodities as values is purely social, this social existence can be expressed by the totality of their social relations alone, and consequently that the form of their value must be a socially recognised form.

All commodities being equated to linen now appear not only as qualitatively equal as values generally, but also as values whose magnitudes are capable of comparison. By expressing the magnitudes of their values in one and the same material, the linen, those magnitudes are also compared with each other. For instance, 10 lbs. of tea=20 yards of linen, and 40 lbs. of coffee=20 yards of linen. Therefore, 10 lbs. of tea=40 lbs. of coffee. In

other words, there is contained in 1 lb. of coffee only one-fourth as much substance of value — labour — as is contained in 1 lb. of tea.

The general form of relative value, embracing the whole world of commodities, converts the single commodity that is excluded from the rest, and made to play the part of equivalent — here the linen — into the universal equivalent. The bodily form of the linen is now the form assumed in common by the value of all commodities; it therefore becomes directly exchangeable with all and every of them. The substance linen becomes the visible incarnation, the social chrysalis state of every kind of human labour. Weaving, which is the labour of certain private individuals producing a particular article, linen, acquires in consequence a social character, the character of equality with all other kinds of labour. The innumerable equations of which the general form of value is composed, equate in turn the labour embodied in the linen to that embodied in every other commodity, and they thus convert weaving into the general form of manifestation of undifferentiated human labour. In this manner the labour realised in the values of commodities is presented not only under its negative aspect, under which abstraction is made from every concrete form and useful property of actual work, but its own positive nature is made to reveal itself expressly. The general value-form is the reduction of all kinds of actual labour to their common character of being human labour generally, of being the expenditure of human labour power.

The general value form, which represents all products of labour as mere congelations of undifferentiated human labour, shows by its very structure that it is the social resumé of the world of commodities. That form consequently makes it indisputably evident that in the world of commodities the character possessed by all labour of being human labour constitutes its specific social character.

The interdependent development of the Relative form of value, and of the Equivalent form.

The degree of development of the relation form of value corresponds to that of the equivalent form. But we must bear in mind that the development of the latter is only the expression and result of the development of the former.

The primary or isolated relative form of value of one commodity converts some other commodity into an isolated equivalent. The expanded form of relative value, which is the expression of the value of one

commodity in terms of all other commodities, endows those other commodities with the character of particular equivalents differing in kind. And lastly, a particular kind of commodity acquires the character of universal equivalent, because all other commodities make it the material in which they uniformly express their value.

The antagonism between the relative form of value and the equivalent form, the poles of the value form, is developed concurrently with that form itself.

The first form, 20 yds. of linen=one coat, already contains this antagonism, without as yet fixing it. According as we read this equation forwards or backwards, the parts played by the linen and the coat are different. In the one case the relative value of the linen is expressed in the coat, in the other case the relative value of the coat is expressed in the linen. In this first form of value, therefore, it is difficult to grasp the polar contrast.

Form B shows that only one single commodity at a time can completely expand its relative value, and that it acquires this expanded form only because, and in so far as, all other commodities are, with respect to it, equivalents. Here we cannot reverse the equation, as we can the equation 20 yds. of linen=1 coat, without altering its general character, and converting it from the expanded form of value into the general form of value.

Finally, the form C gives to the world of commodities a general social relative form of value, because, and in so far as, thereby all commodities, with the exception of one, are excluded from the equivalent form. A single commodity, the linen, appears therefore to have acquired the character of direct exchangeability with every other commodity because, and in so far as, this character is denied to every other commodity.

The commodity that figures as universal equivalent, is, on the other hand, excluded from the relative value form. If the linen, or any other commodity serving as universal equivalent, were, at the same time, to share in the relative form of value, it would have to serve as its own equivalent. We should then have 20 yds. of linen=20 yds. of linen; this tautology expresses neither value, nor magnitude of value. In order to express the relative value of the universal equivalent, we must rather reverse the form C. This equivalent has no relative form of value in common with other commodities, but its value is relatively expressed by a never ending series of other commodities. Thus, the expanded form of relative value, or form B,

now shows itself as the specific form of relative value for the equivalent commodity.

Transition from the General form of value to the Money form.

The universal equivalent form is a form of value in general. It can, therefore, be assumed by any commodity. On the other hand, if a commodity be found to have assumed the universal equivalent form (form C), this is only because and in so far as it has been excluded from the rest of all other commodities as their equivalent, and that by their own act. And from the moment that this exclusion becomes finally restricted to one particular commodity, from that moment only, the general form of relative value of the world of commodities obtains real consistence and general social validity.

The particular commodity, with whose bodily form the equivalent form is thus socially identified, now becomes the money commodity, or serves as money. It becomes the special social function of that commodity, and consequently its social monopoly, to play within the world of commodities the part of the universal equivalent. Amongst the commodities which, in form B, figure as particular equivalents of the linen, and in form C, express in common their relative values in linen, this foremost place has been attained by one in particular — namely, gold. If, then, in form C we replace the linen by gold, we get,

The Money form.

20 yards of linen	=	
1 coat	=	
10 lb of tea	=	
40 lb of coffee	=	} 2 ounces of gold.
1 qr. of corn	=	
½ a ton iron	=	
x commodity A	=	

In passing from form A to form B, and from the latter to form C, the changes are fundamental. On the other hand, there is no difference between forms C and D, except that, in the latter, gold has assumed the equivalent form in the place of linen. Gold is in form D, what linen was in form C — the universal equivalent. The progress consists in this alone, that the character of direct and universal exchangeability — in other words, that the

universal equivalent form — has now, by social custom, become finally identified with the substance, gold.

Gold is now money with reference to all other commodities only because it was previously, with reference to them, a simple commodity. Like all other commodities, it was also capable of serving as an equivalent, either as simple equivalent in isolated exchanges, or as particular equivalent by the side of others. Gradually it began to serve, within varying limits, as universal equivalent. So soon as it monopolises this position in the expression of value for the world of commodities, it becomes the money commodity, and then, and not till then, does form D become distinct from form C, and the general form of value become changed into the money form.

The elementary expression of the relative value of a single commodity, such as linen, in terms of the commodity, such as gold, that plays the part of money, is the price form of that commodity. The price form of the linen is therefore

20 yards of linen=2 ounces of gold, or, if 2 ounces of gold when coined are £2, 20 yards of linen=£2.

The difficulty in forming a concept of the money form, consists in clearly comprehending the universal equivalent form, and as a necessary corollary, the general form of value, form C. The latter is deducible from form B, the expanded form of value, the essential component element of which, we saw, is form A, 20 yards of linen=1 coat or x commodity A=y commodity B. The simple commodity form is therefore the germ of the money form.

SECTION 4. — THE FETISHISM OF COMMODITIES AND THE SECRET THEREOF.

A commodity appears, at first sight, a very trivial thing, and easily understood. Its analysis shows that it is, in reality, a very queer thing, abounding in metaphysical subtleties and theological niceties. So far as it is a value in use, there is nothing mysterious about it, whether we consider it from the point of view that by its properties it is capable of satisfying human wants, or from the point that those properties are the product of human labour. It is as clear as noon-day, that man, by his industry, changes

the forms of the materials furnished by nature, in such a way as to make them useful to him. The form of wood, for instance, is altered, by making a table out of it. Yet, for all that the table continues to be that common, everyday thing, wood. But, so soon as it steps forth as a commodity, it is changed into something transcendent. It not only stands with its feet on the ground, but, in relation to all other commodities, it stands on its head, and evolves out of its wooden brain grotesque ideas, far more wonderful than “table-turning” ever was.

The mystical character of commodities does not originate, therefore, in their use-value. Just as little does it proceed from the nature of the determining factors of value. For, in the first place, however varied the useful kinds of labour, or productive activities, may be, it is a physiological fact, that they are functions of the human organism, and that each such function, whatever may be its nature or form, is essentially the expenditure of human brain, nerves, muscles, &c. Secondly, with regard to that which forms the ground-work for the quantitative determination of value, namely, the duration of that expenditure, or the quantity of labour, it is quite clear that there is a palpable difference between its quantity and quality. In all states of society, the labour-time that it costs to produce the means of subsistence must necessarily be an object of interest to mankind, though not of equal interest in different stages of development. And lastly, from the moment that men in any way work for one another, their labour assumes a social form.

Whence, then, arises the enigmatical character of the product of labour, so soon as it assumes the form of commodities? Clearly from this form itself. The equality of all sorts of human labour is expressed objectively by their products all being equally values; the measure of the expenditure of labour-power by the duration of that expenditure, takes the form of the quantity of value of the products of labour; and finally, the mutual relations of the producers, within which the social character of their labour affirms itself, take the form of a social relation between the products.

A commodity is therefore a mysterious thing, simply because in it the social character of men’s labour appears to them as an objective character stamped upon the product of that labour; because the relation of the producers to the sum total of their own labour is presented to them as a social relation, existing not between themselves, but between the products of their labour. This is the reason why the products of labour become

commodities, social things whose qualities are at the same time perceptible and imperceptible by the senses. In the same way the light from an object is perceived by us not as the subjective excitation of our optic nerve, but as the objective form of something outside the eye itself. But, in the act of seeing, there is at all events, an actual passage of light from one thing to another, from the external object to the eye. There is a physical relation between physical things. But it is different with commodities. There, the existence of the things quâ commodities, and the value relation between the products of labour which stamps them as commodities, have absolutely no connection with their physical properties and with the material relations arising therefrom. There it is a definite social relation between men, that assumes, in their eyes, the fantastic form of a relation between things. In order, therefore, to find an analogy, we must have recourse to the mist-enveloped regions of the religious world. In that world the productions of the human brain appear as independent beings endowed with life, and entering into relation both with one another and the human race. So it is in the world of commodities with the products of men's hands. This I call the Fetishism which attaches itself to the products of labour, so soon as they are produced as commodities, and which is therefore inseparable from the production of commodities.

This Fetishism of commodities has its origin, as the foregoing analysis has already shown, in the peculiar social character of the labour that produces them.

As a general rule, articles of utility become commodities, only because they are products of the labour of private individuals or groups of individuals who carry on their work independently of each other. The sum total of the labour of all these private individuals forms the aggregate labour of society. Since the producers do not come into social contact with each other until they exchange their products, the specific social character of each producer's labour does not show itself except in the act of exchange. In other words, the labour of the individual asserts itself as a part of the labour of society, only by means of the relations which the act of exchange establishes directly between the products, and indirectly, through them, between the producers. To the latter, therefore, the relations connecting the labour of the individual with that of the rest appear, not as direct social relations between individuals at work, but as what they really are, material relations between persons and social relations between things. It is only by

being exchanged that the products of labour acquire, as values, one uniform social status, distinct from their varied forms of existence as objects of utility. This division of a product into a useful thing and a value becomes practically important, only when exchange has acquired such an extension that useful articles are produced for the purpose of being exchanged, and their character as values has therefore to be taken into account, beforehand, during production. From this moment the labour of the individual producer acquires socially a two-fold character. On the one hand, it must, as a definite useful kind of labour, satisfy a definite social want, and thus hold its place as part and parcel of the collective labour of all, as a branch of a social division of labour that has sprung up spontaneously. On the other hand, it can satisfy the manifold wants of the individual producer himself, only in so far as the mutual exchangeability of all kinds of useful private labour is an established social fact, and therefore the private useful labour of each producer ranks on an equality with that of all others. The equalization of the most different kinds of labour can be the result only of an abstraction from their inequalities, or of reducing them to their common denominator, viz., expenditure of human labour power or human labour in the abstract. The two-fold social character of the labour of the individual appears to him, when reflected in his brain, only under those forms which are impressed upon that labour in everyday practice by the exchange of products. In this way, the character that his own labour possesses of being socially useful takes the form of the condition, that the product must be not only useful, but useful for others, and the social character that his particular labour has of being the equal of all other particular kinds of labour, takes the form that all the physically different articles that are the products of labour, have one common quality, viz, that of having value.

Hence, when we bring the products of our labour into relation with each other as values, it is not because we see in these articles the material receptacles of homogeneous human labour. Quite the contrary; whenever, by an exchange, we equate as values our different products, by that very act, we also equate, as human labour, the different kinds of labour expended upon them. We are not aware of this, nevertheless we do it. Value, therefore, does not stalk about with a label describing what it is. It is value, rather, that converts every product into a social hieroglyphic. Later on, we try to decipher the hieroglyphic, to get behind the secret of our own social products; for to stamp an object of utility as a value, is just as much a social

product as language. The recent scientific discovery, that the products of labour, so far as they are values, are but material expressions of the human labour spent in their production, marks, indeed, an epoch in the history of the development of the human race, but, by no means, dissipates the mist through which the social character of labour appears to us to be an objective character of the products themselves. The fact, that in the particular form of production with which we are dealing, viz., the production of commodities, the specific social character of private labour carried on independently, consists in the equality of every kind of the labour, by virtue of its being human labour, which character, therefore, assumes in the product the form of value — this fact appears to the producers, notwithstanding the discovery above referred to, to be just as real and final, as the fact, that, after the discovery by science of the component gases of air, the atmosphere itself remained unaltered.

What, first of all, practically concerns producers when they make an exchange, is the question, how much of some other product they get for their own? in what proportions the products are exchangeable? When these proportions have, by custom, attained a certain stability, they appear to result from the nature of the products, so that, for instance, one ton of iron and two ounces of gold appear as naturally to be of equal value as a pound of gold and a pound of iron in spite of their different physical and chemical qualities appear to be of equal weight. The character of having value, when once impressed upon products, obtains fixity only by reason of their acting and re-acting upon each other as quantities of value. These quantities vary continually, independently of the will, foresight and action of the producers. To them, their own social action takes the form of the action of objects, which rule the producers instead of being ruled by them. It requires a fully developed production of commodities before, from accumulated experience alone, the scientific conviction springs up, that all the different kinds of private labour, which are carried on independently of each other, and yet as spontaneously developed branches of the social division of labour, are continually being reduced to the quantitative proportions in which society requires them. And why? Because, in the midst of all the accidental and ever fluctuating exchange-relations between the products, the labour-time socially necessary for their production forcibly asserts itself like an overriding law of nature. The law of gravity thus asserts itself when a house falls about our ears. The determination of the magnitude of value by labour-

time is therefore a secret, hidden under the apparent fluctuations in the relative values of commodities. Its discovery, while removing all appearance of mere accidentality from the determination of the magnitude of the values of products, yet in no way alters the mode in which that determination takes place.

Man's reflections on the forms of social life, and consequently, also, his scientific analysis of those forms, taken a course directly opposite to that of their actual historical development. He begins, *post festum*, with the results of the process of development ready to hand before him. The characters that stamp products as commodities, and whose establishment is a necessary preliminary to the circulation of commodities, have already acquired the stability of natural, self-understood forms of social life, before man seeks to decipher, not their historical character, for in his eyes they are immutable, but their meaning. Consequently it was the analysis of the prices of commodities that alone led to the determination of the magnitude of value, and it was the common expression of all commodities in money that alone led to the establishment of their characters as values. It is, however, just this ultimate money form of the world of commodities that actually conceals, instead of disclosing, the social character of private labour, and the social relations between the individual producers. When I state that coats or boots stand in a relation to linen, because it is the universal incarnation of abstract human labour, the absurdity of the statement is self-evident. Nevertheless, when the producers of coats and boots compare those articles with linen, or, what is the same thing with gold or silver, as the universal equivalent, they express the relation between their own private labour and the collective labour of society in the same absurd form.

The categories of bourgeois economy consist of such like forms. They are forms of thought expressing with social validity the conditions and relations of a definite, historically determined mode of production, viz., the production of commodities. The whole mystery of commodities, all the magic and necromancy that surrounds the products of labour as long as they take the form of commodities, vanishes therefore, so soon as we come to other forms of production.

Since Robinson Crusoe's experiences are a favorite theme with political economists, let us take a look at him on his island. Moderate though he be, yet some few wants he has to satisfy, and must therefore do a little useful

work of various sorts, such as making tools and furniture, taming goats, fishing and hunting. Of his prayers and the like we take no account, since they are a source of pleasure to him, and he looks upon them as so much recreation. In spite of the variety of his work, he knows that his labour, whatever its form, is but the activity of one and the same Robinson, and consequently, that it consists of nothing but different modes of human labour. Necessity itself compels him to apportion his time accurately between his different kinds of work. Whether one kind occupies a greater space in his general activity than another, depends on the difficulties, greater or less as the case may be, to be overcome in attaining the useful effect aimed at. This our friend Robinson soon learns by experience, and having rescued a watch, ledger, and pen and ink from the wreck, commences, like a true-born Briton, to keep a set of books. His stock-book contains a list of the objects of utility that belong to him, of the operations necessary for their production; and lastly; of the labour time that definite quantities of those objects have, on an average, cost him. All the relations between Robinson and the objects that form this wealth of his own creation, are here so simple and clear as to be intelligible without exertion, even to Mr. Sedley Taylor. And yet those relations contain all that is essential to the determination of value.

Let us now transport ourselves from Robinson's island bathed in light to the European middle ages shrouded in darkness. Here, instead of the independent man, we find everyone dependent, serfs and lords, vassals and suzerains, laymen and clergy. Personal dependence here characterises the social relations of production just as much as it does the other spheres of life organized on the basis of that production. But for the very reason that personal dependence forms the groundwork of society, there is no necessity for labour and its products to assume a fantastic form different from their reality. They take the shape, in the transactions of society, of services in kind and payments in kind. Here the particular and natural form of labour, and not, as in a society based on production of commodities, its general abstract form is the immediate social form of labour. Compulsory labour is just as properly measured by time, as commodity-producing labour; but every serf knows that what he expends in the service of his lord, is a definite quantity of his own personal labour-power. The tithe to be rendered to the priest is more matter of fact than his blessing. No matter, then, what we may think of the parts played by the different classes of people

themselves in this society, the social relations between individuals in the performance of their labour, appear at all events as their own mutual personal relations, and are not disguised under the shape of social relations between the products of labour.

For an example of labour in common or directly associated labour, we have no occasion to go back to that spontaneously developed form which we find on the threshold of the history of all civilized races. We have one close at hand in the patriarchal industries of a peasant family, that produces corn, cattle, yarn, linen, and clothing for home use. These different articles are, as regards the family, so many products of its labour, but as between themselves, they are not commodities. The different kinds of labour, such as tillage, cattle tending, spinning, weaving and making clothes, which result in the various products, are in themselves, and such as they are, direct social functions, because functions of the family, which just as much as a society based on the production of commodities, possesses a spontaneously developed system of division of labour. The distribution of the work within the family, and the regulation of the labour-time of the several members, depend as well upon differences of age and sex as upon natural conditions varying with the seasons. The labour-power of each individual, by its very nature, operates in this case merely as a definite portion of the whole labour-power of the family, and therefore, the measure of the expenditure of individual labour-power by its duration, appears here by its very nature as a social character of their labour.

Let us now picture to ourselves, by way of change, a community of free individuals, carrying on their work with the means of production in common, in which the labour-power of all the different individuals is consciously applied as the combined labour-power of the community. All the characteristics of Robinson's labour are here repeated, but with this difference, that they are social, instead of individual. Everything produced by him was exclusively the result of his own personal labour, and therefore simply an object of use for himself. The total product of our community is a social product. One portion serves as fresh means of production and remains social. But another portion is consumed by the members as means of subsistence. A distribution of this portion amongst them is consequently necessary. The mode of this distribution will vary with the productive organization of the community, and the degree of historical development attained by the producers. We will assume, but merely for the sake of a

parallel with the production of commodities, that the share of each individual producer in the means of subsistence is determined by his labour-time. Labour-time would, in that case, play a double part. Its apportionment in accordance with a definite social plan maintains the proper proportion between the different kinds of work to be done and the various wants of the community. On the other hand, it also serves as a measure of the portion of the common labour borne by each individual and of his share in the part of the total product destined for individual consumption. The social relations of the individual producers, with regard both to their labour and to its products, are in this case perfectly simple and intelligible, and that with regard not only to production but also to distribution.

The religious world is but the reflex of the real world. And for a society based upon the production of commodities, in which the producers in general enter into social relations with one another by treating their products as commodities and values, whereby they reduce their individual private labour to the standard of homogeneous human labour — for such a society, Christianity with its cultus of abstract man, more especially in its bourgeois developments, Protestantism, Deism, &c., is the most fitting form of religion. In the ancient Asiatic and other ancient modes of production, we find that the conversion of products into commodities, and therefore the conversion of men into producers of commodities, holds a subordinate place, which, however, increases in importance as the primitive communities approach nearer and nearer to their dissolution. Trading nations, properly so called, exist in the ancient world only in its interstices, like the gods of Epicurus in the Intermundia, or like Jews in the pores of Polish society. Those ancient social organisms of production are, as compared with bourgeois society, extremely simple and transparent. But they are founded either on the immature development of man individually, who has not yet severed the umbilical cord that unites him with his fellow men in a primitive tribal community, or upon direct relations of subjection. They can arise and exist only when the development of the productive power of labour has not risen beyond a low stage, and when, therefore, the social relations within the sphere of material life, between man and man, and between man and Nature, are correspondingly narrow. This narrowness is reflected in the ancient worship of Nature, and in the other elements of the popular religions. The religious reflex of the real world can, in any case, only then finally vanish, when the practical relations of everyday life offer

to man none but perfectly intelligible and reasonable relations with regard to his fellowmen and to nature.

The life-process of society, which is based on the process of material production, does not strip off its mystical veil until it is treated as production by freely associated men, and is consciously regulated by them in accordance with a settled plan. This, however, demands for society a certain material groundwork or set of conditions of existence which in their turn are the spontaneous product of a long and painful process of development.

Political economy has indeed analysed, however incompletely, value and its magnitude, and has discovered what lies beneath these forms. But it has never once asked the question why labour is represented by the value of its product and labour time by the magnitude of that value. These formulæ, which bear stamped upon them in unmistakeable letters, that they belong to a state of society, in which the process of production has the mastery over man, instead of being controlled by him, such formulæ appear to the bourgeois intellect to be as much a self-evident necessity imposed by nature as productive labour itself. Hence forms of social production that preceded the bourgeois form, are treated by the bourgeoisie in much the same way as the Fathers of the Church treated pre-Christian religions.

To what extent some economists are misled by the Fetishism inherent in commodities, or by the objective appearance of the social characteristics of labour, is shown, amongst other ways, by the dull and tedious quarrel over the part played by Nature in the formation of exchange value. Since exchange value is a definite social manner of expressing the amount of labour bestowed upon an object, Nature has no more to do with it, than it has in fixing the course of exchange.

The mode of production in which the product takes the form of a commodity, or is produced directly for exchange, is the most general and most embryonic form of bourgeois production. It therefore makes its appearance at an early date in history, though not in the same predominating and characteristic manner as now-a-days. Hence its Fetish character is comparatively easy to be seen through. But when we come to more concrete forms, even this appearance of simplicity vanishes. Whence arose the illusions of the monetary system? To it gold and silver, when serving as money, did not represent a social relation between producers, but were

natural objects with strange social properties. And modern economy, which looks down with such disdain on the monetary system, does not its superstition come out as clear as noon-day, whenever it treats of capital? How long is it since economy discarded the physiocratic illusion, that rents grow out of the soil and not out of society?

But not to anticipate, we will content ourselves with yet another example relating to the commodity form. Could commodities themselves speak, they would say: Our use-value may be a thing that interests men. It is no part of us as objects. What, however, does belong to us as objects, is our value. Our natural intercourse as commodities proves it. In the eyes of each other we are nothing but exchange values. Now listen how those commodities speak through the mouth of the economist. “Value” — (i.e., exchange value) “is a property of things, riches” — (i.e., use-value) “of man. Value, in this sense, necessarily implies exchanges, riches do not.” “Riches” (use-value) “are the attribute of men, value is the attribute of commodities. A man or a community is rich, a pearl or a diamond is valuable...A pearl or a diamond is valuable” as a pearl or diamond. So far no chemist has ever discovered exchange value either in a pearl or a diamond. The economical discoverers of this chemical element, who by-the-by lay special claim to critical acumen, find however that the use-value of objects belongs to them independently of their material properties, while their value, on the other hand, forms a part of them as objects. What confirms them in this view, is the peculiar circumstances that the use-value of objects is realised without exchange, by means of a direct relation between the objects and man, while, on the other hand, their value is realised only by exchange, that is, by means of a social process. Who fails here to call to mind our good friend, Dogberry, who informs neighbour Seacoal, that, “To be a well-favoured man is the gift of fortune; but reading and writing comes by nature.”

CHAPTER II. EXCHANGE.

IT is plain that commodities cannot go to market and make exchanges of their own account. We must, therefore, have recourse to their guardians, who are also their owners. Commodities are things, and therefore without power of resistance against man. If they are wanting in docility he can use force; in other words, he can take possession of them. In order that these objects may enter into relation with each other as commodities, their guardians must place themselves in relation to one another, as persons whose will resides in those objects, and must behave in such a way that each does not appropriate the commodity of the other, and part with his own, except by means of an act done by mutual consent. They must, therefore, mutually recognise in each other the right of private proprietors. This juridical relation, which thus expresses itself in a contract, whether such contract be part of a developed legal system or not, is a relation between two wills, and is but the reflex of the real economical relation between the two. It is this economical relation that determines the subject matter comprised in each such juridical act. The persons exist for one another merely as representatives of, and, therefore, as owners of, commodities. In the course of our investigation we shall find, in general, that the characters who appear on the economic stage are but the personifications of the economical relations that exist between them.

What chiefly distinguishes a commodity from its owner is the fact, that it looks upon every other commodity as but the form of appearance of its own value. A born leveller and a cynic, it is always ready to exchange not only soul, but body, with any and every other commodity, be the same more repulsive than Maritornes herself. The owner makes up for this lack in the commodity of a sense of the concrete, by his own five and more senses. His commodity possesses for himself no immediate use-value. Otherwise, he would not bring it to the market. It has use-value for others; but for himself its only direct use-value is that of being a depository of exchange value, and consequently, a means of exchange. Therefore, he makes up his mind to part with it for commodities whose value in use is of service to him. All commodities are non-use-values for their owners, and use-values for their non-owners. Consequently, they must all change hands. But this change of

hands is what constitutes their exchange, and the latter puts them in relation with each other as values, and realises them as values. Hence commodities must be realised as values before they can be realised as use-values.

On the other hand, they must show that they are use-values before they can be realised as values. For the labour spent upon them counts effectively, only in so far as it is spent in a form that is useful for others. Whether that labour is useful for others and its product consequently capable of satisfying the wants of others, can be proved only by the act of exchange.

Every owner of a commodity wishes to part with it in exchange only for those commodities whose use-value satisfies some want of his. Looked at in this way, exchange is for him simply a private transaction. On the other hand, he desires to realise the value of his commodity, to convert it into any other suitable commodity of equal value, irrespective of whether his own commodity has or has not any use-value for the owner of the other. From this point of view, exchange is for him a social transaction of a general character. But one and the same set of transactions cannot be simultaneously for all owners of commodities both exclusively private and exclusively social and general.

Let us look at the matter a little closer. To the owner of a commodity, every other commodity is, in regard to his own, a particular equivalent, and consequently his own commodity is the universal equivalent for all the others. But since this applies to every owner, there is, in fact, no commodity acting as universal equivalent, and the relative value of commodities possesses no general form under which they can be equated as values and have the magnitude of their values compared. So far, therefore, they do not confront each other as commodities, but only as products or use-values. In their difficulties our commodity-owners think like Faust: "Im Anfang war die That." They therefore acted and transacted before they thought. Instinctively they conform to the laws imposed by the nature of commodities. They cannot bring their commodities into relation as values, and therefore as commodities, except by comparing them with some one other commodity as the universal equivalent. That we saw from the analysis of a universal equivalent. That we saw from the analysis of a commodity. But a particular commodity cannot become the universal equivalent except by a social act. The social action therefore of all other commodities, sets apart the particular commodity in which they all represent their values. Thereby the bodily form of this commodity becomes the form of the

socially recognised universal equivalent. To be the universal equivalent, becomes, by this social process, the specific function of the commodity thus excluded by the rest. Thus it becomes — money. “Illi unum consilium habent et virtutem et potestatem suam bestiæ tradunt. Et ne quis possit emere aut vendere, nisi qui habet characterem aut nomen bestiæ, aut numerum nominis ejus.” (Apocalypse.)

Money is a crystal formed of necessity in the course of the exchanges, whereby different products of labour are practically equated to one another and thus by practice converted into commodities. The historical progress and extension of exchanges develops the contrast, latent in commodities, between use-value and value. The necessity for giving an external expression to this contrast for the purposes of commercial intercourse, urges on the establishment of an independent form of value, and finds no rest until it is once for all satisfied by the differentiation of commodities into commodities and money. At the same rate, then, as the conversion of products into commodities is being accomplished, so also is the conversion of one special commodity into money.

The direct barter of products attains the elementary form of the relative expression of value in one respect, but not in another. That form is x Commodity A = y Commodity B. The form of direct barter is x use-value A = y use-value B. The articles A and B in this case are not as yet commodities, but become so only by the act of barter. The first step made by an object of utility towards acquiring exchange-value is when it forms a non-use-value for its owner, and that happens when it forms a superfluous portion of some article required for his immediate wants. Objects in themselves are external to man, and consequently alienable by him. In order that this alienation may be reciprocal, it is only necessary for men, by a tacit understanding, to treat each other as private owners of those alienable objects, and by implication as independent individuals. But such a state of reciprocal independence has no existence in a primitive society based on property in common, whether such a society takes the form of a patriarchal family, an ancient Indian community, or a Peruvian Inca State. The exchange of commodities, therefore, first begins on the boundaries of such communities, at their points of contact with other similar communities, or with members of the latter. So soon, however, as products once become commodities in the external relations of a community, they also, by reaction, become so in its internal intercourse. The proportions in which

they are exchangeable are at first quite a matter of chance. What makes them exchangeable is the mutual desire of their owners to alienate them. Meantime the need for foreign objects of utility gradually establishes itself. The constant repetition of exchange makes it a normal social act. In the course of time, therefore, some portion at least of the products of labour must be produced with a special view to exchange. From that moment the distinction becomes firmly established between the utility of an object for the purposes of consumption, and its utility for the purposes of exchange. Its use-value becomes distinguished from its exchange value. On the other hand, the quantitative proportion in which the articles are exchangeable, becomes dependent on their production itself. Custom stamps them as values with definite magnitudes.

In the direct barter of products, each commodity is directly a means of exchange to its owner, and to all other persons an equivalent, but that only in so far as it has use-value for them. At this stage, therefore, the articles exchanged do not acquire a value-form independent of their own use-value, or of the individual needs of the exchangers. The necessity for a value-form grows with the increasing number and variety of the commodities exchanged. The problem and the means of solution arise simultaneously. Commodity-owners never equate their own commodities to those of others, and exchange them on a large scale, without different kinds of commodities belong to different owners being exchangeable for, and equated as values to, one and the same special article. Such last-mentioned article, by becoming the equivalent of various other commodities, acquires at once, though within narrow limits, the character of a general social equivalent. This character comes and goes with the momentary social acts that called it into life. In turns and transiently it attaches itself first to this and then to that commodity. But with the development of exchange it fixes itself firmly and exclusively to particular sorts of commodities, and becomes crystallised by assuming the money-form. The particular kind of commodity to which it sticks is at first a matter of accident. Nevertheless there are two circumstances whose influence is decisive. The money-form attaches itself either to the most important articles of exchange from outside, and these in fact are primitive and natural forms in which the exchange-value of home products finds expression; or else it attaches itself to the object of utility that forms, like cattle, the chief portion of indigenous alienable wealth. Nomad races are the first to develop the money-form, because all their

worldly goods consist of movable objects and are therefore directly alienable; and because their mode of life, by continually bringing them into contact with foreign communities, solicits the exchange of products. Man has often made man himself, under the form of slaves, serve as the primitive material of money, but has never used land for that purpose. Such an idea could only spring up in a bourgeois society already well developed. It dates from the last third of the 17th century, and the first attempt to put it in practice on a national scale was made a century afterwards, during the French bourgeois revolution.

In proportion as exchange bursts its local bonds, and the value of commodities more and more expands into an embodiment of human labour in the abstract, in the same proportion the character of money attaches itself to commodities that are by nature fitted to perform the social function of a universal equivalent. Those commodities are the precious metals.

The truth of the proposition that, “although gold and silver are not by nature money, money is by nature gold and silver,” is shown by the fitness of the physical properties of these metals for the functions of money. Up to this point, however, we are acquainted only with one function of money, namely, to serve as the form of manifestation of the value of commodities, or as the material in which the magnitudes of their values are socially expressed. An adequate form of manifestation of value, a fit embodiment of abstract, undifferentiated, and therefore equal human labour, that material alone can be whose every sample exhibits the same uniform qualities. On the other hand, since the difference between the magnitudes of value is purely quantitative, the money commodity must be susceptible of merely quantitative differences, must therefore be divisible at will, and equally capable of being re-united. Gold and silver possess these properties by nature.

The use-value of the money commodity becomes twofold. In addition to its special use-value as a commodity (gold, for instance, serving to stop teeth, to form the raw material of articles of luxury, 8c.), it acquires a formal use-value, originating in its specific social function.

Since all commodities are merely particular equivalents of money, the latter being their universal equivalent, they, with regard to the latter as the universal commodity, play the parts of particular commodities.

We have seen that the money-form is but the reflex, thrown upon one single commodity, of the value relations between all the rest. That money is

a commodity is therefore a new discovery only for those who, when they analyse it, start from its fully developed shape. The act of exchange gives to the commodity converted into money, not its value, but its specific value-form. By confounding these two distinct things some writers have been led to hold that the value of gold and silver is imaginary. The fact that money can, in certain functions, be replaced by mere symbols of itself, gave rise to that other mistaken notion, that it is itself a mere symbol. Nevertheless under this error lurked a presentiment that the money-form of an object is not an inseparable part of that object, but is simply the form under which certain social relations manifest themselves. In this sense every commodity is a symbol, since, in so far as it is value, it is only the material envelope of the human labour spent upon it. But if it be declared that the social characters assumed by objects, or the material forms assumed by the social qualities of labour under the régime of a definite mode of production, are mere symbols, it is in the same breath also declared that these characteristics are arbitrary fictions sanctioned by the so-called universal consent of mankind. This suited the mode of explanation in favour during the 18th century. Unable to account for the origin of the puzzling forms assumed by social relations between man and man, people sought to denude them of their strange appearance by ascribing to them a conventional origin.

It has already been remarked above that the equivalent form of a commodity does not imply the determination of the magnitude of its value. Therefore, although we may be aware that gold is money, and consequently directly exchangeable for all other commodities, yet that fact by no means tells how much 10 lbs, for instance, of gold is worth. Money, like every other commodity, cannot express the magnitude of its value except relatively in other commodities. This value is determined by the labour-time required for its production, and is expressed by the quantity of any other commodity that costs the same amount of labour-time. Such quantitative determination of its relative value takes place at the source of its production by means of barter. When it steps into circulation as money, its value is already given. In the last decades of the 17th century it had already been shown that money is a commodity, but this step marks only the infancy of the analysis. The difficulty lies, not in comprehending that money is a commodity, but in discovering how, why and by what means a commodity becomes money.

We have already seen, from the most elementary expression of value, x commodity A = y commodity B, that the object in which the magnitude of the value of another object is represented, appears to have the equivalent form independently of this relation, as a social property given to it by Nature. We followed up this false appearance to its final establishment, which is complete so soon as the universal equivalent form becomes identified with the bodily form of a particular commodity, and thus crystallised into the money-form. What appears to happen is, not that gold becomes money, in consequence of all other commodities expressing their values in it, but, on the contrary, that all other commodities universally express their values in gold, because it is money. The intermediate steps of the process vanish in the result and leave no trace behind. Commodities find their own value already completely represented, without any initiative on their part, in another commodity existing in company with them. These objects, gold and silver, just as they come out of the bowels of the earth, are forthwith the direct incarnation of all human labour. Hence the magic of money. In the form of society now under consideration, the behaviour of men in the social process of production is purely atomic. Hence their relations to each other in production assume a material character independent of their control and conscious individual action. These facts manifest themselves at first by products as a general rule taking the form of commodities. We have seen how the progressive development of a society of commodity-producers stamps one privileged commodity with the character of money. Hence the riddle presented by money is but the riddle presented by commodities; only it now strikes us in its most glaring form.

CHAPTER III. MONEY, OR THE CIRCULATION OF COMMODITIES.

SECTION 1. THE MEASURE OF VALUES.

THROUGHOUT this work, I assume, for the sake of simplicity, gold as the money-commodity.

The first chief function of money is to supply commodities with the material for the expression of their values, or to represent their values as magnitudes of the same denomination, qualitatively equal, and quantitatively comparable. It thus serves as a universal measure of value. And only by virtue of this function does gold, the equivalent commodity par excellence, become money.

It is not money that renders commodities commensurable. Just the contrary. It is because all commodities, as values, are realised human labour, and therefore commensurable, that their values can be measured by one and the same special commodity, and the latter be converted into the common measure of their values, i.e., into money. Money as a measure of value, is the phenomenal form that must of necessity be assumed by that measure of value which is immanent in commodities, labour-time.

The expression of the value of a commodity in gold — x commodity $A=y$ money-commodity — is its money-form or price. A single equation, such as 1 ton of iron=2 ounces of gold, now suffices to express the value of the iron in a socially valid manner. There is no longer any need for this equation to figure as a link in the chain of equations that express the values of all other commodities, because the equivalent commodity, gold, now has the character of money. The general form of relative value has resumed its original shape of simple or isolated relative value. On the other hand, the expanded expression of relative value, the endless series of equations, has now become the form peculiar to the relative value of the money-commodity. The series itself, too, is now given, and has social recognition in the prices of actual commodities. We have only to read the quotations of a price-list backwards, to find the magnitude of the value of money expressed in all sorts of commodities. But money itself has no price. In

order to put it on an equal footing with all other commodities in this respect, we should be obliged to equate it to itself as its own equivalent.

The price or money-form of commodities is, like their form of value generally, a form quite distinct from their palpable bodily form; it is, therefore, a purely ideal or mental form. Although invisible, the value of iron, linen and corn has actual existence in these very articles: it is ideally made perceptible by their equality with gold, a relation that, so to say, exists only in their own heads. Their owner must, therefore, lend them his tongue, or hang a ticket on them, before their prices can be communicated to the outside world. Since the expression of the value of commodities in gold is a merely ideal act, we may use for this purpose imaginary or ideal money. Every trader knows, that he is far from having turned his goods into money, when he has expressed their value in a price or in imaginary money, and that it does not require the least bit of real gold, to estimate in that metal millions of pounds' worth of goods. When, therefore, money serves as a measure of value, it is employed only as imaginary or ideal money. This circumstance has given rise to the wildest theories. But, although the money that performs the functions of a measure of value is only ideal money, price depends entirely upon the actual substance that is money. The value, or in other words, the quantity of human labour contained in a ton of iron, is expressed in imagination by such a quantity of the money-commodity as contains the same amount of labour as the iron. According, therefore, as the measure of value is gold, silver, or copper, the value of the ton of iron will be expressed by very different prices, or will be represented by very different quantities of those metals respectively.

If, therefore, two different commodities, such as gold and silver, are simultaneously measures of value, all commodities have two prices — one a gold-price, the other a silver-price. These exist quietly side by side, so long as the ratio of the value of silver to that of gold remains unchanged, say, at 15:1. Every change in their ratio disturbs the ratio which exists between the gold-prices and the silver-prices of commodities, and thus proves, by facts, that a double standard of value is inconsistent with the functions of a standard.

Commodities with definite prices present themselves under the form: a commodity $A = x$ gold; b commodity $B = z$ gold; c commodity $C = y$ gold, &c., where a, b, c, represent definite quantities of the commodities A, B, C and

x, z, y, definite quantities of gold. The values of these commodities are, therefore, changed in imagination into so many different quantities of gold. Hence, in spite of the confusing variety of the commodities themselves, their values become magnitudes of the same denomination, gold-magnitudes. They are now capable of being compared with each other and measured, and the want becomes technically felt of comparing them with some fixed quantity of gold as a unit measure. This unit, by subsequent division into aliquot parts, becomes itself the standard or scale. Before they become money, gold, silver, and copper already possess such standard measures in their standards of weight, so that, for example, a pound weight, while serving as the unit, is, on the one hand, divisible into ounces, and, on the other, may be combined to make up hundred weights. It is owing to this that, in all metallic currencies, the names given to the standards of money or of price were originally taken from the pre-existing names of the standards of weight.

As measure of value and as standard of price, money has two entirely distinct functions to perform. It is the measure of value inasmuch as it is the socially recognised incarnation of human labour; it is the standard of price inasmuch as it is a fixed weight of metal. As the measure of value it serves to convert the values of all the manifold commodities into prices, into imaginary quantities of gold; as the standard of price it measures those quantities of gold. The measure of values measures commodities considered as values; the standard of price measures, on the contrary, quantities of gold by a unit quantity of gold, not the value of one quantity of gold by the weight of another. In order to make gold a standard of price, a certain weight must be fixed upon as the unit. In this case, as in all cases of measuring quantities of the same denomination, the establishment of an unvarying unit of measure is all-important. Hence, the less the unit is subject to variation, so much the better does the standard of price fulfill its office. But only in so far as it is itself a product of labour, and, therefore, potentially variable in value, can gold serve as a measure of value.

It is, in the first place, quite clear that a change in the value of gold does not, in any way, affect its function as a standard of price. No matter how this value varies, the proportions between the values of different quantities of the metal remain constant. However great the fall in its value, 12 ounces of gold still have 12 times the value of 1 ounce; and in prices, the only thing considered is the relation between different quantities of gold. Since, on the

other hand, no rise or fall in the value of an ounce of gold can alter its weight, no alteration can take place in the weight of its aliquot parts. Thus gold always renders the same service as an invariable standard of price, however much its value may vary.

In the second place, a change in the value of gold does not interfere with its functions as a measure of value. The change affects all commodities simultaneously, and, therefore, *cœteris paribus*, leaves their relative values *inter se*, unaltered, although those values are now expressed in higher or lower gold-prices.

Just as when we estimate the value of any commodity by a definite quantity of the use-value of some other commodity, so in estimating the value of the former in gold, we assume nothing more than that the production of a given quantity of gold costs, at the given period, a given amount of labour. As regards the fluctuations of prices generally, they are subject to the laws of elementary relative value investigated in a former chapter.

A general rise in the prices of commodities can result only, either from a rise in their values — the value of money remaining constant — or from a fall in the value of money, the values of commodities remaining constant. On the other hand, a general fall in prices can result only, either from a fall in the values of commodities — the value of money remaining constant — or from a rise in the value of money, the values of commodities remaining constant. It therefore by no means follows, that a rise in the value of money necessarily implies a proportional fall in the prices of commodities; or that a fall in the value of money implies a proportional rise in prices. Such change of price holds good only in the case of commodities whose value remains constant. With those, for example whose value rises, simultaneously with, and proportionally to, that of money, there is no alteration in price. And if their value rise either slower or faster than that of money, the fall or rise in their prices will be determined by the difference between the change in their value and that of money; and so on.

Let us now go back to the consideration of the price-form.

By degrees there arises a discrepancy between the current money names of the various weights of the precious metal figuring as money, and the actual weights which those names originally represented. This discrepancy is the result of historical causes, among which the chief are: — (1) The importation of foreign money into an imperfectly developed community.

This happened in Rome in its early days, where gold and silver coins circulated at first as foreign commodities. The names of these foreign coins never coincide with those of the indigenous weights. (2) As wealth increases, the less precious metal is thrust out by the more precious from its place as a measure of value, copper by silver, silver by gold, however much this order or sequence may be in contradiction with poetical chronology. The word pound, for instance, was the money-name given to an actual pound weight of silver. When gold replaced silver as a measure of value, the same name was applied according to the ratio between the values of silver and gold, to perhaps 1-15th of a pound of gold. The word pound, as a money-name, thus becomes differentiated from the same word as a weight-name. (3) The debasing of money carried on for centuries by kings and princes to such an extent that, of the original weights of the coins, nothing in fact remained but the names.

These historical causes convert the separation of the money name from the weight-name into an established habit with the community. Since the standard of money is on the one hand purely conventional, and must on the other hand find general acceptance, it is in the end regulated by law. A given weight of one of the precious metals, an ounce of gold, for instance, becomes officially divided into aliquot parts, with legally bestowed names, such as pound, dollar, 8c. These aliquot parts, which henceforth serve as units or money, are then subdivided into other aliquot parts with legal names, such as shilling, penny, 8c. But, both before and after these divisions are made, a definite weight of metal is the standard of metallic money. The sole alteration consists in the subdivision and denomination.

The prices, or quantities of gold, into which the values of commodities are ideally changed, are therefore now expressed in the names of coins, or in the legally valid names of the subdivisions of the gold standard. Hence, instead of saying: A quarter of wheat is worth an ounce of gold; we say, it is worth £3 17s. 10½d. In this way commodities express by their prices how much they are worth, and money serves as money of account whenever it is a question of fixing the value of an article in its money-form.

The name of a thing is something distinct from the qualities of that thing. I know nothing of a man, by knowing that his name is Jacob. In the same way with regard to money, every trace of a value-relation disappears in the names pound, dollar, franc, ducat, 8c. The confusion caused by attributing a

hidden meaning to these cabalistic signs is all the greater, because these money-names express both the values of commodities, and, at the same time, aliquot parts of the weight of the metal that is the standard of money. On the other hand, it is absolutely necessary that value, in order that it may be distinguished from the varied bodily forms of commodities, should assume this material and unmeaning, but, at the same time, purely social form.

Price is the money-name of the labour realised in a commodity. Hence the expression of the equivalence of a commodity with the sum of money constituting its price, is a tautology, just as in general the expression of the relative value of a commodity is a statement of the equivalence of two commodities. But although price, being the exponent of the magnitude of a commodity's value, is the exponent of its exchange-ratio with money, it does not follow that the exponent of this exchange-ratio is necessarily the exponent of the magnitude of the commodity's value. Suppose two equal quantities of socially necessary labour to be respectively represented by 1 quarter of wheat and £2 (nearly $\frac{1}{2}$ oz. of gold), £2 is the expression in money of the magnitude of the value of the quarter of wheat, or is its price. If now circumstances allow of this price being raised to £3, or compel it to be reduced to £1, then although £1 and £3 may be too small or too great properly to express the magnitude of the wheat's value, nevertheless they are its prices, for they are, in the first place, the form under which its value appears, i.e., money; and in the second place, the exponents of its exchange-ratio with money. If the conditions of production, in other words, if the productive power of labour remain constant, the same amount of social labour-time must, both before and after the change in price, be expended in the reproduction of a quarter of wheat. This circumstance depends, neither on the will of the wheat producer, nor on that of the owners of other commodities.

Magnitude of value expresses a relation of social production, it expresses the connection that necessarily exists between a certain article and the portion of the total labour-time of society required to produce it. As soon as magnitude of value is converted into price, the above necessary relation takes the shape of a more or less accidental exchange-ratio between a single commodity and another, the money-commodity. But this exchange-ratio may express either the real magnitude of that commodity's value, or the

quantity of gold deviating from that value, for which, according to circumstances, it may be parted with. The possibility, therefore, of quantitative incongruity between price and magnitude of value, or the deviation of the former from the latter, is inherent in the price-form itself. This is no defect, but, on the contrary, admirably adapts the price-form to a mode of production whose inherent laws impose themselves only as the mean of apparently lawless irregularities that compensate one another.

The price-form, however, is not only compatible with the possibility of a quantitative incongruity between magnitude of value and price, i.e., between the former and its expression in money, but it may also conceal a qualitative inconsistency, so much so, that, although money is nothing but the value-form of commodities, price ceases altogether to express value. Objects that in themselves are no commodities, such as conscience, honour, &c., are capable of being offered for sale by their holders, and of thus acquiring, through their price, the form of commodities. Hence an object may have a price without having value. The price in that case is imaginary, like certain quantities in mathematics. On the other hand, the imaginary price-form may sometimes conceal either a direct or indirect real value-relation; for instance, the price of uncultivated land, which is without value, because no human labour has been incorporated in it.

Price, like relative value in general, expresses the value of a commodity (e.g., a ton of iron), by stating that a given quantity of the equivalent (e.g., an ounce of gold), is directly exchangeable for iron. But it by no means states the converse, that iron is directly exchangeable for gold. In order, therefore, that a commodity may in practice act effectively as exchange value, it must quit its bodily shape, must transform itself from mere imaginary into real gold, although to the commodity such transubstantiation may be more difficult than to the Hegelian “concept,” the transition from “necessity” to “freedom,” or to a lobster the casting of his shell, or to Saint Jerome the putting off of the old Adam. Though a commodity may, side by side with its actual form (iron, for instance), take in our imagination the form of gold, yet it cannot at one and the same time actually be both iron and gold. To fix its price, it suffices to equate it to gold in imagination. But to enable it to render to its owner the service of a universal equivalent, it must be actually replaced by gold. If the owner of the iron were to go to the owner of some other commodity offered for exchange, and were to refer him to the price of the iron as proof that it was already money, he would get

the same answer as St. Peter gave in heaven to Dante, When the latter recited the creed —

“Assai bene è trascorsa
D’esta moneta già la lega e’l peso
Ma dimmi se tu l’hai nella tua borsa.”

A price therefore implies both that a commodity is exchangeable for money, and also that it must be so exchanged. On the other hand, gold serves as an ideal measure of value, only because it has already, in the process of exchange, established itself as the money-commodity. Under the ideal measure of values there lurks the hard cash.

SECTION 2. — THE MEDIUM OF CIRCULATION.

The Metamorphosis of Commodities.

We saw in a former chapter that the exchange of commodities implies contradictory and mutually exclusive conditions. The differentiation of commodities into commodities and money does not sweep away these inconsistencies, but develops a *modus vivendi*, a form in which they can exist side by side. This is generally the way in which real contradictions are reconciled. For instance, it is a contradiction to depict one body as constantly falling towards another, and as, at the same time, constantly flying away from it. The ellipse is a form of motion which, while allowing this contradiction to go on, at the same time reconciles it.

In so far as exchange is a process, by which commodities are transferred from hands in which they are non-use-values, to hands in which they become use-values, it is a social circulation of matter. The product of one form of useful labour replaces that of another. When once a commodity has found a resting-place, where it can serve as a use-value, it falls out of the sphere of exchange into that of consumption. But the former sphere alone interests us at present. We have, therefore, now to consider exchange from a formal point of view; to investigate the change of form or metamorphosis of commodities which effectuates the social circulation of matter.

The comprehension of this change of form is, as a rule, very imperfect. The cause of this imperfection is, apart from indistinct notions of value itself, that every change of form in a commodity results from the exchange of two commodities, an ordinary one and the money-commodity. If we keep

in view the material fact alone that a commodity has been exchanged for gold we overlook the very thing that we ought to observe — namely, what has happened to the form of the commodity. We overlook the facts that gold, when a mere commodity, is not money, and that when other commodities express their prices in gold, this gold is but the money-form of those commodities themselves.

Commodities, first of all, enter into the process of exchange just as they are. The process then differentiates them into commodities and money, and thus produces an external opposition corresponding to the internal opposition inherent in them, as being at once use-values and values. Commodities as use-values now stand opposed to money as exchange value. On the other hand, both opposing sides are commodities, unities of use-value and value. But this unity of differences manifests itself at two opposite poles, and at each pole in an opposite way. Being poles they are as necessarily opposite as they are connected. On the one side of the equation we have an ordinary commodity, which is in reality a use-value. Its value is expressed only ideally in its price, by which it is equated to its opponent, the gold, as to the real embodiment of its value. On the other hand, the gold, in its metallic reality ranks as the embodiment of value, as money. Gold, as gold, is exchange value itself. As to its use-value, that has only an ideal existence, represented by the series of expressions of relative value in which it stands face to face with all other commodities, the sum of whose uses makes up the sum of the various uses of gold. These antagonistic forms of commodities are the real forms in which the process of their exchange moves and takes place.

Let us now accompany the owner of some commodity — say, our old friend the weaver of linen — to the scene of action, the market. His 20 yards of linen has a definite price, £2. He exchanges it for the £2, and then, like a man of the good old stamp that he is, he parts with the £2 for a family Bible of the same price. The linen, which in his eyes is a mere commodity, a depository of value, he alienates in exchange for gold, which is the linen's value-form, and this form he again parts with for another commodity, the Bible, which is destined to enter his house as an object of utility and of edification to its inmates. The exchange becomes an accomplished fact by two metamorphoses of opposite yet supplementary character — the conversion of the commodity into money, and the re-conversion of the money into a commodity. The two phases of this metamorphosis are both of

them distinct transactions of the weaver — selling, or the exchange of the commodity for money; buying, or the exchange of the money for a commodity; and, the unity of the two acts, selling in order to buy.

The result of the whole transaction, as regards the weaver, is this, that instead of being in possession of the linen, he now has the Bible; instead of his original commodity, he now possesses another of same value but of different utility. In like manner he procures his other means of subsistence and means of production. From his point of view, the whole process effectuates nothing more than the exchange of the product of his labour for the product of some one else's, nothing more than an exchange of products.

The exchange of commodities is therefore accompanied by the following changes in their form.

Commodity — Money — Commodity.
C — M — C.

The result of the whole process is; so far as concerns the objects themselves, C — C, the exchange of one commodity for another, the circulation of materialised social labour. When this result is attained, the process is at an end.

C — M. First metamorphosis, or sale.

The leap taken by value from the body of the commodity, into the body of the gold, is, as I have elsewhere called it, the salto mortale of the commodity. If it falls short, then, although the commodity itself is not harmed, its owner decidedly is. The social division of labour causes his labour to be as one-sided as his wants are many-sided. This is precisely the reason why the product of his labour serves him solely as exchange value. But it cannot acquire the properties of a socially recognised universal equivalent, except by being converted into money. That money, however, is in some one else's pocket. In order to entice the money out of that pocket, our friend's commodity must, above all things, be a use-value to the owner of the money. For this, it is necessary that the labour expended upon it, be of a kind that is socially useful, of a kind that constitutes a branch of the social division of labour. But division of labour is a system of production which has grown up spontaneously and continues to grow behind the backs of the producers. The commodity to be exchanged may possibly be the

product of some new kind of labour, that pretends to satisfy newly arisen requirements, or even to give rise itself to new requirements. A particular operation, though yesterday, perhaps, forming one out of the many operations conducted by one producer in creating a given commodity, may to-day separate itself from this connection, may establish itself as an independent branch of labour and send its incomplete product to market as an independent commodity. The circumstances may or may not be ripe for such a separation. To-day the product satisfies a social want. To-morrow the article may, either altogether or partially, be superseded by some other appropriate product. Moreover, although our weaver's labour may be a recognised branch of the social division of labour, yet that fact is by no means sufficient to guarantee the utility of his 20 yards of linen. If the community's want of linen, and such a want has a limit like every other want, should already be saturated by the products of rival weavers, our friend's product is superfluous, redundant, and consequently useless. Although people do not look a gift-horse in the mouth, our friend does not frequent the market for the purpose of making presents. But suppose his product turn out a real use-value, and thereby attracts money? The question arises, how much will it attract? No doubt the answer is already anticipated in the price of the article, in the exponent of the magnitude of its value. We leave out of consideration here any accidental miscalculation of value by our friend, a mistake that is soon rectified in the market. We suppose him to have spent on his product only that amount of labour-time that is on an average socially necessary. The price then, is merely the money-name of the quantity of social labour realised in his commodity. But without the leave, and behind the back, of our weaver, the old fashioned mode of weaving undergoes a change. The labour-time that yesterday was without doubt socially necessary to the production of a yard of linen, ceases to be so to-day, a fact which the owner of the money is only too eager to prove from the prices quoted by our friend's competitors. Unluckily for him, weavers are not few and far between. Lastly, suppose that every piece of linen in the market contains no more labour-time than is socially necessary. In spite of this, all these pieces taken as a whole, may have had superfluous labour-time spent upon them. If the market cannot stomach the whole quantity at the normal price of 2 shillings a yard, this proves that too great a portion of the total labour of the community has been expended in the form of weaving. The effect is the same as if each individual weaver had expended

more labour-time upon his particular product than is socially necessary. Here we may say, with the German proverb: caught together, hung together. All the linen in the market counts but as one article of commerce, of which each piece is only an aliquot part. And as a matter of fact, the value also of each yard is but the materialised form of the same definite and socially fixed quantity of homogeneous human labour.

We see then, commodities are in love with money, but “the course of true love never did run smooth.” The quantitative division of labour is brought about in exactly the same spontaneous and accidental manner as its qualitative division. The owners of commodities therefore find out, that the same division of labour that turns them into independent private producers, also frees the social process of production and the relations of the individual producers to each other within that process, from all dependence on the will of those producers, and that the seeming mutual independence of the individuals is supplemented by a system of general and mutual dependence through or by means of the products.

The division of labour converts the product of labour into a commodity, and thereby makes necessary its further conversion into money. At the same time it also makes the accomplishment of this trans-substantiation quite accidental. Here, however, we are only concerned with the phenomenon in its integrity, and we therefore assume its progress to be normal. Moreover, if the conversion take place at all, that is, if the commodity be not absolutely unsaleable, its metamorphosis does take place although the price realised may be abnormally above or below the value.

The seller has his commodity replaced by gold, the buyer has his gold replaced by a commodity. The fact which here stares us in the face is, that a commodity and gold, 20 yards of linen and £2, have changed hands and places, in other words, that they have been exchanged. But for what is the commodity exchanged? For the shape assumed by its own value, for the universal equivalent. And for what is the gold exchanged? For a particular form of its own use-value. Why does gold take the form of money face to face with the linen? Because the linen’s price of £2, its denomination in money, has already equated the linen to gold in its character of money. A commodity strips off its original commodity-form on being alienated, i.e., on the instant its use-value actually attracts the gold, that before existed only ideally in its price. The realisation of a commodity’s price, or of its ideal value-form, is therefore at the same time the realisation of the ideal

use-value of money; the conversion of a commodity into money, is the simultaneous conversion of money into a commodity. The apparently single process is in reality a double one. From the pole of the commodity owner it is a sale, from the opposite pole of the money owner, it is a purchase. In other words, a sale is a purchase, $C - M$ is also $M - C$.

Up to this point we have considered men in only one economical capacity, that of owners of commodities, a capacity in which they appropriate the produce of the labour of others, by alienating that of their own labour. Hence, for one commodity owner to meet with another who has money, it is necessary, either, that the product of the labour of the latter person, the buyer, should be in itself money, should be gold, the material of which money consists, or that his product should already have changed its skin and have stripped off its original form of a useful object. In order that it may play the part of money, gold must of course enter the market at some point or other. This point is to be found at the source of production of the metal, at which place gold is bartered, as the immediate product of labour, for some other product of equal value. From that moment it always represents the realised price of some commodity. Apart from its exchange for other commodities at the source of its production, gold, in whose-so-ever hands it may be, is the transformed shape of some commodity alienated by its owner; it is the product of a sale or of the first metamorphosis $C - M$. Gold, as we saw, became ideal money, or a measure of values, in consequence of all commodities measuring their values by it, and thus contrasting it ideally with their natural shape as useful objects, and making it the shape of their value. It became real money, by the general alienation of commodities, by actually changing places with their natural forms as useful objects, and thus becoming in reality the embodiment of their values. When they assume this money-shape, commodities strip off every trace of their natural use-value, and of the particular kind of labour to which they owe their creation, in order to transform themselves into the uniform, socially recognised incarnation of homogeneous human labour. We cannot tell from the mere look of a piece of money, for what particular commodity it has been exchanged. Under their money-form all commodities look alike. Hence, money may be dirt, although dirt is not money. We will assume that the two gold pieces, in consideration of which our weaver has parted with his linen, are the metamorphosed shape of a quarter of wheat. The sale of the linen, $C - M$,

is at the same time its purchase, $M - C$. But the sale is the first act of a process that ends with a transaction of an opposite nature, namely, the purchase of a Bible; the purchase of the linen, on the other hand, ends a movement that began with a transaction of an opposite nature, namely, with the sale of the wheat. $C - M$ (linen — money), which is the first phase of $C - M - C$ (linen — money — Bible), is also $M - C$ (money — C (money — linen), the last phase of another movement $C - M - C$ (wheat — money — linen). The first metamorphosis of one commodity into money, is therefore also invariably the second metamorphosis of some other commodity, the retransformation of the latter from money into a commodity.

$M - C$, or purchase. The second and concluding metamorphosis of a commodity.

Because money is the metamorphosed shape of all other commodities, the result of their general alienation, for this reason it is alienable itself without restriction or condition. It reads all prices backwards, and thus, so to say, depicts itself in the bodies of all other commodities, which offer to it the material for the realisation of its own use-value. At the same time the prices, wooing glances cast at money by commodities, define the limits of its convertibility, by pointing to its quantity. Since every commodity, on becoming money, disappears as a commodity, it is impossible to tell from the money itself, how it got into the hands of its possessor, or what article has been changed into it. Non olet, from whatever source it may come. Representing on the other hand a sold commodity, it represents on the other hand a commodity to be bought.

$M - C$, a purchase, is, at the same time, $C - M$, a sale; the concluding metamorphosis of one commodity is the first metamorphosis of another. With regard to our weaver, the life of his commodity ends with the Bible, into which he has reconverted his £2. But suppose the seller of the Bible turns the £2 set free by the weaver into brandy. $M - C$, the concluding phase of $C - M - C$ (linen, money, Bible), is also $C - M$, the first phase of $C - M - C$ (Bible, money, brandy). The producer of a particular commodity has that one article alone to offer; this he sells very often in large quantities, but his many and various wants compel him to split up the price realised, the sum of money set free, into numerous purchases. Hence a sale leads to many purchases of various articles. The concluding metamorphoses of various other commodities.

If we now consider the completed metamorphosis of a commodity, as a whole, it appears in the first place, that it is made up of two opposite and complementary movements, $C - M$ and $M - C$. These two antithetical transmutations of a commodity are brought about by two antithetical social acts on the part of the owner, and these acts in their turn stamp the character of the economical parts played by him. As the person who makes a sale, he is a seller; as the person who makes a purchase, he is a buyer. But just as, upon every such transmutation of a commodity, its two forms, commodity-form and money-form, exist simultaneously but at opposite poles, so every seller has a buyer opposed to him, and every buyer a seller. While one particular commodity is going through its two transmutations in succession, from a commodity into money and from money into another commodity, the owner of the commodity changes in succession his part from that of seller to that of buyer. These characters of seller and buyer are therefore not permanent, but attach themselves in turns to the various persons engaged in the circulation of commodities.

The complete metamorphosis of a commodity, in its simplest form, implies four extremes, and three *dramatis personæ*. First, a commodity comes face to face with money; the latter is the form taken by the value of the former, and exists in all its hard reality, in the pocket of the buyer. A commodity-owner is thus brought into contact with a possessor of money. So soon, now, as the commodity has been changed into money, the money becomes its transient equivalent-form, the use-value of which equivalent-form is to be found in the bodies of other commodities. Money, the final term of the first transmutation, is at the same time the starting point for the second. The person who is a seller in the first transaction thus becomes a buyer in the second, in which a third commodity-owner appears on the scene as a seller.

The two phases, each inverse to the other, that make up the metamorphosis of a commodity constitute together a circular movement, a circuit: commodity-form, stripping off of this form, and return to the commodity-form. No doubt, the commodity appears here under two different aspects. At the starting point it is not a use-value to its owner; at the finishing point it is. So, too, the money appears in the first phase as a solid crystal of value, a crystal into which the commodity eagerly solidifies, and in the second, dissolves into the mere transient equivalent-form destined to be replaced by a use-value.

The two metamorphoses constituting the circuit are at the same time two inverse partial metamorphoses of two other commodities. One and the same commodity, the linen, opens the series of its own metamorphoses, and completes the metamorphosis of another (the wheat). In the first phase or sale, the linen plays there two parts in its own person. But, then, changed into gold, it completes its own second and final metamorphosis, and helps at the same time to accomplish the first metamorphosis of a third commodity. Hence the circuit made by one commodity in the course of its metamorphoses is inextricably mixed up with the circuits of other commodities. The total of all the different circuits constitutes the circulation of commodities.

The circulation of commodities differs from the direct exchange of products (barter), not only in form, but in substance. Only consider the course of events. The weaver has, as a matter of fact, exchanged his linen for a Bible, his own commodity for that of some one else. But this is true only so far as he himself is concerned. The seller of the Bible, who prefers something to warm his inside, no more thought of exchanging his Bible for linen than our weaver knew that wheat had been exchanged for his linen. B's commodity replaces that of A, but A and B do not mutually exchange those commodities. It may, of course, happen that A and B make simultaneous purchases, the one from the other; but such exceptional transactions are by no means the necessary result of the general conditions of the circulation of commodities. We see here, on the one hand, how the exchange of commodities breaks through all local and personal bounds inseparable from direct barter, and develops the circulation of the products of social labor; and on the other hand, how it develops a whole network of social relations spontaneous in their growth and entirely beyond the control of the actors. It is only because the farmer has sold his wheat that the weaver is enabled to sell his linen, only because the weaver has sold his linen that our Hotspur is enabled to sell his Bible, and only because the latter has sold the water of everlasting life that the distiller is enabled to sell his eau-de-vie, and so on.

The process of circulation, therefore, does not, like direct barter of products, become extinguished upon the use values changing places and hands. The money does not vanish on dropping out of the circuit of the metamorphosis of a given commodity. It is constantly being precipitated into new places in the arena of circulation vacated by other commodities.

In the complete metamorphosis of the linen, for example, linen — money — Bible, the linen first falls out of circulation, and money steps into its place. Then the Bible falls out of circulation, and again money takes its place. When one commodity replaces another, the money commodity always sticks to the hands of some third person. Circulation sweats money from every pore.

Nothing can be more childish than the dogma, that because every sale is a purchase, and every purchase a sale, therefore the circulation of commodities necessarily implies an equilibrium of sales and purchases. If this means that the number of actual sales is equal to the number of purchases, it is mere tautology. But its real purport is to prove that every seller brings his buyer to market with him. Nothing of the kind. The sale and the purchase constitute one identical act, an exchange between a commodity-owner and an owner of money, between two persons as opposed to each other as the two poles of a magnet. They form two distinct acts, of polar and opposite characters, when performed by one single person. Hence the identity of sale and purchase implies that the commodity is useless, if, on being thrown into the alchemistical retort of circulation, it does not come out again in shape of money; if, in other words, it cannot be sold by its owner, and therefore be bought by the owner of the money. That identity further implies that the exchange, if it does take place, constitutes a period of rest, an interval, long or short, in the life of the commodity. Since the first metamorphosis of a commodity is at once a sale and a purchase, it is also an independent process in itself. The purchaser has the commodity, the seller has the money, i.e., a commodity ready to go into circulation at any time. No one can sell unless some one else purchases. But no one is forthwith bound to purchase, because he has just sold. Circulation bursts through all restrictions as to time, place, and individuals, imposed by direct barter, and this it effects by splitting up, into the antithesis of a sale and a purchase, the direct identity that in barter does exist between the alienation of one's own and the acquisition of some other man's product. To say that these two independent and antithetical acts have an intrinsic unity, are essentially one, is the same as to say that this intrinsic oneness expresses itself in an external antithesis. If the interval in time between the two complementary phases of the complete metamorphosis of a commodity becomes too great, if the split between the sale and the purchase becomes too pronounced, the intimate connexion between them, their oneness,

asserts itself by producing — a crisis. The antithesis, use-value and value; the contradictions that private labour is bound to manifest itself as direct social labour, that a particularized concrete kind of labour has to pass for abstract human labour; the contradiction between the personification of objects and the representation of persons by things; all these antitheses and contradictions, which are immanent in commodities, assert themselves, and develop their modes of motion, in the antithetical phases of the metamorphosis of a commodity. These modes therefore imply the possibility, and no more than the possibility, of crisis. The conversion of this mere possibility into a reality is the result of a long series of relations, that, from our present standpoint of simple circulation, have as yet no existence.

The currency of money.

The change of form, $C — M — C$, by which the circulation of the material products of labour is brought about, requires that a given value in the shape of a commodity shall begin the process, and shall, also in the shape of a commodity, end it. The movement of the commodity is therefore a circuit. On the other hand, the form of this movement precludes a circuit from being made by the money. The result is not the return of the money, but its continued removal further and further away from its starting-point. So long as the seller sticks fast to his money, which is the transformed shape of his commodity, that commodity is still in the first phase of its metamorphosis, and has completed only half its course. But so soon as he completes the process, so soon as he supplements his sale by a purchase, the money again leaves the hands of its possessor. It is true that if the weaver, after buying the Bible, sells more linen, money comes back into his hands. But this return is not owing to the circulation of the first 20 yards of linen; that circulation resulted in the money getting into the hands of the seller of the Bible. The return of money into the hands of the weaver is brought about only by the renewal or repetition of the process of circulation with a fresh commodity, which renewed process ends with the same result as its predecessor did. Hence the movement directly imparted to money by the circulation of commodities takes the form of a constant motion away from its starting point, of course from the hands of one commodity owner into those of another. This course constitutes its currency (*cours de la monnaie*).

The currency of money is the constant and monotonous repetition of the same process. The commodity is always in the hands of the seller; the

money, as a means of purchase, always in the hands of the buyer. And money serves as a means of purchase by realising the price of the commodity. This realisation transfers the commodity from the seller to the buyer, and removes the money from the hands of the buyer into those of the seller, where it again goes through the same process with another commodity. That this one-sided character of the money's motion arises out of the two-sided character of the commodity's motion, is a circumstance that is veiled over. The very nature of the circulation of commodities begets the opposite appearance. The first metamorphosis of a commodity is visibly, not only the money's movement, but also that of the commodity itself; in the second metamorphosis, on the contrary, the movement appears to us as the movement of the money alone. In the first phase of its circulation the commodity changes place with the money. Thereupon the commodity, under its aspect of a useful object, falls out of circulation into consumption. In its stead we have its value-shape — the money. It then goes through the second phase of its circulation, not under its own natural shape, but under the shape of money. The continuity of the movement is therefore kept up by the money alone, and the same movement that as regards the commodity consists of two processes of an antithetical character, is, when considered as the movement of the money, always one and the same process, a continued change of places with ever fresh commodities. Hence the result brought about by the circulation of commodities, namely, the replacing of one commodity by another, takes the appearance of having been effected not by means of the change of form of the commodities, but rather by the money acting as a medium of circulation, by an action that circulates commodities, to all appearance motionless in themselves, and transfers them from hands in which they are non-use-values, to hands in which they are use-values; and that in a direction constantly opposed to the direction of the money. The latter is continually withdrawing commodities from circulation and stepping into their places, and in this way continually moving further and further from its starting-point. Hence, although the movement of the money is merely the expression of the circulation of commodities, yet the contrary appears to be the actual fact, and the circulation of commodities seems to be the result of the movement of the money.

Again, money functions as a means of circulation, only because in it the values of commodities have independent reality. Hence its movement, as

the medium of circulation, is, in fact, merely the movement of commodities while changing their forms. This fact must therefore make itself plainly visible in the currency of money. The twofold change of form in a commodity is reflected in the twice repeated change of place of the same piece of money during the complete metamorphosis of a commodity, and in its constantly repeated change of place, as metamorphosis follows metamorphosis, and each becomes interlaced with the others.

The linen, for instance, first of all exchanges its commodity-form for its money-form. The last term of its first metamorphosis ($C \rightarrow M$), or the money-form, is the first term of its final metamorphosis ($M \rightarrow C$), of its re-conversion into a useful commodity, the Bible. But each of these changes of form is accomplished by an exchange between commodity and money, by their reciprocal displacement. The same pieces of coin, in the first act, changed places with the linen, in the second, with the Bible. They are displaced twice. The first metamorphosis puts them into the weaver's pocket, the second draws them out of it. The two inverse changes undergone by the same commodity are reflected in the displacement, twice repeated, but in opposite directions, of the same pieces of coin.

If, on the contrary, only one phase of the metamorphosis is gone through, if there are only sales or only purchases, then a given piece of money changes its place only once. Its second change corresponds to and expresses the second metamorphosis of the commodity, its re-conversion from money into another commodity intended for use. It is a matter of course, that all this is applicable to the simple circulation of commodities alone, the only form that we are now considering.

Every commodity, when it first steps into circulation, and undergoes its first change of form, does so only to fall out of circulation again and to be replaced by other commodities. Money, on the contrary, as the medium of circulation, keeps continually within the sphere of circulation, and moves about in it. The question therefore arises, how much money this sphere constantly absorbs?

In a given country there take place every day at the same time, but in different localities, numerous one-sided metamorphoses of commodities, or, in other words, numerous sales and numerous purchases. The commodities are equated beforehand in imagination, by their prices, to definite quantities of money. And since, in the form of circulation now under consideration, money and commodities always come bodily face to face, one at the

positive pole of purchase, the other at the negative pole of sale, it is clear that the amount of the means of circulation required, is determined beforehand by the sum of the prices of all these commodities. As a matter of fact, the money in reality represents the quantity or sum of gold ideally expressed beforehand by the sum of the prices of the commodities. The equality of these two sums is therefore self-evident. We know, however, that, the values of commodities remaining constant, their prices vary with the value of gold (the material of money), rising in proportion as it falls, and falling in proportion as it rises. Now if, in consequence of such a rise or fall in the value of gold, the sum of the prices of commodities fall or rise, the quantity of money in currency must fall or rise to the same extent. The change in the quantity of the circulating medium is, in this case, it is true, caused by money itself, yet not in virtue of its function as a medium of circulation, but of its function as a measure of value. First, the price of the commodities varies inversely as the value of the money, and then the quantity of the medium of circulation varies directly as the price of the commodities. Exactly the same thing would happen if, for instance, instead of the value of gold falling, gold were replaced by silver as the measure of value, or if, instead of the value of silver rising, gold were to thrust silver out from being the measure of value. In the one case, more silver would be current than gold was before; in the other case, less gold would be current than silver was before. In each case the value of the material of money, i.e., the value of the commodity that serves as the measure of value, would have undergone a change, and therefore, so, too, would the prices of commodities which express their values in money, and so, too, would the quantity of money current whose function it is to realise those prices. We have already seen, that the sphere of circulation has an opening through which gold (or the material of money generally) enters into it as a commodity with a given value. Hence, when money enters on its functions as a measure of value, when it expresses prices, its value is already determined. If now its value fall, this fact is first evidenced by a change in the prices of those commodities that are directly bartered for the precious metals at the sources of their production. The greater part of all other commodities, especially in the imperfectly developed stages of civil society, will continue for a long time to be estimated by the former antiquated and illusory value of the measure of value. Nevertheless, one commodity infects another through their common value-relation, so that their prices, expressed

in gold or in silver, gradually settle down into the proportions determined by their comparative values, until finally the values of all commodities are estimated in terms of the new value of the metal that constitutes money. This process is accompanied by the continued increase in the quantity of the precious metals, an increase caused by their streaming in to replace the articles directly bartered for them at their sources of production. In proportion therefore as commodities in general acquire their true prices, in proportion as their values become estimated according to the fallen value of the precious metal, in the same proportion the quantity of that metal necessary for realising those new prices is provided beforehand. A one-sided observation of the results that followed upon the discovery of fresh supplies of gold and silver, led some economists in the 17th, and particularly in the 18th century, to the false conclusion, that the prices of commodities had gone up in consequence of the increased quantity of gold and silver serving as means of circulation. Henceforth we shall consider the value of gold to be given, as, in fact, it is momentarily whenever we estimate the price of a commodity.

On this supposition then, the quantity of the medium of circulation is determined by the sum of the prices that have to be realised. If now we further suppose the price of each commodity to be given, the sum of the prices clearly depends on the mass of commodities in circulation. It requires but little racking of brains to comprehend that if one quarter of wheat cost £2, 100 quarters will cost £200, 200 quarters £400, and so on, that consequently the quantity of money that changes place with the wheat, when sold, must increase with the quantity of that wheat.

If the mass of commodities remain constant, the quantity of circulating money varies with the fluctuations in the prices of those commodities. It increases and diminishes because the sum of the prices increases or diminishes in consequence of the change of price. To produce this effect, it is by no means requisite that the prices of all commodities should rise or fall simultaneously. A rise or fall in the prices of a number of leading articles, is sufficient in the one case to increase, in the other to diminish, the sum of the prices of all commodities, and, therefore, to put more or less money in circulation. Whether the change in the price correspond to an actual change of value in the commodities, or whether it be the result of mere fluctuations in market prices, the effect on the quantity of the medium of circulation remains the same.

Suppose the following articles to be sold or partially metamorphosed simultaneously in different localities: say, one quarter of wheat, 20 yards of linen, one Bible, and 4 gallons of brandy. If the price of each article be £2, and the sum of the prices to be realised be consequently £8, it follows that £8 in money must go into circulation. If, on the other hand, these same articles are links in the following chain of metamorphoses: 1 quarter of wheat — £2 — 20 yards of linen — £2 — 1 Bible — £2 — 4 gallons of brandy — £2, a chain that is already well-known to us, in that case the £2 cause the different commodities to circulate one after the other, and after realizing their prices successively, and therefore the sum of those prices, £8, they come to rest at last in the pocket of the distiller. The £2 thus make four moves. This repeated change of place of the same pieces of money corresponds to the double change in form of the commodities, to their motion in opposite directions through two stages of circulation, and to the interlacing of the metamorphoses of different commodities. These antithetic and complementary phases, of which the process of metamorphosis consists, are gone through, not simultaneously, but successively. Time is therefore required for the completion of the series. Hence the velocity of the currency of money is measured by the number of moves made by a given piece of money in a given time. Suppose the circulation of the 4 articles takes a day. The sum of the prices to be realised in the day is £8, the number of moves of the two pieces of money is four, and the quantity of money circulating is £2. Hence, for a given interval of time during the process of circulation, we have the following relation: the quantity of money functioning as the circulating medium is equal to the sum of the prices of the commodities divided by the number of moves made by coins of the same denomination. This law holds generally.

The total circulation of commodities in a given country during a given period is made up on the one hand of numerous isolated and simultaneous partial metamorphoses, sales which are at the same time purchases, in which each coin changes its place only once, or makes only one move; on the other hand, of numerous distinct series of metamorphoses partly running side by side, and partly coalescing with each other, in each of which series each coin makes a number of moves, the number being greater or less according to circumstances. The total number of moves made by all the circulating coins of one denomination being given, we can arrive at the average number of moves made by a single coin of that denomination, or at

the average velocity of the currency of money. The quantity of money thrown into the circulation at the beginning of each day is of course determined by the sum of the prices of all the commodities circulating simultaneously side by side. But once in circulation, coins are, so to say, made responsible for one another. If the one increase its velocity, the other either retards its own, or altogether falls out of circulation; for the circulation can absorb only such a quantity of gold as when multiplied by the mean number of moves made by one single coin or element, is equal to the sum of the prices to be realised. Hence if the number of moves made by the separate pieces increase, the total number of those pieces in circulation diminishes. If the number of the moves diminish, the total number of pieces increases. Since the quantity of money capable of being absorbed by the circulation is given for a given mean velocity of currency, all that is necessary in order to abstract a given number of sovereigns from the circulation is to throw the same number of one-pound notes into it, a trick well known to all bankers.

Just as the currency of money, generally considered, is but a reflex of the circulation of commodities, or of the antithetical metamorphoses they undergo, so, too, the velocity of that currency reflects the rapidity with which commodities change their forms, the continued interlacing of one series of metamorphoses with another, the hurried social interchange of matter, the rapid disappearance of commodities from the sphere of circulation, and the equally rapid substitution of fresh ones in their places. Hence, in the velocity of the currency we have the fluent unity of the antithetical and complementary phases, the unity of the conversion of the useful aspect of commodities into their value-aspect, and their re-conversion from the latter aspect to the former, or the unity of the two processes of sale and purchase. On the other hand, the retardation of the currency reflects the separation of these two processes into isolated antithetical phases, reflects the stagnation in the change of form, and therefore, in the social interchange of matter. The circulation itself, of course, gives no clue to the origin of this stagnation; it merely puts in evidence the phenomenon itself. The general public, who, simultaneously, with the retardation of the currency, see money appear and disappear less frequently at the periphery of circulation, naturally attribute this retardation to a quantitative deficiency in the circulating medium.

The total quantity of money functioning during a given period as the circulating medium, is determined, on the one hand, by the sum of the prices of the circulating commodities, and on the other hand, by the rapidity with which the antithetical phases of the metamorphoses follow one another. On this rapidity depends what proportion of the sum of the prices can, on the average, be realised by each single coin. But the sum of the prices of the circulating commodities depends on the quantity, as well as on the prices, of the commodities. These three factors, however, state of prices, quantity of circulating commodities, and velocity of money-currency, are all variable. Hence, the sum of the prices to be realised, and consequently the quantity of the circulating medium depending on that sum, will vary with the numerous variations of these three factors in combination. Of these variations we shall consider those alone that have been the most important in the history of prices.

While prices remain constant, the quantity of the circulating medium may increase owing to the number of circulating commodities increasing, or to the velocity of currency decreasing, or to a combination of the two. On the other hand the quantity of the circulating medium may decrease with a decreasing number of commodities, or with an increasing rapidity of their circulation.

With a general rise in the prices of commodities, the quantity of the circulating medium will remain constant, provided the number of commodities in the circulation decrease proportionally to the increase in their prices, or provided the velocity of currency increase at the same rate as prices rise, the number of commodities in circulation remaining constant. The quantity of the circulating medium may decrease, owing to the number of commodities decreasing more rapidly; or to the velocity of currency increasing more rapidly, than prices rise.

With a general fall in the prices of commodities, the quantity of the circulating medium will remain constant, provided the number of commodities increase proportionately to their fall in price, or provided the velocity of currency decrease in the same proportion. The quantity of the circulating medium will increase, provided the number of commodities increase quicker, or the rapidity of circulation decrease quicker, than the prices fall.

The variations of the different factors may mutually compensate each other, so that notwithstanding their continued instability, the sum of the

prices to be realised and the quantity of money in circulation remains constant; consequently, we find, especially if we take long periods into consideration, that the deviations from the average level, of the quantity of money current in any country, are much smaller than we should at first sight expect, apart of course from excessive perturbations periodically arising from industrial and commercial crises, or, less frequently, from fluctuations in the value of money.

The law, that the quantity of the circulating medium is determined by the sum of the prices of the commodities circulating, and the average velocity of currency may also be stated as follows: given the sum of the values of commodities, and the average rapidity of their metamorphoses, the quantity of precious metal current as money depends on the value of that precious metal. The erroneous opinion that it is, on the contrary, prices that are determined by the quantity of the circulating medium, and that the latter depends on the quantity of the precious metals in a country; this opinion was based by those who first beheld it, on the absurd hypothesis that commodities are without a price, and money without a value, when they first enter into circulation, and that, one in the circulation, an aliquot part of the medley of commodities is exchanged for an aliquot part of the heap of precious metals.

Coin and symbols of value.

That money takes the shape of coin, springs from its function as the circulating medium. The weight of gold represented in imagination by the prices or money-names of commodities, must confront those commodities, within the circulation, in the shape of coins or pieces of gold of a given denomination. Coining, like the establishment of a standard of prices, is the business of the State. The different national uniforms worn at home by gold and silver as coins, and doffed again in the market of the world, indicate the separation between the internal or national spheres of the circulation of commodities, and their universal sphere.

The only difference, therefore, between coin and bullion, is one of shape, and gold can at any time pass from one form to the other. But no sooner does coin leave the mint, than it immediately finds itself on the high-road to the melting pot. During their currency, coins wear away, some more, others less. Name and substance, nominal weight and real weight, begin their process of separation. Coins of the same denomination become different in

value, because they are different in weight. The weight of gold fixed upon as the standard of prices, deviates from the weight that serves as the circulating medium, and the latter thereby ceases any longer to be a real equivalent of the commodities whose prices it realises. The history of coinage during the middle ages and down into the 18th century, records the ever renewed confusion arising from this cause. The natural tendency of circulation to convert coins into a mere semblance of what they profess to be, into a symbol of the weight of metal they are officially supposed to contain, is recognised by modern legislation, which fixes the loss of weight sufficient to demonetise a gold coin, or to make it no longer legal tender.

The fact that the currency of coins itself effects a separation between their nominal and their real weight, creating a distinction between them as mere pieces of metal on the one hand, and as coins with a definite function on the other — this fact implies the latent possibility of replacing metallic coins by tokens of some other material, by symbols serving the same purposes as coins. The practical difficulties in the way of coining extremely minute quantities of gold or silver, and the circumstance that at first the less precious metal is used as a measure of value instead of the more precious, copper instead of silver, silver instead of gold, and that the less precious circulates as money until dethroned by the more precious — all these facts explain the parts historically played by silver and copper tokens as substitutes for gold coins. Silver and copper tokens take the place of gold in those regions of the circulation where coins pass from hand to hand most rapidly, and are subject to the maximum amount of wear and tear. This occurs where sales and purchases on a very small scale are continually happening. In order to prevent these satellites from establishing themselves permanently in the place of gold, positive enactments determine the extent to which they must be compulsorily received as payment instead of gold. The particular tracks pursued by the different species of coin in currency, run naturally into each other. The tokens keep company with gold, to pay fractional parts of the smallest gold coin; gold is, on the one hand, constantly pouring into retail circulation, and on the other hand is as constantly being thrown out again by being changed into tokens.

The weight of metal in the silver and copper tokens is arbitrarily fixed by law. When in currency, they wear away even more rapidly than gold coins. Hence their functions are totally independent of their weight, and consequently of all value. The function of gold as coin becomes completely

independent of the metallic value of that gold. Therefore things that are relatively without value, such as paper notes, can serve as coins in its place. This purely symbolic character is to a certain extent masked in metal tokens. In paper money it stands out plainly. In fact, ce n'est que le premier pas qui coûte.

We allude here only to inconvertible paper money issued by the State and having compulsory circulation. It has its immediate origin in the metallic currency. Money based upon credit implies on the other hand conditions, which from our standpoint of the simple circulation of commodities, are as yet totally unknown to us. But we may affirm this much, that just as true paper money takes its rise in the function of money as the circulating medium, so money based upon credit takes root spontaneously in the function of money as the means of payment.

The State puts in circulation bits of paper on which their various denominations, say £1, £5, 8c., are printed. In so far as they actually take the place of gold to the same amount, their movement is subject to the laws that regulate the currency of money itself. A law peculiar to the circulation of paper money can spring up only from the proportion in which that paper money represents gold. Such a law exists; stated simply, it is as follows: the issue of paper money must not exceed in amount the gold (or silver as the case may be) which would actually circulate if not replaced by symbols. Now the quantity of gold which the circulation can absorb, constantly fluctuates about a given level. Still, the mass of the circulating medium in a given country never sinks below a certain minimum easily ascertained by actual experience. The fact that this minimum mass continually undergoes changes in its constituent parts, or that the pieces of gold of which it consists are being constantly replaced by fresh ones, causes of course no change either in its amount or in the continuity of its circulation. It can therefore be replaced by paper symbols. If, on the other hand, all the conduits of circulation were to-day filled with paper money, to the full extent of their capacity for absorbing money, they might to-morrow be overflowing in consequence of a fluctuation in the circulation of commodities. There would no longer be any standard. If the paper money exceed its proper limit, which is the amount of gold coins of the like denomination that can actually be current, it would, apart from the danger of falling into general disrepute, represent only that quantity of gold, which, in accordance with the laws of the circulation of commodities, is required,

and is alone capable of being represented by paper. If the quantity of paper money issued be double what it ought to be, then, as a matter of fact, £1 would be the money-name not of $\frac{1}{4}$ of an ounce, but of $\frac{1}{8}$ of an ounce of gold. The effect would be the same as if an alteration had taken place in the function of gold as a standard of prices. Those values that were previously expressed by the price of £1 would now be expressed by the price of £2.

Paper-money is a token representing gold or money. The relation between it and the values of commodities is this, that the latter are ideally expressed in the same quantities of gold that are symbolically represented by the paper. Only in so far as paper-money represents gold, which like all other commodities has value, is it a symbol of value.

Finally, some one may ask why gold is capable of being replaced by tokens that have no value? But, as we have already seen, it is capable of being so replaced only in so far as it functions exclusively as coin, or as the circulating medium, and as nothing else. Now, money has other functions besides this one, and the isolated function of serving as the mere circulating medium is not necessarily the only one attached to gold coin, although this is the case with those abraded coins that continue to circulate. Each piece of money is a mere coin, or means of circulation, only so long as it actually circulates. But this is just the case with that minimum mass of gold, which is capable of being replaced by paper-money. That mass remains constantly within the sphere of circulation, continually functions as a circulating medium, and exists exclusively for that purpose. Its movement therefore represents nothing but the continued alteration of the inverse phases of the metamorphosis $C - M - C$, phases in which commodities confront their value-forms, only to disappear again immediately. The independent existence of the exchange value of a commodity is here a transient apparition, by means of which the commodity is immediately replaced by another commodity. Hence, in this process which continually makes money pass from hand to hand, the mere symbolical existence of money suffices. Its functional existence absorbs, so to say, its material existence. Being a transient and objective reflex of the prices of commodities, it serves only as a symbol of itself, and is therefore capable of being replaced by a token. One thing is, however, requisite; this token must have an objective social validity of its own, and this the paper symbol acquires by its forced currency. This compulsory action of the State can take effect only within that inner sphere of circulation which is co-terminous with the territories of

the community, but it is also only within that sphere that money completely responds to its function of being the circulating medium, or becomes coin.

SECTION 3. — MONEY.

The commodity that functions as a measure of value, and, either in its own person or by a representative, as the medium of circulation, is money. Gold (or silver) is therefore money. It functions as money, on the one hand, when it has to be present in its own golden person. It is then the money-commodity, neither merely ideal, as in its function of a measure of value, nor capable of being represented, as in its function of circulating medium. On the other hand, it also functions as money, when by virtue of its function, whether that function be performed in person or by representative, it congeals into the sole form of value, the only adequate form of existence of exchange-value, in opposition to use-value, represented by all other commodities.

Hoarding.

The continual movement in circuits of the two antithetical metamorphoses of commodities, or the never ceasing alternation of sale and purchase, is reflected in the restless currency of money, or in the function that money performs of a perpetuum mobile of circulation. But so soon as the series of metamorphoses is interrupted, so soon as sales are not supplemented by subsequent purchases, money ceases to be mobilised; it is transformed, as Boisguillebert says, from “meuble” into “immeuble,” from movable into immovable, from coin into money.

With the very earliest development of the circulation of commodities, there is also developed the necessity, and the passionate desire, to hold fast the product of the first metamorphosis. This product is the transformed shape of the commodity, or its gold-chrysalis. Commodities are thus sold not for the purpose of buying others, but in order to replace their commodity-form by their money-form. From being the mere means of effecting the circulation of commodities, this change of form becomes the end and aim. The changed form of the commodity is thus prevented from functioning as its unconditionally alienable form, or as its merely transient money-form. The money becomes petrified into a hoard, and the seller becomes a hoarder of money.

In the early stages of the circulation of commodities, it is the surplus use-values alone that are converted into money. Gold and silver thus become of themselves social expressions for superfluity or wealth. This naïve form of hoarding becomes perpetuated in those communities in which the traditional mode of production is carried on for the supply of a fixed and limited circle of home wants. It is thus with the people of Asia, and particularly of the East Indies. Vanderlint, who fancies that the prices of commodities in a country are determined by the quantity of gold and silver to be found in it, asks himself why Indian commodities are so cheap. Answer: Because the Hindoos bury their money. From 1602 to 1734, he remarks, they buried 150 millions of pounds sterling of silver, which originally came from America of Europe. In the 10 years from 1856 to 1866, England exported to India and China £120,000,000 in silver, which had been received in exchange for Australian gold. Most of the silver exported to China makes its way to India.

As the production of commodities further develops, every producer of commodities is compelled to make sure of the nexus rerum of the social pledge. His wants are constantly making themselves felt, and necessitate the continual purchase of other people's commodities, while the production and sale of his own goods require time, and depend upon circumstances. In order then to be able to buy without selling, he must have sold previously without buying. This operation, conducted on a general scale, appears to imply a contradiction. But the precious metals at the sources of their production are directly exchanged for other commodities. And here we have sales (by the owners of commodities) without purchases (by the owners of gold or silver.) And subsequent sales, by other producers, unfollowed by purchases, merely bring about the distribution of the newly produced precious metals among all the owners of commodities. In this way, all along the line of exchange, hoards of gold and silver of varied extent are accumulated. With the possibility of holding and storing up exchange value in the shape of a particular commodity, arises also the greed for gold. Along with the extension of circulation, increases the power of money, that absolutely social form of wealth ever ready for use. "Gold is a wonderful thing! Whoever possesses it is lord of all he wants. By means of gold one can even get souls into Paradise." (Columbus in his letter from Jamaica, 1503.) Since gold does not disclose what has been transformed into it, everything, commodity or not, is convertible into gold. Everything becomes

saleable and buyable. The circulation becomes the great social retort into which everything is thrown, to come out again as a gold crystal. Not even are the bones of saints, and still less are more delicate *res sacrosanctæ extra commercium hominum* able to withstand this alchemy. Just as every qualitative difference between commodities is extinguished in money, so money, on its side, like the radical leveller that it is, does away with all distinctions. But money itself is a commodity, an external object, capable of becoming the private property of any individual. Thus social power becomes the private power of private persons. The ancients therefore denounced money as subversive of the economical and moral order of things. Modern society, which soon after its birth, pulled Plutus by the hair of his head from the bowels of the earth, greets gold as its Holy Grail, as the glittering incarnation of the very principle of its own life.

A commodity, in its capacity of a use-value, satisfies a particular want, and is a particular element of material wealth. But the value of a commodity measures the degree of its attraction for all other elements of material wealth, and therefore measures the social wealth of its owner. To a barbarian owner of commodities, and even to a West-European peasant, value is the same as value-form, and therefore, to him the increase in his hoard of gold and silver is an increase in value. It is true that the value of money varies, at one time in consequence of a variation in its own value, at another, in consequence of a change in the value of commodities. But this, on the one hand, does not prevent 200 ounces of gold from still containing more value than 100 ounces, nor, on the other hand, does it hinder the actual metallic form of this article from continuing to be the universal equivalent form of all other commodities, and the immediate social incarnation of all human labour. The desire after hoarding is in its very nature unsatiable. In its qualitative aspect, or formally considered, money has no bounds to its efficacy, i.e., it is the universal representative of material wealth, because it is directly convertible into any other commodity. But, at the same time, every actual sum of money is limited in amount, and therefore, as a means of purchasing, has only a limited efficacy. This antagonism between the quantitative limits of money and its qualitative boundlessness, continually acts as a spur to the hoarder in his Sisyphus-like labour of accumulating. It is with him as it is with a conqueror who sees in every new country annexed, only a new boundary.

In order that gold may be held as money, and made to form a hoard, it must be prevented from circulating, or from transforming itself into a means of enjoyment. The hoarder, therefore, makes a sacrifice of the lusts of the flesh to his gold fetish. He acts in earnest up to the Gospel of abstention. On the other hand, he can withdraw from circulation no more than what he has thrown into it in the shape of commodities. The more he produces, the more he is able to sell. Hard work, saving and avarice, are, therefore, his three cardinal virtues, and to sell much and buy little the sum of his political economy.

By the side of the gross form of a hoard, we find also its æsthetic form in the possession of gold and silver articles. This grows with the wealth of civil society. “Soyons riches ou paraissions riches “ (Diderot). In this way there is created, on the one hand, a constantly extending market for gold and silver, unconnected with their functions as money, and, on the other hand, a latent source of supply, to which recourse is had principally in times of crisis and social disturbance.

Hoarding serves various purposes in the economy of the metallic circulation. Its first function arises out of the conditions to which the currency of gold and silver coins is subject. We have seen how, along with the continual fluctuations in the extent and rapidity of the circulation of commodities and in their prices, the quantity of money current unceasingly ebbs and flows. This mass must, therefore, be capable of expansion and contraction. At one time money must be attached in order to act as circulating coin, at another, circulating coin must be repelled in order to act again as more or less stagnant money. In order that the mass of money, actually current, may constantly saturate the absorbing power of the circulation, it is necessary that the quantity of gold and silver in a country be greater than the quantity required to function as coin. This condition is fulfilled by money taking the form of hoards. These reserves serve as conduits for the supply or withdrawal of money to or from the circulation, which in this way never overflows its banks.

Means of Payment.

In the simple form of the circulation of commodities hitherto considered, we found a given value always presented to us in a double shape, as a commodity at one pole, as money at the opposite pole. The owners of commodities came therefore into contact as the respective representatives of what were already equivalents. But with the development of circulation,

conditions arise under which the alienation of commodities becomes separated, by an interval of time, from the realisation of their prices. It will be sufficient to indicate the most simple of these conditions. One sort of article requires a longer, another a shorter time for its production. Again, the production of different commodities depends on different seasons of the year. One sort of commodity may be born on its own market place, another has to make a long journey to market. Commodity-owner No. 1, may therefore be ready to sell, before No. 2 is ready to buy. When the same transactions are continually repeated between the same persons, the conditions of sale are regulated in accordance with the conditions of production. On the other hand, the use of a given commodity, of a house, for instance, is sold (in common parlance; let) for a definite period. Hence, it is only at the end of the term that the buyer has actually received the use-value of the commodity. He therefore buys it before he pays for it. The vendor sells an existing commodity, the purchaser buys as the mere representative of money, or rather of future money. The vendor becomes a creditor, the purchaser becomes a debtor. Since the metamorphosis of commodities, or the development of their value-form, appears here under a new aspect, money also acquires a fresh function; it becomes the means of payment.

The character of creditor, or of debtor, results here from the simple circulation. The change in the form of that circulation stamps buyer and seller with this new die. At first, therefore, these new parts are just as transient and alternating as those of seller and buyer, and are in turns played by the same actors. But the opposition is not nearly so pleasant, and is far more capable of crystallization. The same characters can, however, be assumed independently of the circulation of commodities. The class-struggles of the ancient world took the form chiefly of a contest between debtors and creditors, which in Rome ended in the ruin of the plebeian debtors. They were displaced by slaves. In the middle-ages the contest ended with the ruin of the feudal debtors, who lost their political power together with the economical basis on which it was established. Nevertheless, the money relation of debtor and creditor that existed at these two periods reflected only the deeper-lying antagonism between the general economical conditions of existence of the classes in question.

Let us return to the circulation of commodities. The appearance of the two equivalents, commodities and money, at the two poles of the process of

sale, has ceased to be simultaneous. The money functions now, first as a measure of value in the determination of the price of the commodity sold; the price fixed by the contract measures the obligation of the debtor, or the sum of money that he has to pay at a fixed date. Secondly, it serves as an ideal means of purchase. Although existing only in the promise of the buyer to pay, it causes the commodity to change hands. It is not before the day fixed for payment that the means of payment actually steps into circulation, leaves the hand of the buyer for that of the seller. The circulating medium was transformed into a hoard, because the process stopped short after the first phase, because the converted shape of the commodity, viz., the money, was withdrawn from circulation. The means of payment enters the circulation, but only after the commodity has left it. The money is no longer the means that brings about the process. It only brings it to a close, by stepping in as the absolute form of existence of exchange value, or as the universal commodity. The seller turned his commodity into money, in order thereby to satisfy some want; the hoarder did the same in order to keep his commodity in its money-shape, and the debtor in order to be able to pay; if he do not pay, his goods will be sold by the sheriff. The value-form of commodities, money, is therefore now the end and aim of a sale, and that owing to a social necessity springing out of the process of circulation itself.

The buyer converts money back into commodities before he has turned commodities into money: in other words, he achieves the second metamorphosis of commodities before the first. The seller's commodity circulates, and realises its price, but only in the shape of a legal claim upon money. It is converted into a use-value before it has been converted into money. The completion of its first metamorphosis follows only at a later period.

The obligations falling due within a given period, represent the sum of the prices of the commodities, the sale of which gave rise to those obligations. The quantity of gold necessary to realise this sum, depends, in the first instance, on the rapidity of currency of the means of payment. That quantity is conditioned by two circumstances: first the relations between debtors and creditors form a sort of chain, in such a way that A, when he receives money from his debtor B, straightway hands it over to C his creditor, and so on; the second circumstance is the length of the intervals between the different due-days of the obligations. The continuous chain of

payments, or retarded first metamorphoses, is essentially different from that interlacing of the series of metamorphoses which we considered on a former page. By the currency of the circulating medium, the connexion between buyers and sellers, is not merely expressed. This connexion is originated by, and exists in, the circulation alone. Contrariwise, the movement of the means of payment expresses a social relation that was in existence long before.

The fact that a number of sales take place simultaneously, and side by side, limits the extent to which coin can be replaced by the rapidity of currency. On the other hand, this fact is a new lever in economising the means of payment. In proportion as payments are concentrated at one spot, special institutions and methods are developed for their liquidation. Such in the middle ages were the virements at Lyons. The debts due to A from B, to B from C, to C from A, and so on, have only to be confronted with each other, in order to annul each other to a certain extent like positive and negative quantities. There thus remains only a single balance to pay. The greater the amount of the payments concentrated, the less is this balance relatively to that amount, and the less is the mass of the means of payment in circulation.

The function of money as the means of payment implies a contradiction without a terminus medius. In so far as the payments balance one another, money functions only ideally as money of account, as a measure of value. In so far as actual payments have to be made, money does not serve as a circulating medium, as a mere transient agent in the interchange of products, but as the individual incarnation of social labour, as the independent form of existence of exchange value, as the universal commodity. This contradiction comes to a head in those phases of industrial and commercial crises which are known as monetary crises. Such a crisis occurs only where the ever-lengthening chain of payments, and an artificial system of settling them, has been fully developed. Whenever there is a general and extensive disturbance of this mechanism, no matter what its cause, money becomes suddenly and immediately transformed, from its merely ideal shape of money of account, into hard cash. Profane commodities can no longer replace it. The use-value of commodities becomes value-less, and their value vanishes in the presence of its own independent form. On the eve of crisis, the bourgeois, with the self-sufficiency that springs from intoxicating prosperity, declares money to be a

vain imagination. Commodities alone are money. But now the cry is everywhere: money alone is a commodity! As the hart pants after fresh water, so pants his soul after money, the only wealth. In a crisis, the antithesis between commodities and their value-form, money, becomes heightened into an absolute contradiction. Hence, in such events, the form under which money appears is of no importance. The money famine continues, whether payments have to be made in gold or in credit money such as bank notes.

If we now consider the sum total of the money current during a given period, we shall find that, given the rapidity of currency of the circulating medium and of the means of payment, it is equal to the sum of the prices to be realised, plus the sum of the payments falling due, minus the payments that balance each other, minus finally the number of circuits in which the same piece of coin serves in turn as means of circulation and of payment. Hence, even when prices, rapidity of currency, and the extent of the economy in payments, are given, the quantity of money current and the mass of commodities circulating during a given period, such as a day, no longer correspond. Money that represents commodities long withdrawn from circulation, continues to be current. Commodities circulate, whose equivalent in money will not appear on the scene till some future day. Moreover, the debts contracted each day, and the payments falling due on the same day, are quite incommensurable quantities.

Credit-money springs directly out of the function of money as a means of payment. Certificates of the debts owing for the purchased commodities circulate for the purpose of transferring those debts to others. On the other hand, to the same extent as the system of credit is extended, so is the function of money as a means of payment. In that character it takes various forms peculiar to itself under which it makes itself at home in the sphere of great commercial transactions. Gold and silver coin, on the other hand, are mostly relegated to the sphere of retail trade.

When the production of commodities has sufficiently extended itself, money begins to serve as the means of payment beyond the sphere of the circulation of commodities. It becomes the commodity that is the universal subject-matter of all contracts. Rents, taxes, and such like payments are transformed from payments in kind into money payments. To what extent this transformation depends upon the general conditions of production, is shown, to take one example, by the fact that the Roman Empire twice failed

in its attempt to levy all contributions in money. The unspeakable misery of the French agricultural population under Louis XIV., a misery so eloquently denounced by Biosguillebert, Marshal, Vauban, and others, was due not only to the weight of the taxes, but also to the conversion of taxes in kind into money taxes. In Asia, on the other hand, the fact that state taxes are chiefly composed of rents payable in kind, depends on conditions of production that are reproduced with the regularity of natural phenomena. And this mode of payment tends in its turn to maintain the ancient form of production. It is one of the secrets of the conservation of the Ottoman Empire. If the foreign trade, forced upon Japan by Europeans, should lead to the substitution of money rents for rents in kind, it will be all up with the exemplary agriculture of that country. The narrow economical conditions under which that agriculture is carried on, will be swept away.

In every country, certain days of the year become by habit recognised settling days for various large and recurrent payments. These dates depend, apart from other revolutions in the wheel of reproduction, on conditions closely connected with the seasons. They also regulate the dates for payments that have no direct connexion with the circulation of commodities such as taxes, rents, and so on. The quantity of money requisite to make the payments, falling due on those dates all over the country, causes periodical, though merely superficial, perturbations in the economy of the medium of payment.

From the law of the rapidity of currency of the means of payment, it follows that the quantity of the means of payment required for all periodical payments, whatever their source, is in inverse proportion to the length of their periods.

The development of money into a medium of payment makes it necessary to accumulate money against the dates fixed for the payment of the sums owing. While hoarding, as a distinct mode of acquiring riches, vanishes with the progress of civil society, the formation of reserves of the means of payment grows with that progress.

Universal Money.

When money leaves the home sphere of circulation, it strips off the local garbs which it there assumes, of a standard of prices, of coin, of tokens, and of a symbol of value, and returns to its original form of bullion. In the trade between the markets of the world, the value of commodities is expressed so

as to be universally recognised. Hence their independent value-form also, in these cases, confronts them under the shape of universal money. It is only in the markets of the world that money acquires to the full extent the character of the commodity whose bodily form is also the immediate social incarnation of human labour in the abstract. Its real mode of existence in this sphere adequately corresponds to its ideal concept.

Within the sphere of home circulation, there can be but one commodity which, by serving as a measure of value, becomes money. In the markets of the world a double measure of value holds sway, gold and silver.

Money of the world serves as the universal medium of payment, as the universal means of purchasing, and as the universally recognised embodiment of all wealth. Its function as a means of payment in the settling of international balances is its chief one. Hence the watchword of the mercantilists, balance of trade. Gold and silver serve as international means of purchasing chiefly and necessarily in those periods when the customary equilibrium in the interchange of products between different nations is suddenly disturbed. And lastly, it serves as the universally recognised embodiment of social wealth, whenever the question is not of buying or paying, but of transferring wealth from one country to another, and whenever this transference in the form of commodities is rendered impossible, either by special conjunctures in the markets, or by the purpose itself that is intended.

Just as every country needs a reserve of money for its home circulation, so, too, it requires one for external circulation in the markets of the world. The functions of hoards, therefore, arise in part out of the function of money, as the medium of the home circulation and home payments, and in part out of its function of money of the world. For this latter function, the genuine money-commodity, actual gold and silver, is necessary. On that account, Sir James Steuart, in order to distinguish them from their purely local substitutes, calls gold and silver “money of the world.”

The current of the stream of gold and silver is a double one. On the one hand, it spreads itself from its sources over all the markets of the world, in order to become absorbed, to various extents, into the different national spheres of circulation, to fill the conduits of currency, to replace abraded gold and silver coins, to supply the material of articles of luxury, and to petrify into hoards. This first current is started by the countries that

exchange their labour, realise in commodities, for the labour embodied in the precious metals by gold and silver-producing countries. On the other hand, there is a continual flowing backwards and forwards of gold and silver between the different national spheres of circulation, a current whose motion depends on the ceaseless fluctuations in the course of exchange.

Countries in which the bourgeois form of production is developed to a certain extent, limit the hoards concentrated in the strong rooms of the banks to the minimum required for the proper performance of their peculiar functions. Whenever these hoards are strikingly above their average level, it is, with some exceptions, an indication of stagnation in the circulation of commodities, of an interruption in the even flow of their metamorphoses.

PART II. THE TRANSFORMATION OF MONEY INTO CAPITAL.

CHAPTER IV. THE GENERAL FORMULA FOR CAPITAL.

THE circulation of commodities is the starting point of capital. The production of commodities, their circulation, and that more developed form of their circulation called commerce, these form the historical groundwork from which it rises. The modern history of capital dates from the creation in the 16th century of a world-embracing commerce and a world-embracing market.

If we abstract from the material substance of the circulation of commodities, that is, from the exchange of the various use-values, and consider only the economic forms produced by this process of circulation, we find its final result to be money: this final product of the circulation of commodities is the first form in which capital appears.

As a matter of history, capital, as opposed to landed property, invariably takes the form at first of money; it appears as moneyed wealth, as the capital of the merchant and of the usurer. But we have no need to refer to the origin of capital in order to discover that the first form of appearance of capital is money. We can see it daily under our very eyes. All new capital, to commence with, comes on the stage, that is, on the market, whether of commodities, labour, or money, even in our days, in the shape of money that by a definite process has to be transformed into capital.

The first distinction we notice between money that is money only, and money that is capital, is nothing more than a difference in their form of circulation.

The simplest form of the circulation of commodities is $C — M — C$, the transformation of commodities into money, and the change of the money back again into commodities; or selling in order to buy. But alongside of this form we find another specifically different form: $M — C — M$, the transformation of money into commodities, and the change of commodities back again into money; or buying in order to sell. Money that circulates in the latter manner is thereby transformed into, becomes capital, and is already potentially capital.

Now let us examine the circuit $M — C — M$ a little closer. It consists, like the other, of two antithetical phases. In the first phase, $M — C$, or the purchase, the money is changed into a commodity. In the second phase, C

— M, or the sale, the commodity is changed back into money. The combination of these two phases constitutes the single movement whereby money is exchanged for a commodity and the same commodity is again exchanged for money; whereby a commodity is bought in order to be sold, or, neglecting the distinction in form between buying and selling, whereby a commodity is bought with money, and then money is bought with a commodity. The result, in which the phases of the process vanish, is the exchange of money for money, $M — M$. If I purchase 2000 lbs. of cotton for £100, and resell the 2000 lbs. of cotton for £110, I have, in fact, exchanged £100 for £110, money for money.

Now it is evident that the circuit $M — C — M$ would be absurd and without meaning if the intention were to exchange by this means two equal sums of money, £100 for £100. The miser's plan would be far simpler and surer; he sticks to his £100 instead of exposing it to the dangers of circulation. And yet, whether the merchant who has paid £100 for his cotton sells it for £110, or lets it go for £100, or even £50, his money has, at all events, gone through a characteristic and original movement, quite different in kind from that which it goes through in the hands of the peasant who sells corn, and with the money thus set free buys clothes. We have therefore to examine first the distinguishing characteristics of the forms of the circuits $M — C — M$ and $C — M — C$, and in doing this the real difference that underlies the mere difference of form will reveal itself.

Let us see, in the first place, what the two forms have in common.

Both circuits are resolvable into the same two antithetical phases, $C — M$, a sale, and $M — C$, a purchase. In each of these phases the same material elements — a commodity, and money, and the same economical dramatis personæ, a buyer and a seller — confront one another. Each circuit is the unity of the same two antithetical phases, and in each case this unity is brought about by the intervention of three contracting parties, of whom one only sells, another only buys, while the third both buys and sells.

What, however, first and foremost distinguishes the circuit $C — M — C$ from the circuit $M — C — M$, is the inverted order of succession of the two phases. The simple circulation of commodities begins with a sale and ends with a purchase, while the circulation of money as capital begins with a purchase and ends with a sale. In the one case both the starting point and the goal are commodities, in the other they are money. In the first form the

movement is brought about by the intervention of money, in the second by that of a commodity.

In the circulation $C — M — C$, the money is in the end converted into a commodity, that serves as a use-value; it is spent once for all. In the inverted form, $M — C — M$, on the contrary, the buyer lays out money in order that, as a seller, he may recover money. By the purchase of his commodity he throws money into circulation, in order to withdraw it again by the sale of the same commodity. He lets the money go, but only with the sly intention of getting it back again. The money, therefore, is not spent, it is merely advanced.

In the circuit $C — M — C$, the same piece of money changes its place twice. The seller gets it from the buyer and pays it away to another seller. The complete circulation, which begins with the receipt, concludes with the payment, of money for commodities. It is the very contrary in the circuit $M — C — M$. Here it is not the piece of money that changes its place twice, but the commodity. The buyer takes it from the hands of the seller and passes it into the hands of another buyer. Just as in the simple circulation of commodities the double change of place of the same piece of money effects its passage from one hand into another, so here the double change of place of the same commodity brings about the reflux of the money to its point of departure.

Such reflux is not dependent on the commodity being sold for more than was paid for it. This circumstance influences only the amount of the money that comes back. The reflux itself takes place, so soon as the purchased commodity is resold, in other words, so soon as the circuit $M — C — M$ is completed. We have here, therefore, a palpable difference between the circulation of money as capital, and its circulation as mere money.

The circuit $C — M — C$ comes completely to an end, so soon as the money brought in by the sale of one commodity is abstracted again by the purchase of another.

If, nevertheless, there follows a reflux of money to its starting point, this can only happen through a renewal or repetition of the operation. If I sell a quarter of corn for £3, and with this £3 buy clothes, the money, so far as I am concerned, is spent and done with. It belongs to the clothes merchant. If I now sell a second quarter of corn, money indeed flows back to me, not however as a sequel to the first transaction, but in consequence of its repetition. The money again leaves me, so soon as I complete this second

transaction by a fresh purchase. Therefore, in the circuit $C — M — C$, the expenditure of money has nothing to do with its reflux. On the other hand, in $M — C — M$, the reflux of the money is conditioned by the very mode of its expenditure. Without this reflux, the operation fails, or the process is interrupted and incomplete, owing to the absence of its complementary and final phase, the sale.

The circuit $C — M — C$ starts with one commodity, and finishes with another, which falls out of circulation and into consumption. Consumption, the satisfaction of wants, in one word, use-value, is its end and aim. The circuit $M — C — M$, on the contrary, commences with money and ends with money. Its leading motive, and the goal that attracts it, is therefore mere exchange value.

In the simple circulation of commodities, the two extremes of the circuit have the same economic form. They are both commodities, and commodities of equal value. But they are also use-values differing in their qualities, as, for example, corn and clothes. The exchange of products, of the different materials in which the labour of society is embodied, forms here the basis of the movement. It is otherwise in the circulation $M — C — M$, which at first sight appears purposeless, because tautological. Both extremes have the same economic form. They are both money, and therefore are not qualitatively different use-values; for money is but the converted form of commodities, in which their particular use-values vanish. To exchange £100 for cotton, and then this same cotton again for £100, is merely a roundabout way of exchanging money for money, the same for the same, and appears to be an operation just as purposeless as it is absurd. One sum of money is distinguishable from another only by its amount. The character and tendency of the process $M — C — M$, is therefore not due to any qualitative difference between its extremes, both being money, but solely to their quantitative difference. More money is withdrawn from circulation at the finish than was thrown into it at the start. The cotton that was bought for £100 is perhaps resold for £100+£10 or £110. The exact form of this process is therefore $M — C — M'$, where $M' = M + \Delta$; M = the original sum advanced, plus an increment. This increment or excess over the original value I call “surplus-value.” The value originally advanced, therefore, not only remains intact while in circulation, but adds to itself a surplus-value or expands itself. It is this movement that converts it into capital.

Of course it is also possible, that in $C — M — C$, the two extremes $C — C$, say corn and clothes, may represent different quantities of value. The farmer may sell his corn above its value, or may buy the clothes at less than their value. He may, on the other hand, “be done” by the clothes merchant. Yet, in the form of circulation now under consideration, such differences in value are purely accidental. The fact that the corn and the clothes are equivalents, does not deprive the process of all meanings, as it does in $M — C — M$. The equivalence of their values is rather a necessary condition to its normal course.

The repetition or renewal of the act of selling in order to buy, is kept within bounds by the very object it aims at, namely, consumption or the satisfaction of definite wants, an aim that lies altogether outside the sphere of circulation. But when we buy in order to sell, we, on the contrary, begin and end with the same thing, money, exchange-value; and thereby the movement becomes interminable. No doubt, M becomes $M + \Delta M$, £100 become £110. But when viewed in their qualitative aspect alone, £110 are the same as £100, namely money; and considered quantitatively, £110 is, like £100, a sum of definite and limited value. If now, the £110 be spent as money, they cease to play their part. They are no longer capital. Withdrawn from circulation, they become petrified into a hoard, and though they remained in that state till doomsday, not a single farthing would accrue to them. If, then, the expansion of value is once aimed at, there is just the same inducement to augment the value of the £110 as that of the £100; for both are but limited expressions for exchange-value, and therefore both have the same vocation to approach, by quantitative increase, as near as possible to absolute wealth. Momentarily, indeed, the value originally advanced, the £100 is distinguishable from the surplus value of £10 that is annexed to it during circulation; but the distinction vanishes immediately. At the end of the process we do not receive with one hand the original £100, and with the other, the surplus-value of £10. We simply get a value of £110, which is in exactly the same condition and fitness for commencing the expanding process, as the original £100 was. Money ends the movement only to begin it again. Therefore, the final result of every separate circuit, in which a purchase and consequent sale are completed, forms of itself the starting point of a new circuit. The simple circulation of commodities — selling in order to buy — is a means for carrying out a purpose unconnected with circulation, namely, the appropriation of use-values, the satisfaction of

wants. The circulation of money as capital is, on the contrary, an end in itself, for the expansion of value takes place only within this constantly renewed movement. The circulation of capital has therefore no limits. Thus the conscious representative of this movement, the possessor of money becomes a capitalist. His person, or rather his pocket, is the point from which the money starts and to which it returns. The expansion of value, which is the objective basis or main-spring of the circulation $M — C — M$, becomes his subjective aim, and it is only in so far as the appropriation of ever more and more wealth is the abstract becomes the sole motive of his operations, that he functions as a capitalist, that is, as capital personified and endowed with consciousness and a will. Use-values must therefore never be looked upon as the real aim of the capitalist; neither must the profit on any single transaction. The restless never-ending process of profit-making alone is what he aims at. This boundless greed after riches, this passionate chase after exchange-value, is common to the capitalist and the miser; but while the miser is merely a capitalist gone mad, the capitalist is a rational miser. The never-ending augmentation of exchange-value, which the miser strives after, by seeking to save his money from circulation, is attained by the more acute capitalist, by constantly throwing it afresh into circulation.

The independent form, i.e., the money-form, which the value of commodities assumes in the case of simple circulation, serves only one purpose, namely, their exchange, and vanishes in the final result of the movement. On the other hand, in the circulation $M — C — M$, both the money and the commodity represent only different modes of existence of value itself, the money its general mode, and the commodity its particular, or, so to say, disguised mode. It is constantly changing from one form to the other without thereby becoming lost, and thus assumes an automatically active character. If now we take in turn each of the two different forms which self-expanding value successively assumes in the course of its life, we then arrive at these two propositions: Capital is money: Capital is commodities. In truth, however, value is here the active factor in a process, in which, while, constantly assuming the form in turn of money and commodities, it at the same time changes in magnitude, differentiates itself by throwing off surplus-value from itself; the original value, in other words, expands spontaneously. For the movement, in the course of which it adds surplus value, is its own movement, its expansion, therefore, is

automatic expansion. Because it is value, it has acquired the occult quality of being able to add value to itself. It brings forth living offspring, or, at the least, lays golden eggs.

Value, therefore, being the active factor in such a process, and assuming at one time the form of money, at another that of commodities, but through all these changes preserving itself and expanding, it requires some independent form, by means of which its identity may at any time be established. And this form it possesses only in the shape of money. It is under the form of money that value begins and ends, and begins again, every act of its own spontaneous generation. It began by being £100, it is now £110, and so on. But the money itself is only one of the two forms of value. Unless it takes the form of some commodity, it does not become capital. There is here no antagonism, as in the case of hoardings, between the money and commodities. The capitalist knows that all commodities, however scurvy they may look, or however badly they may smell, are in faith and in truth money, inwardly circumcised Jews, and what is more, a wonderful means whereby out of money to make more money.

In simple circulation, $C - M - C$, the value of commodities attained at the most a form independent of their use-values, i.e., the form of money; but that same value now in the circulation $M - C - M$, or the circulation of capital, suddenly presents itself as an independent substance, endowed with a motion of its own, passing through a life-process of its own, in which money and commodities are mere forms which it assumes and casts off in turn. Nay, more: instead of simply representing the relations of commodities, it enters now, so to say, into private relations with itself. It differentiates itself as original value from itself as surplus-value; as the father differentiates himself from himself quâ the son, yet both are one and of one age: for only by the surplus value of £10 does the £100 originally advanced become capital, and so soon as this takes place, so soon as the son, and by the son, the father, is begotten, so soon does their difference vanish, and they again become one, £110.

Value therefore now becomes value in process, money in process, and, as such, capital. It comes out of circulation, enters into it again, preserves and multiplies itself within its circuit, comes back out of it with expanded bulk, and begins the same round ever afresh. $M - M'$, money which begets money, such is the description of Capital from the mouths of its first interpreters, the Mercantilists.

Buying in order to sell, or, more accurately, buying in order to sell dearer, $M — C — M'$, appears certainly to be a form peculiar to one kind of capital alone, namely, merchants' capital. But industrial capital too is money, that is changed into commodities, and by the sale of these commodities, is reconverted into more money. The events that take place outside the sphere of circulation, in the interval between the buying and selling, do not affect the form of this movement. Lastly, in the case of interest-bearing capital, the circulation $M — C — M'$ appears abridged. We have its result without the intermediate stage, in the form $M — M'$, “en style lapidaire” so to say, money that is worth more money, value that is greater than itself.

$M — C — M'$ is therefore in reality the general formula of capital as it appears *prima facie* within the sphere of circulation.

CHAPTER V. CONTRADICTIONS IN THE GENERAL FORMULA OF CAPITAL.

THE form which circulation takes when money becomes capital, is opposed to all the laws we have hitherto investigated bearing on the nature of commodities, value and money, and even of circulation itself. What distinguishes this form from that of the simple circulation of commodities, is the inverted order of succession of the two antithetical processes, sale and purchase. How can this purely formal distinction between these processes change their character as it were by magic?

But that is not all. This inversion has no existence for two out of the three persons who transact business together. As capitalist, I buy commodities from A and sell them again to B, but as a simple owner of commodities, I sell them to B and then purchase fresh ones from A. A and B see no difference between the two sets of transactions. They are merely buyers or sellers. And I on each occasion meet them as a mere owner of either money or commodities, as a buyer or a seller, and, what is more, in both sets of transactions, I am opposed to A only as a buyer and to B only as a seller, to the one only as money, to the other only as commodities, and to either of them as capital or a capitalist, or as representative of anything that is more than money or commodities, or that can produce any effect beyond what money and commodities can. For me the purchase from A and the sale to B are part of a series. But the connexion between the two acts exists for me alone. A does not trouble himself about my transaction with B, nor does B about my business with A. And if I offered to explain to them the meritorious nature of my action in inverting the order of succession, they would probably point out to me that I was mistaken as to that order of succession, and that the whole transaction, instead of beginning with a purchase and ending with a sale, began, on the contrary, with a sale and was concluded with a purchase. In truth, my first act, the purchase, was from the standpoint of A, a sale, and my second act, the sale, was from the standpoint of B, a purchase. Not content with that, A and B would declare that the whole series was superfluous and nothing but Hokus Pokus; that for the future A would buy direct from B, and B sell direct to A. Thus the whole transaction would be reduced to a single act forming an isolated, non-

complemented phase in the ordinary circulation of commodities, a mere sale from A's point of view, and from B's, a mere purchase. The inversion, therefore, of the order of succession, does not take us outside the sphere of the simple circulation of commodities, and we must rather look, whether there is in this simple circulation anything permitting an expansion of the value that enters into circulation, and, consequently, a creation of surplus-value.

Let us take the process of circulation in a form under which it presents itself as a simple and direct exchange of commodities. This is always the case when two owners of commodities buy from each other, and on the settling day the amounts mutually owing are equal and cancel each other. The money in this case is money of account and serves to express the value of the commodities by their prices, but is not, itself, in the shape of hard cash, confronted with them. So far as regards use-values, it is clear that both parties may gain some advantage. Both part with goods that, as use-values, are of no service to them, and receive others that they can make use of. And there may also be a further gain. A, who sells wine and buys corn, possibly produces more wine, with given labour time, than farmer B could, and B, on the other hand, more corn than wine-grower A could. A, therefore, may get, for the same exchange value, more corn, and B more wine, than each would respectively get without any exchange by producing his own corn and wine. With reference, therefore, to use-value, there is good ground for saying that "exchange is a transaction by which both sides gain." It is otherwise with exchange value. "A man who has plenty of wine and no corn treats with a man who has plenty of corn and no wine; an exchange takes place between them of corn to the value of 50, for wine of the same value. This act produces no increase of exchange value either for the one or the other; for each of them already possessed, before the exchange, a value equal to that which he acquired by means of that operation." The result is not altered by introducing money, as a medium of circulation, between the commodities, and making the sale and the purchase two distinct acts. The value of a commodity is expressed in its price before it goes into circulation, and is therefore a precedent condition of circulation, not its result.

Abstractedly considered, that is, apart from circumstances not immediately flowing from the laws of the simple circulation of commodities, there is in an exchange nothing (if we except the replacing of

one use-value by another) but a metamorphosis, a mere change in the form of the commodity. The same exchange value, i.e., the same quantity of incorporated social labour, remains throughout in the hands of the owner of the commodity first in the shape of his own commodity, then in the form of the money for which he exchanged it, and lastly, in the shape of the commodity he buys with that money. This change of form does not imply a change in the magnitude of the value. But the change, which the value of the commodity undergoes in this process, is limited to a change in its money form. This form exists first as the price of the commodity offered for sale, then as an actual sum of money, which, however, was already expressed in the price, and lastly, as the price of an equivalent commodity. This change of form no more implies, taken alone, a change in the quantity of value, than does the change of a £5 note into sovereigns, half sovereigns and shillings. So far therefore as the circulation of commodities effects a change in the form alone of their values, and is free from disturbing influences, it must be the exchange of equivalents. Little as Vulgar-Economy knows about the nature of value, yet whenever it wishes to consider the phenomena of circulation in their purity, it assumes that supply and demand are equal, which amounts to this, that their effect is nil. If therefore, as regards the use-values exchanged, both buyer and seller may possibly gain something, this is not the case as regards the exchange values. Here we must rather say, "Where equality exists there can be no gain." It is true, commodities may be sold at prices deviating from their values, but these deviations are to be considered as infractions of the laws of the exchange of commodities, which in its normal state is an exchange of equivalents, consequently, no method for increasing value.

Hence, we see that behind all attempts to represent the circulation of commodities as a source of surplus-value, there lurks a quid pro quo, a mixing up of use-value and exchange value. For instance, Condillac says: "It is not true that on an exchange of commodities we give value for value. On the contrary, each of the two contracting parties in every case, gives a less for a greater value....if we really exchanged equal values, neither party could make a profit. And yet, they both gain, or ought to gain. Why? The value of a thing consists solely in its relation to our wants. what is more to the one is less to the other, and vice versa....It is not to be assumed that we offer for sale articles required for our own consumption....We wish to part with a useless thing, in order to get one that we need; we want to give less

for more....It was natural to think that, in an exchange, value was given for value, whenever each of the articles exchanged was of equal value with the same quantity of gold....But there is another point to be considered in our calculation. The question is, whether we both exchange something superfluous for something necessary.” We see in this passage, how Condillac not only confuses use-value with exchange value, but in a really childish manner assumes, that in a society, in which the production of commodities is well developed, each producer produces his own means of subsistence, and throws into circulation only the excess over his own requirements. Still, Condillac’s argument is frequently used by modern economists, more especially when the point is to show, that the exchange of commodities in its developed form, commerce, is productive of surplus-value. For instance, “Commerce...adds value to products, for the same products in the hands of consumers, are worth more than in the hands of producers, and it may strictly be considered an act of production.” But commodities are not paid for twice over, once on account of their use-value, and again on account of their value. And though the use-value of a commodity is more serviceable to the buyer than to the seller, its money form is more serviceable to the seller. Would he otherwise sell it? We might therefore just as well say that the buyer performs “strictly an act of production,” by converting stockings, for example, into money.

If commodities, or commodities and money, of equal exchange-value, and consequently equivalents, are exchanged, it is plain that no one abstracts more value from, than he throws into, circulation. There is no creation of surplus-value. And, in its normal form, the circulation of commodities demands the exchange of equivalents. But in actual practice, the process does not retain its normal form. Let us, therefore, assume an exchange of non-equivalents.

In any case the market for commodities is only frequented by owners of commodities, and the power which these persons exercise over each other, is no other than the power of their commodities. The material variety of these commodities is the material incentive to the act of exchange, and makes buyers and sellers mutually dependent, because none of them possesses the object of his own wants, and each holds in his hand the object of another’s wants. Besides these material differences of their use-values, there is only one other difference between commodities, namely, that between their bodily form and the form into which they are converted by

sale, the difference between commodities and money. And consequently the owners of commodities are distinguishable only as sellers, those who own commodities, and buyers, those who own money.

Suppose then, that by some inexplicable privilege, the seller is enabled to sell his commodities above their value, what is worth 100 for 110, in which case the price is nominally raised 10%. The seller therefore pockets a surplus value of 10. But after he has sold he becomes a buyer. A third owner of commodities comes to him now as seller, who in this capacity also enjoys the privilege of selling his commodities 10% too dear. Our friend gained 10 as a seller only to lose it again as a buyer. The nett result is, that all owners of commodities sell their goods to one another at 10% above their value, which comes precisely to the same as if they sold them at their true value. Such a general and nominal rise of prices has the same effect as if the values had been expressed in weight of silver instead of in weight of gold. The nominal prices of commodities would rise, but the real relation between their values would remain unchanged.

Let us make the opposite assumption, that the buyer has the privilege of purchasing commodities under their value. In the case it is no longer necessary to bear in mind that he in his turn will become a seller. He was so before he became buyer; he had already lost 10% in selling before he gained 10% as buyer. Everything is just as it was.

The creation of surplus-value, and therefore the conversion of money into capital, can consequently be explained neither on the assumption that commodities are sold above their value, nor that they are bought below their value.

The problem is in no way simplified by introducing irrelevant matters after the manner of Col. Torrens: "Effectual demand consists in the power and inclination (!), on the part of consumers, to give for commodities, either by immediate or circuitous barter, some greater portion of...capital than their production costs." In relation to circulation, producers and consumers meet only as buyers and sellers. To assert that the surplus-value acquired by the producer has its origin in the fact that consumers pay for commodities more than their value, is only to say in other words: The owner of commodities possesses, as a seller, the privilege of selling too dear. The seller has himself produced the commodities or represents their producer, but the buyer has to no less extent produced the commodities represented by

his money, or represents their producer. The distinction between them is, that one buys and the other sells. The fact that the owner of the commodities, under the designation of consumer, pays too much for them, does not carry us a single step further.

To be consistent therefore, the upholders of the delusion that surplus-value has its origin in a nominal rise of prices or in the privilege which the seller has of selling too dear, must assume the existence of a class that only buys and does not sell, i.e., only consumes and does not produce. The existence of such a class is inexplicable from the standpoint we have so far reached, viz., that of simple circulation. But let us anticipate. The money with which such a class is constantly making purchases, must constantly flow into their pockets, without any exchange, gratis, by might or right, from the pockets of commodity-owners themselves. To sell commodities above their value to such a class, is only to crib back again a part of the money previously given to it. The towns of Asia Minor thus paid a yearly money tribute to ancient Rome. With this money Rome purchased from them commodities, and purchased them too dear. The provincials cheated the Romans, and thus got back from their conquerors, in the course of trade, a portion of the tribute. yet, for all that, the conquered were the really cheated. Their goods were still paid for with their own money. That is not the way to get rich or to create surplus-value.

Let us therefore keep within the bounds of exchange where sellers are also buyers, sellers. Our difficulty may perhaps have arisen from treating the actors as personifications instead of as individuals.

A may be clever enough to get the advantage of B or C without their being able to retaliate. A sells wine worth £40 to B, and obtains from his in exchange corn to the value of £50. A has converted his £0 into £50, has made more money out of less, and has converted his commodities into capital. Let us examine this a little more closely. Before the exchange we had £40 worth of wine in the hands of A, and £50 worth of corn in those of B, a total value of £90. After the exchange we have still the same total value of £90. The value in circulation has not increased by one iota, it is only distributed differently between A and B. What is a loss of value to B is a surplus-value to A; what is “minus” to one is “plus” to the other. The same change would have taken place, if A, without the formality of an exchange, had directly stolen the £10 from B. The sum of the values in circulation can clearly not be augmented by any change in their distribution, any more than

the quantity of the precious metals in a country by a Jew selling a Queen Ann's farthing for a guinea. The capitalist class, as a whole, in any country, cannot over-reach themselves.

Turn and twist then as we may, the fact remains unaltered. If equivalents are exchanged, no surplus-value results and if non-equivalents are exchanged, still no surplus-value. Circulation, or the exchange of commodities, begets no value.

The reason is now therefore plain why, in analysing the standard form of capital, the form under which it determines the economical organisation of modern society, we entirely left out of consideration its most popular, and, so to say, ante-diluvian forms, merchants' capital and money-lenders' capital.

The circuit $M - C - M'$, buying in order to sell dearer, is seen most clearly in genuine merchants' capital. But the movement takes place entirely within the sphere of circulation. Since, however, it is impossible, by circulation alone, to account for the conversion of money into capital, for the formation of surplus-value, it would appear, that merchants' capital is an impossibility, so long as equivalents are exchanged; that, therefore, it can only have its origin in the two fold advantage gained, over both the selling and buying producers, by the merchant who parasitically shoves himself in between them. It is in this sense that Franklin says, "war is robbery, commerce is generally cheating." If the transformation of merchants' money into capital is to be explained otherwise than by the producers being simply cheated, a long series of intermediate steps would be necessary, which, at present, when the simple circulation of commodities forms our only assumption, are entirely wanting.

What we have said with reference to merchants' capital, applies still more to money-lenders' capital. In merchants' capital, the two extremes, the money that is thrown upon the market, and the augmented money that is withdrawn from the market, are at least connected by a purchase and a sale, in other words by the movements of the circulation. In money-lenders' capital the form $M - C - M'$ is reduced to the two extremes without a mean, $M - M'$, money exchanged for more money, a form that is incompatible with the nature of money and therefore remains inexplicable from the standpoint of the circulation of commodities. Hence Aristotle: "since chrematistic is a double science, one part belonging to commerce, the other to economic, the latter being necessary and praiseworthy, the

formed based on circulation and with justice disapproved (for it is not based on Nature, but on mutual cheating), therefore the usurer is most rightly hated, because money itself is the source of his gain, and is not used for the purposes for which it was invented. For it originated for the exchange of commodities, but interest makes out of money, more money. Hence its name ('tokos' interest and offspring). For the begotten are like those who beget them. But interest is money of money, so that of all modes of making a living, this is the most contrary to nature."

In the course of our investigation, we shall find that both merchants' capital and interest-bearing capital are derivative forms, and at the same time it will become clear, why these two forms appear in the course of history before the modern standard form of capital.

We have shown that surplus-value cannot be created by circulation, and, therefore, that in its formation, something must take place in the background, which is not apparent in the circulation itself. But can surplus-value possibly originate anywhere else than in circulation, which is the sum total of all the mutual relations of commodity-owners, as far as they are determined by their commodities? Apart from circulation, the commodity-owner is in relation only with his own commodity. So far as regards value, that relation is limited to this, that the commodity contains a quantity of his labour, that quantity being measured by a definite social standard. This quantity is expressed by the value of the commodity, and since the value is reckoned in money of account, this quantity is also expressed by the price, which we will suppose to be £10. But his labour is not represented both by the value of the commodity, and by a surplus over that value, not by a price of 10 that is also a price of 11, not by a value that is greater than itself. The commodity owner can, by his labour, create value, but not self-expanding value. He can increase the value of his commodity, by adding fresh labour, and therefore more value to the value in hand, by making, for instance, leather into boots. The same material has now more value, because it contains a greater quantity of labour. The boots have therefore more value than the leather, but the value of the leather remains what it was; it has not expanded itself, has not, during the making of the boots, annexed surplus value. It is therefore impossible that outside the sphere of circulation, a producer of commodities can, without coming into contact with other commodity owners, expand value, and consequently convert money or commodities into capital.

It is therefore impossible for capital to be produced by circulation, and it is equally impossible for it to originate apart from circulation. It must have its origin both in circulation and yet not in circulation.

We have, therefore, got a double result.

The conversion of money into capital has to be explained on the basis of the laws that regulate the exchange of commodities, in such a way that the starting point is the exchange of equivalents. Our friend, Moneybags, who as yet is only an embryo capitalist, must buy his commodities at their value, must sell them at their value, and yet at the end of the process must withdraw more value from circulation than he threw into it at starting. His development into a full-grown capitalist must take place, both within the sphere of circulation and without it. These are the conditions of the problem. *Hic Rhodus, hic salta!*

CHAPTER VI. THE BUYING AND SELLING OF LABOUR-POWER.

THE change of value that occurs in the case of money intended to be converted into capital, cannot take place in the money itself, since in its function of means of purchase and of payment, it does no more than realise the price of the commodity it buys or pays for; and, as hard cash, it is value petrified, never varying. Just as little can it originate in the second act of circulation, the re-sale of the commodity, which does no more than transform the article from its bodily form back again into its money-form. The change must, therefore, take place in the commodity bought by the first act, $M - C$, but not in its value, for equivalents are exchanged, and the commodity is paid for at its full value. We are, therefore, forced to the conclusion that the change originates in the use-value, as such of the commodity, i.e., in its consumption. In order to be able to extract value from the consumption of a commodity, our friend, Moneybags, must be so lucky as to find, within the sphere of circulation, in the market, a commodity, whose use-value possesses the peculiar property of being a source of value, whose actual consumption, therefore, is itself an embodiment of labour, and, consequently, a creation of value. The possessor of money does find on the market such a special commodity in capacity for labour or labour-power.

By labour-power or capacity for labour is to be understood the aggregate of these mental and physical capabilities existing in a human being, which he exercises whenever he produces a use-value of any description.

But in order that our owner of money may be able to find labour-power offered for sale as a commodity, various conditions must first be fulfilled. The exchange of commodities of itself implies no other relations of dependence than those which result from its own nature. On this assumption, labour-power can appear upon the market as a commodity only if, and so far as, its possessor, the individual whose labour-power it is, offers it for sale, or sells it, as a commodity. In order that he may be able to do this, he must have it at his disposal, must be the untrammelled owner of his capacity for labour, i.e., of his person. He and the owner of money meet in the market, and deal with each other as on the basis of equal rights, with

this difference alone, that one is buyer, the other seller; both, therefore, equal in the eyes of the law. The continuance of this relation demands that the owner of the labour-power should sell it only for a definite period, for if he were to sell it rump and stump, once for all, he would be selling himself, converting himself from a free man into a slave, from an owner of a commodity into a commodity. He must constantly look upon his labour-power as his own property, his own commodity, and this he can only do by placing it at the disposal of the buyer temporarily, for a definite period of time. By this means alone can he avoid renouncing his rights of ownership over it.

The second essential condition to the owner of money finding labour-power in the market as a commodity in this — that the labourer instead of being in the position to sell commodities in which his labour is incorporated, must be obliged to offer for sale as a commodity that very labour-power, which exists only in his living self.

In order that a man may be able to sell commodities other than labour-power, he must of course have the means of production, as raw material, implements, &c. No boots can be made without leather. He requires also the means of subsistence. Nobody — not even “a musician of the future” can live upon future products, or upon use-values in an unfinished state; and ever since the first moment of his appearance on the world’s stage, man always has been, and must still be a consumer, both before and while he is producing. In a society where all products assume the form of commodities, these commodities must be sold after they have been produced; it is only after their sale that they can serve in satisfying the requirements of their producer. The time necessary for their sale is superadded to that necessary for their production.

For the conversion of his money into capital, therefore, the owner of money must meet in the market with the free labourer, free in the double sense, that as a free man he can dispose of his labour-power as his own commodity, and that on the other hand he has no other commodity for sale, is short of everything necessary for the realisation of his labour-power.

The question why this free labourer confronts him in the market, has no interest for the owner of money, who regards the labour market as a branch of the general market for commodities. And for the present it interests us just as little. We cling to the fact theoretically, as he does practically. One thing, however, is clear — nature does not produce on the one side owners

of money or commodities, and on the other men possessing nothing but their won labour-power. This relation has no natural basis, neither is its social basis one that is common to all historical periods. It is clearly the result of a past historical development, the product of many economical revolutions, of the extinction of a whole series of older forms of social production.

So, too, the economical categories, already discussed by us bear the stamp of history. Definite historical conditions are necessary that a product may become a commodity. It must not be produced as the immediate means of subsistence of the producer himself. Had we gone further, and inquired under what circumstances all, or even the majority of products take the form of commodities, we should have found that this can only happen with production of a very specific kind, capitalist production. Such an inquiry, however, would have been foreign to the analysis of commodities. Production and circulation of commodities can take place, although the great mass of the objects produced are intended for the immediate requirements of their producers, are not turned into commodities, and consequently social production is not yet by a long way dominated in its length and breadth by exchange-value, the appearance of products as commodities presupposed such a development of the social division of labour, that the separation of use-value from exchange-value, a separation which first begins with barter, must already have been completed. But such a degree of development is common to many forms of society, which in other respects present the most varying historical features. On the other hand, if we consider money, its existence implies a definite stage in the exchange of commodities. The particular functions of money which it performs, either as the mere equivalent of commodities, or as means of circulation, or means of payment, as hoard or as universal money, point, according to the extent and relative preponderance of the one function or the other, to very different stages in the process of social production. Yet we know by experience that a circulation of commodities relatively primitive, suffices for the production of all these forms. Otherwise with capital. The historical conditions of its existence are by no means given with the mere circulation of money and commodities. It can spring into life, only when the owner of the means of production and subsistence meets in the market with the free labourer selling his labour-power. And this one historical condition

comprises a world's history. Capital therefore, announces from its first appearance a new epoch in the process of social production.

We must now examine more closely this peculiar commodity, labour-power. Like all others it has a value. How is that value determined?

The value of labour-power is determined, as in the case of every other commodity, by the labour-time necessary for the production, and consequently also the reproduction, of this special article. So far as it has value, it represents no more than a definite quantity of the average labour of society incorporated in it. Labour-power exists only as a capacity, or power of the living individual. Its production consequently presupposes his existence. Given the individual, the production of labour-power consists in his reproduction of himself or his maintenance. For his maintenance he requires a given quantity of the means of subsistence. Therefore the labour-time requisite for the production of labour-power reduces itself to that necessary for the production of those means of subsistence; in other words, the value of labour-power is the value of the means of subsistence necessary for the maintenance of the labourer. Labour-power, however, becomes a reality only by its exercise; it sets itself in action only by working. But thereby a definite quantity of human muscle, nerve, brain, &c., is wasted, and these require to be restored. This increased expenditure demands a larger income. If the owner of labour-power works to-day, to-morrow he must again be able to repeat the same process in the same conditions as regards health and strength. His means of subsistence must therefore be sufficient to maintain him in his normal state as a labouring individual. His natural wants, such as food, clothing, fuel, and housing, vary according to the climatic and other physical conditions of his country. On the other hand, the number and extent of his so-called necessary wants, as also the modes of satisfying them, are themselves the product of historical development, and depend therefore to a great extent on the degree of civilisation of a country, more particularly on the conditions under which, and consequently on the habits and degree of comfort in which, the class of free labourers has been formed. In contradistinction therefore to the case of other commodities, there enters into the determination of the value of labour-power a historical and moral element. Nevertheless, in a given country, at a given period, the average quantity of the means of subsistence necessary for the labourer is practically known.

The owner of labour-power is mortal. If then his appearance in the market is to be continuous, and the continuous conversion of money into capital assumes this, the seller of labour-power must perpetuate himself, “in the way that every living individual perpetuates himself, by procreation”. The labour-power withdrawn from the market by wear and tear and death, must be continually replaced by, at the very least, an equal amount of fresh labour-power. Hence the sum of the means of subsistence necessary for the production of labour-power must include the means necessary for the labourer’s substitutes, i.e., his children, in order that this race of peculiar commodity-owners may perpetuate its appearance in the market.

In order to modify the human organism, so that it may acquire skill and handiness in a given branch of industry, and become labour-power of a special kind, a special education or training is requisite, and this, on its part, costs an equivalent in commodities of a greater or less amount. This amount varies according to the more or less complicated character of the labour-power. The expenses of this education (excessively small in the case of ordinary labour-power), enter pro tanto into the total value spent in its production.

The value of labour-power resolves itself into the value of a definite quantity of the means of subsistence. It therefore varies with the value of these means or with the quantity of labour requisite for their production.

Some of the means of subsistence, such as food and fuel, are consumed daily, and a fresh supply must be provided daily. Others such a clothes and furniture last for longer periods and require to be replaced only at longer intervals. One article must be bought or paid for daily, another weekly, another quarterly, and so on. But in whatever way the sum total of these outlays may be spread over the year, they must be covered by the average income, taking one day with another. If the total of the commodities required daily for the production of labour-power=A, and those required weekly=B, and those required quarterly=C, and so on, the daily average of these commodities= $(365A+52B+4C+8c)/365$. Suppose that in this mass of commodities requisite for the average day there are embodied 6 hours of social labour, then there is incorporated daily in labour-power half a day’s average social labour, in other words, half a day’s labour in requisite for the daily production of labour-power. This quantity of labour forms the value of a day’s labour-power or the value of the labour-power daily reproduced. If half a day’s average social labour is incorporated in three shillings, then

three shillings is the price corresponding to the value of a day's labour-power. If its owner therefore offers it for sale at three shillings a day, its selling price is equal to its value, and according to our supposition, our friend Moneybags, who is intent upon converting his three shillings into capital, pays this value.

The minimum limit of the value of labour-power is determined by the value of the commodities, without the daily supply of which the labourer cannot renew his vital energy, consequently by the value of those means of subsistence that are physically indispensable. If the price of labour-power fall to this minimum, it falls below its value, since under such circumstances it can be maintained and developed only in a crippled state. But the value of every commodity is determined by the labour-time requisite to turn it out so as to be of normal quality.

It is a very cheap sort of sentimentality which declares this method of determining the value of labour-power, a method prescribed by the very nature of the case, to be a brutal method, and which wails with Rossi that, "To comprehend capacity for labour (*puissance de travail*) at the same time that we make abstraction from the means of subsistence of the labourers during the process of production, is to comprehend a phantom (*être de raison*). When we speak of labour, or capacity for labour, we speak at the same time of the labourer and his means of subsistence, of labourer and wages". When we speak of capacity for labour, we do not speak of labour, any more than when we speak of capacity for digestion, we speak of digestion. The latter process requires something more than a good stomach. When we speak of capacity for labour we do not abstract from the necessary means of subsistence. On the contrary, their value is expressed in its value. If his capacity for labour remains unsold, the labourer derives no benefit from it, but rather he will feel it to be a cruel nature-imposed necessity that this capacity has cost for its production a definite amount of the means of subsistence and that it will continue to do so for its reproduction. He will then agree with Sismondi: "that capacity for labour... is nothing unless it is sold."

One consequence of the peculiar nature of labour-power as a commodity is, that its use-value does not, on the conclusion of this contract between the buyer and seller, immediately pass into the hands of the former. Its value, like that of every other commodity, is already fixed before it goes into circulation, since a definite quantity of social labour has been spent upon it;

but its use-value consists in the subsequent exercise of its force. The alienation of labour-power and its actual appropriation by the buyer, its employment as a use-value, are separated by an interval of time. But in those cases in which the formal alienation by sale of the use-value of a commodity, is not simultaneous with its actual delivery to the buyer, the money of the latter usually functions as means of payment. In every country in which the capitalist mode of production reigns, it is the custom not to pay for labour-power before it has been exercised for the period fixed by the contract, as for example, the end of each week. In all cases, therefore, the use-value of the labour-power is advanced to the capitalist: the labourer allows the buyer to consume it before he receives payment of the price; he everywhere gives credit to the capitalist. That this credit is no mere fiction, is shown not only by the occasional loss of wages on the bankruptcy of the capitalist, but also by a series of more enduring consequences. Nevertheless, whether money serves as a means of purchase or as a means of payment, this makes no alteration in the nature of the exchange of commodities. The price of the labour-power is fixed by the contract, although it is not realised till later, like the rent of a house. The labour-power is sold, although it is only paid for at a later period. It will, therefore, be useful, for a clear comprehension of the relation of the parties, to assume provisionally, that the possessor of labour-power, on the occasion of each sale, immediately receives the price stipulated to be paid for it.

We now know how the value paid by the purchaser to the possessor of this peculiar commodity, labour-power, is determined. The use-value which the former gets in exchange, manifests itself only in the actual usufruct, in the consumption of the labour-power. The money owner buys everything necessary for this purpose, such as raw material, in the market, and pays for it at its full value. The consumption of labour-power is at one and the same time the production of commodities and of surplus value. The consumption of labour-power is completed, as in the case of every other commodity, outside the limits of the market or of the sphere of circulation. Accompanied by Mr. Moneybags and by the possessor of labour-power, we therefore take leave for a time of this noisy sphere, where everything takes place on the surface and in view of all men, and follow them both into the hidden abode of production, on whose threshold there stares us in the face “No admittance except on business.” Here we shall see, not only how

capital produces, but how capital is produced. We shall at last force the secret of profit making.

This sphere that we are deserting, within whose boundaries the sale and purchase of labour-power goes, is in fact a very Eden of the innate rights of man. There alone rule Freedom, Equality, Property and Bentham. Freedom, because both buyer and seller of a commodity, say of labour-power, are constrained only by their own free will. They contract as free agents, and the agreement they come to, is but the form in which they give legal expression to their common will. Equality, because each enters into relation with the other, as with a simply owner of commodities, and they exchange equivalent for equivalent. Property, because each disposes only of what is his own. And Bentham, because each looks only to himself. The only force that brings them together and puts them in relation with each other, is the selfishness, the gain and the private interests of each. Each looks to himself only, and no one troubles himself about the rest, and just because they do so, do they all, in accordance with the pre-established harmony of things, or under the auspices of an all-shrewd providence, work together to their mutual advantage, for the common weal and in the interest of all.

On leaving this sphere of simple circulation or of exchange of commodities, which furnishes the “Free-trader Vulgaris” with his views and ideas, and with the standard by which he judges a society based on capital and wages, we think we can perceive a change in the physiognomy of our *dramatis personæ*. He, who before was the money owner, now strides, in front as capitalist; the possessor of labour-power follows as his labourer. The one with an air of importance, smirking, intent on business; the other, timid and holding back, like one who is bringing his own hide to market and has nothing to expect but — a hiding.

PART III. THE PRODUCTION OF ABSOLUTE SURPLUS-VALUE.

CHAPTER VII. THE LABOUR-PROCESS AND THE PROCESS OF PRODUCING SURPLUS-VALUE.

SECTION 1. — THE LABOUR-PROCESS OR THE PRODUCTION OF USE-VALUES.

THE capitalist buys labour-power in order to use it; and labour-power in use is labour itself. The purchaser of labour-power consumes it by setting the seller of it to work. By working, the latter becomes actually, what before he only was potentially, labour-power in action, a labourer. In order that his labour may reappear in a commodity, he must, before all things, expend it on something useful, on something capable of satisfying a want of some sort. Hence, what the capitalist sets the labourer to produce, is a particular use-value, a specified article. The fact that the production of use-values, or goods, is carried on under the control of a capitalist and on his behalf, does not alter the general character of that production. We shall, therefore, in the first place, have to consider the labour-process independently of the particular form it assumes under given social conditions.

Labour is, in the first place, a process in which both man and Nature participate, and in which man of his own accord starts, regulates, and controls the material re-actions between himself and Nature. He opposes himself to Nature as one of her own forces, setting in motion arms and legs, head and hands, the natural forces of his body, in order to appropriate Nature's productions in a form adapted to his own wants. By thus acting on the external world and changing it, he at the same time change his own nature. He develops his slumbering powers and compels them to act in obedience to his sway. We are not now dealing with these primitive instinctive forms of labour that remind us of the mere animal. An immeasurable interval of time separates the state of things in which a man brings his labour-power to market for sale as a commodity, from that state in which human labour was still in its first instinctive stage. We presuppose labour in a form that stamps it as exclusively human. A spider conducts operations that resemble those of a weaver, and a bee puts to shame many an architect in the construction of her cells. But what distinguishes the worst architect from the best of bees is this, that the architect raises his

structure in imagination before he erects it in reality. At the end of every labour-process, we get a result that already existed in the imagination of the labourer at its commencement. He not only effects a change of form in the material on which he works, but he also realises a purpose of his own that gives the law to his *modus operandi*, and to which he must subordinate his will. And this subordination is no mere momentary act. Besides the exertion of the bodily organs, the process demands that, during the whole operation, the workman's will be steadily in consonance with his purpose. This means close attention. The less he is attracted by the nature of the work, and the mode in which it is carried on, and the less, therefore, he enjoys it as something which gives play to his bodily and mental powers, the more close his attention is forced to be.

The elementary factors of the labour-process are 1, the personal activity of man, i.e., work itself, 2, the subject of that work, and 3, its instruments.

The soil (and this, economically speaking, includes water) in the virgin state in which it supplies man with necessities or the means of subsistence ready to hand, exists independently of him, and is the universal subject of human labour. All those things which labour merely separates from immediate connection with their environment, are subjects of labour spontaneously provided by Nature. Such are fish which we catch and take from their element, water, timber which we fell in the virgin forest, and ores which we extract from their veins. If, on the other hand, the subject of labour has, so to say, been filtered through previous labour, we call it raw material; such is ore already extracted and ready for washing. All raw material is the subject of labour, but not every subject of labour is raw material; it can only become so, after it has undergone some alteration by means of labour.

An instrument of labour is a thing, or a complex of things, which the labourer interposes between himself and the subject of his labour, and which serves as the conductor of his activity. He makes use of the mechanical, physical, and chemical properties of some substances in order to make other substances subservient to his aims. Leaving out of consideration such ready-made means of subsistence as fruits, in gathering which a man's own limbs serve as the instruments of his labour, the first thing of which the labourer possesses himself is not the subject of labour but its instrument. Thus Nature becomes one of the organs of his activity, one that he annexes to his own bodily organs, adding stature to himself in

spite of the Bible. As the earth is his original larder, so too it is his original tool house. It supplies him, for instance, with stones for throwing, grinding, pressing, cutting, &c. The earth itself is an instrument of labour, but when used as such in agriculture implies a whole series of other instruments and a comparatively high development of labour. . No sooner does labour undergo the least development, than it requires specially prepared instruments. Thus in the oldest caves we find stone implements and weapons. In the earliest period of human history domesticated animals, i.e., animals which have been bred for the purpose, and have undergone modifications by means of labour, play the chief part as instruments of labour along with specially prepared stones, wood, bones, and shells. The use and fabrication of instruments of labour, although existing in the germ among certain species of animals, is specifically characteristic of the human labour-process, and Franklin therefore defines man as a tool-making animal. Relics of by-gone instruments of labour possess the same importance for the investigation of extinct economical forms of society, as do fossil bones for the determination of extinct species of animals. It is not the articles made, but how they are made, and by what instruments, that enables us to distinguish different economical epochs. Instruments of labour not only supply a standard of the degree of development to which human labour has attained, but they are also indicators of the social conditions under which that labour is carried on. Among the instruments of labour, those of a mechanical nature, which, taken as a whole, we may call the bone and muscles of production, offer much more decided characteristics of a given epoch of production, than those which, like pipes, tubs, baskets, jars, &c., serve only to hold the materials for labour, which latter class, we may in a general way, call the vascular system of production. The latter first begins to play an important part in the chemical industries.

In a wider sense we may include among the instruments of labour, in addition to those things that are used for directly transferring labour to its subject, and which therefore, in one way or another, serve as conductors of activity, all such objects as are necessary for carrying on the labour-process. These do not enter directly into the process, but without them it is either impossible for it to take place at all, or possible only to a partial extent. Once more we find the earth to be a universal instrument of this sort, for it furnishes a locus standi to the labourer and a field of employment for his

activity. Among instruments that are the result of previous labour and also belong to this class, we find workshops, canals, roads, and so forth.

In the labour-process, therefore, man's activity, with the help of the instruments of labour, effects an alteration, designed from the commencement, in the material worked upon. The process disappears in the product; the latter is a use-value, Nature's material adapted by a change of form to the wants of man. Labour has incorporated itself with its subject: the former is materialised, the latter transformed. That which in the labourer appeared as movement, now appears in the product as a fixed quality without motion. The blacksmith forges and the product is a forging.

If we examine the whole process from the point of view of its result, the product, it is plain that both the instruments and the subject of labour, are means of production, and that the labour itself is productive labour.

Though a use-value, in the form of a product, issues from the labour-process, yet other use-values, products of previous labour, enter into it as means of production. The same use-value is both the product of a previous process, and a means of production in a later process. Products are therefore not only results, but also essential conditions of labour.

With the exception of the extractive industries, in which the material for labour is provided immediately by nature, such as mining, hunting, fishing, and agriculture (so far as the latter is confined to breaking up virgin soil), all branches of industry manipulate raw material, objects already filtered through labour, already products of labour. Such is seed in agriculture. Animals and plants, which we are accustomed to consider as products of nature, are in their present form, not only products of, say last year's labour, but the result of a gradual transformation, continued through many generations, under man's superintendence, and by means of his labour. But in the great majority of cases, instruments of labour show even to the most superficial observer, traces of the labour of past ages.

Raw material may either form the principal substance of a product, or it may enter into its formation only as an accessory. An accessory may be consumed by the instruments of labour, as coal under a boiler, oil by a wheel, hay by draught-horses, or it may be mixed with the raw material in order to produce some modification thereof, as chlorine into unbleached linen, coal with iron, dye-stuff with wool, or again, it may help to carry on the work itself, as in the case of the materials used for heating and lighting workshops. The distinction between principal substance and accessory

vanishes in the true chemical industries, because there none of the raw material reappears, in its original composition, in the substance of the product.

Every object possesses various properties, and is thus capable of being applied to different uses. One and the same product may therefore serve as raw material in very different processes. Corn, for example, is a raw material for millers, starch-manufacturers, distillers, and cattle-breeders. It also enters as raw material into its own production in the shape of seed: coal, too, is at the same time the product of, and a means of production in, coal-mining.

Again, a particular product may be used in one and the same process, both as an instrument of labour and as raw material. Take, for instance, the fattening of cattle, where the animal is the raw material, and at the same time an instrument for the production of manure.

A product, though ready for immediate consumption, may yet serve as raw material for a further product, as grapes when they become the raw material for wine. On the other hand, labour may give us its product in such a form, that we can use it only as raw material, as is the case with cotton, thread, and yarn. Such a raw material, though itself a product, may have to go through a whole series of different processes: in each of these in turn, it serves, with constantly varying form, as raw material, until the last process of the series leaves it a perfect product, ready for individual consumption, or for use as an instrument of labour.

Hence we see, that whether a use-value is to be regarded as raw material, as instrument of labour, or as product, this is determined entirely by its function in the labour process, by the position it there occupies: as this varies, so does its character.

Whenever therefore a product enters as a means of production into a new labour-process, it thereby loses its character of product, and becomes a mere factor in the process. A spinner treats spindles only as implements for spinning, and flax only as the material that he spins. Of course it is impossible to spin without material and spindles; and therefore the existence of these things as products, at the commencement of the spinning operation, must be presumed: but in the process itself, the fact that they are products of previous labour, is a matter of utter indifference; just as in the digestive process, it is of no importance whatever, that bread is the produce of the previous labour of the farmer, the miller, and the baker. On the

contrary, it is generally by their imperfections as products, that the means of production in any process assert themselves in their character as products. A blunt knife or weak thread forcibly remind us of Mr. A., the cutler, or Mr. B., the spinner. In the finished product the labour by means of which it has acquired its useful qualities is not palpable, has apparently vanished.

A machine which does not serve the purposes of labour, is useless. In addition, it falls a prey to the destructive influence of natural forces. Iron rusts and wood rots. Yarn with which we neither weave nor knit, is cotton wasted. Living labour must seize upon these things and rouse them from their death-sleep, change them from mere possible use-values into real and effective ones. Bathed in the fire of labour, appropriated as part and parcel of labour's organism, and, as it were, made alive for the performance of their functions in the process, they are in truth consumed, but consumed with a purpose, as elementary constituents of new use-values, of new products, ever ready as means of subsistence for individual consumption, or as means of production for some new labour-process.

If then, on the one hand, finished products are not only results, but also necessary conditions, of the labour-process, on the other hand, their assumption into that process, their contact with living labour, is the sole means by which they can be made to retain their character of use-values, and be utilised.

Labour uses up its material factors, its subject and its instruments, consumes them, and is therefore a process of consumption. Such productive consumption is distinguished from individual consumption by this, that the latter uses up products, as means of subsistence for the living individual; the farmer, as means whereby alone, labour, the labour-power of the living individual, is enabled to act. The product, therefore, of individual consumption, is the consumer himself; the result of productive consumption, is a product distinct from the consumer.

In so far then, as its instruments and subjects are themselves products, labour consumes products in order to create products, or in other words, consumes one set of products by turning them into means of production for another set. But, just as in the beginning, the only participators in the labour-process were man and the earth, which latter exists independently of man, so even now we still employ in the process many means of production, provided directly by nature, that do not represent any combination of natural substances with human labour.

The labour process, resolved as above into its simple elementary factors, is human action with a view to the production of use-values, appropriation of natural substances to human requirements; it is the necessary condition for effecting exchange of matter between man and Nature; it is the everlasting nature-imposed condition of human existence, and therefore is independent of every social phase of that existence, or rather, is common to every such phase. It was, therefore, not necessary to represent our labourer in connexion with other labourers; man and his labour on one side, Nature and its materials on the other, sufficed. As the taste of the porridge does not tell you who grew the oats, no more does this simple process tell you of itself what are the social conditions under which it is taking place, whether under the slave-owner's brutal lash, or the anxious eye of the capitalist, whether Cincinnatus carries it on in tilling his modest farm or a savage in killing wild animals with stones.

Let us now return to our would-be capitalist. We left him just after he had purchased, in the open market, all the necessary factors of the labour-process; its objective factors, the means of production, as well as its subjective factor, labour-power. With the keen eye of an expert, he had selected the means of production and the kind of labour-power best adapted to his particular trade, be it spinning, bootmaking, or any other kind. He then proceeds to consume the commodity, the labour-power that he has just bought, by causing the labourer, the impersonation of that labour-power, to consume the means of production by his labour. The general character of the labour-process is evidently not changed by the fact, that the labourer works for the capitalist instead of for himself; moreover, the particular methods and operations employed in boot-making or spinning are not immediately changed by the intervention of the capitalist. He must begin by taking the labour-power as he finds it in the market, and consequently be satisfied with labour of such a kind as would be found in the period immediately preceding the rise of the capitalists. Changes in the methods of production by the subordination of labour to capital, can take place only at a later period, and therefore will have to be treated of in a later chapter.

The labour-process, turned into the process by which the capitalist consumes labour-power, exhibits two characteristic phenomena. First, the labourer works under the control of the capitalist to whom his labour belongs; the capitalist taking good care that the work is done in a proper manner, and that the means of production are used with intelligence, so that

there is no unnecessary waste of raw material, and no wear and tear of the implements beyond what is necessarily caused by the work.

Secondly, the product is the property of the capitalist and not that of the labourer, its immediate producer. Suppose that a capitalist pays for a day's labour-power at its value; then the right to use that power for a day belongs to him, just as much as the right to use any other commodity, such as a horse that he has hired for the day. To the purchaser of a commodity belongs its use, and the seller of labour-power, by giving his labour, does no more, in reality, than part with the use-value that he has sold. From the instant he steps into the workshop, the use-value of his labour-power, and therefore also its use, which is labour, belongs to the capitalist. By the purchase of labour-power, the capitalist incorporates labour, as a living ferment, with the lifeless constituents of the product. From his point of view, the labour-process is nothing more than the consumption of the commodity purchased, i.e., of labour-power; but this consumption cannot be effected except by supplying the labour-power with the means of production. The labour-process is a process between things that the capitalist has purchased, things that have become his property. The product of this process also belongs, therefore, to him, just as much as does the wine which is the product of a process of fermentation completed in his cellar.

SECTION 2. — THE PRODUCTION OF SURPLUS-VALUE.

The product appropriated by the capitalist is a use-value, as yarn, for example, or boots. But, although boots are, in one sense, the basis of all social progress, and our capitalist is a decided “progressist,” yet he does not manufacture boots for their own sake. Use-value is, by no means, the thing “*qu'on aime pour lui-même*” in the production of commodities. Use-values are only produced by capitalists, because, and in so far as, they are the material substratum, the depositaries of exchange-value. Our capitalist has two objects in view: in the first place, he wants to produce a use-value that has a value in exchange, that is to say, an article destined to be sold, a commodity; and secondly, he desires to produce a commodity whose value shall be greater than the sum of the values of the commodities used in its production, that is, of the means of production and the labour-power, that he purchased with his good money in the open market. His aim is to produce

not only a use-value, but a commodity also; not only use-value, but value; not only value, but at the same time surplus-value.

It must be borne in mind, that we are now dealing with the production of commodities, and that, up to this point, we have only considered one aspect of the process. Just as commodities are, at the same time, use-values and values, so the process of producing them must be a labour-process, and at the same time, a process of creating value.

Let us now examine production as a creation of value.

We know that the value of each commodity is determined by the quantity of labour expended on and materialised in it, by the working-time necessary, under given social conditions, for its production. This rule also holds good in the case of the product that accrued to our capitalist, as the result of the labour-process carried on for him. Assuming this product to be 10 lbs. of yarn, our first step is to calculate the quantity of labour realised in it.

For spinning the yarn, raw material is required; suppose in this case 10 lbs. of cotton. We have no need at present to investigate the value of this cotton, for our capitalist has, we will assume, bought it at its full value, say of ten shillings. In this price the labour required for the production of the cotton is already expressed in terms of the average labour of society. We will further assume that the wear and tear of the spindle, which, for our present purpose, may represent all other instruments of labour employed, amounts to the value of 2s. If, then, twenty-four hours' labour, or two working days, are required to produce the quantity of gold represented by twelve shillings, we have here, to begin with, two days' labour already incorporated in the yarn.

We must not let ourselves be misled by the circumstance that the cotton has taken a new shape while the substance of the spindle has to a certain extent been used up. By the general law of value, if the value of 40 lbs. of yarn = the value of 40 lbs. of cotton + the value of a whole spindle, i.e., if the same working time is required to produce the commodities on either side of this equation, then 10 lbs. of yarn are an equivalent for 10 lbs. of cotton, together with one-fourth of a spindle. In the case we are considering the same working time is materialised in the 10 lbs. of yarn on the one hand, and in the 10 lbs. of cotton and the fraction of a spindle on the other. Therefore, whether value appears in cotton, in a spindle, or in yarn, makes

no difference in the amount of that value. The spindle and cotton, instead of resting quietly side by side, join together in the process, their forms are altered, and they are turned into yarn; but their value is no more affected by this fact than it would be if they had been simply exchanged for their equivalent in yarn.

The labour required for the production of the cotton, the raw material of the yarn, is part of the labour necessary to produce the yarn, and is therefore contained in the yarn. The same applies to the labour embodied in the spindle, without whose wear and tear the cotton could not be spun.

Hence, in determining the value of the yarn, or the labour-time required for its production, all the special processes carried on at various times and in different places, which were necessary, first to produce the cotton and the wasted portion of the spindle, and then with the cotton and spindle to spin the yarn, may together be looked on as different and successive phases of one and the same process. The whole of the labour in the yarn is past labour; and it is a matter of no importance that the operations necessary for the production of its constituent elements were carried on at times which, referred to the present, are more remote than the final operation of spinning. If a definite quantity of labour, say thirty days, is requisite to build a house, the total amount of labour incorporated in it is not altered by the fact that the work of the last day is done twenty-nine days later than that of the first. Therefore the labour contained in the raw material and the instruments of labour can be treated just as if it were labour expended in an earlier stage of the spinning process, before the labour of actual spinning commenced.

The values of the means of production, i.e., the cotton and the spindle, which values are expressed in the price of twelve shillings, are therefore constituent parts of the value of the yarn, or, in other words, of the value of the product.

Two conditions must nevertheless be fulfilled. First, the cotton and spindle must concur in the production of a use-value; they must in the present case become yarn. Value is independent of the particular use-value by which it is borne, but it must be embodied in a use-value of some kind. Secondly, the time occupied in the labor of production must not exceed the time really necessary under the given social conditions of the case. Therefore, if no more than 1 lb. of cotton be requisite to spin 1 lb. of yarn, care must be taken that no more than this weight of cotton is consumed in the production of 1 lb. of yarn; and similarly with regard to the spindle.

Though the capitalist have a hobby, and use a gold instead of a steel spindle, yet the only labour that counts for anything in the value of the yarn is that which would be required to produce a steel spindle, because no more is necessary under the given social conditions.

We now know what portion of the value of the yarn is owing to the cotton and the spindle. It amounts to twelve shillings or the value of two days' work. The next point for our consideration is, what portion of the value of the yarn is added to the cotton by the labour of the spinner.

We have now to consider this labour under a very different aspect from that which it had during the labour-process; there, we viewed it solely as that particular kind of human activity which changes cotton into yarn; there, the more the labour was suited to the work, the better the yarn, other circumstances remaining the same. The labour of the spinner was then viewed as specifically different from other kinds of productive labour, different on the one hand in its special aim, viz., spinning, different, on the other hand, in the special character of its operations, in the special nature of its means of production and in the special use-value of its product. For the operation of spinning, cotton and spindles are a necessity, but for making rifled cannon they would be of no use whatever. Here, on the contrary, where we consider the labour of the spinner only so far as it is value-creating, i.e., a source of value, his labour differs in no respect from the labour of the man who bores cannon, or (what here more nearly concerns us), from the labour of the cotton-planter and spindle-maker incorporated in the means of production. It is solely by reason of this identity, that cotton planting, spindle making and spinning, are capable of forming the component parts, differing only quantitatively from each other, of one whole, namely, the value of the yarn. Here, we have nothing more to do with the quality, the nature and the specific character of the labour, but merely with its quantity. And this simply requires to be calculated. We proceed upon the assumption that spinning is simple, unskilled labour, the average labour of a given state of society. Hereafter we shall see that the contrary assumption would make no difference.

While the labourer is at work, his labour constantly undergoes a transformation: from being motion, it becomes an object without motion; from being the labourer working, it becomes the thing produced. At the end of one hour's spinning, that act is represented by a definite quantity of yarn; in other words, a definite quantity of labour, namely that of one hour, has

become embodied in the cotton. We say labour, i.e., the expenditure of his vital force by the spinner, and not spinning labour, because the special work of spinning counts here, only so far as it is the expenditure of labour-power in general, and not in so far as it is the specific work of the spinner.

In the process we are now considering it is of extreme importance, that no more time be consumed in the work of transforming the cotton into yarn than is necessary under the given social conditions. If under normal, i.e., average social conditions of production, a pounds of cotton ought to be made into b pounds of yarn by one hour's labour, then a day's labour does not count as 12 hours' labour unless 12 a pounds of cotton have been made into 12 b pounds of yarn; for in the creation of value, the time that is socially necessary alone counts.

Not only the labour, but also the raw material and the product now appear in quite a new light, very different from that in which we viewed them in the labour-process pure and simple. The raw material serves now merely as an absorbent of a definite quantity of labour. By this absorption it is in fact changed into yarn, because it is spun, because labour-power in the form of spinning is added to it; but the product, the yarn, is now nothing more than a measure of the labour absorbed by the cotton. If in one hour $1\frac{2}{3}$ lbs. of cotton can be spun into $1\frac{2}{3}$ lbs. of yarn, then 10 lbs. of yarn indicate the absorption of 6 hours' labour. Definite quantities of product, these quantities being determined by experience, now represent nothing but definite quantities of labour, definite masses of crystallized labour-time. They are nothing more than the materialisation of so many hours or so many days of social labour.

We are here no more concerned about the facts, that the labour is the specific work of spinning, that its subject is cotton and its product yarn, than we are about the fact that the subject itself is already a product and therefore raw material. If the spinner, instead of spinning, were working in a coal mine, the subject of his labour, the coal, would be supplied by Nature; nevertheless, a definite quantity of extracted coal, a hundred weight, for example, would represent a definite quantity of absorbed labour.

We assumed, on the occasion of its sale, that the value of a day's labour-power is three shillings, and that six hours' labour are incorporated in that sum; and consequently that this amount of labour is requisite to produce the necessities of life daily required on an average by the labourer. If now our spinner by working for one hour, can convert $1\frac{2}{3}$ lbs. of cotton into $1\frac{2}{3}$

lbs. of yarn, it follows that in six hours he will convert 10 lbs. of cotton into 10 lbs. of yarn. Hence, during the spinning process, the cotton absorbs six hours' labour. The same quantity of labour is also embodied in a piece of gold of the value of three shillings. Consequently by the mere labour of spinning, a value of three shillings is added to the cotton.

Let us now consider the total value of the product, the 10 lbs. of yarn. Two and a half days' labour have been embodied in it, of which two days were contained in the cotton and in the substance of the spindle worn away, and half a day was absorbed during the process of spinning. This two and a half days' labour is also represented by a piece of gold of the value of fifteen shillings. Hence, fifteen shillings is an adequate price for the 10 lbs. of yarn, or the price of one pound is eighteen-pence.

Our capitalist stares in astonishment. The value of the product is exactly equal to the value of the capital advanced. The value so advanced has not expanded, no surplus-value has been created, and consequently money has not been converted into capital. The price of the yarn is fifteen shillings, and fifteen shillings were spent in the open market upon the constituent elements of the product, or, what amounts to the same thing; upon the factors of the labour-process; ten shillings were paid for the cotton, two shillings for the substance of the spindle worn away, and three shillings for the labour-power. The swollen value of the yarn is of no avail, for it is merely the sum of the values formerly existing in the cotton, the spindle, and the labour-power; out of such a simple addition of existing values, no surplus-value can possibly arise. These separate values are now all concentrated in one thing; but so they were also in the sum of fifteen shillings, before it was split up into three parts, by the purchase of the commodities.

There is in reality nothing very strange in this result. The value of one pound of yarn being eighteenpence, if our capitalist buys 10 lbs. of yarn in the market, he must pay fifteen shillings for them. It is clear that, whether a man buys his house ready built, or gets it built for him, in neither case will the mode of acquisition increase the amount of money laid out on the house.

Our capitalist, who is at home in his vulgar economy, exclaims: "Oh! but I advanced my money for the express purpose of making more money." The way to Hell is paved with good intentions, and he might just as easily have intended to make money, without producing at all. He threatens all sorts of things. He won't be caught napping again. In future he will buy the

commodities in the market, instead of manufacturing them himself. But if all his brother capitalists were to do the same, where would he find his commodities in the market? And his money he cannot eat. He tries persuasion. "Consider my abstinence; I might have played ducks and drakes with the 15 shillings; but instead of that I consumed it productively, and made yarn with it." Very well, and by way of reward he is now in possession of good yarn instead of a bad conscience; and as for playing the part of a miser, it would never do for him to relapse into such bad ways as that; we have seen before to what results such asceticism leads. Besides, where nothing is, the king has lost his rights: whatever may be the merit of his abstinence, there is nothing wherewith specially to remunerate it, because the value of the product is merely the sum of the values of the commodities that were thrown into the process of production. Let him therefore console himself with the reflection that virtue is its own reward. But no, he becomes importunate. He says: "The yarn is of no use to me: I produced it for sale." In that case let him sell it, or, still better, let him for the future produce only things for satisfying his personal wants, a remedy that his physician M'Culloch has already prescribed as infallible against an epidemic of over-production. He now gets obstinate. "Can the labourer," he asks, "merely with his arms and legs, produce commodities out of nothing? Did I not supply him with the materials, by means of which, and in which alone, his labour could be embodied? And as the greater part of society consists of such ne'er-do-weels, have I not rendered society incalculable service by my instruments of production, my cotton and my spindle, and not only society, but the labourer also, whom in addition I have provided with the necessaries of life? And am I to be allowed nothing in return for all this service?" Well, but has not the labourer rendered him the equivalent service of changing his cotton and spindle into yarn? Moreover, there is here no question of service. A service is nothing more than the useful effect of a use-value, be it of a commodity, or be it of labour. But here we are dealing with exchange-value. The capitalist paid to the labourer a value of 3 shillings, and the labourer gave him back an exact equivalent in the value of 3 shillings, added by him to the cotton: he gave him value for value. Our friend, up to this time so purse-proud, suddenly assumes the modest demeanour of his own workman, and exclaims: "Have I myself not worked? Have I not performed the labour of superintendence and of overlooking the spinner? And does not this labour, too, create value?" His overlooker and

his manager try to hide their smiles. Meanwhile, after a hearty laugh, he re-assumes his usual mien. Though he chanted to us the whole creed of the economists, in reality, he says, he would not give a brass farthing for it. He leaves this and all such like subterfuges and juggling tricks to the professors of political economy, who are paid for it. He himself is a practical man; and though he does not always consider what he says outside his business, yet in his business he knows what he is about.

Let us examine the matter more closely. The value of a day's labour-power amounts to 3 shillings, because on our assumption half a day's labour is embodied in that quantity of labour-power, i.e., because the means of subsistence that are daily required for the production of labour-power, cost half a day's labour. But the past labour that is embodied in the labour-power, and the living labour that it can call into action; the daily cost of maintaining it, and its daily expenditure in work, are two totally different things. The former determines the exchange-value of the labour-power, the latter is its use value. The fact that half a day's labour is necessary to keep the labourer alive during 24 hours, does not in any way prevent him from working a whole day. Therefore, the value of labour-power, and the value which that labour-power creates in the labour process, are two entirely different magnitudes; and this difference of the two values was what the capitalist had in view, when he was purchasing the labour-power. The useful qualities that labour-power possesses, and by virtue of which it makes yarn or boots, were to him nothing more than a condition sine qua non; for in order to create value, labour must be expended in a useful manner. What really influenced him was the specific use-value which this commodity possesses of being a source not only of value, but of more value than it has itself. This is the special service that the capitalist expects from labour-power, and in this transaction he acts in accordance with the "eternal laws" of the exchange of commodities. The seller of labour-power, like the seller of any other commodity, realises its exchange-value, and parts with its use-value. He cannot take the one without giving the other. The use-value of labour-power, or in other words, labour, belongs just as little to its seller, as the use-value of oil after it has been sold belongs to the dealer who has sold it. The owner of the money has paid the value of a day's labour-power; his, therefore, is the use of it for a day; a day's labour belongs to him. The circumstance, that on the one hand the daily sustenance of labour-power costs only half a day's labour, while on the other hand the very same labour-

power can work during a whole day, that consequently the value which its use during one day creates, is double what he pays for that use, this circumstance is, without doubt, a piece of good luck for the buyer, but by no means an injury to the seller.

Our capitalist foresaw this state of things, and that was the cause of his laughter. The labourer therefore finds, in the workshop, the means of production necessary for working, not only during six, but during twelve hours. Just as during the six hours' process our 10 lbs. of cotton absorbed six hours' labour, and became 10 lbs. of yarn, so now, 20 lbs. of cotton will absorb 12 hours' labour and be changed into 20 lbs. of yarn. Let us now examine the product of this prolonged process. There is now materialised in this 20 lbs. of yarn the labour of five days, of which four days are due to the cotton and the lost steel of the spindle, the remaining day having been absorbed by the cotton during the spinning process. Expressed in gold, the labour of five days is thirty shillings. This is therefore the price of the 20 lbs. of yarn, giving, as before, eighteenpence as the price of a pound. But the sum of the values of the commodities that entered into the process amounts to 27 shillings. The value of the yarn is 30 shillings. Therefore the value of the product is $\frac{1}{9}$ greater than the value advanced for its production; 27 shillings have been transformed into 30 shillings; a surplus-value of 3 shillings has been created. The trick has at last succeeded; money has been converted into capital.

Every condition of the problem is satisfied, while the laws that regulate the exchange of commodities, have been in no way violated. Equivalent has been exchanged for equivalent. For the capitalist as buyer paid for each commodity, for the cotton, the spindle and the labour-power, its full value. He then did what is done by every purchaser of commodities; he consumed their use-value. The consumption of the labour-power, which was also the process of producing commodities, resulted in 20 lbs. of yarn, having a value of 30 shillings. The capitalist, formerly a buyer, now returns to market as a seller, of commodities. He sells his yarn at eighteenpence a pound, which is its exact value. Yet for all that he withdraws 3 shillings more from circulation than he originally threw into it. This metamorphosis, this conversion of money into capital, takes place both within the sphere of circulation and also outside it; within the circulation, because conditioned by the purchase of the labour-power in the market; outside the circulation, because what is done within it is only a stepping-stone to the production of

surplus-value, a process which is entirely confined to the sphere of production. Thus “tout est pour le mieux dans le meilleur des mondes possibles.”

By turning his money into commodities that serve as the material elements of a new product, and as factors in the labour-process, by incorporating living labour with their dead substance, the capitalist at the same time converts value, i.e., past, materialised, and dead labour into capital, into value big with value, a live monster that is fruitful and multiplies.

If we now compare the two processes of producing value and of creating surplus-value, we see that the latter is nothing but the continuation of the former beyond a definite point. If on the one hand the process be not carried beyond the point, where the value paid by the capitalist for the labour-power is replaced by an exact equivalent, it is simply a process of producing value; if, on the other hand, it be continued beyond that point, it becomes a process of creating surplus-value.

If we proceed further, and compare the process of producing value with the labour-process, pure and simple, we find that the latter consists of the useful labour, the work, that produces use-values. Here we contemplate the labour as producing a particular article; we view it under its qualitative aspect alone, with regard to its end and aim. But viewed as a value-creating process, the same labour-process presents itself under its quantitative aspect alone. Here it is a question merely of the time occupied by the labourer in doing the work; of the period during which the labour-power is usefully expended. Here, the commodities that take part in the process, do not count any longer as necessary adjuncts of labour-power in the production of a definite, useful object. They count merely as depositaries of so much absorbed or materialised labour; that labour, whether previously embodied in the means of production, or incorporated in them for the first time during the process by the action of labour-power, counts in either case only according to its duration; it amounts to so many hours or days as the case may be.

Moreover, only so much of the time spent in the production of any article is counted, as, under the given social conditions, is necessary. The consequences of this are various. In the first place, it becomes necessary that the labour should be carried on under normal conditions. If a self-acting

mule is the implement in general use for spinning, it would be absurd to supply the spinner with a distaff and spinning wheel. The cotton too must not be such rubbish as to cause extra waste in being worked, but must be of suitable quality. Otherwise the spinner would be found to spend more time in producing a pound of yarn than is socially necessary, in which case the excess of time would create neither value nor money. But whether the material factors of the process are of normal quality or not, depends not upon the labourer, but entirely upon the capitalist. Then again, the labour-power itself must be of average efficacy. In the trade in which it is being employed, it must possess the average skill, handiness and quickness prevalent in that trade, and our capitalist took good care to buy labour-power of such normal goodness. This power must be applied with the average amount of exertion and with the usual degree of intensity; and the capitalist is as careful to see that this is done, as that his workmen are not idle for a single moment. He has bought the use of the labour-power for a definite period, and he insists upon his rights. He has no intention of being robbed. Lastly, and for this purpose our friend has a penal code of his own, all wasteful consumption of raw material or instruments of labour is strictly forbidden, because what is so wasted, represents labour superfluously expended, labour that does not count in the product or enter into its value.

We now see, that the difference between labour, considered on the one hand as producing utilities, and on the other hand, as creating value, a difference which we discovered by our analysis of a commodity, resolves itself into a distinction between two aspects of the process of production.

The process of production, considered on the one hand as the unity of the labour-process and the process of creating value, is production of commodities; considered on the other hand as the unity of the labour-process and the process of producing surplus-value, it is the capitalist process of production, or capitalist production of commodities.

We stated, on a previous page, that in the creation of surplus-value it does not in the least matter, whether the labour appropriated by the capitalist be simple unskilled labour of average quality or more complicated skilled labour. All labour of a higher or more complicated character than average labour is expenditure of labour-power of a more costly kind, labour-power whose production has cost more time and labour, and which therefore has a higher value, than unskilled or simple labour-power. This power being of higher value, its consumption is labour of a higher class,

labour that creates in equal times proportionally higher values than unskilled labour does. Whatever difference in skill there may be between the labour of a spinner and that of a jeweller, the portion of his labour by which the jeweller merely replaces the value of his own labour-power, does not in any way differ in quality from the additional portion by which he creates surplus-value. In the making of jewellery, just as in spinning, the surplus-value results only from a quantitative excess of labour, from a lengthening-out of one and the same labour-process, in the one case, of the process of making jewels, in the other of the process of making yarn.

But on the other hand, in every process of creating value, the reduction of skilled labour to average social labour, e.g., one day of skilled to six days of unskilled labour, is unavoidable. We therefore save ourselves a superfluous operation, and simplify our analysis, by the assumption, that the labour of the workman employed by the capitalist is unskilled average labour.

CHAPTER VIII. CONSTANT CAPITAL AND VARIABLE CAPITAL

THE various factors of the labour-process play different parts in forming the value of the product.

The labourer adds fresh value to the subject of his labour by expending upon it a given amount of additional labour, no matter what the specific character and utility of that labour may be. On the other hand, the values of the means of production used up in the process are preserved, and present themselves afresh as constituent parts of the value of the product; the values of the cotton and the spindle, for instance, reappear again in the value of the yarn. The value of the means of production is therefore preserved, by being transferred to the product. This transfer takes place during the conversion of those means into a product, or in other words, during the labour-process. It is brought about by labour; but how?

The labourer does not perform two operations at once, one in order to add value to the cotton, the other in order to preserve the value of the means of production, or, in what amounts to the same thing, to transfer to the yarn, to the product, the value of the cotton on which he works, and part of the value of the spindle with which he works. But, by the very act of adding new value, he preserves their former values. Since, however, the addition of new value to the subject of his labour, and the preservation of its former value, are two entirely distinct results, produced simultaneously by the labourer, during one operation, it is plain that this twofold nature of the result can be explained only by the twofold nature of his labour; at one and the same time, it must in one character create value, and in another character preserve or transfer value.

Now, in what manner does every labourer add new labour and consequently new value? Evidently, only by labouring productively in a particular way; the spinner by spinning, the weaver by weaving, the smith by forging. But, while thus incorporating labour generally, that is value, it is by the particular form alone of the labour, by the spinning, the weaving and the forging respectively, that the means of production, the cotton and spindle, the yarn and loom, and the iron and anvil become constituent elements of the product, of a new use-value. Each use-value disappears, but

only to re-appear under a new form in a new use-value. Now, we saw, when we were considering the process of creating value, that, if a use-value be effectively consumed in the production of a new use-value, the quantity of labour expended in the production of the consumed article, forms a portion of the quantity of labour necessary to produce the new use-value; this portion is therefore labour transferred from the means of production to the new product. Hence, the labourer preserves the values of the consumed means of production, or transfers them as portions of its value to the product, not by virtue of his additional labour, abstractedly considered, but by virtue of the particular useful character of that labour, by virtue of its special productive form. In so far then as labour is such specific productive activity, in so far as it is spinning, weaving, or forging, it raises, by mere contact, the means of production from the dead, makes them living factors of the labour-process, and combines with them to form the new products.

If the special productive labour of the workman were not spinning, he could not convert the cotton into yarn, and therefore could not transfer the values of the cotton and spindle to the yarn. Suppose the same workman were to change his occupation to that of a joiner, he would still by a day's labour add value to the material he works upon. Consequently, we see, first, that the addition of new value takes place not by virtue of his labour being spinning in particular, or joinering in particular, but because it is labour in the abstract, a portion of the total labour of society; and we see next, that the value added is of a given definite amount, not because his labour has a special utility, but because it is exerted for a definite time. On the one hand, then, it is by virtue of its general character, as being expenditure of human labour-power in the abstract, that spinning adds new value to the values of the cotton and the spindle; and on the other hand, it is by virtue of its special character, as being a concrete, useful process, that the same labour of spinning both transfers the values of the means of production to the product, and preserves them in the product. Hence at one and the same time there is produced a twofold result.

By the simple addition of a certain quantity of labour, new value is added, and by the quality of this added labour, the original values of the means of production are preserved in the product. This twofold effect, resulting from the two-fold character of labour, may be traced in various phenomena.

Let us assume, that some invention enables the spinner to spin as much cotton in 6 hours as he was able to spin before in 36 hours. His labour is now six times as effective as it was, for the purposes of useful production. The product of 6 hours' work has increased sixfold, from 6 lbs. to 36 lbs. But now the 36 lbs. of cotton absorb only the same amount of labour as formerly did the 6 lbs. One-sixth as much new labour is absorbed by each pound of cotton, and consequently, the value added by the labour to each pound is only one-sixth of what it formerly was. On the other hand, in the product, in the 36 lbs. of yarn, the value transferred from the cotton is six times as great as before. By the 6 hours' spinning, the value of the raw material preserved and transferred to the product is six times as great as before, although the new value added by the labour of the spinner to each pound of the very same raw material is one-sixth what it was formerly. This shows that the two properties of labour, by virtue of which it is enabled in one case to preserve value, and in the other to create value, are essentially different. On the one hand, the longer the time necessary to spin a given weight of cotton into yarn, the greater is the new value added to the material; on the other hand, the greater the weight of the cotton spun in a given time, the greater is the value preserved, by being transferred from it to the product.

Let us now assume, that the productiveness of the spinner's labour, instead of varying, remains constant, that he therefore requires the same time as he formerly did, to convert one pound of cotton into yarn, but that the exchange value of the cotton varies, either by rising to six times its former value or falling to one-sixth of that value. In both these cases, the spinner puts the same quantity of labour into a pound of cotton, and therefore adds as much value, as he did before the change in the value: he also produces a given weight of yarn in the same time as he did before. Nevertheless, the value that he transfers from the cotton to the yarn is either one-sixth of what it was before the variation, or, as the case may be, six times as much as before. The same result occurs when the value of the instruments of labour rises or falls, while their useful efficacy in the process remains unaltered.

Again, if the technical conditions of the spinning process remain unchanged, and no change of value takes place in the means of production, the spinner continues to consume in equal working-times equal quantities of raw material, and equal quantities of machinery of unvarying value. The

value that he preserves in the product is directly proportional to the new value that he adds to the product. In two weeks he incorporates twice as much labour, and therefore twice as much value, as in one week, and during the same time he consumes twice as much material, and wears out twice as much machinery, of double the value in each case; he therefore preserves, in the product of two weeks, twice as much value as in the product of one week. So long as the conditions of production remain the same, the more value the labourer adds by fresh labour, the more value he transfers and preserves; but he does so merely because this addition of new value takes place under conditions that have not varied and are independent of his own labour. Of course, it may be said in one sense, that the labourer preserves old value always in proportion to the quantity of new value that he adds. Whether the value of cotton rise from one shilling to two shillings, or fall to six-pence, the workman invariably preserves in the product of one hour only one half as much value as he preserves in two hours. In like manner, if the productiveness of his own labour varies by rising or falling, he will in one hour spin either more or less cotton, as the case may be, than he did before, and will consequently preserve in the product of one hour, more or less value of cotton; but, all the same, he will preserve by two hours' labour twice as much value as he will by one.

Value exists only in articles of utility, in objects: we leave out of consideration its purely symbolical representation by tokens. (Man himself, viewed as the impersonation of labour-power, is a natural object, a thing, although a living conscious thing, and labour is the manifestation of this power residing in him.) If therefore an article loses its utility, it also loses its value. The reason why means of production do not lose their value, at the same time that they lose their use-value, is this: they lose in the labour-process the original form of their use-value, only to assume in the product the form of a new use-value. But, however important it may be to value, that it should have some object of utility to embody itself in, yet it is a matter of complete indifference what particular object serves this purpose; this we saw when treating of the metamorphosis of commodities. Hence it follows that in the labour-process the means of production transfer their value to the product only so far as along with their use-value they lose also their exchange value. They give up to the product that value alone which they themselves lose as means of production. But in this respect the material factors of the labour-process do not all behave alike.

The coal burnt under the boiler vanishes without leaving a trace; so, too, the tallow with which the axles of wheels are greased. Dye stuffs and other auxiliary substances also vanish but re-appear as properties of the product. Raw material forms the substance of the product, but only after it has changed its form. Hence raw material and auxiliary substances lost the characteristic form with which they are clothed on entering the labour-process. It is otherwise with the instruments of labour. Tools, machines, workshops, and vessels, are of use in the labour-process, only so long as they retain their original shape, and are ready each morning to renew the process with their shape unchanged. And just as during their lifetime, that is to say, during the continued labour-process in which they serve, they retain their shape independent of the product, so, too, they do after their death. The corpses of machines, tools, workshops, &c., are always separate and distinct from the product they helped to turn out. If we now consider the case of any instrument of labour during the whole period of its service, from the day of its entry into the workshop, till the day of its banishment into the lumber room, we find that during this period its use-value has been completely consumed, and therefore its exchange value completely transferred to the product. For instance, if a spinning machine lasts for 10 years, it is plain that during that working period its total value is gradually transferred to the product of the 10 years. The lifetime of an instrument of labour, therefore, is spent in the repetition of a greater or less number of similar operations. Its life may be compared with that of a human being. Every day brings a man 24 hours nearer to his grave: but how many days he has still to travel on that road, no man can tell accurately by merely looking at him. This difficulty, however, does not prevent life insurance offices from drawing, by means of the theory of averages, very accurate, and at the same time very profitable conclusions. So it is with the instruments of labour. It is known by experience how long on the average a machine of a particular kind will last. Suppose its use-value in the labour-process to last only six days. Then, on the average, it loses each day one-sixth of its use-value, and therefore parts with one-sixth of its value to the daily product. The wear and tear of all instruments, their daily loss of use-value, and the corresponding quantity of value they part with to the product, are accordingly calculated upon this basis.

It is thus strikingly clear, that means of production never transfer more value to the product than they themselves lose during the labour-process by

the destruction of their own use-value. If such an instrument has no value to lose, if, in other words, it is not the product of human labour, it transfers no value to the product. It helps to create use-value without contributing to the formation of exchange value. In this class are included all means of production supplied by Nature without human assistance, such as land, wind, water, metals in situ, and timber in virgin forests.

Yet another interesting phenomenon here presents itself. Suppose a machine to be worth £1000, and to wear out in 1000 days. Then one thousandth part of the value of the machine is daily transferred to the day's product. At the same time, though with diminishing vitality, the machine as a whole continues to take part in the labour-process. Thus it appears that one factor of the labour-process, a means of production, continually enters as a whole into that process, while it enters into the process of the formation of value by fractions only. The difference between the two processes is here reflected in their material factors, by the same instrument of production taking part as a whole in the labour-process, while at the same time as an element in the formation of value, it enters only by fractions.

On the other hand, a means of production may take part as a whole in the formation of value, while into the labour-process it enters only bit by bit. Suppose that in spinning cotton, the waste for every 115 lbs. used amounts to 15 lbs., which is converted, not into yarn, but into "devil's dust." Now, although this 15 lbs. of cotton never becomes a constituent element of the yarn, yet assuming this amount of waste to be normal and inevitable under average conditions of spinning, its value is just as surely transferred to the value of the yarn, as is the value of the 100 lbs. that form the substance of the yarn. The use-value of 15 lbs. of cotton must vanish into dust, before 100 lbs. of yarn can be made. The destruction of this cotton is therefore a necessary condition in the production of the yarn. And because it is a necessary condition, and for no other reason, the value of that cotton is transferred to the product. The same holds good for every kind of refuse resulting from a labour-process, so far at least as such refuse cannot be further employed as a means in the production of new and independent use-values. Such an employment of refuse may be seen in the large machine works at Manchester, where mountains of iron turnings are carted away to the foundry in the evening, in order the next morning to re-appear in the workshops as solid masses of iron.

We have seen that the means of production transfer value to the new product, so far only as during the labour-process they lose value in the shape of their old use-value. The maximum loss of value that they can suffer in the process, is plainly limited by the amount of the original value with which they came into the process, or in other words, by the labour-time necessary for their production. Therefore the means of production can never add more value to the product than they themselves possess independently of the process in which they assist. However useful a given kind of raw material, or a machine, or other means of production may be, though it may cost £150, or, say, 500 days' labour, yet it cannot, under any circumstances, add to the value of the product more than £150. Its value is determined not by the labour-process into which it enters as a means of production, but by that out of which it has issued as a product. In the labour-process it only serves as a mere use-value, a thing with useful properties, and could not, therefore, transfer any value to the product, unless it possessed such value previously.

While productive labour is changing the means of production into constituent elements of a new product, their value undergoes a metempsychosis. It deserts the consumed body, to occupy the newly created one. But this transmigration takes place, as it were, behind the back of the labourer. He is unable to add new labour, to create new value, without at the same time preserving old values, and this, because the labour he adds must be of a specific useful kind; and he cannot do work of a useful kind, without employing products as the means of production of a new product, and thereby transferring their value to the new product. The property therefore which labour-power in action, living labour, possesses of preserving value, at the same time that it adds it, is a gift of Nature which costs the labourer nothing, but which is very advantageous to the capitalist inasmuch as it preserves the existing value of his capital. So long as trade is good, the capitalist is too much absorbed in money-grubbing to take notice of this gratuitous gift of labour. A violent interruption of the labour-process by a crisis, makes him sensitively aware of it.

As regards the means of production, what is really consumed is their use-value, and the consumption of this use-value by labour results in the product. There is no consumption of their value, and it would therefore be inaccurate to say that it is reproduced. It is rather preserved; not by reason

of any operation it undergoes itself in the process; but because the article in which it originally exists, vanishes, it is true, but vanishes into some other article. Hence, in the value of the product, there is a re-appearance of the value of the means of production, but there is, strictly speaking, no reproduction of that value. That which is produced is a new use-value in which the old exchange-value re-appears.

It is otherwise with the subjective factor of the labour-process, with labour-power in action. While the labourer, by virtue of his labour being of a specialised kind that has a special object, preserves and transfers to the product the value of the means of production, he at the same time, by the mere act of working, creates each instant an additional or new value. Suppose the process of production to be stopped just when the workman has produced an equivalent for the value of his own labour-power, when, for example, by six hours' labour, he has added a value of three shillings. This value is the surplus, of the total value of the product, over the portion of its value that is due to the means of production. It is the only original bit of value formed during this process, the only portion of the value of the product created by this process. Of course, we do not forget that this new value only replaces the money advanced by the capitalist in the purchase of the labour-power, and spent by the labourer on the necessities of life. With regard to the money spent, the new value is merely a reproduction; but, nevertheless, it is an actual, and not, as in the case of the value of the means of production, only an apparent, reproduction. The substitution of one value for another, is here effected by the creation of new value.

We know, however, from what has gone before, that the labour-process may continue beyond the time necessary to reproduce and incorporate in the product a mere equivalent for the value of the labour-power. Instead of the six hours that are sufficient for the latter purpose, the process may continue for twelve hours. The action of labour-power, therefore, not only reproduces its own value, but produces value over and above it. This surplus-value is the difference between the value of the product and the value of the elements consumed in the formation of that product, in other words, of the means of production and the labour-power.

By our explanation of the different parts played by the various factors of the labour-process in the formation of the product's value, we have, in fact, disclosed the characters of the different functions allotted to the different elements of capital in the process of expanding its own value. The surplus

of the total value of the product, over the sum of the values of its constituent factors, is the surplus of the expanded capital over the capital originally advanced. The means of production on the one hand, labour-power on the other, are merely the different modes of existence which the value of the original capital assumed when from being money it was transformed into the various factors of the labour-process. That part of capital then, which is represented by the means of production, by the raw material, auxiliary material and the instruments of labour, does not, in the process of production, undergo any quantitative alteration of value. I therefore call it the constant part of capital, or, more shortly, constant capital.

On the other hand, that part of capital, represented by labour-power, does, in the process of production, undergo an alteration of value. It both reproduces the equivalent of its own value, and also produces an excess, a surplus-value, which may itself vary, may be more or less according to circumstances. This part of capital is continually being transformed from a constant into a variable magnitude. I therefore call it the variable part of capital, or, shortly, variable capital. The same elements of capital which, from the point of view of the labour-process, present themselves respectively as the objective and subjective factors, as means of production and labour-power, present themselves, from the point of view of the process of creating surplus-value, as constant and variable capital.

The definition of constant capital given above by no means excludes the possibility of a change of value in its elements. Suppose the price of cotton to be one day sixpence a pound, and the next day, in consequence of a failure of the cotton crop, a shilling a pound. Each pound of the cotton bought at sixpence, and worked up after the rise in value, transfers to the product a value of one shilling; and the cotton already spun before the rise, and perhaps circulating in the markets as yarn, likewise transfers to the product twice its original value. It is plain, however, that these changes of value are independent of the increment or surplus-value added to the value of the cotton by the spinning itself. If the old cotton had never been spun, it could, after the rise, be resold at a shilling a pound instead of at sixpence. Further, the fewer the processes the cotton has gone through, the more certain is this result. We therefore find that speculators make it a rule when such sudden changes in value occur to speculate in that material on which the least possible quantity of labour has been spent: to speculate, therefore, in yarn rather than in cloth, in cotton itself, rather than in yarn. The change

of value in the case we have been considering, originates, not in the process in which the cotton plays the part of a means of production, and in which it therefore functions as constant capital, but in the process in which the cotton itself is produced. The value of a commodity, it is true, is determined by the quantity of labour contained in it, but this quantity is itself limited by social conditions. If the time socially necessary for the production of any commodity alters — and a given weight of cotton represents, after a bad harvest, more labour than after a good one — all previously existing commodities of the same class are affected, because they are, as it were, only individuals of the species, and their value at any given time is measured by the labour socially necessary, i.e., by the labour necessary for their production under the then existing social conditions.

As the value of the raw material may change, so, too, may that of the instruments of labour, of the machinery, &c., employed in the process; and consequently that portion of the value of the product transferred to it from them, may also change. If in consequence of a new invention, machinery of a particular kind can be produced by a diminished expenditure of labour, the old machinery becomes depreciated more or less and consequently transfers so much less value to the product. But here again, the change in value originates outside the process in which the machine is acting as a means of production. Once engaged in this process, the machine cannot transfer more value than it possesses apart from the process.

Just as a change in the value of the means of production, even after they have commenced to take a part in the labour process, does not alter their character as constant capital, so, too, a change in the proportion of constant to variable capital does not affect the respective functions of these two kinds of capital. The technical conditions of the labour process may be revolutionised to such an extent, that where formerly ten men using ten implements of small value worked up a relatively small quantity of raw material, one man may now, with the aid of one expensive machine, work up one hundred times as much raw material. In the latter case we have an enormous increase in the constant capital, that is represented by the total value of the means of production used, and at the same time a great reduction in the variable capital, invested in labour-power. Such a revolution, however, alters only the quantitative relation between the constant and the variable capital, or the proportions in which the total capital is split

up into its constant and variable constituents; it has not in the least degree affected the essential difference between the two.

CHAPTER IX. THE RATE OF SURPLUS-VALUE.

SECTION 1. — THE DEGREE OF EXPLOITATION OF LABOUR-POWER.

THE surplus-value generated in the process of production by C , the capital advanced, or in other words, the self-expansion of the value of the capital C , presents itself for our consideration, in the first place, as a surplus, as the amount by which the value of the product exceeds the value of its constituent element.

The capital C is made up of two components, one, the sum of money c laid out upon the means of production, and the other, the sum of money v expended upon the labour-power; c represents the portion that has become constant capital, and v the portion that has become variable capital. At first then, $C=c+v$: for example, if £500 is the capital advanced, its components may be such that the £500=£410 const.+£90 var. When the process of production is finished, we get a commodity whose title= $(c+v)+s$, where s is the surplus-value; or taking our former figures, the value of this commodity may be (£410 const.+£90 var.)+£90 surpl. The original capital has now changed from C to C' , from £500 to £590. The difference is s or a surplus value of £90. Since the value of the constituent elements of the product is equal to the value of the advanced capital, it is mere tautology to say, that the excess of the value of the product over the value of its constituent elements, is equal to the expansion of the capital advanced or to the surplus-value produced.

Nevertheless, we must examine this tautology a little more closely. The two things compared are, the value of the product, and the value of its constituents consumed in the process of production. Now we have seen how that portion of the constant capital which consists of the instruments of labour, transfers to the product only a fraction of its value, while the remainder of that value continues to reside in those instruments. Since this remainder plays no part in the formation of value, we may at present leave it on one side. To introduce it into the calculation would make no difference. For instance, taking our former example, c =£410: suppose this

sum to consist of £312 value of raw material, £44 value of auxiliary material, and £54 value of the machinery worn away in the process; and suppose that the total value of the machinery employed is £1,054. Out of this latter sum, then, we reckon as advanced for the purpose of turning out the product, the sum of £54 alone, which the machinery loses by wear and tear in the process; for this is all it parts with to the product. Now if we also reckon the remaining £1,000, which still continues in the machinery, as transferred to the product, we ought also to reckon it as part of the value advanced, and thus make it appear on both sides of our calculation. We should, in this way, get £1,500 on one side and £1,590 on the other. The difference of these two sums, or the surplus-value, would still be £90. Throughout this Book therefore, by constant capital advanced for the production of value, we always mean, unless the context is repugnant thereto, the value of the means of production actually consumed in the process, and that value alone.

This being so, let us return to the formula $C=c+v$, which we saw transformed into $C'=(c+v)+s$, C becoming C' . We know that the value of the constant capital is transferred to, and merely re-appears in the product. The new value actually created in the process, the value produced, or value-product, is therefore not the same as the value of the product; it is not, as it would at first sight appear $(c+v)+s$ or £410 const.+£90 var.+£90 surpl.; but $v+s$ or £90 var.+£90 surpl. not £590 but £180. If $c=0$, or in other words, if there were branches of industry in which the capitalist could dispense with all means of production made by previous labour, whether they be raw material, auxiliary material, or instruments of labour, employing only labour-power and materials supplied by Nature, in that case, there would be no constant capital to transfer to the product. This component of the value of the product, i.e., the £410 in our example, would be eliminated, but the sum of £180, the amount of new value created, or the value produced, which contains £90 of surplus-value, would remain just as great as if c represented the highest value imaginable. We should have $C=(0+v)=v$ or C' the expanded capital= $v+s$ and therefore $C'-C=s$ as before. On the other hand, if $s=0$, or in other words, if the labour-power, whose value is advanced in the form of variable capital, were to produce only its equivalent, we should have $C=c+v$ or C' the value of the product= $(c+v)+0$ or $C=C'$. The capital advanced would, in this case, not have expanded its value.

From what has gone before, we know that surplus-value is purely the result of a variation in the value of v , of that portion of the capital which is transformed into labour-power; consequently, $v+s=v+v'$ or v plus an increment of v . But the fact that it is v alone that varies, and the conditions of that variation, are obscured by the circumstance that in consequence of the increase in the variable component of the capital, there is also an increase in the sum total of the advanced capital. It was originally £500 and becomes £590. Therefore in order that our investigation may lead to accurate results, we must make abstraction from that portion of the value of the product, in which constant capital alone appears, and consequently must equate the constant capital to zero or make $c=0$. This is merely an application of a mathematical rule, employed whenever we operate with constant and variable magnitudes, related to each other by the symbols of addition and subtraction only.

A further difficulty is caused by the original form of the variable capital. In our example, $C' = £410 \text{ const.} + £90 \text{ var.} + £90 \text{ surpl.}$; but £90 is a given and therefore a constant quantity; hence it appears absurd to treat it as variable. But in fact, the term £90 var. is here merely a symbol to show that this value undergoes a process. The portion of the capital invested in the purchase of labour-power is a definite quantity of materialised labour, a constant value like the value of the labour-power purchased. But in the process of production the place of the £90 is taken by the labour-power in action, dead labour is replaced by living labour, something stagnant by something flowing, a constant by a variable. The result is the reproduction of v plus an increment of v . From the point of view, then, of capitalist production, the whole process appears as the spontaneous variation of the originally constant value, which is transformed into labour-power. Both the process and its result, appear to be owing to this value. If, therefore, such expressions as “£90 variable capital,” or “so much self-expanding value,” appear contradictory, this is only because they bring to the surface a contradiction immanent in capitalist production.

At first sight it appears a strange proceeding, to equate the constant capital to zero. Yet it is what we do every day. If, for example, we wish to calculate the amount of England's profits from the cotton industry, we first of all deduct the sums paid for cotton to the United States, India, Egypt and other countries; in other words, the value of the capital that merely reappears in the value of the product, is put $=0$.

Of course the ratio of surplus-value not only to that portion of the capital from which it immediately springs, and whose change of value it represents, but also to the sum total of the capital advanced is economically of very great importance. We shall, therefore, in the third book, treat of this ratio exhaustively. In order to enable one portion of a capital to expand its value by being converted into labour-power, it is necessary that another portion be converted into means of production. In order that variable capital may perform its function, constant capital must be advanced in proper proportion, a proportion given by the special technical conditions of each labour-process. The circumstance, however, that retorts and other vessels, are necessary to a chemical process, does not compel the chemist to notice them in the result of his analysis. If we look at the means of production, in their relation to the creation of value, and to the variation in the quantity of value, apart from anything else, they appear simply as the material in which labour-power, the value-creator, incorporates itself. Neither the nature, nor the value of this material is of any importance. The only requisite is that there be a sufficient supply to absorb the labour expended in the process of production. That supply once given, the material may rise or fall in value, or even be, as land and the sea, without any value in itself; but this will have no influence on the creation of value or on the variation in the quantity of value.

In the first place then we equate the constant capital to zero. The capital advanced is consequently reduced from $c+v$ to v , and instead of the value of the product $(c+v)+s$ we have now the value produced $(v+s)$. Given the new value produced = £180, which sum consequently represents the whole labour expended during the process, then subtracting from it £90 the value of the variable capital, we have remaining £90, the amount of the surplus-value. This sum of £90 or s expresses the absolute quantity of surplus-value produced. The relative quantity produced, or the increase per cent of the variable capital, is determined, it is plain, by the ratio of the surplus-value to the variable capital, or is expressed by s/v . In our example this ratio is $90/90$, which gives an increase of 100%. This relative increase in the value of the variable capital, or the relative magnitude of the surplus-value, I call, "The rate of surplus-value."

We have seen that the labourer, during one portion of the labour-process, produces only the value of his labour-power, that is, the value of his means of subsistence. Now since his work forms part of a system, based on the

social division of labour, he does not directly produce the actual necessities which he himself consumes; he produces instead a particular commodity, yarn for example, whose value is equal to the value of those necessities or of the money with which they can be bought. The portion of his day's labour devoted to this purpose, will be greater or less, in proportion to the value of the necessities that he daily requires on an average, or, what amounts to the same thing, in proportion to the labour-time required on an average to produce them. If the value of those necessities represents on an average the expenditure of six hours' labour, the workman must on an average work for six hours to produce that value. If instead of working for the capitalist, he worked independently on his own account, he would, other things being equal, still be obliged to labour for the same number of hours, in order to produce the value of his labour-power, and thereby to gain the means of subsistence necessary for his conservation or continued reproduction. But as we have seen, during that portion of his day's labour in which he produces the value of his labour-power, say three shillings, he produces only an equivalent for the value of his labour-power already advanced by the capitalist; the new value created only replaces the variable capital advanced. It is owing to this fact, that the production of the new value of three shillings takes the semblance of a mere reproduction. That portion of the working day, then, during which this reproduction takes place, I call "necessary" labour-time, and the labour expended during that time I call "necessary" labour. Necessary, as regards the labourer, because independent of the particular social form of his labour; necessary, as regards capital, and the world of capitalists, because on the continued existence of the labourer depends their existence also.

During the second period of the labour-process, that in which his labour is no longer necessary labour, the workman, it is true, labours, expends labour-power; but his labour, being no longer necessary labour, he creates no value for himself. He creates surplus-value which, for the capitalist, has all the charms of a creation out of nothing. This portion of the working day, I name surplus labour-time, and to the labour expended during that time, I give the name of surplus-labour. It is every bit as important, for a correct understanding of surplus-value, to conceive it as a mere congelation of surplus-labour-time, as nothing but materialised surplus-labour, as it is, for a proper comprehension of value, to conceive it as a mere congelation of so many hours of labour, as nothing but materialised labour. The essential

difference between the various economic forms of society, between, for instance, a society based on slave labour, and one based on wage labour, lies only in the mode in which this surplus-labour is in each case extracted from the actual producer, the labourer.

Since, on the one hand, the values of the variable capital and of the labour-power purchased by that capital are equal, and the value of this labour-power determines the necessary portion of the working day; and since, on the other hand, the surplus-value is determined by the surplus portion of the working day, it follows that surplus-value bears the same ratio to variable capital, that surplus-labour does to necessary labour, or in other words, the rate of surplus-value $s/v = (\text{surplus labor})/(\text{necessary labor})$. Both ratios, s/v and $(\text{surplus labor})/(\text{necessary labor})$ express the same thing in different ways; in the one case by reference to materialised, incorporated labour, in the other by reference to living, fluent labour.

The rate of surplus-value is therefore an exact expression for the degree of exploitation of labour-power by capital, or of the labourer by the capitalist.

We assumed in our example, that the value of the product = £410 const. + £90 var. + £90 surpl., and that the capital advanced = £500. Since the surplus-value = £90, and the advanced capital = £500, we should, according to the usual way of reckoning, get as the rate of surplus value (generally confounded with rate of profits) 18%, a rate so low as possibly to cause a pleasant surprise to Mr. Carey and other harmonisers. But in truth, the rate of surplus-value is not equal to s/c or s/cv but to s/v : thus it is not $90/500$ but $90/90$ or 100%, which is more than five times the apparent degree of exploitation. Although, in the case we have supposed, we are ignorant of the actual length of the working day, and of the duration in days or weeks of the labour-process, as also of the number of labourers employed, yet the rate of surplus-value s/v accurately discloses to us, by means of its equivalent expression, $(\text{surplus labor})/(\text{necessary labor})$ the relation between the two parts of the working day. This relation is here one of equality, the rate being 100%. Hence, it is plain, the labourer, in our example, works one half of the day for himself, the other half for the capitalist.

The method of calculating the rate of surplus value is therefore, shortly, as follows. We take the total value of the product and put the constant capital which merely re-appears in it, equal to zero. What remains, is the

only value that has, in the process of producing the commodity, been actually created. If the amount of surplus-value be given, we have only to deduct it from this remainder, to find the variable capital. And vice versa, if the latter be given, and we require to find the surplus-value. If both be given, we have only to perform the concluding operation, viz., to calculate s/v , the ratio of the surplus-value to the variable capital.

Though the method is so simple, yet it may not be amiss, by means of a few examples, to exercise the reader in the application of the novel principles underlying it.

First we will take the case of a spinning mill containing 10,000 mule spindles, spinning No. 32 yarn from American cotton, and producing 1 lb. of yarn weekly per spindle. We assume the waste to be 6%: under these circumstances 10,600 lbs. of cotton are consumed weekly, of which 600 lbs. go to waste. The price of the cotton in April, 1871, was $7\frac{3}{4}$ d. per lb.; the raw material therefore costs in round numbers £342. The 10,000 spindles, including preparation-machinery, and motive power, cost, we will assume, £1 per spindle, amounting to a total of £10,000. The wear and tear we put at 10%, or £1000 yearly=£20 weekly. The rent of the building we suppose to be £300 a year or £6 a week. Coal consumed (for 100 horse-power indicated, at 4 lbs. of coal per horse-power per hour during 60 hours, and inclusive of that consumed in heating the mill), 11 tons a week at 8s. 6d. a ton, amounts to about £4½ a week: gas, £1 a week, oil, 8c., £4½ a week. Total cost of the above auxiliary materials, £10 weekly. Therefore the constant portion of the value of the week's product is £378. Wages amount to £52 a week. The price of the yarn is $12\frac{1}{4}$ d. per lb., which gives for the value of 10,000 lbs. the sum of £510. The surplus value is therefore in this case £510 — £430=£80. We put the constant part of the value of the product=0, as it plays no part in the creation of value. There remains £132 as the weekly value created, which=£52 var.+ £80 surpl. The rate of surplus-value is therefore $80/52 = 153\frac{11}{13}\%$. In a working day of 10 hours with average labour the result is: necessary labour=3 $\frac{31}{33}$ hours and surplus-labour=6 $\frac{2}{33}$.

One more example. Jacob gives the following calculation for the year 1815. Owing to the previous adjustment of several items it is very imperfect; nevertheless for our purpose it is sufficient. In it he assumes the price of wheat to be 8s. a quarter, and the average yield per acre to be 22 bushels,

VALUE PRODUCED PER ACRE.

Seed,...	£1	9	0	Tithes, Rates, and Taxes,...	£1	1	0
Manure,...	2	10	0	Rent...	1	8	0
Wages,...	3	10	0	Farmer's Profit and Interest,...	1	2	0
Total,...	£7	9	0	Total,...	£3	11	0

Assuming that the price of the product is the same as its value, we here find the surplus-value distributed under the various heads of profit, interest, rent, &c. We have nothing to do with these in detail; we simply add them together, and the sum is a surplus-value of £3 11s. 0d. The sum of £3 19s. 0d., paid for seed and manure, is constant capital, and we put it equal to zero. There is left the sum of £3 10s. 0d., which is the variable capital advanced: and we see that a new value of £3 10s. 0d.+£3 11s. 0d. has been produced in its place. Therefore $s/v = (£3\ 11s.\ 0d.)/ (£3\ 10s.\ 0d.)$, giving a rate of surplus-value of more than 100%. The labourer employs more than one half of his working day in producing the surplus-value, which different persons, under different pretexts, share amongst themselves.

SECTION 2. — THE REPRESENTATION OF THE COMPONENTS OF THE VALUE OF THE PRODUCT BY CORRESPONDING PROPORTIONAL PARTS OF THE PRODUCT ITSELF.

Let us now return to the example by which we were shown how the capitalist converts money into capital.

The product of a working day of 12 hours is 20 lbs. of yarn, having a value of 30s. No less than 8/10ths of this value, or 24s., is due to mere re-appearance in it, of the value of the means of production (20 lbs. of cotton, value 20s., and spindle worn away, 4s.): it is therefore constant capital. The remaining 2/10ths or 6s. is the new value created during the spinning process: of this one half replaces the value of the day's labour-power, or the variable capital, the remaining half constitutes a surplus-value of 3s. The total value then of the 20 lbs. of yarn is made up as follows:

30s. value of yarn=24 const.+3s. var.+3s. surpl.

Since the whole of the value is contained in the 20 lbs. of yarn produced, it follows that the various component parts of this value, can be represented as being contained respectively in corresponding parts of the product.

If the value of 30s. is contained in 20 lbs. of yarn, then $\frac{8}{10}$ ths of this value, or the 24s. that form its constant part, is contained in $\frac{8}{10}$ ths of the product or in 16 lbs. of yarn. Of the latter $13\frac{1}{3}$ lbs. represent the value of the raw material, the 20s. worth of cotton spun, and $2\frac{2}{3}$ lbs. represent the 4s. worth of spindle, 8c., worn away in the process.

Hence the whole of the cotton used up in spinning the 20 lbs. of yarn, is represented by $13\frac{1}{3}$ lbs. of yarn. This latter weight of yarn contains, it is true, by weight, no more than $13\frac{1}{3}$ lbs. of cotton, worth $13\frac{1}{3}$ shillings; but the $6\frac{2}{3}$ shillings additional value contained in it, are the equivalent for the cotton consumed in spinning the remaining $6\frac{2}{3}$ lbs. of yarn. The effect is the same as if these $6\frac{2}{3}$ lbs. of yarn contained no cotton at all, and the whole 20 lbs. of cotton were concentrated in the $13\frac{1}{3}$ lbs. of yarn. The latter weight, on the other hand, does not contain an atom either of the value of the auxiliary materials and implements, or of the value newly created in the process.

In the same way, the $2\frac{2}{3}$ lbs. of yarn, in which the 4s., the remainder of the constant capital, is embodied, represents nothing but the value of the auxiliary materials and instruments of labour consumed in producing the 20 lbs. of yarn.

We have, therefore, arrived at this result: although eight-tenths of the product, or 16 lbs. of yarn, is, in its character of an article of utility, just as much the fabric of the spinner's labour, as the remainder of the same product, yet when viewed in this connexion, it does not contain, and has not absorbed any labour expended during the process of spinning. It is just as if the cotton had converted itself into yarn, without help; as if the shape it had assumed was mere trickery and deceit: for so soon as our capitalist sells it for 24s., and with the money replaces his means of production, it becomes evident that this 16 lbs. of yarn is nothing more than so much cotton and spindle-waste in disguise.

On the other hand, the remaining $\frac{2}{10}$ ths of the product, or 4 lbs. of yarn, represent nothing but the new value of 6s., created during the 12 hours' spinning process. All the value transferred to those 4 lbs., from the raw material and instruments of labour consumed, was, so to say, intercepted in order to be incorporated in the 16 lbs. first spun. In this case, it is as if the spinner had spun 4 lbs. of yarn out of air, or, as if he had spun them with the aid of cotton and spindles, that, being the spontaneous gift of Nature, transferred no value to the product.

Of this 4 lbs. of yarn, in which the whole of the value newly created during the process, is condensed, one half represents the equivalent for the value of the labour consumed, or the 3s. variable capital, the other half represents the 3s. surplus-value.

Since 12 working hours of the spinner are embodied in 6s., it follows that in yarn of the value of 30s., there must be embodied 60 working hours. And this quantity of labour-time does in fact exist in the 20 lbs. of yarn; for in 8/10ths or 16 lbs. there are materialised the 48 hours of labour expended, before the commencement of the spinning process, on the means of production; and in the remaining 2/10ths or 4 lbs. there are materialised the 12 hours' work done during the process itself.

On a former page we saw that the value of the yarn is equal to the sum of the new value created during the production of that yarn plus the value previously existing in the means of production.

It has now been shown how the various component parts of the value of the product, parts that differ functionally from each other, may be represented by corresponding proportional parts of the product itself.

To split up in this manner the product into different parts, of which one represents only the labour previously spent on the means of production, or the constant capital, another, only the necessary labour spent during the process of production, or the variable capital, and another and last part, only the surplus-labour expended during the same process, or the surplus-value; to do this, is, as will be seen later on from its application to complicated and hitherto unsolved problems, no less important than it is simple.

In the preceding investigation we have treated the total product as the final result, ready for use, of a working day of 12 hours. We can however follow this total product through all the stages of its production; and in this way we shall arrive at the same result as before, if we represent the partial products, given off at the different stages, as functionally different parts of the final or total product.

The spinner produces in 12 hours 20 lbs. of yarn, or in 1 hour $1\frac{2}{3}$ lbs.; consequently he produces in 8 hours $13\frac{1}{3}$ lbs., or a partial product equal in value to all the cotton that is spun in a whole day. In like manner the partial product of the next period of 1 hour and 36 minutes, is $2\frac{2}{3}$ lbs. of yarn: this represents the value of the instruments of labour that are consumed in 12 hours. In the following hour and 12 minutes, the spinner produces 2 lbs. of yarn worth 3 shillings, a value equal to the whole value

he creates in his 6 hours necessary labour. Finally, in the last hour and 12 minutes he produces another 2 lbs. of yarn, whose value is equal to the surplus-value, created by his surplus-labour during half a day. This method of calculation serves the English manufacturer for everyday use; it shows, he will say, that in the first 8 hours, or $\frac{2}{3}$ of the working day, he gets back the value of his cotton; and so on for the remaining hours. It is also a perfectly correct method: being in fact the first method given above with this difference, that instead of being applied to space, in which the different parts of the completed product lie side by side, it deals with time, in which those parts are successively produced. But it can also be accompanied by very barbarian notions, more especially in the heads of those who are as much interested, practically, in the process of making value beget value, as they are in misunderstanding that process theoretically. Such people may get the notion into their heads, that one spinner, for example, produces or replaces in the first 8 hours of his working day the value of the cotton; in the following hour and 36 minutes the value of the instruments of labour worn away; in the next hour and 12 minutes the value of the wages; and that he devotes to the production of surplus-value for the manufacturer, only that well known "last hour." In this way the poor spinner is made to perform the two-fold miracle not only of producing cotton, spindles, steam-engine, coal, oil, &c., at the same time that he spins with them, but also of turning one working day into five; for in, the example we are considering, the production of the raw material and instruments of labour demands four working days of twelve hours each, and their conversion into yarn requires another such day. That the love of lucre induces an easy belief in such miracles, and that sycophant doctrinaires are never wanting to prove them, is vouched for by the following incident of historical celebrity.

SECTION 3. — SENIOR'S "LAST HOUR."

One fine morning, in the year 1836, Nassau W. Senior, who may be called the bel-esprit of English economists, well known, alike for his economical "science," and for his beautiful style, was summoned from Oxford to Manchester, to learn in the latter place the political economy that he taught in the former. The manufacturers elected him as their champion, not only against the newly passed Factory Act, but against the still more menacing Ten-hours' agitation. With their usual practical acuteness, they had found

out that the learned Professor “wanted a good deal of finishing;” it was this discovery that caused them to write for him. On his side the Professor has embodied the lecture he received from the Manchester manufacturers, in a pamphlet, entitled: “Letters on the Factory Act, as it affects the cotton manufacture.” London, 1837. Here we find, amongst others, the following edifying passage: “Under the present law, no mill in which persons under 18 years of age are employed,...can be worked more than 11½ hours a day, that is 12 hours for 5 days in the week, and nine on Saturday.

“Now the following analysis (!) will show that in a mill so worked, the whole net profit is derived from the last hour. I will suppose a manufacturer to invest £100,000: — £80,000 in his mill and machinery, and £20,000 in raw material and wages. The annual return of that mill, supposing the capital to be turned once a year, and gross profits to be 15 per cent., ought to be goods worth £115,000.... Of this £115,000, each of the twenty-three half-hours of work produces 5-115ths or one twenty-third. Of these 23-23rds (constituting the whole £115,000) twenty, that is to say £100,000 out of the £115,000, simply replace the capital; — one twenty-third (or £5000 out of the £115,000) makes up for the deterioration of the mill and machinery. The remaining 2-23rds, that is, the last two of the twenty-three half-hours of every day, produce the net profit of 10 per cent. If, therefore (prices remaining the same), the factory could be kept at work thirteen hours instead of eleven and a half, with an addition of about £2600 to the circulating capital, the net profit would be more than doubled. On the other hand, if the hours of working were reduced by one hour per day (prices remaining the same), the net profit would be destroyed — if they were reduced by one hour and a half, even the gross profit would be destroyed.”

And the professor calls this an “analysis!” If, giving credence to the outcries of the manufacturers, he believed that the workmen spend the best part of the day in the production, i.e., the reproduction or replacement of the value of the buildings, machinery, cotton, coal, 8c., then his analysis was superfluous. His answer would simply have been: — Gentlemen! if you work your mills for 10 hours instead of 11½, then, other things being equal, the daily consumption of cotton, machinery, 8c., will decrease in proportion. You gain just as much as you lose. Your work-people will in future spend one hour and a half less time in producing or replacing the capital that has been advanced. — If, on the other hand, he did not believe

them without further inquiry, but, as being an expert in such matters, deemed an analysis necessary, then he ought, in a question that is concerned exclusively with the relations of net profit to the length of the working day, before all things to have asked the manufacturers, to be careful not to lump together machinery, workshops, raw material, and labour, but to be good enough to place the constant capital, invested in buildings, machinery, raw material, &c., on one side of the account, and the capital advanced in wages on the other side. If the professor then found, that in accordance with the calculation of the manufacturers, the workman reproduced or replaced his wages in 2 half-hours, in that case, he should have continued his analysis thus:

According to your figures, the workman in the last hour but one produces his wages, and in the last hour your surplus-value or net profit. Now, since in equal periods he produces equal values, the produce of the last hour but one, must have the same value as that of the last hour. Further, it is only while he labours that he produces any value at all, and the amount of his labour is measured by his labour-time. This you say, amounts to $11\frac{1}{2}$ hours a day. He employs one portion of these $11\frac{1}{2}$ hours, in producing or replacing his wages, and the remaining portion in producing your net profit. Beyond this he does absolutely nothing. But since, on your assumption, his wages, and the surplus-value he yields, are of equal value, it is clear that he produces his wages in $5\frac{3}{4}$ hours, and your net profit in the other $5\frac{3}{4}$ hours. Again, since the value of the yarn produced in 2 hours, is equal to the sum of the values of his wages and of your net profit, the measure of the value of this yarn must be $11\frac{1}{2}$ working hours, of which $5\frac{3}{4}$ hours measure the value of the yarn produced in the last hour but one, and $5\frac{3}{4}$, the value of the yarn produced in the last hour. We now come to a ticklish point; therefore, attention! The last working hour but one is, like the first, an ordinary working hour, neither more nor less. How then can the spinner produce in one hour, in the shape of yarn, a value that embodies $5\frac{3}{4}$ hours labour? The truth is that he performs no such miracle. The use-value produced by him in one hour, is a definite quantity of yarn. The value of this yarn is measured by $5\frac{3}{4}$ working hours, of which $4\frac{3}{4}$ were, without any assistance from him, previously embodied in the means of production, in the cotton, the machinery, and so on; the remaining one hour is added by him. Therefore since his wages are produced in $5\frac{3}{4}$ hours, and the yarn produced in one hour also contains $5\frac{3}{4}$ hours' work, there is no witchcraft

in the result, that the value created by his $5\frac{3}{4}$ hours' spinning, is equal to the value of the product spun in one hour. You are altogether on the wrong track, if you think that he loses a single moment of his working day, in reproducing or replacing the values of the cotton, the machinery, and so on. On the contrary, it is because his labour converts the cotton and spindles into yarn, because he spins, that the values of the cotton and spindles go over to the yarn of their own accord. This result is owing to the quality of his labour, not to its quantity. It is true, he will in one hour transfer to the yarn more value, in the shape of cotton, than he will in half an hour; but that is only because in one hour he spins up more cotton than in half an hour. You see then, your assertion, that the workman produces, in the last hour but one, the value of his wages, and in the last hour your net profit, amounts to no more than this, that in the yarn produced by him in 2 working hours, whether they are the 2 first or the 2 last hours of the working day, in that yarn, there are incorporated $11\frac{1}{2}$ working hours, or just a whole day's work, i.e., two hours of his own work and $9\frac{1}{2}$ hours of other people's. And my assertion that, in the first $5\frac{3}{4}$ hours, he produces his wages, and in the last $5\frac{3}{4}$ hours your net profit, amounts only to this, that you pay him for the former, but not for the latter. In speaking of payment of labour, instead of payment of labour-power, I only talk your own slang. Now, gentlemen, if you compare the working time you pay for, with that which you do not pay for, you will find that they are to one another, as half a day is to half a day; this gives a rate of 100%, and a very pretty percentage it is. Further, there is not the least doubt, that if you make your "hands" toil for 13 hours instead of $11\frac{1}{2}$, and, as may be expected from you, treat the work done in that extra one hour and a half, as pure surplus-labour, then the latter will be increased from $5\frac{3}{4}$ hours' labour to $7\frac{1}{4}$ hours' labour, and the rate of surplus-value from 100%, to $126\frac{2}{23}\%$. So that you are altogether too sanguine in expecting that by such an addition of $1\frac{1}{2}$ hours to the working day, the rate will rise from 100% to 200% and more, in other words that it will be "more than doubled." On the other hand — man's heart is a wonderful thing, especially when carried in the purse — you take too pessimistic a view, when you fear, that with a reduction of the hours of labour from $11\frac{1}{2}$ to 10, the whole of your net profit will go to the dogs. Not at all. All other conditions remaining the same, the surplus-labour will fall from $5\frac{3}{4}$ hours to $4\frac{3}{4}$ hours, a period that still gives a very profitable rate of surplus-value, namely $82\frac{14}{32}\%$. But this dreadful "last hour," about which you have

invented more stories than have the millenarians about the day of judgment, is “all bosh.” If it goes, it will cost neither you, your net profit, nor the boys and girls whom you employ, their “purity of mind.” Whenever your “last hour” strikes in earnest, think on the Oxford Professor. And now, gentleman, “farewell, and may we meet again in yonder better world, but not before.”

Senior invented the battle cry of the “last hour” in 1836. In the London Economist of the 15th April, 1848, the same cry was again raised by James Wilson, an economical mandarin of high standing: this time in opposition to the 10 hours’ bill.

SECTION 4. — SURPLUS PRODUCE

The portion of the product that represents the surplus-value, (one-tenth of the 20 lbs., or 2 lbs. of yarn, in the example given in Sec. 2,) we call “surplus-produce.” Just as the rate of surplus-value is determined by its relation, not to the sum total of the capital, but to its variable part; in like manner, the relative quantity of surplus-produce is determined by the ratio that this produce bears, not to the remaining part of the total product, but to that part of it in which is incorporated the necessary labour. Since the production of surplus-value is the chief end and aim of capitalist production, it is clear, that the greatness of a man’s or a nation’s wealth should be measured, not by the absolute quantity produced, but by the relative magnitude of the surplus-produce.

The sum of the necessary labour and the surplus-labour, i.e., of the periods of time during which the workman replaces the value of his labour-power, and produces the surplus-value, this sum constitutes the actual time during which he works, i.e., the working day.

CHAPTER X. THE WORKING DAY

SECTION 1 — THE LIMITS OF THE WORKING DAY

WE started with the supposition that labour-power is bought and sold at its value. Its value, like that of all other commodities, is determined by the working time necessary to its production. If the production of the average daily means of subsistence of the labourer takes up 6 hours, he must work, on the average, 6 hours every day, to produce his daily labour-power, or to reproduce the value received as the result of its sale. The necessary part of his working day amounts to 6 hours, and is, therefore, *ceteris paribus*, a given quantity. But with this, the extent of the working day itself is not yet given.

Let us assume that the line A B represents the length of the necessary working time, say 6 hours. If the labour be prolonged 1, 3, or 6 hours beyond A B, we have 3 other lines:

Working day I.	Working day II.	Working day III.
A ——— — B —	A ——— — B ———	A ——— — B ——— —
C.	C.	C.

representing 3 different working days of 7, 9, and 12 hours. The extension B C of the line A B represents the length of the surplus labour. As the working day is A B + B C or A C, it varies with the variable quantity B C. Since A B is constant, the ratio of B C to A B can always be calculated. In working day I. it is $1/6$, in working day II, $3/6$ in working day III, $6/6$ of A B. Since, further the ratio (surplus working time)/(necessary working time) determines the rate of the surplus-value, the latter is given by the ratio of B C to A B. It amounts in the 3 different working days respectively to $16\frac{2}{3}$, 50 and 100 per cent. On the other hand, the rate of surplus-value alone would not give us the extent of the working day. If this rate e.g., were 100 per cent., the working day might be of 8, 10, 12, or more hours. It would indicate that the 2 constituent parts of the working day, necessary-labour and surplus-labour time, were equal in extent, but not how long each of these two constituent parts was.

The working day is thus not a constant, but a variable quantity. One of its parts, certainly, is determined by the working time required for the

reproduction of the labour-power of the labourer himself. But its total amount varies with the duration of the surplus-labour. The working day is, therefore, determinable, but is, per se, indeterminate.

Although the working day is not a fixed, but a fluent quantity, it can, on the other hand, only vary within certain limits. The minimum limit is, however, not determinable; of course, if we make the extension line BC or the surplus-labour=0, we have a minimum limit, i.e., the part of the day which the labourer must necessarily work for his own maintenance. On the basis of capitalist production, however, this necessary labour can form a part only of the working day; the working day itself can never be reduced to this minimum. On the other hand, the working day has a maximum limit. It cannot be prolonged beyond a certain point. This maximum limit is conditioned by two things. First, by the physical bounds of labour-power. Within the 24 hours of the natural day a man can expend only a definite quantity of his vital force, A horse, in like manner, can only work from day to day, 8 hours. During part of the day this force must rest, sleep; during another part the man has to satisfy other physical needs, to feed, wash, and clothe himself. Besides these purely physical limitations, the extension of the working day encounters moral ones. The labourer needs time for satisfying his intellectual and social wants, the extent and number of which are conditioned by the general state of social advancement. The variation of the working day fluctuates, therefore, within physical and social bounds. But both these limiting conditions are of a very elastic nature, and allow the greatest latitude. So we find working days of 8, 10, 12, 14, 16, 18 hours, i.e., of the most different lengths.

The capitalist has bought the labour-power at its day-rate. To him its use-value belongs during one working day. He has thus acquired the right to make the labour work for him during one day. But what is a working day?

At all events, less than a natural day. By how much? The capitalist has his own views of this ultima Thule, the necessary limit of the working day. As capitalist, he is only capital personified. His soul is the soul of capital. But capital has one single life impulse, the tendency to create value and surplus-value, to make its constant factor, the means of production, absorb the greatest possible amount of surplus-labour.

Capital is dead labour, that vampire-like, only lives by sucking living labour, and lives the more, the more labour it sucks. The time during which

the labourer works, is the time during which the capitalist consumes the labour-power he has purchased of him.

If the labourer consumes his disposable time for himself, he robs the capitalist.

The capitalist then takes his stand on the law of the exchange of commodities. He, like all other buyers, seeks to get the greatest possible benefit out of the use-value of his commodity. Suddenly the voice of the labourer, which had been stifled in the storm and stress of the process of production, rises:

The commodity that I have sold to you differs from the crowd of other commodities, in that its use creates value, and a value greater than its own. That is why you bought it. That which on your side appears a spontaneous expansion of capital, is on mine extra expenditure of labour-power. You and I know on the market only one law, that of the exchange of commodities. And the consumption of the commodity belongs not to the seller who parts with it, but to the buyer, who acquires it. To you, therefore, belongs the use of my daily labour-power. But by means of the price that you pay for it each day, I must be able to reproduce it daily, and to sell it again. Apart from natural exhaustion through age, &c., I must be able on the morrow to work with the same normal amount of force, health and freshness as to-day. You preach to me constantly the gospel of “saving” and “abstinence.” Good! I will, like a sensible saving owner, husband my sole wealth, labour-power, and abstain from all foolish waste of it. I will each day spend, set in motion, put into action only as much of it as is compatible with its normal duration, and healthy development. By an unlimited extension of the working day, you may in one day use up a quantity of labour-power greater than I can restore in three. What you gain in labour I lose in substance. The use of my labour-power and the spoliation of it are quite different things. If the average time that (doing a reasonable amount of work) an average labourer can live, is 30 years, the value of my labour-power, which you pay me from day to day is $\frac{1}{365} \times 30$ or $\frac{1}{10950}$ of its total value. But if you consume it in ten years, you pay me daily $\frac{1}{10950}$ instead of $\frac{1}{3650}$ of its total value, i.e., only $\frac{1}{3}$ of its daily value, and you rob me, therefore, every day of $\frac{2}{3}$ of the value of my commodity. You pay me for one day’s labour-power, whilst you use that of 3 days. That is against our contract and the law of exchanges. I demand, therefore, a working day of normal length, and I demand it without any appeal to your heart, for in money matters sentiment

is out of place. You may be a model citizen, perhaps a member of the Society for the Prevention of Cruelty to Animals, and in the odour of sanctity to boot; but the thing that you represent face to face with me has no heart in its breast. That which seems to throb there is my own heart-beating. I demand the normal working day because I, like every other seller, demand the value of my commodity.

We see then, that, apart from extremely elastic bounds, the nature of the exchange of commodities itself imposes no limit to the working day, no limit to surplus-labour. The capitalist maintains his rights as a purchaser when he tries to make the working day as long as possible, and to make, whenever possible, two working days out of one. On the other hand, the peculiar nature of the commodity sold implies a limit to its consumption by the purchaser, and the labourer maintains his right as seller when he wishes to reduce the working day to one of definite normal duration. There is here, therefore, an antinomy, right against right, both equally bearing the seal of the law of exchanges. Between equal rights force decides. Hence is it that in the history of capitalist production, the determination of what is a working day, presents itself as the result of a struggle, a struggle between collective capital, i.e., the class of capitalists, and collective labour, i.e., the working class.

SECTION 2. — THE GREED FOR SURPLUS LABOR, MANUFACTURER AND BOYARD

Capital has not invented surplus-labour. Wherever a part of society possesses the monopoly of the means of production, the labourer free or not free, must add to the working time necessary for his own maintenance an extra working time in order to produce the means of subsistence for the owners of the means of production, whether this proprietor be the Athenian ‘kalos kagathos’, Etruscan theocrat, civis Romanus, Norman baron, American slave owner, Wallachian Boyard, modern landlord or capitalist. It is, however, clear that in any given economic formation of society, where not the exchange value but the use-value of the product predominates, surplus-labour will be limited by a given set of wants which may be greater or less, and that here no boundless thirst for surplus-labour arises from the nature of the production itself. Hence in antiquity overwork becomes horrible only when the object is to obtain exchange value in its specific

independent moneyform; in the production of gold and silver. Compulsory working to death is here the recognized form of over-work. Only read Diodorus Siculus. Still these are exceptions in antiquity. But as soon as people, whose production still moves within the lower forms of slave-labour, *corvée*-labour, 8c., are drawn into the whirlpool of an international market dominated by the capitalistic mode of production, the sale of their products for export becoming their principal interest, the civilized horrors of over-work are grafted on the barbaric horrors of slavery, serfdom, 8c. Hence the negro labour in the Southern States of the American Union preserved something of a patriarchal character, so long as production was chiefly directed to immediate local consumption. But in proportion, as the export of cotton became of vital interest to these states, the over-working of the negro and sometimes the using up of his life in 7 years' of labour became a factor in a calculated and calculating system. It was no longer a question of obtaining from him a certain quantity of useful products. It was now a question of production of surplus-labour itself. So was it also with the *corvée*, e.g., in the Danubian Principalities (now Roumania).

The comparison of the greed for surplus-labour in the Danubian Principalities with the same greed in English factories has special interest, because surplus-labour, in the *corvée* has an independent and palpable form.

Suppose the working day consists of 6 hours of necessary labour, and 6 hours of surplus-labour. Then the free labourer gives the capitalist every week 6×6 or 36 hours of surplus-labour. It is the same as if he worked 3 days in the week for himself, and 3 days in the week gratis for the capitalist. But this is not evident on the surface. Surplus-labour and necessary labour glide one into the other. I can, therefore, express the same relationship by saying, e.g., that the labourer in every minute works 30 seconds for himself, and 30 for the capitalist, etc. It is otherwise with the *corvée*. The necessary labour which the Wallachian peasant does for his own maintenance is distinctly marked off from his surplus-labour on behalf of the Boyard. The one he does on his own field, the other on the seignorial estate. Both parts of the labour-time exist, therefore, independently, side by side one with the other. In the *corvée* the surplus-labour is accurately marked off from the necessary labour. This, however, can make no difference with regard to the quantitative relation of surplus-labour, to necessary labour. Three days' surplus-labour in the week remain three days that yield no equivalent to the

labourer himself, whether it be called *corvée* or wage-labour. But in the capitalist the greed for surplus-labour appears in the straining after an unlimited extension of the working day, in the Boyard more simply in a direct hunting after days of *corvée*.

In the Danubian Principalities the *corvée* was mixed up with rents in kind and other appurtenances of bondage, but it formed the most important tribute paid to the ruling class. Where this was the case, the *corvée* rarely arose from serfdom; serfdom much more frequently on the other hand took origin from the *corvée*. This is what took place in the Roumanian Provinces. Their original mode of production was based on community of the soil, but not in the Slavonic or Indian form. Part of the land was cultivated in severalty as freehold by the members of the community, another part — *ager publicus* — was cultivated by them in common. The products of this common labour served partly as a reserve fund against bad harvests and other accidents, partly as a public store for providing the costs of war, religion, and other common expenses. In course of time military and clerical dignitaries usurped, along with the common land, the labour spent upon it. The labour of the free peasants on their common land was transformed into *corvée* for the thieves of the common land. This *corvée* soon developed into a servile relationship existing in point of fact, not in point of law, until Russia, the liberator of the world, made it legal under pretence of abolishing serfdom. The code of the *corvée*, which the Russian General Kisseleff proclaimed in 1831, was of course dictated by the Boyards themselves. Thus Russia conquered with one blow the magnates of the Danubian provinces, and the applause of liberal crétins throughout Europe.

According to the “*Réglement organique*,” as this code of the *corvée* is called, every Wallachian peasant owes to the so-called landlord, besides a mass of detailed payments in kind: (1), 12 days of general labour; (2), one day of field labour; (3), one day of wood carrying. In all, 14 days in the year. With deep insight into political economy, however, the working day is not taken in its ordinary sense, but as the working day necessary to the production of an average daily product; and that average daily product is determined in so crafty a way that no Cyclops would be done with it in 24 hours. In dry words, the *Réglement* itself declares with true Russian irony that by 12 working days one must understand the product of the manual labour of 36 days, by 1 day of field labour 3 days, and by 1 day of wood

carrying in like manner three times as much. In all, 42 corvée days. To this had to be added the so-called jobagie, service due to the lord for extraordinary occasions. In proportion to the size of its population, every village has to furnish annually a definite contingent to the jobagie. This additional corvée is estimated at 14 days for each Wallachian peasant. Thus the prescribed corvée amounts to 56 working days yearly. But the agricultural year in Wallachia numbers in consequence of the severe climate only 210 days, of which 40 for Sundays and holidays, 30 on an average for bad weather, together 70 days, do not count. 140 working days remain. The ratio of the corvée to the necessary labour $56/84$ or $66\frac{2}{3}\%$ gives a much smaller rate of surplus-value than that which regulates the labour of the English agricultural or factory labourer. This is, however, only the legally prescribed corvée. And in a spirit yet more “liberal” than the English Factory Acts, the “Réglement organique” has known how to facilitate its own evasion. After it has made 56 days out of 12, the nominal days work of each of the 56 corvée days is again so arranged that a portion of it must fall on the ensuing day. In one day, e.g., must be weeded an extent of land, which, for this work, especially in maize plantations, needs twice as much time. The legal day’s work for some kinds of agricultural labour is interpretable in such a way that the day begins in May and ends in October. In Moldavia conditions are still harder. “The corvée days of the ‘Réglement organique,’ ” cried a Boyard, drunk with victory, “amount to 365 days in the year.”

If the Réglement organique of the Danubian provinces was a positive expression of the greed for surplus-labour which every paragraph legalised, the English Factory Acts are the negative expression of the same greed. These acts curb the passion of capital for a limitless draining of labour-power, by forcibly limiting the working day by state regulations, made by a state that is ruled by capitalist and landlord. Apart from the working-class movement that daily grew more threatening, the limiting of factory labour was dictated by the same necessity which spread guano over the English fields. The same blind eagerness for plunder that in the one case exhausted the soil, had, in the other, torn up by the roots the living force of the nation. Periodical epidemics speak on this point as clearly as the diminishing military standard in Germany and France.

The Factory Act of 1850 now in force (1867) allows for the average working-day 10 hours, i.e., for the first 5 days 12 hours from 6 a.m. to 6

p.m., including $\frac{1}{2}$ an hour for breakfast, and an hour for dinner, and thus leaving $10\frac{1}{2}$ working hours, and 8 hours for Saturday, from 6 a.m. to 2 p.m., of which $\frac{1}{2}$ an hour is subtracted for breakfast. 60 working hours are left, $10\frac{1}{2}$ for each of the first 5 days, $7\frac{1}{2}$ for the last. Certain guardians of these laws are appointed, Factory Inspectors, directly under the Home Secretary, whose reports are published half-yearly by order of Parliament. They give regular and official statistics of the capitalistic greed for surplus-labour.

Let us listen, for a moment, to the Factory Inspectors.

“The fraudulent millowner begins work at a quarter of an hour (sometimes more, sometimes less) before 6 a.m., and leaves off a quarter of an hour (sometimes more, sometimes less) after 6 p.m. He takes 5 minutes from the beginning and from the end of the half hour nominally allowed for breakfast, and 10 minutes at the beginning and end of the hour nominally allowed for dinner. He works for a quarter of an hour (sometimes more, sometimes less after 2 p.m. on Saturday. Thus his gain is

Before 6 a. m....	15 minutes.
After 6 p. m....	15 minutes.
At breakfast time...	10 minutes.
At dinner time...	20 minutes.
	60 minutes.

Five days — 300 minutes.

On Saturday before 6 a. m....	15 minutes.
At breakfast time...	10 minutes.
After 2 p. m....	15 minutes.
	40 minutes.

Total weekly...	340 minutes.
-----------------	--------------

Or 5 hours and 40 minutes weekly, which multiplied by 50 working weeks in the year (allowing two for holidays and occasional stoppages) is equal to 27 working days.”

“Five minutes a day’s increased work, multiplied by 50 weeks, are equal to two and a half days of produce in the year.”

“An additional hour a day gained by small instalments before 6 a.m., after 6 p.m., and at the beginning and end of the times nominally fixed for meals, is nearly equivalent to working 13 months in the year.”

Crises during which production is interrupted and the factories work “short time,” i.e., for only a part of the week, naturally do not affect the tendency to extend the working day. The less business there is, the more profit has to be made on the business done. The less time spent in work, the more of that time has to be turned into surplus labour-time.

Thus the Factory Inspector’s report on the period of the crisis from 1857 to 1858:

“It may seem inconsistent that there should be any over-working at a time when trade is so bad; but that very badness leads to the transgression by unscrupulous men, they get the extra profit of it.... In the last half year, says Leonard Horner, 122 mills in my district have been given up; 143 were found standing,” yet, overwork is continued beyond the legal hours.

“For a great part of the time,” says Mr. Howell, “owing to the depression of trade, many factories were altogether closed, and a still greater number were working short time. I continue, however, to receive about the usual number of complaints that half, or three-quarters of an hour in the day, are snatched from the workers by encroaching upon the times professedly allowed for rest and refreshment.” The same phenomenon was reproduced on a smaller scale during the frightful cotton-crisis from 1861 to 1865. “It is sometimes advanced by way of excuse, when persons are found at work in a factory, either at a meal hour, or at some illegal time, that they will not leave the mill at the appointed hour, and that compulsion is necessary to force them to cease work [cleaning their machinery, 8c.], especially on Saturday afternoons. But, if the hands remain in a factory after the machinery has ceased to revolve...they would not have been so employed if sufficient time had been set apart specially for cleaning, 8c., either before 6 a.m. [sic!] or before 2 p. m. on Saturday afternoons.”

“The profit to be gained by it (over-working in violation of the Act) appears to be, to many, a greater temptation than they can resist; they calculate upon the chance of not being found out; and when they see the small amount of penalty and costs, which those who have been convicted have had to pay, they find that if they should be detected there will still be a considerable balance of gain.... In cases where the additional time is gained by a multiplication of small thefts in the course of the day, there are insuperable difficulties to the inspectors making out a case.”

These “small thefts” of capital from the labourer’s meal and recreation time, the factory inspectors also designate as “petty pilfering of minutes,”

“snatching a few minutes,” or, as the labourers technically called them, “nibbling and cribbling at meal times.”

It is evident that in this atmosphere the formation of surplus-value by surplus-labour, is not secret. “If you allow me,” said a highly respectable master to me, “to work only ten minutes in the day over-time, you put one thousand a year in my pocket.” “Moments are the elements of profit.”

Nothing is from this point of view more characteristic than the designation of the workers who work full time as “full-timers,” and the children under 13 who are only allowed to work 6 hours as “half-timers.” The worker is here nothing more than personified labour-time. All individual distinctions are merged in those of “full-timers” and “half-timers.”

SECTION 3. — BRANCHES OF ENGLISH INDUSTRY WITHOUT LEGAL LIMITS TO EXPLOITATION

We have hitherto considered the tendency to the extension of the working day, the were-wolf’s hunger for surplus-labour in a department where the monstrous exactions, not surpassed, says an English bourgeois economist, by the cruelties of the Spaniards to the American red-skins, caused capital at last to be bound by the chains of legal regulations. Now, let us cast a glance at certain branches of production in which the exploitation of labour is either free from fetters to this day, or was so yesterday.

Mr. Broughton Charlton, county magistrate, declared as chairman of a meeting held at the Assembly Rooms, Nottingham, on the 14th of January, 1860, “that there was an amount of privation and suffering among that portion of the population connected with the lace trade, unknown in other parts of the kingdom, indeed, in the civilized world...Children of nine or ten years are dragged from their squalid beds at two, three, or four o’clock in the morning and compelled to work for a bare subsistence until ten, eleven, or twelve at night, their limbs wearing away, their frames dwindling, their faces whitening, and their humanity absolutely sinking into a stone-like torpor, utterly horrible to contemplate.... We are not surprised that Mr. Mallett, or any other manufacturer, should stand forward and protest against discussion.... The system, as the Rev. Montagu Valpy describes it, is one of unmitigated slavery, socially, physically, morally, and spiritually.... What

can be thought of a town which holds a public meeting to petition that the period of labour for men shall be diminished to eighteen hours a day?.... We declaim against the Virginian and Carolina cotton-planters. Is their black-market, their lash, and their barter of human flesh more detestable than this slow sacrifice of humanity which takes place in order that veils and collars may be fabricated for the benefit of capitalists?"

The potteries of Staffordshire have, during the last 22 years, been the subject of three parliamentary inquiries. The result is embodied in Mr. Scriven's Report of 1841 to the "Children's Employment Commissioners," in the report of Dr. Greenhow of 1860 published by order of the medical officer of the Privy Council (Public Health, 3rd Report, 112-113), lastly, in the report of Mr. Longe of 1862 in the "First Report of the Children's Employment Commission, of the 13th June, 1863." For my purpose it is enough to take, from the reports of 1860 and 1863, some depositions of the exploited children themselves. From the children we may form an opinion as to the adults, especially the girls and women, and that in a branch of industry by the side of which cotton-spinning appears an agreeable and healthful occupation.

William Wood, 9 years old, was 7 years and 10 months when he began to work. He "ran moulds" (carried ready-moulded articles into the drying room, afterwards bringing back the empty mould) from the beginning. He came to work every day in the week at 6 a.m., and left off about 9 p.m. "I work till 9 o'clock at night six days in the week. I have done so seven or eight weeks." Fifteen hours of labour for a child of 7 years old! J. Murray, 12 years of age, says: "I turn jigger, and run moulds. I come at 6. Sometimes I come at 4. I worked all last night, till 6 o'clock this morning. I have not been in bed since the night before last. There were eight or nine other boys working last night. All but one have come this morning. I get 3 shillings and sixpence. I do not get any more for working at night. I worked two nights last week." Fernyhough, a boy of ten: "I have not always an hour (for dinner). I have only half an hour sometimes; on Thursday, Friday, and Saturday."

Dr. Greenhow states that the average duration of life in the pottery districts of Stoke-on-Trent, and Wolstanton is extraordinarily short. Although in the district of Stoke, only 36.6% and in Wolstanton only 30.4% of the adult male population above 20 are employed in the potteries, among the men of that age in the first district more than half, in the second, nearly

2/5 of the whole deaths are the result of pulmonary diseases among the potters. Dr. Boothroyd, a medical practitioner at Hanley, says: "Each successive generation of potters is more dwarfed and less robust than the preceding one." In like manner another doctor, Mr. M'Bean: "Since he began to practise among the potters 25 years ago, he has observed a marked degeneration especially shown in diminution of stature and breadth." These statements are taken from the report of Dr. Greenhow in 1860.

From the report of the Commissioners in 1863, the following: Dr. J. T. Arledge, senior physician of the North Staffordshire Infirmary, says: "The potters as a class, both men and women, represent a degenerated population, both physically and morally. They are, as a rule, stunted in growth, ill-shaped, and frequently ill-formed in the chest; they become prematurely old, and are certainly short-lived; they are phlegmatic and bloodless, and exhibit their debility of constitution by obstinate attacks of dyspepsia, and disorders of the liver and kidneys, and by rheumatism. But of all diseases they are especially prone to chest-disease, to pneumonia, phthisis, bronchitis, and asthma. One form would appear peculiar to them, and is known as potter's asthma, or potter's consumption. Scrofula attacking the glands, or bones, or other parts of the body, is a disease of two-thirds or more of the potters.... That the 'degenerescence' of the population of this district is not even greater than it is, is due to the constant recruiting from the adjacent country, and intermarriages with more healthy races."

Mr. Charles Parsons, late house surgeon of the same institution, writes in a letter to Commissioner Longe, amongst other things: "I can only speak from personal observation and not from statistical data (but I do not hesitate to assert that my indignation has been aroused again and again at the sight of poor children whose health has been sacrificed to gratify the avarice of either parents or employers." He enumerates the causes of the diseases of the potters, and sums them up in the phrase, "long hours." The report of the Commission trusts that "a manufacture which has assumed so prominent a place in the whole world, will not long be subject to the remark that its great success is accompanied with the physical deterioration, wide-spread bodily suffering, and early death of the workpeople . . by whose labour and skill such great results have been achieved." And all that holds of the potteries in England is true of those in Scotland.

The manufacture of lucifer matches dates from 1833, from the discovery of the method of applying phosphorus to the match itself. Since 1845 this

manufacture has rapidly developed in England, and has extended especially amongst the thickly populated parts of London as well as in Manchester, Birmingham, Liverpool, Bristol, Norwich, Newcastle and Glasgow. With it has spread the form of lockjaw, which a Vienna physician in 1845 discovered to be a disease peculiar to lucifer-matchmakers. Half the workers are children under thirteen, and young persons under eighteen. The manufacture is on account of its unhealthiness and unpleasantness in such bad odour that only the most miserable part of the labouring class, half-starved widows and so forth, deliver up their children to it, “the ragged, half-starved, untaught children.”

Of the witnesses that Commissioner White examined (1863), 270 were under 18, 50 under 10, 10 only 8, and 5 only 6 years old. A range of the working day from 12 to 14 or 15 hours, night-labour, irregular meal times, meals for the most part taken in the very workrooms that are pestilent with phosphorus. Dante would have found the worst horrors of his *Inferno* surpassed in this manufacture.

In the manufacture of paper-hangings the coarser sorts are printed by machine; the finer by hand (block-printing). The most active business months are from the beginning of October to the end of April. During this time the work goes on fast and furious without intermission from 6 a.m. to 10 p.m. or further into the night.

J. Leach deposes: “Last winter six out of nineteen girls were away from ill-health at one time from over-work. I have to bawl at them to keep them awake.” W. Duffy: “I have seen when the children could none of them keep their eyes open for the work; indeed, none of us could.” J. Lightbourne: “Am 13...We worked last winter till 9 (evening), and the winter before till 10. I used to cry with sore feet every night last winter.” G. Apsden: “That boy of mine...when he was 7 years old I used to carry him on my back to and fro through the snow, and he used to have 16 hours a day...I have often knelt down to feed him as he stood by the machine, for he could not leave it or stop.” Smith, the managing partner of a Manchester factory: “We (he means his “hands” who work for “us”) work on, with no stoppage for meals, so that the day’s work of 10½ hours is finished by 4.30. p.m., and all after that is overtime.” (Does this Mr. Smith take no meals himself during 10½ hours?) “We (this same Smith) seldom leave off working before 6 p.m. (he means leave off the consumption of ‘our’ labour-power machines), so that we (iterum Crispinus) are really working overtime the whole year

round.... For all these, children and adults alike (152 children and young persons and 140 adults), the average work for the last 18 months has been at the very least 7 days, 5 hours, or 78½ hours a week. For the six weeks ending May 2nd this year (1862), the average was higher — 8 days or 84 hours a week.” Still this same Mr. Smith, who is so extremely devoted to the pluralis majestatis, adds with a smile, “Machine work is not great.” So the employers in the block-printing say: “Hand labour is more healthy than machine-work.” On the whole, manufacturers declare with indignation against the proposal “to stop the machines at least during meal times.’ A clause, says Mr. Otley, manager of a wall-paper factory in the Borough, “which allowed work between, say 6 a.m. and 9 p.m....would suit us (!) very well, but the factory hours, 6 a.m. to 6 p.m., are not suitable. Our machine is always stopped for dinner. (What generosity!) There is no waste of paper and colour to speak of. But,” he adds sympathetically, “I can understand the loss of time not being liked.’ The report of the Commission opines with naïveté that the fear of some “leading firms” of losing time, i.e., the time for appropriating the labour of others, and thence losing profit is not a sufficient reason for allowing children under 13, and young persons under 18, working 12 to 16 hours per day, to lose their dinner, nor for giving it to them as coal and water are supplied to the steam-engine, soap to wool, oil to the wheel — as merely auxiliary material to the instruments of labour, during the process of production itself.

No branch of industry in England (we do not take into account the making of bread by machinery recently introduced) has preserved up to the present day a method of production so archaic, so — as we see from the poets of the Roman Empire — pre-Christian, as baking. But capital, as was said earlier, is at first indifferent as to the technical character of the labour-process; it begins by taking it just as it finds it.

The incredible adulteration of bread, especially in London, was first revealed by the House of Commons Committee “on the adulteration of articles of food” (1855-56), and Dr. Hassall’s work, “Adulterations detected.” The consequence of these revelations was the Act of August 6th, 1860, “for preventing the adulteration of articles of food and drink,” an inoperative law, as it naturally shows the tenderest consideration for every free-trader who determines by the buying or selling of adulterated commodities “to turn an honest penny.” The Committee itself formulated more or less naïvely its conviction that free-trade meant essentially trade

with adulterated, or as the English ingeniously put it, “sophisticated” goods. In fact this kind of sophistry knows better than Protagoras how to make white black, and black white, and better than the Eleatics how to demonstrate *ad oculos* that everything is only appearance.

At all events the committee had directed the attention of the public to its “daily bread,” and therefore to the baking trade. At the same time in public meetings and in petitions to Parliament rose the cry of the London journeymen bakers against their over-work, 8c. The cry was so urgent that Mr. H. S. Tremenheere, also a member of the Commission of 1863 several times mentioned, was appointed Royal Commissioner of Inquiry. His report, together with the evidence given, roused not the heart of the public but its stomach. Englishmen, always well up in the Bible, knew well enough that man, unless by elective grace a capitalist, or landlord, or sinecurist, is commanded to eat his bread in the sweat of his brow, but they did not know that he had to eat daily in his bread a certain quantity of human perspiration mixed with the discharge of abscesses, cobwebs, dead black-beetles, and putrid German yeast, without counting alum, sand, and other agreeable mineral ingredients. Without any regard to his holiness, Free-trade, the free baking-trade was therefore placed under the supervision of the State inspectors (Close of the Parliamentary session of 1863), and by the same Act of Parliament, work from 9 in the evening to 5 in the morning was forbidden for journeymen bakers under 18. The last clause speaks volumes as to the over-work in this old-fashioned, homely line of business.

“The work of a London journeyman baker begins, as a rule, at about eleven at night. At that hour he ‘makes the dough,’ — a laborious process, which lasts from half-an-hour to three quarters of an hour, according to the size of the batch or the labour bestowed upon it. He then lies down upon the kneading-board, which is also the covering of the trough in which the dough is ‘made;’ and with a sack under him, and another rolled up as a pillow, he sleeps for about a couple of hours. He is then engaged in a rapid and continuous labour for about five hours — throwing out the dough, ‘scaling it off,’ moulding it, putting it into the oven, preparing and baking rolls and fancy bread, taking the batch bread out of the oven, and up into the shop, 8c., 8c. The temperature of a bakehouse ranges from about 75 to upwards of 90 degrees, and in the smaller bakehouses approximates usually to the higher rather than to the lower degree of heat. When the business of making the bread, rolls, 8c., is over, that of its distribution begins, and a

considerable proportion of the journeymen in the trade, after working hard in the manner described during the night, are upon their legs for many hours during the day, carrying baskets, or wheeling hand-carts, and sometimes again in the bakehouse, leaving off work at various hours between 1 and 6 p.m. according to the season of the year, or the amount and nature of their master's business; while others are again engaged in the bakehouse in 'bringing out' more batches until late in the afternoon. ...During what is called 'the London season,' the operatives belonging to the 'full-priced' bakers at the West End of the town, generally begin work at 11 p.m., and are engaged in making the bread, with one or two short (sometimes very short) intervals of rest, up to 8 o'clock the next morning. They are then engaged all day long, up to 4, 5, 6, and as late as 7 o'clock in the evening carrying out bread, or sometimes in the afternoon in the bakehouse again, assisting in the biscuitbaking. They may have, after they have done their work, sometimes five or six, sometimes only four or five hours' sleep before they begin again. On Fridays they always begin sooner, some about ten o'clock, and continue in some cases, at work, either in making or delivering the bread up to 8 p.m. on Saturday night, but more generally up to 4 or 5 o'clock, Sunday morning. On Sundays the men must attend twice or three times during the day for an hour or two to make preparations for the next day's bread.... The men employed by the underselling masters (who sell their bread under the 'full price,' and who, as already pointed out, comprise three-fourths of the London bakers) have not only to work on the average longer hours, but their work is almost entirely confined to the bakehouse. The underselling masters generally sell their bread....in the shop. If they send it out, which is not common, except as supplying chandlers' shops, they usually employ other hands for that purpose. It is not their practice to deliver bread from house to house. Towards the end of the week....the men begin on Thursday night at 10 o'clock, and continue on with only slight intermission until late on Saturday evening."

Even the bourgeois intellect understands the position of the "underselling" masters. "The unpaid labour of the men was made the source whereby the competition was carried on." And the "full-priced" baker denounces his underselling competitors to the Commission of Inquiry as thieves of foreign labour and adulterators. "They only exist now by first defrauding the public, and next getting 18 hours work out of their men for 12 hours' wages."

The adulteration of bread and the formation of a class of bakers that sells the bread below the full price, date from the beginning of the 18th century, from the time when the corporate character of the trade was lost, and the capitalist in the form of the miller or flour-factor, rises behind the nominal master baker. Thus was laid the foundation of capitalistic production in this trade, of the unlimited extension of the working day and of night labour, although the latter only since 1824 gained a serious footing, even in London.

After what has just been said, it will be understood that the Report of the Commission classes journeymen bakers among the short-lived labourers, who, having by good luck escaped the normal decimation of the children of the working-class, rarely reach the age of 42. Nevertheless, the baking trade is always overwhelmed with applicants. The sources of the supply of these labour-powers to London are Scotland, the western agricultural districts of England, and Germany.

In the years 1858-60, the journeymen bakers in Ireland organized at their own expense great meetings to agitate against night and Sunday work. The public — e.g., at the Dublin meeting in May, 1860 — took their part with Irish warmth. As a result of this movement, day labor alone was successfully established in Wexford, Kilkenny, Clonmel, Waterford, &c. “In Limerick, where the grievances of the journeymen are demonstrated to be excessive, the movement has been defeated by the opposition of the master bakers, the miller bakers being the greatest opponents. The example of Limerick led to a retrogression in Ennis and Tipperary. In Cork, where the strongest possible demonstration of feeling took place, the masters, by exercising their power of turning the men out of employment, have defeated the movement. In Dublin, the master bakers have offered the most determined opposition to the movement, and by discountenancing as much as possible the journeymen promoting it, have succeeded in leading the men into acquiescence in Sunday work and night work, contrary to the convictions of the men.”

The Committee of the English Government, which Government, in Ireland, is armed to the teeth, and generally knows how to show it, remonstrates in mild, though funereal, tones with the implacable master bakers of Dublin, Limerick, Cork, &c.: “The Committee believe that the hours of labour are limited by natural laws, which cannot be violated with

impunity. That for master bakers to induce their workmen, by the fear of losing employment, to violate their religious convictions and their better feelings, to disobey the laws of the land, and to disregard public opinion (this all refers to Sunday labour), is calculated to provoke ill-feeling between workmen and masters,...and affords an example dangerous to religion, morality, and social order.... The Committee believe that any constant work beyond 12 hours a-day encroaches on the domestic and private life of the working man, and so leads to disastrous moral results, interfering with each man's home, and the discharge of his family duties as a son, a brother, a husband, a father. That work beyond 12 hours has a tendency to undermine the health of the working man, and so leads to premature old age and death, to the great injury of families of working men, thus deprived of the care and support of the head of the family when most required."

So far, we have dealt with Ireland. On the other side of the channel, in Scotland, the agricultural labourer, the ploughman, protests against his 13-14 hours' work in the most inclement climate, with 4 hours' additional work on Sunday (in this land of Sabbatarians!), whilst, at the same time, three railway men are standing before a London coroner's jury — a guard, an engine-driver, a signalman. A tremendous railway accident has hurried hundreds of passengers into another world. The negligence of the employés is the cause of the misfortune. They declare with one voice before the jury that ten or twelve years before, their labour only lasted eight hours a-day. During the last five or six years it had been screwed up to 14, 18, and 20 hours, and under a specially severe pressure of holiday-makers, at times of excursion trains, it often lasted for 40 or 50 hours without a break. They were ordinary men, not Cyclops. At a certain point their labour-power failed. Torpor seized them. Their brain ceased to think, their eyes to see. The thoroughly "respectable" British jurymen answered by a verdict that sent them to the next assizes on a charge of manslaughter, and, in a gentle "rider" to their verdict, expressed the pious hope that the capitalistic magnates of the railways would, in future, be more extravagant in the purchase of a sufficient quantity of labour-power, and more "abstemious," more "self-denying," more "thrifty," in the draining of paid labour-power.

From the motley crowd of labourers of all callings, ages, sexes, that press on us more busily than the souls of the slain on Ulysses, on whom — without referring to the blue books under their arms — we see at a glance

the mark of over-work, let us take two more figures whose striking contrast proves that before capital all men are alike — a milliner and a blacksmith.

In the last week of June, 1863, all the London daily papers published a paragraph with the “sensational” heading “Death from simple over-work.” It dealt with the death of the milliner, Mary Anne Walkley, 20 years of age, employed in a highly-respectable dressmaking establishment, exploited by a lady with the pleasant name of Elise. The old, often-told story, was once more recounted. This girl worked, on an average, 16½ hours, during the season often 30 hours, without a break, whilst her failing labour-power was revived by occasional supplies of sherry, port, or coffee. It was just now the height of the season. It was necessary to conjure up in the twinkling of an eye the gorgeous dresses for the noble ladies bidden to the ball in honour of the newly-imported Princess of Wales. Mary Anne Walkley had worked without intermission for 26½ hours, with 60 other girls, 30 in one room, that only afforded 1/3 of the cubic feet of air required for them. At night, they slept in pairs in one of the stifling holes into which the bedroom was divided by partitions of board. And this was one of the best millinery establishments in London. Mary Anne Walkley fell ill on the Friday, died on Sunday, without, to the astonishment of Madame Elise, having previously completed the work in hand. The doctor, Mr. Keys, called too late to the deathbed, duly bore witness before the coroner’s jury that “Mary Anne Walkley had died from long hours of work in an overcrowded workroom, and a too small and badly-ventilated bedroom.” In order to give the doctor a lesson in good manners, the coroner’s jury thereupon brought in a verdict that “the deceased had died of apoplexy, but there was reason to fear that her death had been accelerated by over-work in an over-crowded workroom, 8c.” “Our white slaves,” cried the “Morning Star,” the organ of the free-traders, Cobden and Bright, “our white slaves, who are toiled into the grave, for the most part silently pine and die.”

“It is not in dressmakers’ rooms that working to death is the order of the day, but in a thousand other places; in every place I had almost said, where ‘a thriving business’ has to be done.... We will take the blacksmith as a type. If the poets were true, there is no man so hearty, so merry, as the blacksmith; he rises early and strikes his sparks before the sun; he eats and drinks and sleeps as no other man. Working in moderation, he is, in fact, in one of the best of human positions, physically speaking. But we follow him into the city or town, and we see the stress of work on that strong man, and

what then is his position in the death-rate of his country. In Marylebone, blacksmiths die at the rate of 31 per thousand per annum, or 11 above the mean of the male adults of the country in its entirety. The occupation, instinctive almost as a portion of human art, unobjectionable as a branch of human industry, is made by mere excess of work, the destroyer of the man. He can strike so many blows per day, walk so many steps, breathe so many breaths, produce so much work, and live an average, say of fifty years; he is made to strike so many more blows, to walk so many more steps, to breathe so many more breaths per day, and to increase altogether a fourth of his life. He meets the effort; the result is, that producing for a limited time a fourth more work, he dies at 37 for 50.”

SECTION 4. — DAY AND NIGHT WORK. THE RELAY SYSTEM

Constant capital, the means of production, considered from the standpoint of the creation of surplus-value, only exist to absorb labour, and with every drop of labour a proportional quantity of surplus-labour. While they fail to do this, their mere existence causes a relative loss to the capitalist, for they represent during the time they lie fallow, a useless advance of capital. And this loss becomes positive and absolute as soon as the intermission of their employment necessitates additional outlay at the recommencement of work. The prolongation of the working day beyond the limits of the natural day, into the night, only acts as a palliative. It quenches only in a slight degree the vampire thirst for the living blood of labour. To appropriate labour during all the 24 hours of the day is, therefore, the inherent tendency of capitalist production. But as it is physically impossible to exploit the same individual labourpower constantly during the night as well as the day, to overcome this physical hindrance, an alternation becomes necessary between the workpeople whose powers are exhausted by day, and those who are used up by night. This alternation may be effected in various ways; e.g., it may be so arranged that part of the workers are one week employed on day work, the next week on night work. It is well-known that this relay system, this alternation of two sets of workers, held full sway in the full-blooded youth-time of the English cotton manufacture, and that at the present time it still flourishes, among others, in the cotton spinning of the Moscow district. This 24 hours' process of production exists to-day as a system in many of the branches of industry of Great Britain that are still

“free,” in the blast-furnaces, forges, plate-rolling mills, and other metallurgical establishments in England, Wales, and Scotland. The working time here includes, besides the 24 hours of the 6 working days, a great part also of the 24 hours of Sunday. The workers consist of men and women, adults and children of both sexes. The ages of the children and young persons run through all intermediate grades, from 8 (in some cases from 6) to 18.

In some branches of industry, the girls and women work through the night together with the males.

Placing on one side the generally injurious influence of night-labour, the duration of the process of production, unbroken during the 24 hours, offers very welcome opportunities of exceeding the limits of the normal working day, e.g., in the branches of industry already mentioned, which are of an exceedingly fatiguing nature; the official working day means for each worker usually 12 hours by night or day. But the over-work beyond this amount is in many cases, to use the words of the English official report, “truly fearful.”

“It is impossible,” the report continues, “for any mind to realise the amount of work described in the following passages as being performed by boys of from 9 to 12 years of age.... without coming irresistibly to the conclusion that such abuses of the power of parents and of employers can no longer be allowed to exist.”

“The practice of boys working at all by day and night turns either in the usual course of things, or at pressing times, seems inevitably to open the door to their not unfrequently working unduly long hours. These hours are, indeed, in some cases, not only cruelly but even incredibly long for children. Amongst a number of boys it will, of course, not unfrequently happen that one or more are from some cause absent. When this happens, their place is made up by one or more boys, who work in the other turn. That this is a well understood system is plain...from the answer of the manager of some large rolling-mills, who, when I asked him how the place of the boys absent from their turn was made up, ‘I daresay, sir, you know that as well as I do,’ and admitted, the fact.”

“At a rolling-mill where the proper hours were from 6 a.m. to 5½ p.m., a boy worked about four nights every week till 8½ p.m. at least...and this for six months. Another, at 9 years old, sometimes made three 12-hour shifts running, and, when 10, has made two days and two nights running.” A

third, “now 10...worked from 6 a.m. till 12 p.m. three nights, and till 9 p.m. the other nights.” “Another, now 13,...worked from 6 p.m. till 12 noon next day, for a week together, and sometimes for three shifts together, e.g., from Monday morning till Tuesday night.” “Another, now 12, has worked in an iron foundry at Stavely from 6 a.m. till 12 p.m. for a fortnight on end; could not do it any more.” “George Allinsworth, age 9, came here as cellar-boy last Friday; next morning we had to begin at 3, so I stopped here all night. Live five miles off. Slept on the floor of the furnace, over head, with an apron under me, and a bit of a jacket over me. The two other days I have been here at 6 a.m. Aye! it is hot in here. Before I came here I was nearly a year at the same work at some works in the country. Began there, too, at 3 on Saturday morning — always did, but was very gain [near] home, and could sleep at home. Other days I began at 6 in the morning, and gi’en over at 6 or 7 in the evening,” 8c.

Let us now hear how capital itself regards this 24 hours’ system. The extreme forms of the system, its abuse in the “cruel and incredible” extension of the working day are naturally passed over in silence. Capital only speaks of the system in its “normal” form.

Messrs. Naylor & Vickers, steel manufacturers, who employ between 600 and 700 persons, among whom only 10 per cent. are under 18, and of those, only 20 boys under 18 work in night sets thus express themselves: “The boys do not suffer from the heat. The temperature is probably from 86° to 90°.... At the forges and in the rolling-mills the hands work night and day, in relays, but all the other parts of the work are day work, i.e., from 6 a.m. to 6 p.m. In the forge the hours are from 12 to 12. Some of the hands always work in the night, without any alternation of day and night work.... We do not find any difference in the health of those who work regularly by night and those who work by day, and probably people can sleep better if they have the same period of rest than if it is changed.... About 20 of the boys under the age of 18 work in the night sets.... We could not well do without lads under 18 working by night. The objection would be in the increase in the cost of production.... Skilled hands and the heads in every department are difficult to get, but of the lads we could get any number.... But from the small proportion of boys that we employ the subject (i.e., of restrictions on night work) is of little importance or interest to us.”

Mr. J. Ellis, one of the firm of Messrs. John Brown & Co., steel and iron works, employing about 3000 men and boys, part of whose operations, namely, iron and heavier steel work, goes on night and day by relays states “that in the heavier steel work one or two boys are employed to a score or two men.” Their concern employs upwards of 500 boys under 18 of whom about 1/3 or 170 are under the age of 13. With reference to the proposed alteration of the law, Mr. Ellis says: “I do not think it would be very objectionable to require that no person under the age of 18 should work more than 12 hours in the 24. But we do not think that any line could be drawn over the age of 12, at which boys could be dispensed with for night work. But we would sooner be prevented from employing boys under the age of 13, or even so high as 14, at all, than not be allowed to employ boys that we do have at night. Those boys who work in the day sets must take their turn in the night sets also, because the men could not work in the night sets only; it would ruin their health.... We think, however, that night work in alternate weeks is no harm. (Messrs. Naylor & Vickers, on the other hand, in conformity with the interest of their business, considered that periodically changed night-labour might possibly do more harm than continual night-labour.) We find the men who do it, as well as the others who do other work only by day...Our objections to not allowing boys under 18 to work at night, would be on account of the increase of expense, but this is the only reason. (What cynical naïveté!) We think that the increase would be more than the trade, with due regard to its being successfully carried out, could fairly bear. (What mealy-mouthed phraseology!) Labour is scarce here, and might fall short if there were such a regulation.” (i.e., Ellis Brown & Co. might fall into the fatal perplexity of being obliged to pay labour-power its full value.)

The “Cyclops Steel and Iron Works,” of Messrs. Cammel & Co., are conducted on the same large scale as those of the above mentioned John Brown & Co. The managing director had handed in his evidence to the Government Commissioner, Mr. White, in writing. Later he found it convenient to suppress the MS. when it had been returned to him for revision. Mr. White, however, has a good memory. He remembered quite clearly that for the Messrs. Cyclops the forbidding of the night-labour of children and young persons “would be impossible, it would be tantamount to stopping their works,” and yet their business employs little more than 6% of boys under 18, and less than 1% under 13.

On the same subject Mr. E. F. Sanderson, of the firm of Sanderson, Bros., & Co., steel rolling-mills and forges, Attercliffe, says: "Great difficulty would be caused by preventing boys under 18 from working at night. The chief would be the increase of cost from employing men instead of boys. I cannot say what this would be, but probably it would not be enough to enable the manufacturers to raise the price of steel, and consequently it would fall on them, as of course the men (what queer-headed folk!) would refuse to pay it." Mr. Sanderson does not know how much he pays the children, but "perhaps the younger boys get from 4s. to 5s. a week.... The boys' work is of a kind for which the strength of the boys is generally ('generally,' of course not always) quite sufficient, and consequently there would be no gain in the greater strength of the men to counterbalance the loss, or it would be only in the few cases in which the metal is heavy. The men would not like so well not to have boys under them, as men would be less obedient. Besides, boys must begin young to learn the trade. Leaving day work alone open to boys would not answer this purpose." And why not? Why could not boys learn their handicraft in the day-time? Your reason? "Owing to the men working days and nights in alternate weeks, the men would be separated half the time from their boys, and would lose half the profit which they make from them. The training which they give to an apprentice is considered as part of the return for the boys' labour, and thus enables the men to get it at a cheaper rate. Each man would want half of this profit." In other words, Messrs. Sanderson would have to pay part of the wages of the adult men out of their own pockets instead of by the night work of the boys. Messrs. Sanderson's profit would thus fall to some extent, and this is the good Sandersonian reason why boys cannot learn their handicraft in the day. In addition to this, it would throw night labour on those who worked instead of the boys, which they would not be able to stand. The difficulties in fact would be so great that they would very likely lead to the giving up of night work altogether, and "as far as the work itself is concerned," says E. F. Sanderson, "this would suit as well, but—" But Messrs. Sanderson have something else to make besides steel. Steel-making is simply a pretext for surplus-value making. The smelting furnaces, rolling-mills, &c., the buildings, machinery, iron, coal, &c. have something more to do than transform themselves into steel. They are there to absorb surplus-labour, and naturally absorb more in 24 hours than in 12. In fact they give, by grace of God and law, the Sandersons a

cheque on the working time of a certain number of hands for all the 24 hours of the day, and they lose their character as capital, are therefore a pure loss for the Sandersons, as soon as their function of absorbing labour is interrupted. "But then there would be the loss from so much expensive machinery, lying idle half the time, and to get through the amount of work which we are able to do on the present system, we should have to double our premises and plant, which would double the outlay." But why should these Sandersons pretend to a privilege not enjoyed by the other capitalists who only work during the day, and whose buildings, machinery, raw material, therefore lie "idle" during the night? E. F. Sanderson answers in the name of all the Sandersons: "It is true that there is this loss from machinery lying idle in those manufactories in which work only goes on by day. But the use of furnaces would involve a further loss in our case. If they were kept up there would be a waste of fuel (instead of, as now, a waste of the living substance of the workers), and if they were not, there would be loss of time in laying the fires and getting the heat up (whilst the loss of sleeping time, even to children of 8, is a gain of working time for the Sanderson tribe), and the furnaces themselves would suffer from the changes of temperature." (Whilst those same furnaces suffer nothing from the day and night changes of labour.)

SECTION 5. — THE STRUGGLE FOR A NORMAL WORKING DAY. COMPULSORY LAWS FOR THE EXTENSION OF THE WORKING DAY FROM THE MIDDLE OF THE 14TH TO THE END OF THE 17TH CENTURY

"What is a working day? What is the length of time during which capital may consume the labour-power whose daily value it buys? How far may the working day be extended beyond the working time necessary for the reproduction of labour-power itself?" It has been seen that to these questions capital replies: the working day contains the full 24 hours, with the deduction of the few hours of repose without which labour-power absolutely refuses its services again. Hence it is self-evident that the labourer is nothing else, his whole life through, than labour-power, that therefore all his disposable time is by nature and law labour-time, to be devoted to the self-expansion of capital. Time for education, for intellectual development, for the fulfilling of social functions and for social intercourse,

for the free-play of his bodily and mental activity, even the rest time of Sunday (and that in a country of Sabbatarians!) — moonshine! But in its blind unrestrainable passion, its were-wolf hunger for surplus-labour, capital oversteps not only the moral, but even the merely physical maximum bounds of the working day. It usurps the time for growth, development, and healthy maintenance of the body. It steals the time required for the consumption of fresh air and sunlight. It higgles over a meal-time, incorporating it where possible with the process of production itself, so that food is given to the labourer as to a mere means of production, as coal is supplied to the boiler, grease and oil to the machinery. It reduces the sound sleep needed for the restoration, reparation, refreshment of the bodily powers to just so many hours of torpor as the revival of an organism, absolutely exhausted, renders essential. It is not the normal maintenance of the labour-power which is to determine the limits of the working day; it is the greatest possible daily expenditure of labour-power, no matter how diseased, compulsory, and painful it may be, which is to determine the limits of the labourers' period of repose. Capital cares nothing for the length of life of labour-power. All that concerns it is simply and solely the maximum of labour-power, that can be rendered fluent in a working day. It attains this end by shortening the extent of the labourer's life, as a greedy farmer snatches increased produce from the soil by robbing it of its fertility.

The capitalistic mode of production (essentially the production of surplus value, the absorption of surplus-labour), produces thus, with the extension of the working day, not only the deterioration of human labour-power by robbing it of its normal, moral and physical, conditions of development and function. It produces also the premature exhaustion and death of this labour-power itself. It extends the labourer's time of production during a given period by shortening his actual life-time.

But the value of the labour-power includes the value of the commodities necessary for the reproduction of the worker, or for the keeping up of the working class. If then the unnatural extension of the working day, that capital necessarily strives after in its unmeasured passion for self-expansion, shortens the length of life of the individual labourer, and therefore the duration of his labour-power, the forces used up have to be replaced at a more rapid rate and the sum of the expenses for the reproduction of labour-power will be greater; just as in a machine the part of its value to be reproduced every day is greater the more rapidly the

machine is worn out. It would seem therefore that the interest of capital itself points in the direction of a normal working day.

The slave-owner buys his labourer as he buys his horse. If he loses his slave, he loses capital that can only be restored by new outlay in the slave-market. But “the rice-grounds of Georgia, or the swamps of the Mississippi may be fatally injurious to the human constitution; but the waste of human life which the cultivation of these districts necessitates, is not so great that it cannot be repaired from the teeming preserves of Virginia and Kentucky. Considerations of economy, moreover, which, under a natural system, afford some security for humane treatment by identifying the master’s interest with the slave’s preservation, when once trading in slaves is practised, become reasons for racking to the uttermost the toil of the slave; for, when his place can at once be supplied from foreign preserves, the duration of his life becomes a matter of less moment than its productiveness while it lasts. It is accordingly a maxim of slave management, in slave-importing countries, that the most effective economy is that which takes out of the human chattel in the shortest space of time the utmost amount of exertion it is capable of putting forth. It is in tropical culture, where annual profits often equal the whole capital of plantations, that negro life is most recklessly sacrificed. It is the agriculture of the West Indies, which has been for centuries prolific of fabulous wealth, that has engulfed millions of the African race. It is in Cuba, at this day, whose revenues are reckoned by millions, and whose planters are princes, that we see in the servile class, the coarsest fare, the most exhausting and unremitting toil, and even the absolute destruction of a portion of its numbers every year.”

Mutato nomine de te fabula narratur. For slave-trade read labour-market, for Kentucky and Virginia, Ireland and the agricultural districts of England, Scotland, and Wales, for Africa, Germany. We heard how over-work thinned the ranks of the bakers in London. Nevertheless the London labour-market is always over-stocked with German and other candidates for death in the bakeries. Pottery, as we saw, is one of the shortest-lived industries. Is there any want therefore of potters? Josiah Wedgwood, the inventor of modern pottery, himself originally a common workman, said in 1785 before the House of Commons that the whole trade employed from 15,000 to 20,000 people. In the year 1861 the population alone of the town centres of this industry in Great Britain numbered 101,302. “The cotton trade has existed for ninety years.... It has existed for three generations of the English

race, and I believe I may safely say that during that period it has destroyed nine generations of factory operatives.

No doubt in certain epochs of feverish activity the labour-market shows significant gaps. In 1834, e.g. But then the manufacturers proposed to the Poor Law Commissioners that they should send the “surplus-population” of the agricultural districts to the north, with the explanation “that the manufacturers would absorb and use it up.” “Agents were appointed with the consent of the Poor Law Commissioners.... An office was set up in Manchester, to which lists were sent of those workpeople in the agricultural districts wanting employment, and their names were registered in books. The manufacturers attended at these offices, and selected such persons as they chose; when they had selected such persons as their ‘wants required,’ they gave instructions to have them forwarded to Manchester, and they were sent, ticketed like bales of goods, by canals, or with carriers, others tramping on the road, and many of them were found on the way lost and half-starved. This system had grown up into a regular trade. This House will hardly believe it, but I tell them, that this traffic in human flesh was as well kept up, they were in effect as regularly sold to these [Manchester] manufacturers as slaves are sold to the cotton-grower in the United States.... In 1860, ‘the cotton trade was at its zenith.’...The manufacturers again found that they were short of hands.... They applied to the ‘flesh agents,’ as they are called. Those agents sent to the southern downs of England, to the pastures of Dorsetshire, to the glades of Devonshire, to the people tending kine in Wiltshire, but they sought in vain. The surplus-population was ‘absorbed.’” The “Bury Guardian,” said, on the completion of the French treaty, that “10,000 additional hands could be absorbed by Lancashire, and that 30,000 or 40,000 will be needed.” After the “flesh agents and subagents” had in vain sought through the agricultural districts, “a deputation came up to London, and waited on the right hon. gentleman [Mr. Villiers, President of the Poor Law Board] with a view of obtaining poor children from certain union houses for the mills of Lancashire.”

What experience shows to the capitalist generally is a constant excess of population, i.e., an excess in relation to the momentary requirements of surplus-labour-absorbing capital, although this excess is made up of generations of human beings stunted, short-lived, swiftly replacing each

other, plucked, so to say, before maturity. And, indeed, experience shows to the intelligent observer with what swiftness and grip the capitalist mode of production, dating, historically speaking, only from yesterday, has seized the vital power of the people by the very root — show how the degeneration of the industrial population is only retarded by the constant absorption of primitive and physically uncorrupted elements from the country — shows how even the country labourers, in spite of fresh air and the principle of natural selection, that works so powerfully amongst them, and only permits the survival of the strongest, are already beginning to die off. Capital that has such good reasons for denying the sufferings of the legions of workers that surround it, is in practice moved as much and as little by the sight of the coming degradation and final depopulation of the human race, as by the probable fall of the earth into the sun. In every stock-jobbing swindle every one knows that some time or other the crash must come, but every one hopes that it may fall on the head of his neighbour, after he himself has caught the shower of gold and placed it in safety. *Après moi le déluge!* is the watchword of every capitalist and of every capitalist nation. Hence Capital is reckless of the health or length of life of the labourer, unless under compulsion from society. To the outcry as to the physical and mental degradation, the premature death, the torture of overwork, it answers: Ought these to trouble us since they increase our profits? But looking at things as a whole, all this does not, indeed, depend on the good or ill will of the individual capitalist. Free competition brings out the inherent laws of capitalist production, in the shape of external coercive laws having power over every individual capitalist.

The establishment of a normal working day is the result of centuries of struggle between capitalist and labourer. The history of this struggle shows two opposed tendencies. Compare, e.g., the English factory legislation of our time with the English Labour Statutes from the 14th century to well into the middle of the 18th. Whilst the modern Factory Acts compulsorily shortened the working-day, the earlier statutes tried to lengthen it by compulsion. Of course the pretensions of capital in embryo — when, beginning to grow, it secures the right of absorbing a quantum sufficit of surplus-labour, not merely by the force of economic relations, but by the help of the State — appear very modest when put face to face with the concessions that, growling and struggling, it has to make in its adult condition. It takes centuries ere the “free” labourer, thanks to the

development of capitalistic production, agrees, i.e., is compelled by social conditions, to sell the whole of his active life, his very capacity for work, for the price of the necessities of life, his birthright for a mess of pottage. Hence it is natural that the lengthening of the working day, which capital from the middle of the 14th to the end of the 17th century, tries to impose by State-measures on adult labourers, approximately coincides with the shortening of the working day which, in the second half of the 19th century, has here and there been effected by the State to prevent the coining of children's blood into capital. That which to-day, e.g., in the State of Massachusetts, until recently the freest State of the North-American Republic, has been proclaimed as the statutory limit of the labour of children under 12, was in England, even in the middle of the 17th century, the normal working-day of able-bodied artizans, robust labourers, athletic blacksmiths.

The first "Statute of Labourers" (23 Edward III., 1349) found its immediate pretext (not its cause, for legislation of this kind lasts centuries after the pretext for it has disappeared) in the great plague that decimated the people, so that, as a Tory writer says, "The difficulty of getting men to work on reasonable terms (i.e., at a price that left their employers a reasonable quantity of surplus-labour) grew to such a height as to be quite intolerable." Reasonable wages were, therefore, fixed by law as well as the limits of the working day. The latter point, the only one that here interests us, is repeated in the Statute of 1496 (Henry VIII.). The working day for all artificers and field labourers from March to September ought, according to this statute (which, however, could not be enforced), to last from 5 in the morning to between 7 and 8 in the evening. But the meal times consist of 1 hour for breakfast, 1½ hours for dinner, and ½ an hour for "noonmeate," i.e., exactly twice as much as under the factory acts now in force. In winter, work was to last from 5 in the morning until dark, with the same intervals. A statute of Elizabeth of 1562 leaves the length of the working day for all labourers "hired for daily or weekly wage" untouched, but aims at limiting the intervals to 2½ hours in the summer, or to 2 in the winter. Dinner is only to last 1 hour, and the "afternoon-sleep of half an hour" is only allowed between the middle of May and the middle of August. For every hour of absence 1d. is to be subtracted from the wage. In practice, however, the conditions were much more favourable to the labourers than in the statute-book. William Petty, the father of political economy, and to some extent the

founder of Statistics, says in a work that he published in the last third of the 17th century: "Labouring-men (then meaning field-labourers) work 10 hours per diem, and make 20 meals per week, viz., 3 a day for working days, and 2 on Sundays; whereby it is plain, that if they could fast on Fryday nights, and dine in one hour and a half, whereas they take two, from eleven to one; thereby this working $\frac{1}{20}$ more, and spending $\frac{1}{20}$ less, the above-mentioned (tax) might be raised." Was not Dr. Andrew Ure right in crying down the 12 hours' bill of 1833 as a retrogression to the times of the dark ages? It is true, these regulations contained in the statute mentioned by Petty, apply also to apprentices. But the condition of child-labour, even at the end of the 17th century, is seen from the following complaint: "'Tis not their practice (in Germany) as with us in this kingdom, to bind an apprentice for seven years; three or four is their common standard: and the reason is, because they are educated from their cradle to something of employment, which renders them the more apt to docile, and consequently the more capable of attaining to a ripeness and quicker proficiency in business. Whereas our youth, here in England, being bred to nothing before they come to be apprentices, make a very slow progress and require much longer time wherein to reach the perfection of accomplished artists."

Still, during the greater part of the 18th century, up to the epoch of Modern Industry and machinism, capital in England had not succeeded in seizing for itself, by the payment of the weekly value of labour-power, the whole week of the labourer with the exception, however, of the agricultural labourers. The fact that they could live for a whole week on the wage of four days, did not appear to the labourers a sufficient reason that they should work the other two days for the capitalist. One party of English economists, in the interest of capital, denounces this obstinacy in the most violent manner, another party defends the labourers. Let us listen, e.g., to the contest between Postlethwayt whose Dictionary of Trade then had the same reputation as the kindred works of M'Culloch and M'Gregor to-day, and the author (already quoted) of the "Essay on Trade and Commerce."

Postlethwayt says among other things: "We cannot put an end to those few observations, without noticing that trite remark in the mouth of too many; that if the industrious poor can obtain enough to maintain themselves in five days, they will not work the whole six. Whence they infer the necessity of even the necessities of life being made dear by taxes, or any other means, to compel the working artizan and manufacturer to labour the

whole six days in the week, without ceasing. I must beg leave to differ in sentiment from those great politicians, who contend for the perpetual slavery of the working people of this kingdom; they forget the vulgar adage, all work and no play. Have not the English boasted of the ingenuity and dexterity of her working artists and manufacturers which have heretofore given credit and reputation to British wares in general? What has this been owing to? To nothing more probably than the relaxation of the working people in their own way. Were they obliged to toil the year round, the whole six days in the week, in a repetition of the same work, might it not blunt their ingenuity, and render them stupid instead of alert and dexterous; and might not our workmen lose their reputation instead of maintaining it by such eternal slavery?...And what sort of workmanship could we expect from such hard-driven animals?...Many of them will execute as much work in four days as a Frenchman will in five or six. But if Englishmen are to be eternal drudges, 'tis to be feared they will degenerate below the Frenchmen. As our people are famed for bravery in war, do we not say that it is owing to good English roast beef and pudding in their bellies, as well as their constitutional spirit of liberty? And why may not the superior ingenuity and dexterity of our artists and manufactures, be owing to that freedom and liberty to direct themselves in their own way, and I hope we shall never have them deprived of such privileges and that good living from whence their ingenuity no less than their courage may proceed." Thereupon the author of the "Essay on Trade and Commerce" replies: "If the making of every seventh day an holiday is supposed to be of divine institution, as it implies the appropriating the other six days to labour" (he means capital as we shall soon see) "surely it will not be thought cruel to enforce it.... That mankind in general, are naturally inclined to ease and indolence, we fatally experience to be true, from the conduct of our manufacturing populace, who do not labour, upon an average, above four days in a week, unless provisions happen to be very dear.... Put all the necessities of the poor under one denomination; for instance, call them all wheat, or suppose that...the bushel of wheat shall cost five shillings and that he (a manufacturer) earns a shilling by his labour, he then would be obliged to work five days only in a week. If the bushel of wheat should cost but four shillings, he would be obliged to work but four days; but as wages in this kingdom are much higher in proportion to the price of necessities...the manufacturer, who labours four days, has a surplus of money to live idle

with the rest of the week...I hope I have said enough to make it appear that the moderate labour of six days in a week is no slavery. Our labouring people do this, and to all appearance are the happiest of all our labouring poor, but the Dutch do this in manufactures, and appear to be a very happy people. The French do so, when holidays do not intervene. But our populace have adopted a notion, that as Englishmen they enjoy a birthright privilege of being more free and independent than in any country in Europe. Now this idea, as far as it may affect the bravery of our troops, may be of some use; but the less the manufacturing poor have of it, certainly the better for themselves and for the State. The labouring people should never think themselves independent of their superiors.... It is extremely dangerous to encourage mobs in a commercial state like ours, where, perhaps, seven parts out of eight of the whole, are people with little or no property. The cure will not be perfect, till our manufacturing poor are contented to labour six days for the same sum which they now earn in four days." To this end, and for "extirpating idleness, debauchery and excess," promoting a spirit of industry, "lowering the price of labour in our manufactories, and easing the lands of the heavy burden of poor's rates," our "faithful Eckart" of capital proposes this approved device: to shut up such labourers as become dependent on public support, in a word, paupers, in "an ideal work-house." Such ideal workhouse must be made a "House of Terror," and not an asylum for the poor, "where they are to be plentifully fed, warmly and decently clothed, and where they do but little work." In this "House of Terror," this "ideal workhouse, the poor shall work 14 hours in a day, allowing proper time for meals, in such manner that there shall remain 12 hours of neat-labour."

Twelve working hours daily in the Ideal Workhouse, in the "House of Terror" of 1770! 63 years later, in 1833, when the English Parliament reduced the working day for children of 13 to 18, in four branches of industry to 12 full hours, the judgment day of English Industry had dawned! In 1852, when Louis Bonaparte sought to secure his position with the bourgeoisie by tampering with the legal working day, the French people cried out with one voice "the law that limits the working day to 12 hours is the one good that has remained to us of the legislation of the Republic!" . At Zürich the work of children over 10, is limited to 12 hours; in Aargau in 1862, the work of children between 13 and 16, was reduced from 12½ to 12 hours; in Austria in 1860, for children between 14 and 16, the same

reduction was made. “What a progress,” since 1770! Macaulay would shout with exultation!

The “House of Terror” for paupers of which the capitalistic soul of 1770 only dreamed, was realized a few years later in the shape of a gigantic “Workhouse” for the industrial worker himself. It is called the Factory. And the ideal this time fades before the reality.

SECTION 6. — THE STRUGGLE FOR THE NORMAL WORKING DAY. COMPULSORY LIMITATION BY LAW OF THE WORKING TIME. THE ENGLISH FACTORY ACTS, 1833 TO 1864.

After capital had taken centuries in extending the working-day to its normal maximum limit, and then beyond this to the limit of the natural day of 12 hours, there followed on the birth of machinism and modern industry in the last third of the 18th century, a violent encroachment like that of an avalanche in its intensity and extent. All bounds of morals and nature, age and sex, day and night, were broken down. Even the ideas of day and night, of rustic simplicity in the old statutes, became so confused that an English judge, as late as 1860, needed a quite Talmudic sagacity to explain “judicially” what was day and what was night. Capital celebrated its orgies.

As soon as the working class, stunned at first by the noise and turmoil of the new system of production, recovered, in some measure, its senses, its resistance began, and first in the native land of machinism, in England. For 30 years, however, the concessions conquered by the workpeople were purely nominal. Parliament passed 5 Labour Laws between 1802 and 1833, but was shrewd enough not to vote a penny for their carrying out, for the requisite officials, 8c.

They remained a dead letter. “The fact is, that prior to the Act of 1833, young persons and children were worked all night, all day, or both *ad libitum*.”

A normal working day for modern industry only dates from the Factory Act of 1833, which included cotton, wool, flax, and silk factories. Nothing is more characteristic of the spirit of capital than the history of the English Factory Acts from 1833 to 1864.

The Act of 1833 declares the ordinary factory working day to be from half-past five in the morning to half-past eight in the evening, and within these limits, a period of 15 hours, it is lawful to employ young persons (i.e.,

persons between 13 and 18 years of age), at any time of the day, provided no one individual young person should work more than 12 hours in any one day, except in certain cases especially provided for. The 6th section of the Act provided: "That there shall be allowed in the course of every day not less than one and a half hours for meals to every such person restricted as hereinbefore provided." The employment of children under 9, with exceptions mentioned later, was forbidden; the work of children between 9 and 13 was limited to 8 hours a day, night work, i.e., according to this Act, work between 8.30 p.m. and 5.30 a.m., was forbidden for all persons between 9 and 18.

The law-makers were so far from wishing to trench on the freedom of capital to exploit adult labour-power, or, as they called it, "the freedom of labour," that they created a special system in order to prevent the Factory Acts from having a consequence so outrageous.

"The great evil of the factory system as at present conducted," says the first report of the Central Board of the Commission of June 28th, 1833, "has appeared to us to be that it entails the necessity of continuing the labour of children to the utmost length of that of the adults. The only remedy for this evil, short of the limitation of the labour of adults, which would, in our opinion, create an evil greater than that which is sought to be remedied, appears to be the plan of working double sets of children."...Under the name of System of Relays, this "plan" was therefore carried out, so that, e.g., from 5.30 a.m. until 1.30 in the afternoon, one set of children between 9 and 13, and from 1.30 p.m. to 8.30 in the evening another set were "put to," 8c.

In order to reward the manufacturers for having, in the most barefaced way, ignored all the Acts as to children's labour passed during the last twenty-two years, the bill was yet further gilded for them. Parliament decreed that after March 1st, 1834, no child under 11, after March 1st, 1835, no child under 12, and after March 1st, 1836, no child under 13, was to work more than eight hours in a factory. This "liberalism," so full consideration for "capital," was the more noteworthy as, Dr. Farre, Sir A. Carlisle, Sir B. Brodie, Sir C. Bell, Mr. Guthrie, 8c., in a word, the most distinguished physicians and surgeons in London, had declared in their evidence before the House of Commons, that there was danger in delay. Dr. Farre expressed himself still more coarsely. "Legislation is necessary for the prevention of death, in any form in which it can be prematurely inflicted,

and certainly this (i.e., the factory method) must be viewed as a most cruel mode of inflicting it.”

That same “reformed” Parliament, which in its delicate consideration for the manufacturers, condemned children under 13, for years to come, to 72 hours of work per week in the Factory Hell, on the other hand, in the Emancipation Act, which also administered freedom drop by drop, forbade the planters, from the outset, to work any negro slave more than 45 hours a week.

But in no wise conciliated capital now began a noisy agitation that went on for several years. It turned chiefly on the age of those who, under the name of children, were limited to 8 hours work, and were subject to a certain amount of compulsory education. According to capitalistic anthropology, the age of childhood ended at 10, or at the outside, at 11. The more nearly the time approached for the coming into full force of the Factory Act, the fatal year 1836, the more wildly raged the mob of manufacturers. They managed, in fact, to intimidate the government to such an extent that in 1835 it proposed to lower the limit of the age of childhood from 13 to 12. In the meantime the pressure from without grew more threatening. Courage failed the House of Commons. It refused to throw children of 13 under the Juggernaut Car of capital for more than 8 hours a day, and the Act of 1833 came into full operation. It remained unaltered until June, 1844.

In the ten years during which it regulated factory work, first in part, and then entirely, the official reports of the factory inspectors teem with complaints as to the impossibility of putting the Act into force. As the law of 1833 left it optional with the lords of capital during the 15 hours, from 5.30 a.m. to 8.30 p.m., to make every “young person,” and “every child” begin, break off, resume, or end his 12 or 8 hours at any moment they liked, and also permitted them to assign to different persons different times for meals, these gentlemen soon discovered a new “system of relays,” by which the labour-horses were not changed at fixed stations, but were constantly re-harnessed at changing stations. We do not pause longer on the beauty of this system, as we shall have to return to it later. But this much is clear at the first glance: that this system annulled the whole Factory Act, not only in the spirit, but in the letter. How could factory inspectors, with this complex book-keeping in respect to each individual child or young person, enforce the legally determined work time and the granting of the legal meal-times?

In a great many of the factories, the old brutalities soon blossomed out again unpunished. In an interview with the Home Secretary (1844), the factory inspectors demonstrated the impossibility of any control under the newly invented relay system. In the mean-time, however, circumstances had greatly changed. The factory hands, especially since 1838, had made the Ten Hours' Bill their economical, as they had made the Charter their political, election-cry. Some of the manufacturers, even, who had managed their factories in conformity with the Act of 1833, overwhelmed Parliament with memorials on the immoral competition of their false brethren whom greater impudence, or more fortunate local circumstances, enabled to break the law. Moreover, however much the individual manufacturer might give the rein to his old lust for gain, the spokesmen and political leaders of the manufacturing class ordered a change of front and of speech towards the workpeople. They had entered upon the contest for the repeal of the Corn Laws, and needed the workers to help them to victory. They promised, therefore, not only a double-sized loaf of bread, but the enactment of the Ten Hours' Bill in the Free Trade millenium. Thus they still less dared to oppose a measure intended only to make the law of 1833 a reality. Threatened in their holiest interest, the rent of land, the Tories thundered with philanthropic indignation against the "nefarious practices" of their foes.

This was the origin of the additional Factory Act of June 7th, 1844. It came into effect on September 10th, 1844. It places under protection a new category of workers, viz., the women over 18. They were placed in every respect on the same footing as the young persons, their work time limited to twelve hours, their night-labour forbidden, &c. For the first time, legislation saw itself compelled to control directly and officially the labour of adults. In the Factory Report of 1844-1845, it is said with irony: "No instances have come to my knowledge of adult women having expressed any regret at their rights being thus far interfered with." The working time of children under 13 was reduced to 6½, and in certain circumstances to 7 hours a-day.

To get rid of the abuses of the "spurious relay-system," the law established besides others the following important regulations:— "That the hours of work of children and young persons shall be reckoned from the time when any child or young person shall begin to work in the morning." So that if A, e.g., begins work at 8 in the morning, and B at 10, B's workday must nevertheless end at the same hour as A's. "The time shall be regulated

by a public clock,” for example, the nearest railway clock, by which the factory clock is to be set. The occupier is to hang up a “legible” printed notice stating the hours for the beginning and ending of work and the times allowed for the several meals. Children beginning work before 12 noon may not be again employed after 1 p.m. The afternoon shift must therefore consist of other children than those employed in the morning. Of the hour and a half for meal times, “one hour thereof at the least shall be given before three of the clock in the afternoon.... and at the same period of the day. No child or young person shall be employed more than five hours before 1 p.m. without an interval for meal time of at least 30 minutes. No child or young person [or female] shall be employed or allowed to remain in any room in which any manufacturing process is then [i.e., at meal times] carried on,” 8c.

It has been seen that these minutiae, which, with military uniformity, regulate by stroke of the clock the times, limits, pauses of the work, were not at all the products of Parliamentary fancy. They developed gradually out of circumstances as natural laws of the modern mode of production. Their formulation, official recognition, and proclamation by the State, were the result of a long struggle of classes. One of their first consequences was that in practice the working day of the adult males in factories became subject to the same limitations, since in most processes of production the co-operation of the children, young persons, and women is indispensable. On the whole, therefore, during the period from 1844 to 1847, the 12 hours’ working day became general and uniform in all branches of industry under the Factory Act.

The manufacturers, however, did not allow this “progress” without a compensating “retrogression.” At their instigation the House of Commons reduced the minimum age for exploitable children from 9 to 8, in order to assure that additional supply of factory children which is due to capitalists, according to divine and human law.

The years 1846-47 are epoch-making in the economic history of England. The Repeal of the Corn Laws, and of the duties on cotton and other raw material; free trade proclaimed as the guiding star of legislation; in a word, the arrival of the millenium. On the other hand, in the same years, the Chartist movement and the 10 hours’ agitation reached their highest point. They found allies in the Tories panting for revenge. Despite the fanatical opposition of the army of perjured Free-traders, with Bright

and Cobden at their head, the Ten Hours' Bill, struggled for so long, went through Parliament.

The new Factory Act of June 8th, 1847, enacted that on July 1st, 1847, there should be a preliminary shortening of the working day for "young persons" (from 13 to 18), and all females to 11 hours, but that on May 1st, 1848, there should be a definite limitation of the working day to 10 hours. In other respects, the Act only amended and completed the Acts of 1833 and 1844.

Capital now entered upon a preliminary campaign in order to hinder the Act from coming into full force on May 1st, 1848. And the workers themselves, under the pretence that they had been taught by experience, were to help in the destruction of their own work. The moment was cleverly chosen. "It must be remembered, too, that there has been more than two years of great suffering (in consequence of the terrible crisis of 1846-47) among the factory operatives, from many mills having worked short time, and many being altogether closed. A considerable number of the operatives must therefore be in very narrow circumstances; many, it is to be feared, in debt; so that it might fairly have been presumed that at the present time they would prefer working the longer time, in order to make up for past losses, perhaps to pay off debts, or get their furniture out of pawn, or replace that sold, or to get a new supply of clothes for themselves and their families."

The manufacturers tried to aggravate the natural effect of these circumstances by a general reduction of wages by 10%. This was done, so to say, to celebrate the inauguration of the new Free Trade era. Then followed a further reduction of 8 1/3% as soon as the working day was shortened to 11, and a reduction of double that amount as soon as it was finally shortened to 10 hours. Wherever, therefore, circumstances allowed it, a reduction of wages of at least 25% took place. Under such favourably prepared conditions the agitation among the factory workers for the repeal of the Act of 1847 was begun. Neither lies, bribery, nor threats were spared in this attempt. But all was in vain. Concerning the half-dozen petitions in which workpeople were made to complain of "their oppression by the Act," the petitioners themselves declared under oral examination, that their signatures had been extorted from them. "They felt themselves oppressed, but not exactly by the Factory Act." But if the manufacturers did not succeed in making the workpeople speak as they wished, they themselves shrieked all the louder in press and Parliament in the name of the

workpeople. They denounced the Factory Inspectors as a kind of revolutionary commissioners like those of the French National Convention ruthlessly sacrificing the unhappy factory workers to their humanitarian crotchet. This manœuvre also failed. Factory Inspector Leonard Horner conducted in his own person, and through his sub-inspectors, many examinations of witnesses in the factories of Lancashire. About 70% of the workpeople examined declared in favour of 10 hours, a much smaller percentage in favour of 11, and an altogether insignificant minority for the old 12 hours.

Another “friendly” dodge was to make the adult males work 12 to 15 hours, and then to blazon abroad this fact as the best proof of what the proletariat desired in its heart of hearts. But the “ruthless” Factory Inspector Leonard Horner was again to the fore. The majority of the “over-timers” declared: “They would much prefer working ten hours for less wages, but that they had no choice; that so many were out of employment (so many spinners getting very low wages by having to work as piecers, being unable to do better), that if they refused to work the longer time, others would immediately get their places, so that it was a question with them of agreeing to work the long time, or of being thrown out of employment altogether.”

The preliminary campaign of capital thus came to grief, and the Ten Hours’ Act came into force May 1st, 1848. But mean-while the fiasco of the Chartist party whose leaders were imprisoned, and whose organisation was dismembered, had shaken the confidence of the English working class in its own strength. Soon after this the June insurrections in Paris and its bloody suppression united, in England as on the Continent, all fractions of the ruling classes, landlords and capitalists, stock-exchange wolves and shop-keepers. Protectionists and Free-traders, government and opposition, priests and free-thinkers, young whores and old nuns, under the common cry for the salvation of Property, Religion, the Family and Society. The working class was everywhere proclaimed, placed under a ban, under a virtual law of suspects. The manufacturers had no need any longer to restrain themselves. They broke out in open revolt not only against the Ten Hours’ Act, but against the whole of the legislation that since 1833 had aimed at restricting in some measure the “free” exploitation of labour-power. It was a pro-slavery rebellion in miniature, carried on for over two years with a cynical

recklessness, a terrorist energy all the cheaper because the rebel capitalist risked nothing except the skin of his “hands.”

To understand that which follows we must remember that the Factory Acts of 1833, 1844, and 1847 were all three in force so far as the one did not amend the other: that not one of these limited the working day of the male worker over 18, and that since 1833 the 15 hours from 5.30 a.m. to 8.30 p.m. had remained the legal “day,” within the limits of which at first the 12, and later the 10 hours’ labour of young persons and women had to be performed under the prescribed conditions.

The manufacturers began by here and there discharging a part of, in many cases half of, the young persons and women employed by them, and then, for the adult males, restoring the almost obsolete night-work. The Ten Hours’ Act, they cried, leaves no other alternative.

Their second step dealt with the legal pauses for meals. Let us hear the Factory Inspectors. “Since the restriction of the hours of work to ten, the factory occupiers maintain, although they have not yet practically gone the whole length, that supposing the hours of work to be from 9 a.m. to 7 p.m., they fulfil the provisions of the statutes by allowing an hour before 9 a.m. and half-an-hour after 7 p.m. [for meals]. In some cases they now allow an hour, or half an hour for dinner, insisting at the same time, that they are not bound to allow any part of the hour and a half in the course of the factory working-day.” The manufacturers maintained therefore that the scrupulously strict provisions of the Acts of 1844 with regard to meal times only gave the operatives permission to eat and drink before coming into, and after leaving the factory — i.e., at home. And why should not the workpeople eat their dinner before 9 in the morning? The crown lawyers, however, decided that the prescribed meal times “must be in the interval during the working hours, and that it will not be lawful to work for 10 hours continuously, from 9 a.m. to 7 p.m., without any interval.”

After these pleasant demonstrations, Capital preluded its revolt by a step which agreed with the letter of the law of 1844, and was therefore legal.

The Act of 1844 certainly prohibited the employment after 1 p.m. of such children, from 8 to 13, as had been employed before noon. But it did not regulate in any way the 6½ hours’ work of the children whose work-time began at 12 midday or later. Children of 8 might, if they began work at noon, be employed from 12 to 1, 1 hour; from 2 to 4 in the afternoon, 2 hours; from 5 to 8:30 in the evening, 3½ hours; in all, the legal 6½ hours.

Or better still. In order to make their work coincide with that of the adult male labourers up to 8.30 p.m., the manufacturers only had to give them no work till 2 in the afternoon; they could then keep them in the factory without intermission till 8.30 in the evening. “And it is now expressly admitted that the practice exists in England from the desire of mill-owners to have their machinery at work for more than 10 hours a-day, to keep the children at work with male adults after all the young persons and women have left, and until 8.30 p.m., if the factory-owners choose.” Workmen and factory inspectors protested on hygienic and moral grounds, but Capital answered:

“My deeds upon my head! I crave the law,
The penalty and forfeit of my bond.”

In fact, according to statistics laid before the House of Commons on July 26th, 1850, in spite of all protests, on July 15th, 1850, 3,742 children were subjected to this “practice” in 257 factories. Still this was not enough. The lynx eye of Capital discovered that the Act of 1844 did not allow 5 hours’ work before mid-day without a pause of at least 30 minutes for refreshment, but prescribed nothing of the kind for work after mid-day. Therefore, it claimed and obtained the enjoyment not only of making children of 8 drudge without intermission from 2 to 8.30 p.m., but also of making them hunger during that time.

“Ay, his heart,
So says the bond.”

This Shylock-clinging to the letter of the law of 1844, so far as it regulated children’s labour, was but to lead up to an open revolt against the same law, so far as it regulated the labour of “young persons and women.” It will be remembered that the abolition of the “false relay system” was the chief aim and object of that law. The masters began their revolt with the simple declaration that the sections of the Act of 1844 which prohibited the ad libitum use of young persons and women in such short fractions of the day of 15 hours as the employer chose, were “comparatively harmless” so long as the work-time was fixed at 12 hours. But under the Ten Hours’ Act they were a “grievous hardship.” They informed the inspectors in the coolest manner that they should place themselves above the letter of the

law, and re-introduce the old system on their own account. They were acting in the interests of the ill-advised operatives themselves, “in order to be able to pay them higher wages.” “This was the only possible plan by which to maintain, under the Ten Hours’ Act, the industrial supremacy of Great Britain.” “Perhaps it may be a little difficult to detect irregularities under the relay system; but what of that? Is the great manufacturing interest of this country to be treated as a secondary matter in order to save some little trouble to Inspectors and Sub-Inspectors of Factories?”

All these shifts naturally were of no avail. The Factory Inspectors appealed to the Law Courts. But soon such a cloud of dust in the way of petitions from the masters overwhelmed the Home Secretary, Sir George Grey, that in a circular of August 5th, 1848, he recommends the inspectors not “to lay informations against mill-owners for a breach of the letter of the Act, or for employment of young persons by relays in cases in which there is no reason to believe that such young persons have been actually employed for a longer period than that sanctioned by law.” Hereupon, Factory Inspector J. Stuart allowed the so-called relay system during the 15 hours of the factory day throughout Scotland, where it soon flourished again as of old. The English Factory Inspectors, on the other hand, declared that the Home Secretary had no power dictatorially to suspend the law, and continued their legal proceedings against the pro-slavery rebellion.

But what was the good of summoning the capitalists when the Courts, in this case the country magistrates — Cobbett’s “Great Unpaid” — acquitted them? In these tribunals, the masters sat in judgment on themselves. An example. One Eskrigge, cotton-spinner, of the firm of Kershaw, Leese, & Co., had laid before the Factory Inspector of his district the scheme of a relay system intended for his mill. Receiving a refusal, he at first kept quiet. A few months later, an individual named Robinson, also a cotton-spinner, and if not his Man Friday, at all events related to Eskrigge, appeared before the borough magistrates of Stockport on a charge of introducing the identical plan of relays invented by Eskrigge. Four Justices sat, among them three cotton-spinners, at their head this same inevitable Eskrigge. Eskrigge acquitted Robinson, and now was of opinion that what was right for Robinson was fair for Eskrigge. Supported by his own legal decision, he introduced the system at once into his own factory. Of course, the composition of this tribunal was in itself a violation of the law. These judicial farces, exclaims Inspector Howell, urgently call for a remedy —

either that the law should be so altered as to be made to conform to these decisions, or that it should be administered by a less fallible tribunal, whose decisions would conform to the law...when these cases are brought forward. I long for a stipendiary magistrate.”

The Crown lawyers declared the masters’ interpretation of the Act of 1848 absurd. But the Saviours of Society would not allow themselves to be turned from their purpose. Leonard Horner reports, “Having endeavoured to enforce the Act...by ten prosecutions in seven magisterial divisions, and having been supported by the magistrates in one case only.... I considered it useless to prosecute more for this evasion of the law. That part of the Act of 1884 which was framed for securing uniformity in the hours of work,...is thus no longer in force in my district (Lancashire). Neither have the sub-inspectors or myself any means of satisfying ourselves, when we inspect a mill working by shifts, that the young persons and women are not working more than 10 hours a-day.... In a return of the 30th April,...of mill-owners working by shifts, the number amounts to 114, and has been for some time rapidly increasing. In general, the time of working the mill is extended to 13½ hours, from 6 a.m. to 7½ p.m.,...in some instances it amounts to 15 hours, from 5½ a.m. to 8½ p.m.” Already, in December, 1848, Leonard Horner had a list of 65 manufacturers and 29 overlookers who unanimously declared that no system of supervision could, under this relay system, prevent enormous overwork. Now, the same children and young persons were shifted from the spinning-room to the weaving-room, now, during 15 hours, from one factory to another. How was it possible to control a system which, “under the guise of relays, is some one of the many plans for shuffling ‘the hands’ about in endless variety, and shifting the hours of work and of rest for different individuals throughout the day, so that you may never have one complete set of hands working together in the same room at the same time.”

But altogether independently of actual overwork, this so-called relay-system was an offspring of capitalistic fantasy such as Fourier, in his humorous sketches of “*Courtes Séances*,” has never surpassed, except that the “attraction of labour” was changed into the attraction of capital. Look, for example, at those schemes of the masters which the “respectable” press praised as models of “what a reasonable degree of care and method can accomplish.” The personnel of the work-people was sometimes divided into from 12 to 14 categories, which themselves constantly changed and

rechanged their constituent parts. During the 15 hours of the factory day, capital dragged in the labourer now for 30 minutes, now for an hour, and then pushed him out again, to drag him into the factory and to thrust him out afresh, hounding him hither and thither, in scattered shreds of time, without ever losing hold of him until the full 10 hours' work was done. As on the stage, the same persons had to appear in turns in the different scenes of the different acts. But as an actor during the whole course of the play belongs to the stage, so the operatives, during 15 hours, belonged to the factory, without reckoning the time for going and coming. Thus the hours of rest were turned into hours of enforced idleness, which drove the youths to the pot-house, and the girls to the brothel. At every new trick that the capitalist, from day to day, hit upon for keeping his machinery going 12 or 15 hours without increasing the number of his hands, the worker had to swallow his meals now in this fragment of time, now in that. At the time of the 10 hours' agitation, the masters cried out that the working mob petitioned in the hope of obtaining 12 hours' wages for 10 hours' work. Now they reversed the medal. They paid 10 hours' wages for 12 or 15 hours' lordship over labour-power. This was the gist of the matter, this the masters' interpretation of the 10 hours' law! These were the same unctuous free-traders, perspiring with the love of humanity, who for full 10 years, during the Anti-Corn Law agitation, had preached to the operatives, by a reckoning of pounds, shillings and pence, that with free importation of corn, and with the means possessed by English industry, 10 hours' labour would be quite enough to enrich the capitalist. This revolt of capital, after two years, was at last crowned with victory by a decision of one of the four highest Courts of Justice in England, the Court of Exchequer, which in a case brought before it on February 8th, 1850, decided that the manufacturers were certainly acting against the sense of the Act of 1844, but that this Act itself contained certain words that rendered it meaningless. "By this decision, the Ten Hours' Act was abolished." A crowd of masters, who until then had been afraid of using the relay-system for young persons and women, now took it up heart and soul.

But on this apparently decisive victory of capital, followed at once a revulsion. The workpeople had hitherto offered a passive, although inflexible and unremitting resistance. They now protested in Lancashire and Yorkshire in threatening meetings. The pretended Ten Hours' Act, was thus simple humbug, parliamentary cheating, had never existed! The Factory

Inspectors urgently warned the Government that the antagonism of classes had arrived at an incredible tension. Some of the masters themselves murmured: "On account of the contradictory decisions of the magistrates, a condition of things altogether abnormal and anarchial obtains. One law holds in Yorkshire, another in Lancashire; one law in one parish of Lancashire, another in its immediate neighborhood. The manufacturer in large towns could evade the law, the manufacturer in country districts could not find the people necessary for the relay-system, still less for the shifting of hands from one factory to another," 8c. And the first birth-right of capital is equal exploitation of labour-power by all capitalists.

Under these circumstances a compromise between masters and men was effected that received the seal of Parliament in the additional Factory Act of August 5th, 1850. The working day for "young persons and women," was raised from 10 to 10½ hours for the first five days of the week, and was shortened to 7½ on the Saturday. The work was to go on between 6 a.m. and 6 p.m., with pauses of not less than 1½ hours for meal-times, these meal-times to be allowed at one and the same time for all, and conformably to the conditions of 1844. By this an end was put to the relay-system once for all. For children's labour, the Act of 1844 remained in force.

One set of masters, this time as before, secured to itself special seigniorial rights over the children of the proletariat. These were the silk manufacturers. In 1833 they had howled out in threatening fashion, "if the liberty of working children of any age for 10 hours a day were taken away, it would stop their works." It would be impossible for them to buy a sufficient number of children over 13. They extorted the privilege they desired. The pretext was shown on subsequent investigation to be a deliberate lie. It did not, however, prevent them, during 10 years, from spinning silk 10 hours a day out of the blood of little children who had to be placed upon stools for the performance of their work. The Act of 1844 certainly "robbed" them of the "liberty" of employing children under 11 longer than 6½ hours a day. But it secured to them, on the other hand, the privilege of working children between 11 and 13, 10 hours a day, and of annulling in their case the education made compulsory for all other factory children. This time the pretext was "the delicate texture of the fabric in which they were employed, requiring a lightness of touch, only to be acquired by their early introduction to these factories." The children were slaughtered out-and-out for the sake of their delicate fingers, as in Southern

Russia the horned cattle for the sake of their hide and tallow. At length, in 1850, the privilege granted in 1844 was limited to the departments of silk-twisting and silk-winding. But here, to make amends to capital bereft of its "freedom," the work time for children from 11 to 13 was raised from 10 to 10½ hours. Pretext: "Labour in silk mills was lighter than in mills for other fabrics, and less likely in other respects also to be prejudicial to health." Official medical inquiries proved afterwards that, on the contrary, "the average death-rate is exceedingly high in the silk districts, and amongst the female part of the population is higher even than it is in the cotton districts of Lancashire." Despite the protests of the Factory Inspector, renewed every 6 months, the mischief continues to this hour.

The Act of 1850 changed the 15 hours' time from 6 a.m. to 8.30 p.m., into the 12 hours from 6 a.m. to 6 p.m. for "young persons and women" only. It did not, therefore, affect children who could always be employed for half an hour before and 2½ hours after this period, provided the whole of their labour did not exceed 6½ hours. Whilst the bill was under discussion, the Factory Inspectors laid before Parliament statistics of the infamous abuses due to this anomaly. To no purpose. In the background lurked the intention of screwing up, during prosperous years, the working day of adult males to 15 hours by the aid of the children. The experience of the three following years showed that such an attempt must come to grief against the resistance of the adult male operatives. The Act of 1850 was therefore finally completed in 1853 by forbidding the "employment of children in the morning before and in the evening after young persons and women." Henceforth with a few exceptions the Factory Act of 1850 regulated the working day of all workers in the branches of industry that come under it. Since the passing of the first Factory Act half a century had elapsed.

Factory legislation for the first time went beyond its original sphere in the "Printworks' Acts of 1845." The displeasure with which capital received this new "extravagance" speaks through every line of the Act. It limits the working day for children from 8 to 13, and for women to 16 hours, between 6 a.m. and 10 p.m., without any legal pause for meal times. It allows males over 13 to be worked at will day and night. It is a Parliamentary abortion.

However, the principle had triumphed with its victory in those great branches of industry which form the most characteristic creation of the modern mode of production. Their wonderful development from 1853 to

1860, hand-in-hand with the physical and moral regeneration of the factory workers, struck the most purblind. The masters from whom the legal limitation and regulation had been wrung step by step after a civil war of half a century, themselves referred ostentatiously to the contrast with the branches of exploitation still “free.” The Pharisees of “political economy” now proclaimed the discernment of the necessity of a legally fixed working day as a characteristic new discovery of their “science.” It will be easily understood that after the factory magnates had resigned themselves and become reconciled to the inevitable, the power of resistance of capital gradually weakened, whilst at the same time the power of attack of the working class grew with the number of its allies in the classes of society not immediately interested in the question. Hence the comparatively rapid advance since 1860.

The dye-works and bleach-works all came under the Factory Act of 1850 in 1860; lace and stocking manufacturers in 1861.

In consequence of the first report of the Commission on the employment of children (1863), the same fate was shared by the manufacturers of all earthenwares (not merely pottery), lucifer-matches, percussion-caps, cartridges, carpets, fustian-cutting, and many processes included under the name of “finishing.” In the year 1863 bleaching in the open air and baking were placed under special Acts, by which, in the former, the labour of young persons and women during the night-time (from 8 in the evening to 6 in the morning), and in the latter, the employment of journeymen bakers under 18, between 9 in the evening and 5 in the morning were forbidden. We shall return to the later proposals of the same Commission, which threatened to deprive of their “freedom” all the important branches of English Industry, with the exception of agriculture, mines, and the means of transport.

SECTION 7. — THE STRUGGLE FOR THE NORMAL WORKING-DAY. RE-ACTION OF THE ENGLISH ACTS ON OTHER COUNTRIES.

The reader will bear in mind that the production of surplus-value, or the extraction of surplus-labour, is the specific end and aim, the sum and substance, of capitalist production quite apart from any changes in the mode

of production, which may arise from the subordination of labour to capital. He will remember that as far as we have at present gone, only the independent labourer, and therefore only the labourer legally qualified to act for himself, enters as a vendor of a commodity into a contract with the capitalist. If, therefore, in our historical sketch, on the one hand, modern industry; on the other, the labour of those who are physically and legally minors, play important parts, the former was to us only a special department, and the latter only a specially striking example of labour exploitation. Without, however, anticipating the subsequent development of our inquiry, from the mere connexion of the historic facts before us, it follows:

First. The passion of capital for an unlimited and reckless extension of the working day, is first gratified in the industries earliest revolutionised by water-power, steam, and machinery, in those first creations of the modern mode of production, cotton, wool, flax, and silk spinning, and weaving. The changes in the material mode of production, and the corresponding changes in the social relations of the producers gave rise first to an extravagance beyond all bounds, and then in opposition to this, called forth a control on the part of Society which legally limits, regulates, and makes uniform the working day and its pauses. This control appears, therefore, during the first half of the nineteenth century simply as exceptional legislation. As soon as this primitive dominion of the new mode of production was conquered, it was found that, in the meantime, not only had many other branches of production been made to adopt the same factory system, but that manufacturers with more or less obsolete methods, such as potteries, glass-making, &c., that old-fashioned handicrafts, like baking, and, finally, even that the so-called domestic industries such as nail-making, had long since fallen as completely under capitalist exploitation as the factories themselves. Legislation was, therefore, compelled to gradually get rid of its exceptional character, or where, as in England, it proceeds after the manner of the Roman Casuists, to declare any house in which work was done to be a factory.

Second. The history of the regulation of the working day in certain branches of production, and the struggle still going on in others in regard to this regulation, prove conclusively that the isolated labourer, the labourer as “free” vendor of his labour-power, when capitalist production has once attained a certain stage, succumbs without any power of resistance. The

creation of a normal working day is, therefore, the product of a protracted civil war, more or less dissembled, between the capitalist class and the working class. As the contest takes place in the arena of modern industry, it first breaks out in the home of that industry — England. The English factory workers were the champions, not only of the English, but of the modern working-class generally, as their theorists were the first to throw down the gauntlet to the theory of capital. Hence, the philosopher of the Factory, Ure, denounces as an ineffable disgrace to the English working-class that they inscribed “the slavery of the Factory Acts” on the banner which they bore against capital, manfully striving for “perfect freedom of labour.”

France limps slowly behind England. The February revolution was necessary to bring into the world the 12 hours’ law, which is much more deficient than its English original. For all that, the French revolutionary method has its special advantages. It once for all commands the same limit to the working-day in all shops and factories without distinction, whilst English legislation reluctantly yields to the pressure of circumstances, now on this point, now on that, and is getting lost in a hopelessly bewildering tangle of contradictory enactments. On the other hand, the French law proclaims as a principle that which in England was only won in the name of children, minors, and women, and has been only recently for the first time claimed as a general right.

In the United States of North America, every independent movement of the workers was paralysed so long as slavery disfigured a part of the Republic. Labour cannot emancipate itself in the white skin where in the black it is branded. But out of the death of slavery a new life at once arose. The first fruit of the Civil War was the eight hours’ agitation, that ran with the seven-leagued boots of the locomotive from the Atlantic to the Pacific, from New England to California. The General Congress of Labour at Baltimore (August 16th, 1866) declared: “The first and great necessity of the present, to free the labour of this country from capitalistic slavery, is the passing of a law by which eight hours shall be the normal working-day in all States of the American Union. We are resolved to put forth all our strength until this glorious result is attained.” At the same time, the Congress of the International Working Men’s Association at Geneva, on the proposition of the London General Council, resolved that “the limitation of

the working-day is a preliminary condition without which all further attempts at improvement and emancipation must prove abortive...the Congress proposes eight hours as the legal limit of the working-day.”

Thus the movement of the working-class on both sides of the Atlantic, that had grown instinctively out of the conditions of production themselves, endorsed the words of the English Factory Inspector, R. J. Saunders: “Further steps towards a reformation of society can never be carried out with any hope of success, unless the hours of labour be limited, and the prescribed limit strictly enforced.”

It must be acknowledged that our labourer comes out of the process of production other than he entered. In the market he stood as owner of the commodity “labour-power” face to face with other owners of commodities, dealer against dealer. The contract by which he sold to the capitalist his labour-power proved, so to say, in black and white that he disposed of himself freely. The bargain concluded, it is discovered that he was no “free agent,” that the time for which he is free to sell his labour-power is the time for which he is forced to sell it, that in fact the vampire will not lose its hold on him “so long as there is a muscle, a nerve, a drop of blood to be exploited.” For “protection” against “the serpent of their agonies,” the labourers must put their heads together, and, as a class, compel the passing of a law, an all-powerful social barrier that shall prevent the very workers from selling, by voluntary contract with capital, themselves and their families into slavery and death. In place of the pompous catalogue of the “inalienable rights of man” comes the modest Magna Charta of a legally limited working-day, which shall make clear “when the time which the worker sells is ended, and when his own begins.” *Quantum mutatus ab illo!*

CHAPTER XI. RATE AND MASS OF SURPLUS-VALUE.

IN this chapter, as hitherto, the value of labour-power, and therefore the part of the working-day necessary for the reproduction or maintenance of that labour-power, are supposed to be given, constant magnitudes.

This premised, with the rate, the mass is at the same time given of the surplus-value that the individual labourer furnishes to the capitalist in a definite period of time. If, e.g., the necessary labour amounts to 6 hours daily, expressed in a quantum of gold=3 shillings, then 3s. is the daily value of one labour-power or the value of the capital advanced in the buying of one labour-power. If, further, the rate of surplus-value be=100%, this variable capital of 3s. produces a mass of surplus-value of 3s., or the labourer supplies daily a mass of surplus-labour equal to 6 hours.

But the variable capital of a capitalist is the expression in money of the total value of all the labour-powers that he employs simultaneously. Its value is, therefore, equal to the average value of one labour-power, multiplied by the number of labour-powers employed. With a given value of labour-power, therefore, the magnitude of the variable capital varies directly as the number of labourers employed simultaneously. If the daily value of one labour-power=3s., then a capital of 300s. must be advanced in order to exploit daily 100 labour-powers, of n times 3s., in order to exploit daily n labour-powers.

In the same way, if a variable capital of 3s., being the daily value of one labour-power, produce a daily surplus-value of 3s., a variable capital of 300s. will produce a daily surplus-value of 300s., and one of n times 3s. a daily surplus-value of $n \times 3s.$ The mass of the surplus-value produced is therefore equal to the surplus-value which the working-day of one labourer supplies multiplied by the number of labourers employed. But as further the mass of surplus-value which a single labourer produces, the value of labour-power being given, is determined by the rate of the surplus-value, this law follows: the mass of the surplus-value produced is equal to the amount of the variable capital advanced, multiplied by the rate of surplus-value; in other words: it is determined by the compound ratio between the

number of labour-powers exploited simultaneously by the same capitalist and the degree of exploitation of each individual labour-power.

Let the mass of the surplus-value be S , the surplus-value supplied by the individual labourer in the average day s , the variable capital daily advanced in the purchase of one individual labour-power v , the sum total of the variable capital V , the value of an average labour-power P , its degree of exploitation $[a' \text{ (surplus-labor)}]/[a \text{ (necessary-labor)}]$ and the number of labourers employed n ; we have:

$$S = \begin{cases} \frac{s}{v} \times V \\ P \times \frac{a'}{a} \times n \end{cases}$$

It is always supposed, not only that the value of an average labour-power is constant, but that the labourers employed by a capitalist are reduced to average labourers. There are exceptional cases in which the surplus-value produced does not increase in proportion to the number of labourers exploited, but then the value of the labour-power does not remain constant.

In the production of a definite mass of surplus-value, therefore, the decrease of one factor may be compensated by the increase of the other. If the variable capital diminishes, and at the same time the rate of surplus-value increases in the same ratio, the mass of surplus-value produced remains unaltered. If on our earlier assumption the capitalist must advance 300s., in order to exploit 100 labourers a day, and if the rate of surplus-value amounts to 50%, this variable capital of 300s. yields a surplus-value of 150s. or of 100×3 working hours. If the rate of surplus-value doubles, or the working day, instead of being extended from 6 to 9, is extended from 6 to 12 hours and at the same time variable capital is lessened by half, and reduced to 150s., it yields also a surplus-value of 150s. or 50×6 working hours. Diminution of the variable capital may therefore be compensated by a proportionate rise in the degree of exploitation of labour-power, or the decrease in the number of the labourers employed by a proportionate

extension of the working-day. Within certain limits therefore the supply of labour exploitable by capital is independent of the supply of labourers. On the contrary, a fall in the rate of surplus-value leaves unaltered the mass of the surplus-value produced, if the amount of the variable capital, or number of the labourers employed, increases in the same proportion.

Nevertheless, the compensation of a decrease in the number of labourers employed, or of the amount of variable capital advanced, by a rise in the rate of surplus-value, or by the lengthening of the working-day, has impassable limits. Whatever the value of labour-power may be, whether the working time necessary for the maintenance of the labourer is 2 or 10 hours, the total value that a labourer can produce, day in, day out, is always less than the value in which 24 hours of labour are embodied, less than 12s., if 12s. is the money expression for 24 hours of realized labour. In our former assumption, according to which 6 working hours are daily necessary in order to reproduce the labour-power itself or to replace the value of the capital advanced in its purchase, a variable capital of 1500s., that employs 500 labourers at a rate of surplus-value of 100% with a 12 hours' working-day, produces daily a surplus-value of 1500s. or of 6×500 working hours. A capital of 300s. that employs 100 labourers a day with a rate of surplus-value of 200% or with a working-day of 18 hours, produces only a mass of surplus-value of 600s. or 12×100 working hours; and its total value-product, the equivalent of the variable capital advanced plus the surplus-value, can, day in, day out, never reach the sum of 1200s. or 24×100 working hours. The absolute limit of the average working-day — this being by Nature always less than 24 hours — sets an absolute limit to the compensation of a reduction of variable capital by a higher rate of surplus-value, or of the decrease of the number of labourers exploited by a higher degree of exploitation of labour-power. This palpable law is of importance for the clearing up of many phenomena, arising from a tendency (to be worked out later on) of capital to reduce as much as possible the number of labourers employed by it, or its variable constituent transformed into labour-power, in contradiction to its other tendency to produce the greatest possible mass of surplus-value. On the other hand, if the mass of labour-power employed, or the amount of variable capital, increases, but not in proportion to the fall in the rate of surplus-value, the mass of the surplus-value produced, falls.

A third law results from the determination, of the mass of the surplus-value produced, by the two factors: rate of surplus-value and amount of

variable capital advanced. The rate of surplus-value, or the degree of exploitation of labour-power, and the value of labour-power, or the amount of necessary working time being given, it is self-evident that the greater the variable capital, the greater would be the mass of the value produced and of the surplus-value. If the limit of the working-day is given, and also the limit of its necessary constituent, the mass of value and surplus-value that an individual capitalist produces, is clearly exclusively dependent on the mass of labour that he sets in motion. But this, under the conditions supposed above, depends on the mass of labour-power, or the number of labourers whom he exploits, and this number in its turn is determined by the amount of the variable capital advanced. With a given rate of surplus-value, and a given value of labour-power, therefore, the masses of surplus-value produced vary directly as the amounts of the variable capitals advanced. Now we know that the capitalist divides his capital into two parts. One part he lays out in means of production. This is the constant part of his capital. The other part he lays out in living labour-power. This part forms his variable capital. On the basis of the same mode of social production, the division of capital into constant and variable differs in different branches of production, and within the same branch of production, too, this relation, changes with changes in the technical conditions and in the social combinations of the processes of production. But in whatever proportion a given capital breaks up into a constant and a variable part, whether the latter is to the former as 1:2 or 1:10 or 1:x, the law just laid down is not affected by this. For, according to our previous analysis, the value of the constant capital reappears in the value of the product, but does not enter into the newly produced value, the newly created value-product. To employ 1000 spinners, more raw material, spindles, &c., are, of course, required, than to employ 100. The value of these additional means of production however may rise, fall, remain unaltered, be large or small; it has no influence on the process of creation of surplus-value by means of the labour-powers that put them in motion. The law demonstrated above now, therefore, takes this form: the masses of value and of surplus-value produced by different capitals — the value of labour-power being given and its degree of exploitation being equal — vary directly as the amounts of the variable constituents of these capitals, i.e., as their constituents transformed into living labour-power.

This law clearly contradicts all experience based on appearance. Every one knows that a cotton spinner, who, reckoning the percentage on the whole of his applied capital, employs much constant and little variable capital, does not, on account of this, pocket less profit or surplus-value than a baker, who relatively sets in motion much variable and little constant capital. For the solution of this apparent contradiction, many intermediate terms are as yet wanted, as from the standpoint of elementary algebra many intermediate terms are wanted to understand that $0/0$ may represent an actual magnitude. Classical economy, although not formulating the law, holds instinctively to it, because it is a necessary consequence of the general law of value. It tries to rescue the law from collision with contradictory phenomena by a violent abstraction. It will be seen later how the school of Ricardo has come to grief over this stumbling-block. Vulgar economy which, indeed, "has really learnt nothing," here as everywhere sticks to appearances in opposition to the law which regulates and explains them. In opposition to Spinoza, it believes that "ignorance is a sufficient reason."

The labour which is set in motion by the total capital of a society, day in, day out, may be regarded as a single collective working-day. If, e.g., the number of labourers is a million, and the average working-day of a labourer is 10 hours, the social working-day consists of ten million hours. With a given length of this working-day, whether its limits are fixed physically or socially, the mass of surplus-value can only be increased by increasing the number of labourers, i.e., of the labouring population. The growth of population here forms the mathematical limit to the production of surplus-value by the total social capital. On the contrary, with a given amount of population, this limit is formed by the possible lengthening of the working-day. It will, however, be seen in the following chapter that this law only holds for the form of surplus-value dealt with up to the present.

From the treatment of the production of surplus-value, so far, it follows that not every sum of money, or of value, is at pleasure transformable into capital. To effect this transformation, in fact, a certain minimum of money or of exchange-value must be presupposed in the hands of the individual possessor of money or commodities. The minimum of variable capital is the cost price of a single labour-power, employed the whole year through, day in, day out, for the production of surplus-value. If this labourer were in possession of his own means of production, and were satisfied to live as a labourer, he need not work beyond the time necessary for the reproduction

of his means of subsistence, say 8 hours a day. He would, besides, only require the means of production sufficient for 8 working hours. The capitalist, on the other hand, who makes him do, besides these 8 hours, say 4 hours' surplus-labour, requires an additional sum of money for furnishing the additional means of production. On our supposition, however, he would have to employ two labourers in order to live, on the surplus-value appropriated daily, as well as, and no better than a labourer, i.e., to be able to satisfy his necessary wants. In this case the mere maintenance of life would be the end of his production, not the increase of wealth; but this latter is implied in capitalist production. That he may live only twice as well as an ordinary labourer, and besides turn half of the surplus-value produced into capital, he would have to raise, with the number of labourers, the minimum of the capital advanced 8 times. Of course he can, like his labourer, take to work himself, participate directly in the process of production, but he is then only a hybrid between capitalist and labourer, a "small master." A certain stage of capitalist production necessitates that the capitalist be able to devote the whole of the time during which he functions as a capitalist, i.e., as personified capital, to the appropriation and therefore control of the labour of others, and to the selling of the products of this labour. The guilds of the middle ages therefore tried to prevent by force the transformation of the master of a trade into a capitalist, by limiting the number of labourers that could be employed by one master within a very small maximum. The possessor of money or commodities actually turns into a capitalist in such cases only where the minimum sum advanced for production greatly exceeds the maximum of the middle ages. Here, as in natural science, is shown the correctness of the law discovered by Hegel (in his "Logic"), that merely quantitative differences beyond a certain point pass into qualitative changes.

The minimum of the sum of value that the individual possessor of money or commodities must command, in order to metamorphose himself into a capitalist, changes with the different stages of development of capitalist production, and is at given stages different in different spheres of production, according to their special and technical conditions. Certain spheres of production demand, even at the very outset of capitalist production, a minimum of capital that is not as yet found in the hands of single individuals. This gives rise partly to state subsidies to private persons, as in France in the time of Colbert, and as in many German states

up to our own epoch; partly to the formation of societies with legal monopoly for the exploitation of certain branches of industry and commerce, the fore-runners of our own modern joint-stock companies.

Within the process of production, as we have seen, capital acquired the command over labour, i.e., over functioning labouring-power or the labourer himself. Personified capital, the capitalist takes care that the labourer does his work regularly and with the proper degree of intensity.

Capital further developed into a coercive relation, which compels the working class to do more work than the narrow round of its own life-wants prescribes. As a producer of the activity of others, as a pumper-out of surplus-labour and exploiter of labour-power, it surpasses in energy, disregard of bounds, recklessness and efficiency, all earlier systems of production based on directly compulsory labour.

At first, capital subordinates labour on the basis of the technical conditions in which it historically finds it. It does not, therefore, change immediately the mode of production. The production of surplus-value — in the form hitherto considered by us — by means of simple extension of the working-day, proved, therefore, to be independent of any change in the mode of production itself. It was not less active in the old-fashioned bakeries than in the modern cotton factories.

If we consider the process of production from the point of view of the simple labour-process, the labourer stands in relation to the means of production, not in their quality as capital, but as the mere means and material of his own intelligent productive activity. In tanning, e.g., he deals with the skins as his simple object of labour. It is not the capitalist whose skin he tans. But it is different as soon as we deal with the process of production from the point of view of the process of creation of surplus-value. The means of production are at once changed into means for the absorption of the labour of others. It is now no longer the labourer that employs the means of production, but the means of production that employ the labourer. Instead of being consumed by him as material elements of his productive activity, they consume him as the ferment necessary to their own life-process, and the life-process of capital consists only in its movement as value constantly expanding, constantly multiplying itself. Furnaces and workshops that stand idle by night, and absorb no living labour, are “a mere loss” to the capitalist. Hence, furnaces and workshops constitute lawful claims upon the night-labour of the workpeople. The

simple transformation of money into the material factors of the process of production, into means of production, transforms the latter into a title and a right to the labour and surplus-labour of others. An example will show, in conclusion, how this sophistication, peculiar to and characteristic of capitalist production, this complete inversion of the relation between dead and living labour, between value and the force that creates value, mirrors itself in the consciousness of capitalists. During the revolt of the English factory lords between 1848 and 1850, “the head of one of the oldest and most respectable houses in the West of Scotland, Messrs. Carlile Sons & Co., of the linen and cotton thread factory at Paisley, a company which has now existed for about a century, which was in operation in 1752, and four generations of the same family have conducted it”...this “very intelligent gentleman” then wrote a letter in the “Glasgow Daily Mail” of April 25th, 1849, with the title, “The relay system,” in which among other things the following grotesquely naïve passage occurs: “Let us now...see what evils will attend the limiting to 10 hours the working of the factory.... They amount to the most serious damage to the millowner’s prospects and property. If he (i.e., his “hands”) worked 12 hours before, and is limited to 10, then every 12 machines or spindles in his establishment shrink to 10, and should the works be disposed of, they will be valued only as 10, so that a sixth part would thus be deducted from the value of every factory in the country.”

To this West of Scotland bourgeois brain, inheriting the accumulated capitalistic qualities of “four generations,” the value of the means of production, spindles, &c. is so inseparably mixed up with their property, as capital, to expand their own value, and to swallow up daily a definite quantity of the unpaid labour of others, that the head of the firm of Carlile & Co. actually imagines that if he sells his factory, not only will the value of the spindles be paid to him, but, in addition, their power of annexing surplus-value, not only the labour which is embodied in them, and is necessary to the production of spindles of this kind, but also the surplus-labour which they help to pump out daily from the brave Scots of Paisley, and for that very reason he thinks that with the shortening of the working-day by 2 hours, the selling-price of 12 spinning machines dwindles to that of 10!

PART IV. PRODUCTION OF RELATIVE SURPLUS-VALUE.

CHAPTER XII. THE CONCEPT OF RELATIVE SURPLUS-VALUE.

THAT portion of the working-day which merely produces an equivalent for the value paid by the capitalist for his labour-power, has, up to this point, been treated by us as a constant magnitude; and such in fact it is, under given conditions of production and at a given stage in the economical development of society. Beyond this, his necessary labour-time, the labourer, we saw, could continue to work for 2, 3, 4, 6, 8c., hours. The rate of surplus-value and the length of the working day depended on the magnitude of this prolongation. Though the necessary labour-time was constant, we saw, on the other hand, that the total working-day was variable. Now suppose we have a working-day whose length, and whose apportionment between necessary labour and surplus-labour, are given. Let the whole line a c, a ——— b — c, represent, for example, a working-day of 12 hours; the portion of a b 10 hours of necessary labour, and the portion b c 2 hours of surplus-labour. How now can the production of surplus-value be increased, i.e., how can the surplus-labour be prolonged, without, or independently of, any prolongation of a c?

Although the length of a c is given, b c appears to be capable of prolongation, if not by extension beyond its end c, which is also the end of the working day a c, yet, at all events, by pushing back its starting point b in the direction of a. Assume that b' — b in the line, a b' b c is equal to half of b c

a ——— — b' — b ——— c

or to one hour's labour-time. If now, in a c, the working day of 12 hours, we move the point b to b', b c becomes b' c; the surplus-labour increases by one-half, from 2 hours to 3 hours, although the working day remains as before at 12 hours. This extension of the surplus labour-time from b c to b' c, from 2 hours to 3 hours, is, however, evidently impossible, without a simultaneous contraction of the necessary labour-time from a b into a b', from 10 hours to 9 hours. The prolongation of the surplus-labour would correspond to a shortening of the necessary labour; or a portion of the labour-time previously consumed, in reality, for the labourer's own benefit, would be converted into labour-time for the benefit of the capitalist. There

would be an alteration, not in the length of the working day, but in its division into necessary labour-time and surplus labour-time.

On the other hand, it is evident that the duration of the surplus-labour is given, when the length of the working day, and the value of labour-power, are given. The value of labour-power, i.e., the labour-time requisite to produce labour-power, determines the labour-time necessary for the reproduction of that value. If one working hour be embodied in sixpence, and the value of a day's labour-power be five shillings, the labourer must work 10 hours a day, in order to replace the value paid by capital for his labour-power, or to produce an equivalent for the value of his daily necessary means of subsistence. Given the value of these means of subsistence, the value of his labour-power is given; and given the value of his labour-power, the duration of his necessary labour-time is given. The duration of the surplus-labour, however, is arrived at, by subtracting the necessary labour-time from the total working day. Ten hours subtracted from twelve, leave two, and it is not easy to see, how, under the given conditions, the surplus-labour can possibly be prolonged beyond two hours. No doubt, the capitalist can, instead of five shillings, pay the labourer four shillings and sixpence or even less. For the reproduction of this value of four shillings and sixpence, nine hours labour-time would suffice; and consequently three hours of surplus-labour, instead of two, would accrue to the capitalist, and the surplus-value would rise from one shilling to eighteenpence. This result, however, would be obtained only by lowering the wages of the labourer below the value of his labour-power. With the four shillings and sixpence which he produces in nine hours, he commands one-tenth less of the necessities of life than before, and consequently the proper reproduction of his labour-power is crippled. The surplus-labour would in this case be prolonged only by an overstepping of its normal limits; its domain would be extended only by a usurpation of part of the domain of necessary labour-time. Despite the important part which this method plays in actual practice, we are excluded from considering it in this place, by our assumption, that all commodities, including labour-power, are bought and sold at their full value. Granted this, it follows that the labour-time necessary for the production of labour-power, or for the reproduction of its value, cannot be lessened by a fall in the labourer's wages below the value of his labour-power, but only by a fall in this value itself. Given the length of the working day, the prolongation of the surplus-labour must of

necessity originate in the curtailment of the necessary labour-time; the latter cannot arise from the former. In the example we have taken, it is necessary that the value of labour-power should actually fall by one-tenth, in order that the necessary labour-time may be diminished by one-tenth, i.e., from ten hours to nine, and in order that the surplus-labour may consequently be prolonged from two hours to three.

Such a fall in the value of labour-power implies, however, that the same necessaries of life which were formerly produced in ten hours, can now be produced in nine hours. But this is impossible without an increase in the productiveness of labour. For example, suppose a shoemaker, with given tools, makes in one working day of twelve hours, one pair of boots. If he must make two pairs in the same time, the productiveness of his labour must be doubled; and this cannot be done, except by an alteration in his tools or in his mode of working, or in both. Hence, the conditions of production, i.e., his mode of production, and the labour-process itself, must be revolutionised. By increase in the productiveness of labour, we mean, generally, an alteration in the labour-process, of such a kind as to shorten the labour-time socially necessary for the production of a commodity, and to endow a given quantity of labour with the power of producing a greater quantity of use-value. Hitherto in treating of surplus-value, arising from a simple prolongation of the working day, we have assumed the mode of production to be given and invariable. But when surplus-value has to be produced by the conversion of necessary labour into surplus-labour, it by no means suffices for capital to take over the labour-process in the form under which it has been historically handed down, and then simply to prolong the duration of that process. The technical and social conditions of the process, and consequently the very mode of production must be revolutionised, before the productiveness of labour can be increased. By that means alone can the value of labour-power be made to sink, and the portion of the working day necessary for the reproduction of that value, be shortened.

The surplus-value produced by prolongation of the working day, I call absolute surplus-value. On the other hand, the surplus-value arising from the curtailment of the necessary labour-time, and from the corresponding alteration in the respective lengths of the two components of the working day, I call relative surplus-value.

In order to effect a fall in the value of labour-power, the increase in the productiveness of labour must seize upon those branches of industry, whose products determine the value of labour-power, and consequently either belong to the class of customary means of subsistence, or are capable of supplying the place of those means. But the value of a commodity is determined, not only by the quantity of labour which the labourer directly bestows upon that commodity, but also by the labour contained in the means of production. For instance, the value of a pair of boots depends, not only on the cobbler's labour, but also on the value of the leather, wax, thread, &c. Hence, a fall in the value of labour-power is also brought about by an increase in the productiveness of labour, and by a corresponding cheapening of commodities in those industries which supply the instruments of labour and the raw material, that form the material elements of the constant capital required for producing the necessities of life. But an increase in the productiveness of labour in those branches of industry which supply neither the necessities of life, nor the means of production for such necessities, leaves the value of labour-power undisturbed.

The cheapened commodity, of course, causes only a pro tanto fall in the value of labour-power, a fall proportional to the extent of that commodity's employment in the reproduction of labour-power. Shirts, for instance, are a necessary means of subsistence, but are only one out of many. The totality of the necessities of life consists, however, of various commodities, each the product of a distinct industry; and the value of each of those commodities enters as a component part into the value of labour-power. This latter value decreases with the decrease of the labour-time necessary for its reproduction; the total decrease being the sum of all the different curtailments of labour-time effected in those various and distinct industries. This general result is treated, here, as if it were the immediate result directly aimed at in each individual case. Whenever an individual capitalist cheapens shirts, for instance, by increasing the productiveness of labour, he by no means necessarily aims at reducing the value of labour-power and shortening, pro tanto, the necessary labour-time. But it is only in so far as he ultimately contributes to this result, that he assists in raising the general rate of surplus-value. The general and necessary tendencies of capital must be distinguished from their forms of manifestation.

It is not our intention to consider, here, the way in which the laws, immanent in capitalist production, manifest themselves in the movements of

individual masses of capital, where they assert themselves as coercive laws of competition, and are brought home to the mind and consciousness of the individual capitalist as the directing motives of his operations. But this much is clear; a scientific analysis of competition is not possible, before we have a conception of the inner nature of capital, just as the apparent motions of the heavenly bodies are not intelligible to any but him, who is acquainted with their real motions, motions which are not directly perceptible by the senses. Nevertheless, for the better comprehension of the production of relative surplus-value, we may add the following remarks, in which we assume nothing more than the results we have already obtained.

If one hour's labour is embodied in sixpence, a value of six shillings will be produced in a working day of 12 hours. Suppose, that with the prevailing productiveness of labour, 12 articles are produced in these 12 hours. Let the value of the means of production used in each article be sixpence. Under these circumstances, each article costs one shilling: sixpence for the value of the means of production, and sixpence for the value newly added in working with those means. Now let some one capitalist contrive to double the productiveness of labour, and to produce in the working day of 12 hours, 24 instead of 12 such articles. The value of the means of production remaining the same, the value of each article will fall to ninepence, made up of sixpence for the value of the means of production and threepence for the value newly added by the labour. Despite the doubled productiveness of labour, the day's labour creates, as before, a new value of six shillings and no more, which, however, is now spread over twice as many articles. Of this value each article now has embodied in it $\frac{1}{24}$ th, instead of $\frac{1}{12}$ th, threepence instead of sixpence; or, what amounts to the same thing, only half an hour's instead of a whole hour's labour-time, is now added to the means of production while they are being transformed into each article. The individual value of these articles is now below their social value; in other words, they have cost less labour-time than the great bulk of the same article produced under the average social conditions. Each article costs, on an average, one shilling, and represents 2 hours of social labour; but under the altered mode of production it costs only ninepence, or contains only $1\frac{1}{2}$ hours' labour. The real value of a commodity is, however, not its individual value, but its social value; that is to say, the real value is not measured by the labour-time that the article in each individual case costs the producer, but by the labour-time socially required for its production. If therefore, the

capitalist who applies the new method, sells his commodity at its social value of one shilling, he sells it for threepence above its individual value, and thus realises an extra surplus-value of threepence. On the other hand, the working day of 12 hours is, as regards him, now represented by 24 articles instead of 12. Hence, in order to get rid of the product of one working day, the demand must be double what it was, i.e., the market must become twice as extensive. Other things being equal, his commodities can command a more extended market only by a diminution of their prices. He will therefore sell them above their individual but under their social value, say at tenpence each. By this means he still squeezes an extra surplus-value of one penny out of each. This augmentation of surplus-value is pocketed by him, whether his commodities belong or not to the class of necessary means of subsistence that participate in determining the general value of labour-power. Hence, independently of this latter circumstance, there is a motive for each individual capitalist to cheapen his commodities, by increasing the productiveness of labour.

Nevertheless, even in this case, the increased production of surplus-value arises from the curtailment of the necessary labour-time, and from the corresponding prolongation of the surplus-labour. Let the necessary labour-time amount to 10 hours, the value of a day's labour-power to five shillings, the surplus labour-time to 2 hours, and the daily surplus-value to one shilling. But the capitalist now produces 24 articles, which he sells at tenpence a-piece, making twenty shillings in all. Since the value of the means of production is twelve shillings, $14 \frac{2}{5}$ of these articles merely replace the constant capital advanced. The labour of the 12 hours' working day is represented by the remaining $9 \frac{3}{5}$ articles. Since the price of the labour power is five shillings, 6 articles represent the necessary labour-time, and $3 \frac{3}{5}$ articles the surplus-labour. The ratio of the necessary labour to the surplus-labour, which under average social conditions was 5:1, is now only 5:3. The same result may be arrived at in the following way. The value of the product of the working day of 12 hours is twenty shillings. Of this sum, twelve shillings belong to the value of the means of production, a value that merely re-appears. There remain eight shillings, which are the expression in money, of the value newly created during the working day. This sum is greater than the sum in which average social labour of the same kind is expressed: twelve hours of the latter labour are expressed by six shillings

only. The exceptionally productive labour operates as intensified labour; it creates in equal periods of time greater values than average social labour of the same kind. (See Ch. I. Sect. 1. .) But our capitalist still continues to pay as before only five shillings as the value of a day's labour-power. Hence, instead of 10 hours, the labourer need now work only $7\frac{1}{5}$ hours, in order to re-produce this value. His surplus-labour is, therefore increased $2\frac{4}{5}$ hours, and the surplus-value he produces grows from one, into three shillings. Hence, the capitalist who applies the improved method of production appropriates to surplus-labour a greater portion of the working day, than the other capitalists in the same trade. He does individually, what the whole body of capitalists engaged in producing relative surplus-value, do collectively. On the other hand, however, this extra surplus-value vanishes, so soon as the new method of production has become general and has consequently caused the difference between the individual value of the cheapened commodity and its social value to vanish. The law of the determination of value by labour-time, a law which brings under its sway the individual capitalist who applies the new method of production, by compelling him to sell his goods under their social value, this same law, acting as a coercive law of competition, forces his competitors to adopt the new method. The general rate of surplus-value is, therefore, ultimately affected by the whole process, only when the increase in the productiveness of labour, has seized upon those branches of production that are connected with, and has cheapened those commodities that form part of, the necessary means of subsistence, and are therefore elements of the value of labour-power.

The value of commodities is in inverse ratio to the productiveness of labour. And so, too, is the value of labour-power, because it depends on the values of commodities. Relative surplus-value is, on the contrary, directly proportional to that productiveness. It rises with rising and falls with falling productiveness. The value of money being assumed to be constant, an average social working day of 12 hours always produces the same new value, six shillings, no matter how this sum may be apportioned between surplus-value and wages. But if, in consequence of increased productiveness, the value of the necessaries of life fall, and the value of a day's labour-power be thereby reduced from five shillings to three, the surplus-value increases from one shilling to three. Ten hours were necessary for the reproduction of the value of the labourpower; now only

six are required. Four hours have been set free, and can be annexed to the domain of surplus-labour. Hence there is immanent in capital an inclination and constant tendency, to heighten the productiveness of labour, in order to cheapen commodities, and by such cheapening to cheapen the labourer himself.

The value of a commodity is, in itself, of no interest to the capitalist. What alone interests him, is the surplus-value that dwells in it, and is realisable by sale. Realisation of the surplus-value necessarily carries with it the refunding of the value that was advanced. Now, since relative surplus-value increases in direct proportion to the development of the productiveness of labour, while, on the other hand, the value of commodities diminishes in the same proportion; since one and the same process cheapens commodities, and augments the surplus-value contained in them; we have here the solution of the riddle: why does the capitalist, whose sole concern is the production of exchange-value, continually strive to depress the exchange-value of commodities? A riddle with which Quesnay, one of the founders of political economy, tormented his opponents, and to which they could give him no answer. "You acknowledge," he says, "that the more expenses and the cost of labour can, in the manufacture of industrial products, be reduced without injury to production, the more advantageous is such reduction, because it diminishes the price of the finished article. And yet, you believe that the production of wealth, which arises from the labour of the workpeople, consists in the augmentation of the exchange-value of their products."

The shortening of the working day is, therefore, by no means what is aimed at, in capitalist production, when labour is economised by increasing its productiveness. It is only the shortening of the labour-time, necessary for the production of a definite quantity of commodities, that is aimed at. The fact that the workman, when the productiveness of his labour has been increased, produces, say 10 times as many commodities as before, and thus spends one-tenth as much labour-time on each, by no means prevents him from continuing to work 12 hours as before, nor from producing in those 12 hours 1200 articles instead of 120. Nay, more, his working day may be prolonged at the same time, so as to make him produce, say 1400 articles in 14 hours. In the treatises, therefore, of economists of the stamp of MacCulloch, Ure, Senior, and tutti quanti, we may read upon one page, that the labourer owes a debt of gratitude to capital for developing his

productiveness, because the necessary labour-time is thereby shortened, and on the next page, that he must prove his gratitude by working in future for 15 hours instead of 10. The object of all development of the productiveness of labour, within the limits of capitalist production, is to shorten that part of the working day, during which the workman must labour for his own benefit, and by that very shortening, to lengthen the other part of the day, during which he is at liberty to work gratis for the capitalist. How far this result is also attainable, without cheapening commodities, will appear from an examination of the particular modes of producing relative surplus-value, to which examination we now proceed.

CHAPTER XIII. CO-OPERATION.

CAPITALIST production only then really begins, as we have already seen, when each individual capital employs simultaneously a comparatively large number of labourers; when consequently the labour-process is carried on on an extensive scale and yields, relatively, large quantities of products. A greater number of labourers working together, at the same time, in one place (or, if you will, in the same field of labour), in order to produce the same sort of commodity under the mastership of one capitalist, constitutes, both historically and logically, the starting point of capitalist production. With regard to the mode of production itself, manufacture, in its strict meaning, is hardly to be distinguished, in its earliest stages, from the handicraft trades of the guilds, otherwise than by the greater number of workmen simultaneously employed by one and the same individual capital. The workshop of the mediæval master handicraftsman is simply enlarged.

At first, therefore, the difference is purely quantitative. We have shown that the surplus-value produced by a given capital is equal to the surplus-value produced by each workman multiplied by the number of workmen simultaneously employed. The number of workmen in itself does not affect, either the rate of surplus-value, or the degree of exploitation of labour-power. If a working day of 12 hours be embodied in six shillings, 1200 such days will be embodied in 1200 times 6 shillings. In one case 12×1200 working hours, and in the other 12 such hours are incorporated in the product. In the production of value a number of workmen rank merely as so many individual workmen; and it therefore makes no difference in the value produced whether the 1200 men work separately or united under the control of one capitalist.

Nevertheless, within certain limits, a modification takes place. The labour realised in value, is labour of an average social quality; is consequently the expenditure of average labour-power. Any average magnitude, however, is merely the average of a number of separate magnitudes all of one kind, but differing as to quantity. In every industry, each individual labourer, be he Peter or Paul, differs from the average labourer. These individual differences, or “errors” as they are called in

mathematics, compensate one another, and vanish, whenever a certain minimum number of workmen are employed together. The celebrated sophist and sycophant, Edmund Burke, goes so far as to make the following assertion, based on his practical observations as a farmer; viz., that “in so small a platoon” as that of five farm labourers, all individual differences in the labour vanish, and that consequently any given five adult farm labourers taken together, will in the same time do as much work as any other five. But, however that may be, it is clear, that the collective working day of a large number of workmen simultaneously employed, divided by the number of these workmen, gives one day of average social labour. For example, let the working day of each individual be 12 hours. Then the collective working day of 12 men simultaneously employed, consists of 144 hours; and although the labour of each of the dozen men may deviate more or less from average social labour, each of them requiring a different time for the same operation, yet since the working day of each is one-twelfth of the collective working day of 144 hours, it possesses the qualities of an average social working day. From the point of view, however, of the capitalist who employs these 12 men, the working day is that of the whole dozen. Each individual man’s day is an aliquot part of the collective working day, no matter whether the 12 men assist one another in their work, or whether the connexion between their operations consists merely in the fact, that the men are all working for the same capitalist. But if the 12 men are employed in six pairs, by as many different small masters, it will be quite a matter of chance, whether each of these masters produces the same value, and consequently whether he realises the general rate of surplus-value. Deviations would occur in individual cases. If one workman required considerably more time for the production of a commodity than is socially necessary, the duration of the necessary labour-time would, in his case, sensibly deviate from the labour-time socially necessary on an average; and consequently his labour would not count as average labour, nor his labour-power as average labour-power. It would either be not saleable at all, or only at something below the average value of labour-power. A fixed minimum of efficiency in all labour is therefore assumed, and we shall see, later on, that capitalist production provides the means of fixing this minimum. Nevertheless, this minimum deviates from the average, although on the other hand the capitalist has to pay the average value of labour-power. Of the six small masters, one would therefore squeeze out more than

the average rate of surplus-value, another less. The inequalities would be compensated for the society at large, but not for the individual masters. Thus the laws of the production of value are only fully realised for the individual producer, when he produces as a capitalist, and employs a number of workmen together, whose labour, by its collective nature, is at once stamped as average social labour.

Even without an alteration in the system of working, the simultaneous employment of a large number of labourers effects a revolution in the material conditions of the labour process. The buildings in which they work, the store-houses for the raw material, the implements and utensils used simultaneously or in turns by the workmen; in short, a portion of the means of production, are now consumed in common. On the one hand, the exchange-value of these means of production is not increased; for the exchange value of a commodity is not raised by its use-value being consumed more thoroughly and to greater advantage. On the other hand, they are used in common, and therefore on a larger scale than before. A room where twenty weavers work at twenty looms must be larger than the room of a single weaver with two assistants. But it costs less labour to build one workshop for twenty persons than to build ten to accommodate two weavers each; thus the value of the means of production that are concentrated for use in common on a large scale does not increase in direct proportion to the expansion and to the increased useful effect of those means. When consumed in common, they give up a smaller part of their value to each single product; partly because the total value they part with is spread over a greater quantity of products, and partly because their value, though absolutely greater, is, having regard to their sphere of action in the process, relatively less than the value of isolated means of production. Owing to this, the value of a part of the constant capital falls, and in proportion to the magnitude of the fall, the total value of the commodity also falls. The effect is the same as if the means of production had cost less. The economy in their application is entirely owing to their being consumed in common by a large number of workmen. Moreover, this character of being necessary conditions of social labour, a character that distinguishes them from the dispersed and relatively more costly means of production of isolated, independent labourers, or small masters, is acquired even when the numerous workmen assembled together do not assist one another, but

merely work side by side. A portion of the instruments of labour acquires this social character before the labour-process itself does so.

Economy in the use of the means of production has to be considered under two aspects. First, as cheapening commodities, and thereby bringing about a fall in the value of labour-power. Secondly, as altering the ratio of the surplus-value to the total capital advanced, i.e., to the sum of the values of the constant and variable capital. The latter aspect will not be considered until we come to the third volume, to which, with the object of treating them in their proper connexion, we also relegate many other points that relate to the present question. The march of our analysis compels this splitting up of the subject matter, a splitting up that is quite in keeping with the spirit of capitalist production. For since, in this mode of production, the workman finds the instruments of labour existing independently of him as another man's property, economy in their use appears, with regard to him, to be a distinct operation, one that does not concern him, and which, therefore, has no connexion with the methods by which his own personal productiveness is increased.

When numerous labourers work together side by side, whether in one and the same process, or in different but connected processes, they are said to co-operate, or to work in co-operation.

Just as the offensive power of a squadron of cavalry, or the defensive power of a regiment of infantry, is essentially different from the sum of the offensive or defensive powers of the individual cavalry or infantry soldiers taken separately, so the sum total of the mechanical forces exerted by isolated workmen differs from the social force that is developed, when many hands take part simultaneously in one and the same undivided operation, such as raising a heavy weight, turning a winch, or removing an obstacle. In such cases the effect of the combined labour could either not be produced at all by isolated individual labour, or it could only be produced by a great expenditure of time, or on a very dwarfed scale. Not only have we here an increase in the productive power of the individual, by means of co-operation, but the creation of a new power, namely, the collective power of masses.

Apart from the new power that arises from the fusion of many forces into one single force, mere social contact begets in most industries an emulation and a stimulation of the animal spirits that heighten the efficiency of each individual workman. Hence it is that a dozen persons working together will,

in their collective working-day of 144 hours, produce far more than twelve isolated men each working 12 hours, or than one man who works twelve days in succession. The reason of this is that a man is, if not as Aristotle contends, a political, at all events a social animal.

Although a number of men may be occupied together at the same time on the same, or the same kind of work, yet the labour of each, as a part of the collective labour, may correspond to a distinct phase of the labour-process, through all whose phases, in consequence of co-operation, the subject of their labour passes with greater speed. For instance, if a dozen masons place themselves in a row, so as to pass stones from the foot of a ladder to its summit, each of them does the same thing; nevertheless, their separate acts form connected parts of one total operation; they are particular phases, which must be gone through by each stone; and the stones are thus carried up quicker by the 24 hands of the row of men than they could be if each man went separately up and down the ladder with his burden. The object is carried over the same distance in a shorter time. Again, a combination of labour occurs whenever a building, for instance, is taken in hand on different sides simultaneously; although here also the cooperating masons are doing the same, or the same kind of work. The 12 masons, in their collective working day of 144 hours, make much more progress with the building than one mason could make working for 12 days, or 144 hours. The reason is, that a body of men working in concert has hands and eyes both before and behind, and is, to a certain degree, omni-present. The various parts of the work progress simultaneously.

In the above instances we have laid stress upon the point that the men do the same, or the same kind of work, because this, the most simple form of labour in common, plays a great part in co-operation, even in its most fully developed stage. If the work be complicated, then the mere number of the men who co-operate allows of the various operations being apportioned to different hands, and, consequently, of being carried on simultaneously. The time necessary for the completion of the whole work is thereby shortened.

In many industries, there are critical periods, determined by the nature of the process, during which certain definite results must be obtained. For instance, if a flock of sheep has to be shorn, or a field of wheat to be cut and harvested, the quantity and quality of the product depends on the work being begun and ended within a certain time. In these cases, the time that ought to be taken by the process is prescribed, just as it is in herring

fishing. A single person cannot carve a working day of more than, say 12 hours, out of the natural day, but 100 men co-operating extend the working day to 1,200 hours. The shortness of the time allowed for the work is compensated for by the large mass of labour thrown upon the field of production at the decisive moment. The completion of the task within the proper time depends on the simultaneous application of numerous combined working days; the amount of useful effect depends on the number of labourers; this number, however, is always smaller than the number of isolated labourers required to do the same amount of work in the same period. It is owing to the absence of this kind of co-operation that, in the western part of the United States, quantities of corn, and in those parts of East India where English rule has destroyed the old communities, quantities of cotton, are yearly wasted.

On the one hand, co-operation allows of the work being carried on over an extended space; it is consequently imperatively called for in certain undertakings, such as draining, constructing dykes, irrigation works, and the making of canals, roads and railways. On the other hand, while extending the scale of production, it renders possible a relative contraction of the arena. This contraction of arena simultaneous with, and arising from, extension of scale, whereby a number of useless expenses are cut down, is owing to the conglomeration of labourers, to the aggregation of various processes, and to the concentration of the means of production.

The combined working day produces, relatively to an equal sum of isolated working-days, a greater quantity of use-values, and, consequently, diminishes the labour-time necessary for the production of a given useful effect. Whether the combined working-day, in a given case, acquires this increased productive power, because it heightens the mechanical force of labour, or extends its sphere of action over a greater space, or contracts the field of production relatively to the scale of production, or at the critical moment sets large masses of labour to work, or excites emulation between individuals and raises their animal spirits, or impresses on the similar operations carried on by a number of men the stamp of continuity and many-sidedness, or performs simultaneously different operations, or economises the means of production by use in common, or lends to individual labour the character of average social labour — which ever of these be the cause of the increase, the special productive power of the

combined working day is, under all circumstances, the social productive power of labour, or the productive power of social labour. This power is due to co-operation itself. When the labourer co-operates systematically with others, he strips off the fetters of his individuality, and develops the capabilities of his species.

As a general rule, labourers cannot co-operate without being brought together: their assemblage in one place is a necessary condition of their co-operation. Hence wage labourers cannot co-operate, unless they are employed simultaneously by the same capital, the same capitalist, and unless therefore their labour-powers are bought simultaneously by him. The total value of these labour-powers, or the amount of the wages of these labourers for a day, or a week, as the case may be, must be ready in the pocket of the capitalist, before the workmen are assembled for the process of production. The payment of 300 workmen at once, though only for one day, requires a greater outlay of capital, than does the payment of a smaller number of men, week by week, during a whole year. Hence the number of the labourers that co-operate, or the scale of co-operation, depends, in the first instance, on the amount of capital that the individual capitalist can spare for the purchase of labour-power; in other words, on the extent to which a single capitalist has command over the means of subsistence of a number of labourers.

And as with the variable, so it is with the constant capital. For example, the outlay on raw material is 30 times as great, for the capitalist who employs 300 men, as it is for each of the 30 capitalists who employ 10 men. The value and quantity of the instruments of labour used in common do not, it is true, increase at the same rate as the number of workmen, but they do increase very considerably. Hence, concentration of large masses of the means of production in the hands of individual capitalists, is a material condition for the co-operation of wage-labourers, and the extent of the co-operation or the scale of production, depends on the extent of this concentration.

We saw in a former chapter, that a certain minimum amount of capital was necessary, in order that the number of labourers simultaneously employed, and, consequently, the amount of surplus-value produced, might suffice to liberate the employer himself from manual labour, to convert him from a small master into a capitalist, and thus formally to establish capitalist production. We now see that a certain minimum amount is a necessary

condition for the conversion of numerous isolated and independent processes into one combined social process.

We also saw that at first, the subjection of labour to capital was only a formal result of the fact, that the labourer, instead of working for himself, works for and consequently under the capitalist. By the co-operation of numerous wage-labourers, the sway of capital develops into a requisite for carrying on the labour-process itself, into a real requisite of production. That a capitalist should command on the field of production, is now as indispensable as that a general should command on the field of battle.

All combined labour on a large scale requires, more or less, a directing authority, in order to secure the harmonious working of the individual activities, and to perform the general functions that have their origin in the action of the combined organism, as distinguished from the action of its separate organs. A single violin player is his own conductor; an orchestra requires a separate one. The work of directing, superintending, and adjusting, becomes one of the functions of capital, from the moment that the labour under the control of capital, becomes co-operative. Once a function of capital, it acquires special characteristics.

The directing motive, the end and aim of capitalist production, is to extract the greatest possible amount of surplus-value, and consequently to exploit labour-power to the greatest possible extent. As the number of the co-operating labourers increases, so too does their resistance to the domination of capital, and with it, the necessity for capital to overcome this resistance by counter-pressure. The control exercised by the capitalist is not only a special function, due to the nature of the social labour-process, and peculiar to that process, but it is, at the same time, a function of the exploitation of a social labour-process, and is consequently rooted in the unavoidable antagonism between the exploiter and the living and labouring raw material he exploits.

Again, in proportion to the increasing mass of the means of production, now no longer the property of the labourer, but of the capitalist, the necessity increases for some effective control over the proper application of those means. Moreover, the co-operation of wage labourers is entirely brought about by the capital that employs them. Their union into one single productive body and the establishment of a connexion between their individual functions, are matters foreign and external to them, are not their own act, but the act of the capital that brings and keeps them together.

Hence the connexion existing between their various labours appears to them, ideally, in the shape of a preconceived plan of the capitalist, and practically in the shape of the authority of the same capitalist, in the shape of the powerful will of another, who subjects their activity to his aims. If, then, the control of the capitalist is in substance twofold by reason of the twofold nature of the process of production itself, — which, on the one hand, is a social process for producing use-values, on the other, a process for creating surplus-value — in form that control is despotic. As co-operation extends its scale, this despotism takes forms peculiar to itself. Just as at first the capitalist is relieved from actual labour so soon as his capital has reached that minimum amount with which capitalist production, as such begins, so now, he hands over the work of direct and constant supervision of the individual workmen, and groups of workmen, to a special kind of wage labourer. An industrial army of workmen, under the command of a capitalist, requires, like a real army, officers (managers), and sergeants (foremen, overlookers), who, while the work is being done, command in the name of the capitalist. The work of supervision becomes their established and exclusive function. When comparing the mode of production of isolated peasants and artisans with production by slave labour the political economist counts this labour of superintendence among the *faux frais* of production. But, when considering the capitalist mode of production, he, on the contrary, treats the work of control made necessary by the co-operative character of the labour process as identical with the different work of control, necessitated by the capitalist character of that process and the antagonism of interests between capitalist and labourer. It is not because he is a leader of industry that a man is a capitalist; on the contrary, he is a leader of industry because he is a capitalist. The leadership of industry is an attribute of capital, just as in feudal times the functions of general and judge were attributes of landed property.

The labourer is the owner of his labour-power until he has done bargaining for its sale with the capitalist; and he can sell no more than what he has — i.e., his individual, isolated labour-power. This state of things is in no way altered by the fact that the capitalist, instead of buying the labour-power of one man, buys that of 100, and enters into separate contracts with 100 unconnected men instead of with one. He is at liberty to set the 100 men to work, without letting them co-operate. He pays them the value of 100 independent labour-powers, but he does not pay for the combined

labour-power of the hundred. Being independent of each other, the labourers are isolated persons, who enter into relations with the capitalist, but not with one another. This co-operation begins only with the labour process, but they have then ceased to belong to themselves. On entering that process, they become incorporated with capital. As co-operators, as members of a working organism, they are but special modes of existence of capital. Hence, the productive power developed by the labourer when working in co-operation, is the productive power of capital. This power is developed gratuitously, whenever the workmen are placed under given conditions, and it is capital that places them under such conditions. Because this power costs capital nothing, and because, on the other hand, the labourer himself does not develop it before his labour belongs to capital, it appears as a power with which capital is endowed by Nature — a productive power that is immanent in capital.

The colossal effects of simple co-operation are to be seen in the gigantic structures of the ancient Asiatics, Egyptians, Etruscans, 8c. “It has happened in times past that these Oriental States, after supplying the expenses of their civil and military establishments, have found themselves in possession of a surplus which they could apply to works of magnificence or utility, and in the construction of these their command over the hands and arms of almost the entire non-agricultural population has produced stupendous monuments which still indicate their power. The teeming valley of the Nile...produced food for a swarming non-agricultural population, and this food, belonging to the monarch and the priesthood, afforded the means of erecting the mighty monuments which filled the land.... In moving the colossal statues and vast masses of which the transport creates wonder, human labour almost alone, was prodigally used.... The number of the labourers and the concentration of their efforts sufficed. We see mighty coral reefs rising from the depths of the ocean into islands and firm land, yet each individual depositor is puny, weak, and contemptible. The non-agricultural labourers of an Asiatic monarchy have little but their individual bodily exertions to bring to the task, but their number is their strength, and the power of directing these masses gave rise to the palaces and temples, the pyramids, and the armies of gigantic statues of which the remains astonish and perplex us. It is that confinement of the revenues which feed them, to one or a few hands, which makes such undertakings possible.” This power of Asiatic and Egyptian kings, Etruscan theocrats, 8c., has in modern

society been transferred to the capitalist, whether he be an isolated, or as in joint stock companies, a collective capitalist.

Co-operation, such as we find it at the dawn of human development, among races who live by the chase, or say, in the agriculture of Indian communities, is based, on the one hand, on ownership in common of the means of production, and on the other hand, on the fact, that in those cases, each individual has no more torn himself off from the navel-string of his tribe or community, than each bee has freed itself from connexion with the hive. Such co-operation is distinguished from capitalistic co-operation by both of the above characteristics. The sporadic application of co-operation on a large scale in ancient times, in the middle ages, and in modern colonies, reposes on relations of dominion and servitude, principally on slavery. The capitalistic form, on the contrary, presupposes from first to last, the free wage labourer, who sells his labour-power to capital. Historically, however, this form is developed in opposition to peasant agriculture and to the carrying on of independent handicrafts whether in guilds or not. From the standpoint of these, capitalistic co-operation does not manifest itself as a particular historical form of co-operation, but co-operation itself appears to be a historical form peculiar to, and specifically distinguishing, the capitalist process of production.

Just as the social productive power of labour that is developed by co-operation, appears to be the productive power of capital, so co-operation itself, contrasted with the process of production carried on by isolated independent labourers, or even by small employers, appears to be a specific form of the capitalist process of production. It is the first change experienced by the actual labour-process, when subjected to capital. This change takes place spontaneously. The simultaneous employment of a large number of wage-labourers, in one and the same process, which is a necessary condition of this change, also forms the starting point of capitalist production. This point coincides with the birth of capital itself. If then, on the one hand, the capitalist mode of production presents itself to us historically, as a necessary condition to the transformation of the labour-process into a social process, so, on the other hand, this social form of the labour-process presents itself, as a method employed by capital for the more profitable exploitation of labour, by increasing that labour's productiveness.

In the elementary form, under which we have hitherto viewed it, co-operation is a necessary concomitant of all production on a large scale, but

it does not, in itself, represent a fixed form characteristic of a particular epoch in the development of the capitalist mode of production. At the most it appears to do so, and that only approximately, in the handicraft-like beginnings of manufacture, and in that kind of agriculture on a large scale, which corresponds to the epoch of manufacture, and is distinguished from peasant agriculture, mainly by the number of the labourers simultaneously employed, and by the mass of the means of production concentrated for their use. Simple co-operation is always the prevailing form, in those branches of production in which capital operates on a large scale, and division of labour and machinery play but a subordinate part.

Co-operation ever constitutes the fundamental form of the capitalist mode of production; nevertheless, the elementary form of co-operation continues to subsist as a particular form of capitalist production side by side with the more developed forms of that mode of production.

CHAPTER XIV. DIVISION OF LABOUR AND MANUFACTURE.

SECTION 1. — TWOFOLD ORIGIN OF MANUFACTURE.

THAT co-operation which is based on division of labour, assumes its typical form in the manufacture, and is the prevalent characteristic form of the capitalist process of production throughout the manufacturing period properly so called. That period, roughly speaking, extends from the middle of the 16th to the last third of the 18th century.

Manufacture takes its rise in two ways: —

By the assemblage, in one workshop under the control of a single capitalist, of labourers belonging to various independent handicrafts, but through whose hands a given article must pass on its way to completion. A carriage, for example, was formerly the product of the labour of a great number of independent artificers, such as wheelwrights, harness-makers, tailors, locksmiths, upholsterers, turners, fringe-makers, glaziers, painters, polishers, gilders, &c. In the manufacture of carriages, however, all these different artificers are assembled in one building, where they work into one another's hands. It is true that a carriage cannot be gilt before it has been made. But if a number of carriages are being made simultaneously, some may be in the hands of the gilders while others are going through an earlier process. So far, we are still in the domain of simple co-operation, which finds its materials ready to hand in the shape of men and things. But very soon an important change takes place. The tailor, the locksmith, and the other artificers, being now exclusively occupied in carriage-making, each gradually loses, through want of practice, the ability to carry on, to its full extent, his old handicraft. But, on the other hand, his activity now confined in one groove, assumes the form best adapted to the narrowed sphere of action. At first, carriage manufacture is a combination of various independent handicrafts. By degrees, it becomes the splitting up of carriage making into its various detail processes, each of which crystallizes into the exclusive function of a particular workman, the manufacture, as a whole, being carried on by the men in conjunction. In the same way, cloth manufacture, as also a whole series of other manufactures, arose by

combining different handicrafts together under the control of a single capitalist.

(2.) Manufacture also arises in a way exactly the reverse of this — namely, by one capitalist employing simultaneously in one workshop a number of artificers, who all do the same, or the same kind of work, such as making paper, type, or needles. This is co-operation in its most elementary form. Each of these artificers (with the help, perhaps, of one or two apprentices), makes the entire commodity, and he consequently performs in succession all the operations necessary for its production. He still works in his old handicraft-like way. But very soon external circumstances cause a different use to be made of the concentration of the workmen on one spot, and of the simultaneousness of their work. An increased quantity of the article has perhaps to be delivered within a given time. The work is therefore re-distributed. Instead of each man being allowed to perform all the various operations in succession, these operations are changed into disconnected, isolated ones, carried on side by side; each is assigned to a different artificer, and the whole of them together are performed simultaneously by the co-operating workmen. This accidental repartition gets repeated, develops advantages of its own, and gradually ossifies into a systematic division of labour. The commodity, from being the individual product of an independent artificer, becomes the social product of a union of artificers, each of whom performs one, and only one, of the constituent partial operations. The same operations which, in the case of a papermaker belonging to a German Guild, merged one into the other as the successive acts of one artificer, became in the Dutch paper manufacture so many partial operations carried on side by side by numerous co-operating labourers. The needlemaker of the Nuremberg Guild was the cornerstone stone on which the English needle manufacture was raised. But while in Nuremberg that single artificer performed a series of perhaps 20 operations one after another, in England it was not long before there were 20 needlemakers side by side, each performing one alone of those 20 operations; and in consequence of further experience, each of those 20 operations was again split up, isolated, and made the exclusive function of a separate workman.

The mode in which manufacture arises, its growth out of handicrafts, is therefore twofold. On the one hand, it arises from the union of various

independent handicrafts, which become stripped of their independence and specialised to such an extent as to be reduced to mere supplementary partial processes in the production of one particular commodity. On the other hand, it arises from the co-operation of artificers of one handicraft; it splits up that particular handicraft into its various detail operations, isolating, and making these operations independent of one another up to the point where each becomes the exclusive function of a particular labourer. On the one hand, therefore, manufacture either introduces division of labour into a process of production, or further develops that division; on the other hand, it unites together handicrafts that were formerly separate. But whatever may have been its particular starting point, its final form is invariably the same — a productive mechanism whose parts are human beings.

For a proper understanding of the division of labour in manufacture, it is essential that the following points be firmly grasped. First, the decomposition of a process of production into its various successive steps coincides, here, strictly with the resolution of a handicraft into its successive manual operations. Whether complex or simple, each operation has to be done by hand, retains the character of a handicraft, and is therefore dependent on the strength, skill, quickness, and sureness, of the individual workman in handling his tools. The handicraft continues to be the basis. This narrow technical basis excludes a really scientific analysis of any definite process of industrial production, since it is still a condition that each detail process gone through by the product must be capable of being done by hand and of forming, in its way, a separate handicraft. It is just because handicraft skill continues, in this way, to be the foundation of the process of production, that each workman becomes exclusively assigned to a partial function, and that for the rest of his life, his labour-power is turned into the organ of this detail function.

Secondly, this division of labour is a particular sort of co-operation, and many of its disadvantages spring from the general character of co-operation, and not from this particular form of it.

SECTION 2. — THE DETAIL LABOURER AND HIS IMPLEMENTS.

If we now go more into detail, it is, in the first place, clear that a labourer who all his life performs one and the same simple operation, converts his

whole body into the automatic, specialised implement of that operation. Consequently, he takes less time in doing it, than the artificer who performs a whole series of operations in succession. But the collective labourer, who constitutes the living mechanism of manufacture, is made up solely of such specialised detail labourers. Hence, in comparison with the independent handicraft, more is produced in a given time, or the productive power of labour is increased. Moreover, when once this fractional work is established as the exclusive function of one person, the methods it employs become perfected. The workman's continued repetition of the same simple act, and the concentration of his attention on it, teach him by experience how to attain the desired effect with the minimum of exertion. But since there are always several generations of labourers living at one time, and working together at the manufacture of a given article, the technical skill, the tricks of the trade thus acquired, become established, and are accumulated and handed down. Manufacture, in fact, produces the skill of the detail labourer, by reproducing, and systematically driving to an extreme within the workshop, the naturally developed differentiation of trades, which it found ready to hand in society at large. On the other hand, the conversion of fractional work into the life-calling of one man, corresponds to the tendency shown by earlier societies, to make trades hereditary; either to petrify them into castes, or whenever definite historical conditions beget in the individual a tendency to vary in a manner incompatible with the nature of castes, to ossify them into guilds. Castes and guilds arise from the action of the same natural law, that regulates the differentiation of plants and animals into species and varieties, except that, when a certain degree of development has been reached, the heredity of castes and the exclusiveness of guilds are ordained as a law of society. "The muslins of Dacca in fineness, the calicoes and other piece goods of Coromandel in brilliant and durable colours, have never been surpassed. Yet they are produced without capital, machinery, division of labour, or any of those means which give such facilities to the manufacturing interest of Europe. The weaver is merely a detached individual, working a web when ordered of a customer, and with a loom of the rudest construction, consisting sometimes of a few branches or bars of wood, put roughly together. There is even no expedient for rolling up the warp; the loom must therefore be kept stretched to its full length, and becomes so inconveniently large, that it cannot be contained within the hut of the manufacturer, who is therefore compelled to ply his

trade in the open air, where it is interrupted by every vicissitude of the weather.” It is only the special skill accumulated from generation to generation, and transmitted from father to son, that gives to the Hindoo, as it does to the spider, this proficiency. And yet the work of such a Hindoo weaver is very complicated, compared with that of a manufacturing labourer.

An artificer, who performs one after another the various fractional operations in the production of a finished article, must at one time change his place, at another his tools. The transition from one operation to another interrupts the flow of his labour, and creates, so to say, gaps in his working day. These gaps close up so soon as he is tied to one and the same operation all day long; they vanish in proportion as the changes in his work diminish. The resulting increased productive power is owing either to an increased expenditure of labour-power in a given time — i.e., to increased intensity of labour — or to a decrease in the amount of labour-power unproductively consumed. The extra expenditure of power, demanded by every transition from rest to motion, is made up for by prolonging the duration of the normal velocity when once acquired. On the other hand, constant labour of one uniform kind disturbs the intensity and flow of a man’s animal spirits, which find recreation and delight in mere change of activity.

The productiveness of labour depends not only on the proficiency of the workman, but on the perfection of his tools. Tools of the same kind, such as knives, drills, gimlets, hammers, &c. may be employed in different processes; and the same tool may serve various purposes in a single process. But so soon as the different operations of a labour-process are disconnected the one from the other, and each fractional operation acquires in the hands of the detail labourer a suitable and peculiar form, alterations become necessary in the implements that previously served more than one purpose. The direction taken by this change is determined by the difficulties experienced in consequence of the unchanged form of the implement. Manufacture is characterized by the differentiation of the instruments of labour — a differentiation whereby implements of a given sort acquire fixed shapes, adapted to each particular application, and by the specialisation of those instruments, giving to each special instrument its full play only in the hands of a specific detail labourer. In Birmingham alone 500 varieties of hammers are produced, and not only is each adapted to one particular process, but several varieties often serve exclusively for the different

operations in one and the same process. The manufacturing period simplifies, improves, and multiplies the implements of labour, by adapting them to the exclusively special functions of each detail labourer. It thus creates at the same time one of the material conditions for the existence of machinery, which consists of a combination of simple instruments.

The detail labourer and his implements are the simplest elements of manufacture. Let us now turn to its aspect as a whole.

SECTION 3. — THE TWO FUNDAMENTAL FORMS OF MANUFACTURE: HETEROGENEOUS MANUFACTURE, SERIAL MANUFACTURE.

The organisation of manufacture has two fundamental forms, which, in spite of occasional blending, are essentially different in kind, and, moreover, play very distinct parts in the subsequent transformation of manufacture into modern industry carried on by machinery. This double character arises from the nature of the article produced. This article either results from the mere mechanical fitting together of partial products made independently, or owes its completed shape to a series of connected processes and manipulations.

A locomotive, for instance, consists of more than 5000 independent parts. It cannot, however, serve as an example of the first kind of genuine manufacture, for it is a structure produced by modern mechanical industry. But a watch can; and William Petty used it to illustrate the division of labour in manufacture. Formerly the individual work of a Nuremberg artificer, the watch has been transformed into the social product of an immense number of detail labourers, such as mainspring makers, dial makers, spiral spring makers, jewelled hole makers, ruby lever makers, hand makers, case makers, screw makers, gilders, with numerous subdivisions, such as wheel makers (brass and steel separate), pin makers, movement makers, *acheveur de pignon* (fixes the wheels on the axles, polishes the facets, 8c.), pivot makers, *planteur de finissage* (puts the wheels and springs in the works), *finisseur de barillet* (cuts teeth in the wheels, makes the holes of the right size, 8c.), escapement makers, cylinder makers for cylinder escapement, escapement wheel makers, balance wheel makers, *raquette* makers (apparatus for regulating the watch), the *planteur d'échappement* (escapement maker proper); then the *repasseur de barillet*

(finishes the box for the spring, 8c.), steel polishers, wheel polishers, screw polishers, figure painters, dial enamellers (melt the enamel on the copper), fabricant de pendants (makes the ring by which the case is hung), finisseur de charnière (puts the brass hinge in the cover, 8c.) faiseur de secret (puts in the springs that open the case), graveur, ciseleur, polisseur de boîte, 8c., 8c., and last of all the repasseur, who fits together the whole watch and hands it over in a going state. Only a few parts of the watch pass through several hands; and all these membra disjecta come together for the first time in the hand that binds them into one mechanical whole. This external relation between the finished product, and its various and diverse elements makes it, as well in this case as in the case of all similar finished articles, a matter of chance whether the detail labourers are brought together in one workshop or not. The detail operations may further be carried on like so many independent handicrafts, as they are in the Cantons of Vaud and Neuchâtel; while in Geneva there exist large watch manufactories where the detail labourers directly co-operate under the control of a single capitalist. And even in the latter case the dial, the springs, and the case, are seldom made in the factory itself. To carry on the trade as a manufacture, with concentration of workmen, is, in the watch trade, profitable only under exceptional conditions, because competition is greater between the labourers who desire to work at home, and because the splitting up of the work into a number of heterogeneous processes, permits but little use of the instruments of labour in common, and the capitalist, by scattering the work, saves the outlay on workshops, 8c. Nevertheless the position of this detail labourer who, though he works at home, does so for a capitalist (manufacturer, établisseur), is very different from that of the independent artificer, who works for his own customers.

The second kind of manufacture, its perfected form, produces articles that go through connected phases of development, through a series of processes step by step, like the wire in the manufacture of needles, which passes through the hands of 72 and sometimes even 92 different detail workmen.

In so far as such a manufacture, when first started, combines scattered handicrafts, it lessens the space by which the various phases of production are separated from each other. The time taken in passing from one stage to another is shortened, so is the labour that effectuates this passage. In comparison with a handicraft, productive power is gained, and this gain is

owing to the general co-operative character of manufacture. On the other hand, division of labour, which is the distinguishing principle of manufacture, requires the isolation of the various stages of production and their independence of each other. The establishment and maintenance of a connexion between the isolated functions necessitates the incessant transport of the article from one hand to another, and from one process to another. From the standpoint of modern mechanical industry, this necessity stands forth as a characteristic and costly disadvantage, and one that is immanent in the principle of manufacture.

If we confine our attention to some particular lot of raw materials, of rags, for instance, in paper manufacture, or of wire in needle manufacture, we perceive that it passes in succession through a series of stages in the hands of the various detail workmen until completion. On the other hand, if we look at the workshop as a whole, we see the raw material in all the stages of its production at the same time. The collective labourer, with one set of his many hands armed with one kind of tools, draws the wire, with another set, armed with different tools, he, at the same time, straightens it, with another, he cuts it, with another points it and so on. The different detail processes which were successive in time, have become simultaneous, go on side by side in space. Hence, production of greater quantum of finished commodities in a given time. This simultaneity, it is true, is due to the general co-operative form of the process as a whole; but Manufacture not only finds the conditions for co-operation really to hand, it also, to some extent, creates them by the sub-division of handicraft labour. On the other hand, it accomplishes this social organisation of the labour-process only by riveting each labourer to a single fractional detail.

Since the fractional product of each detail labourer is, at the same time, only a particular stage in the development of one and the same finished article, each labourer, or each group of labourers, prepares the raw material for another labourer or group. The result of the labour of the one is the starting point for the labour of the other. The workman therefore gives occupation directly to the other. The labour-time necessary in each partial process, for attaining the desired effect, is learnt by experience; and the mechanism of Manufacture, as a whole, is based on the assumption that a given result will be obtained in a given time. It is only on this assumption that the various supplementary labour-processes can proceed uninterruptedly, simultaneously, and side by side. It is clear that this direct

dependence of the operations, and therefore of the labourers, on each other, compels each one of them to spend on his work no more than the necessary time, and thus a continuity, uniformity, regularity, order, and even intensity of labour, of quite a different kind, is begotten than is to be found in an independent handicraft or even in simple co-operation. The rule that the labour-time expended on a commodity should not exceed that which is socially necessary for its production, appears, in the production of commodities generally, to be established by the mere effect of competition; since, to express ourselves superficially, each single producer is obliged to sell his commodity at its market price. In Manufacture, on the contrary, the turning out of a given quantum of product in a given time is a technical law of the process of production itself.

Different operations take, however, unequal periods, and yield therefore, in equal times unequal quantities of fractional products. If, therefore, the same labourer has, day after day, to perform the same operation, there must be a different number of labourers for each operation; for instance, in type manufacture, there are four founders and two breakers to one rubber: the founder casts 2,000 type an hour, the breaker breaks up 4,000, and the rubber polishes 8,000. Here we have again the principle of co-operation in its simplest form, the simultaneous employment of many doing the same thing; only now, this principle is the expression of an organic relation. The division of labour, as carried out in the Manufacture, not only simplifies and multiplies the qualitatively different parts of the social collective labourer, but also creates a fixed mathematical relation or ratio which regulates the qualitative extent of those parts — i.e., the relative number of labourers, or the relative size of the group of labourers, for each detail operation. It develops, along with the qualitative sub-division of the social labour process, a quantitative rule and proportionality for that process.

When once the most fitting proportion has been experimentally established for the numbers of the detail labourers in the various groups when producing on a given scale, that scale can be extended only by employing a multiple of each particular group. There is this to boot, that the same individual can do certain kinds of work just as well on a large as on a small scale; for instance, the labour of superintendence, the carriage of the fractional product from one stage to the next, &c. The isolation of such functions, their allotment to a particular labourer, does not become

advantageous till after an increase in the number of labourers employed; but this increase must affect every group proportionally.

The isolated group of labourers to whom any particular detail function is assigned, is made up of homogeneous elements, and is one of the constituent parts of the total mechanism. In many manufactures, however, the group itself is an organised body of labour, the total mechanism being a repetition or multiplication of these elementary organisms. Take, for instance, the manufacture of glass bottles. It may be resolved into three essentially different stages. First, the preliminary stage, consisting of the preparation of the components of the glass, mixing the sand and lime, 8c., and melting them into a fluid mass of glass. Various detail labourers are employed in this first stage, and also in the final one of removing the bottles from the drying furnace, sorting and packing them, 8c. In the middle, between these two stages, comes the glass melting proper, the manipulation of the fluid mass. At each mouth of the furnace, there works a group, called “the hole,” consisting of one bottlemaker or finisher, one blower, one gatherer, one putter-up or whetter-off, and one taker-in. These five detail workers are so many special organs of a single working organism that acts only as a whole, and therefore can operate only by the direct co-operation of the whole five. The whole body is paralysed if but one of its members be wanting. But a glass furnace has several openings (in England from 4 to 6), each of which contains an earthenware melting-pot full of molten glass, and employs a similar five-membered group of workers. The organisation of each group is based on division of labour, but the bond between the different groups is simple co-operation, which, by using in common one of the means of production the furnace, causes it to be more economically consumed. Such a furnace, with its 4-6 groups, constitutes a glass house; and a glass manufactory comprises a number of such glass houses, together with the apparatus and workmen requisite for the preparatory and final stages.

Finally, just as Manufacture arises in part from the combination of various handicrafts, so, too, it develops into a combination of various manufactures. The larger English glass manufacturers, for instance, make their own earthenware melting-pots, because, on the quality of these depends, to a great extent, the success or failure of the process. The manufacture of one of the means of production is here united with that of the product. On the other hand, the manufacture of the product may be

united with other manufactures, of which that product is the raw material, or with the products of which it is itself subsequently mixed. Thus, we find the manufacture of flint glass combined with that of glass cutting and brass founding; the latter for the metal settings of various articles of glass. The various manufactures so combined form more or less separate departments of a larger manufacture, but are at the same time independent processes, each with its own division of labour. In spite of the many advantages offered by this combination of manufactures, it never grows into a complete technical system on its own foundation. That happens only on its transformation into an industry carried on by machinery.

Early in the manufacturing period, the principle of lessening the necessary labour-time in the production of commodities, was accepted and formulated: and the use of machines, especially for certain simple first processes that have to be conducted on a very large scale, and with the application of great force, sprang up here and there. Thus, at an early period in paper manufacture, the tearing up of the rags was done by paper mills; and in metal works, the pounding of the ores was effected by stamping mills. The Roman Empire had handed down the elementary form of all machinery in the water-wheel.

The handicraft period bequeathed to us the great inventions of the compass, of gunpowder, of type-printing, and of the automatic clock. But, on the whole, machinery played that subordinate part which Adam Smith assigns to it in comparison with division of labour. The sporadic use of machinery in the 17th century was of the greatest importance, because it supplied the great mathematicians of that time with a practical basis and stimulant to the creation of the science of mechanics.

The collective labourer, formed by the combination of a number of detail labourers, is the machinery specially characteristic of the manufacturing period. The various operations that are performed in turns by the producer of a commodity, and coalesce one with another during the progress of production, lay claim to him in various ways. In one operation he must exert more strength, in another more skill, in another more attention; and the same individual does not possess all these qualities in an equal degree. After Manufacture has once separated, made independent, and isolated the various operations, the labourers are divided, classified, and grouped according to their predominating qualities. If their natural endowments are, on the one hand, the foundation on which the division of labour is built up,

on the other hand, Manufacture, once introduced, develops in them new powers that are by nature fitted only for limited and special functions. The collective labourer now possesses, in an equal degree of excellence, all the qualities requisite for production, and expends them in the most economical manner, by exclusively employing all his organs, consisting of particular labourers, or groups of labourers, in performing their special functions. The one-sidedness and the deficiencies of the detail labourer become perfections when he is a part of the collective labourer. The habit of doing only one thing converts him into a never failing instrument, while his connexion with the whole mechanism compels him to work with the regularity of the parts of a machine.

Since the collective labourer has functions, both simple and complex, both high and low, his members, the individual labour-powers, require different degrees of training, and must therefore have different values. Manufacture, therefore, develops a hierarchy of labour-powers, to which there corresponds a scale of wages. If, on the one hand, the individual laborers are appropriated and annexed for life by a limited function; on the other hand, the various operations of the hierarchy are parcelled out among the laboures according to both their natural and their acquired capabilities. Every process of production, however, requires certain simple manipulations, which every man is capable of doing. They too are now severed from their connexion with more pregnant moments of activity, and ossified into exclusive functions of specially appointed labourers. Hence, Manufacture begets, in every handicraft that it seizes upon, a class of so-called unskilled labourers, a class which handicraft industry strictly excluded. If it develops a one-sided specialty into a perfection, at the expense of the whole of a man's working capacity, it also begins to make a specialty of the absence of all development. Alongside of the hierarchic gradation there steps the simple separation of the labourers into skilled and unskilled. For the latter, the cost of apprenticeship vanishes; for the former, it diminishes, compared with that of artificers, in consequence of the functions being simplified. In both cases the value of labour-power falls. An exception to this law holds good whenever the decomposition of the labour-process begets new and comprehensive functions, that either had no place at all, or only a very modest one, in handicrafts. The fall in the value of labour-power, caused by the disappearance or diminution of the expense of apprenticeship, implies a direct increase of surplus-value for the benefit of

capital; for everything that shortens the necessary labour-time required for the reproduction of labour-power, extends the domain of surplus-labour.

SECTION 4. — DIVISION OF LABOUR IN MANUFACTURE, AND DIVISION OF LABOUR IN SOCIETY.

We first considered the origin of Manufacture, then its simple elements, then the detail labourer and his implements, and finally, the totality of the mechanism. We shall now lightly touch upon the relation between the division of labour in manufacture, and the social division of labour, which forms the foundation of all production of commodities.

If we keep labour alone in view, we may designate the separation of social production into its main division or genera — viz., agriculture, industries, etc., as division of labour in general, and the splitting up of these families into species and sub-species, as division of labour in particular, and the division of labour within the workshop as division of labour in singular or in detail.

Division of labour in a society, and the corresponding tying down of individuals to a particular calling, develops itself, just as does the division of labour in manufacture, from opposite starting points. Within a family, and after further development within a tribe, there springs up naturally a division of labour, caused by differences of sex and age, a division that is consequently based on a purely physiological foundation, which division enlarges its materials by the expansion of the community, by the increase of population, and more especially, by the conflicts between different tribes, and the subjugation of one tribe by another. On the other hand, as I have before remarked, the exchange of products springs up at the points where different families, tribes, communities, come in contact; for, in the beginning of civilisation, it is not private individuals but families, tribes, &c., that meet on an independent footing. Different communities find different means of production and different means of subsistence in their natural environment. Hence, their modes of production, and of living, and their products are different. It is this spontaneously developed difference which, when different communities come in contact, calls forth the mutual exchange of products, and the consequent gradual conversion of those products into commodities. Exchange does not create the differences

between the spheres of production, but brings such as are already different into relation, and thus converts them into more or less inter-dependent branches of the collective production of an enlarged society. In the latter case, the social division of labour arises from the exchange between spheres of production, that are originally distinct and independent of one another. In the former, where the physiological division of labour is the starting point, the particular organs of a compact whole grow loose, and break off, principally owing to the exchange of commodities with foreign communities, and then isolate themselves so far, that the sole bond, still connecting the various kinds of work, is the exchange of the products as commodities. In the one case, it is the making dependent what was before independent; in the other case, the making independent what was before dependent.

The foundation of every division of labour that is well developed, and brought about by the exchange of commodities, is the separation between town and country. It may be said, that the whole economical history of society is summed up in the movement of this antithesis. We pass it over, however, for the present.

Just as a certain number of simultaneously employed labourers are the material pre-requisites for division of labour in manufacture, so are the number and density of the population, which here correspond to the agglomeration in one workshop, a necessary condition for the division of labour in society. Nevertheless, this density is more or less relative. A relatively thinly populated country, with well-developed means of communication, has a denser population than a more numerous populated country, with badly-developed means of communication; and in this sense the Northern States of the American Union, for instance, are more thickly populated than India.

Since the production and the circulation of commodities are the general pre-requisites of the capitalist mode of production, division of labour in manufacture demands, that division of labour in society at large should previously have attained a certain degree of development. Inversely, the former division reacts upon and develops and multiplies the latter. Simultaneously, with the differentiation of the instruments of labour, the industries that produce these instruments, become more and more differentiated. If the manufacturing system seize upon an industry, which, previously, was carried on in connexion with others, either as a chief or as a

subordinate industry, and by one producer, these industries immediately separate their connexion, and become independent. If it seize upon a particular stage in the production of a commodity, the other stages of its production become converted into so many independent industries. It has already been stated, that where the finished article consists merely of a number of parts fitted together, the detail operations may re-establish themselves as genuine and separate handicrafts. In order to carry out more perfectly the division of labour in manufacture, a single branch of production is, according to the varieties of its raw material, or the various forms that one and the same raw material may assume, split up into numerous, and to some extent, entirely new manufactures. Accordingly, in France alone, the first half of the 18th century, over 100 different kinds of silk stuffs were woven, and in Avignon, it was law, that “every apprentice should devote himself to only one sort of fabrication, and should not learn the preparation of several kinds of stuff at once.” The territorial division of labour, which confines special branches of production to special districts of a country, acquires fresh stimulus from the manufacturing system, which exploits every special advantage. The Colonial system and the opening out of the markets of the world, both of which are included in the general conditions of existence of the manufacturing period, furnish rich material for developing the division of labour in society. It is not the place, here, to go on to show how division of labour seizes upon, not only the economical, but every other sphere of society, and everywhere lays the foundation of that all engrossing system of specialising and sorting men, that development in a man of one single faculty at the expense of all other faculties, which caused A. Ferguson, the master of Adam Smith, to exclaim: “We make a nation of Helots, and have no free citizens.”

But, in spite of the numerous analogies and links connecting them, division of labour in the interior of a society, and that in the interior of a workshop, differ not only in degree, but also in kind. The analogy appears most indisputable where there is an invisible bond uniting the various branches of trade. For instance the cattle breeder produces hides, the tanner makes the hides into leather, and the shoemaker, the leather into boots. Here the thing produced by each of them is but a step towards the final form, which is the product of all their labours combined. There are, besides, all the various industries that supply the cattle-breeder, the tanner, and the shoemaker with the means of production. Now it is quite possible to

imagine, with Adam Smith, that the difference between the above social division of labour, and the division in manufacture, is merely subjective, exists merely for the observer, who, in a manufacture, can see with one glance, all the numerous operations being performed on one spot, while in the instance given above, the spreading out of the work over great areas, and the great number of people employed in each branch of labour, obscure the connexion. But what is it that forms the bond between the independent labours of the cattle-breeder, the tanner, and the shoemaker? It is the fact that their respective products are commodities. What, on the other hand, characterises division of labour in manufactures? The fact that the detail labourer produces no commodities. It is only the common product of all the detail labourers that becomes a commodity. Division of labour in a society is brought about by the purchase and sale of the products of different branches of industry, while the connexion between the detail operations in a workshop, are due to the sale of the labour-power of several workmen to one capitalist, who applies it as combined labour-power. The division of labour in the workshop implies concentration of the means of production in the hands of one capitalist; the division of labour in society implies their dispersion among many independent producers of commodities. While within the workshop, the iron law of proportionality subjects definite numbers of workmen to definite functions, in the society outside the workshop, chance and caprice have full play in distributing the producers and their means of production among the various branches of industry. The different spheres of production, it is true, constantly tend to an equilibrium: for, on the one hand, while each producer of a commodity is bound to produce a use-value, to satisfy a particular social want, and while the extent of these wants differs quantitatively, still there exists an inner relation which settles their proportions into a regular system, and that system one of spontaneous growth; and, on the other hand, the law of the value of commodities ultimately determines how much of its disposable working-time society can expend on each particular class of commodities. But this constant tendency to equilibrium, of the various spheres of production, is exercised, only in the shape of a reaction against the constant upsetting of this equilibrium. The a priori system on which the division of labour, within the workshop, is regularly carried out, becomes in the division of labour within the society, an a posteriori, nature-imposed necessity, controlling the lawless caprice of the producers, and perceptible in the barometrical

fluctuations of the market prices. Division of labour within the workshop implies the undisputed authority of the capitalist over men, that are but parts of a mechanism that belongs to him. The division of labour within the society brings into contact independent commodity-producers, who acknowledge no other authority but that of competition, of the coercion exerted by the pressure of their mutual interests; just as in the animal kingdom, the bellum omnium contra omnes more or less preserves the conditions of existence of every species. The same bourgeois mind which praises division of labour in the workshop, lifelong annexation of the labourer to a partial operation, and his complete subjection to capital, as being an organisation of labour that increases its productiveness — that same bourgeois mind denounces with equal vigour every conscious attempt to socially control and regulate the process of production, as an inroad upon such sacred things as the rights of property, freedom and unrestricted play for the bent of the individual capitalist. It is very characteristic that the enthusiastic apologists of the factory system have nothing more damning to urge against a general organization of the labour of society, than that it would turn all society into one immense factory.

If, in a society with capitalist production, anarchy in the social division of labour and despotism in that of the workshop are mutual conditions the one of the other, we find, on the contrary, in those earlier forms of society in which the separation of trades has been spontaneously developed, then crystallized, and finally made permanent by law, on the one hand, a specimen of the organization of the labour of society, in accordance with an approved and authoritative plan, and on the other, the entire exclusion of division of labour in the workshop, or at all events a mere dwarflike or sporadic and accidental development of the same.

Those small and extremely ancient Indian communities, some of which have continued down to this day, are based on possession in common of the land, on the blending of agriculture and handicrafts, and on an unalterable division of labour, which serves, whenever a new community is started, as a plan and scheme ready cut and dried. Occupying areas of from 100 up to several thousand acres, each forms a compact whole producing all it requires. The chief part of the products is destined for direct use by the community itself, and does not take the form of a commodity. Hence, production here is independent of that division of labour brought about, in Indian society as a whole, by means of the exchange of commodities. It is

the surplus alone that becomes a commodity; and a portion of even that, not until it has reached the hands of the State, into whose hands from time immemorial a certain quantity of these products has found its way in the shape of rent in kind. The constitution of these communities varies in different parts of India. In those of the simplest form, the land is tilled in common, and the produce divided among the members. At the same time, spinning and weaving are carried on in each family as subsidiary industries. Side by side with the masses thus occupied with one and the same work, we find the “chief inhabitant,” who is judge, police, and tax-gatherer in one; the bookkeeper who keeps the accounts of the tillage and registers everything relating thereto; another official, who prosecutes criminals, protects strangers travelling through, and escorts them to the next village; the boundary man, who guards the boundaries against neighbouring communities; the water-over-seer, who distributes the water from the common tanks for irrigation; the Brahmin, who conducts the religious services; the schoolmaster, who on the sand teaches the children reading and writing; the calendar-Brahmin, or astrologer, who makes known the lucky or unlucky days for seed-time and harvest, and for every other kind of agricultural work; a smith and a carpenter, who make and repair all the agricultural implements; the potter, who makes all the pottery of the village; the barber, the washerman, who washes clothes, the silversmith, here and there the poet, who in some communities replaces the silversmith, in others the schoolmaster. This dozen of individuals is maintained at the expense of the whole community. If the population increases, a new community is founded, on the pattern of the old one, on unoccupied land. The whole mechanism discloses a systematic division of labour; but a division like that in manufactures is impossible, since the smith and the carpenter, &c., find an unchanging market, and at the most there occur, according to the sizes of the villages, two or three of each, instead of one. The law that regulates the division of labour in the community acts with the irresistible authority of a law of Nature, at the same time that each individual artificer, the smith, the carpenter, and so on, conducts in his workshop all the operations of his handicraft in the traditional way, but independently, and without recognizing any authority over him. The simplicity of the organisation for production in these self-sufficing communities that constantly reproduce themselves in the same form, and when accidentally destroyed, spring up again on the spot and with the same name — this simplicity supplies the

key to the secret of the unchangeableness of Asiatic societies, an unchangeableness in such striking contrast with the constant dissolution and refounding of Asiatic States, and the never-ceasing changes of dynasty. The structure of the economical elements of society remains untouched by the storm-clouds of the political sky.

The rules of the guilds, as I have said before, by limiting most strictly the number of apprentices and journeymen that a single master could employ, prevented him from becoming a capitalist. Moreover, he could not employ his journeymen in any other handicraft than the one in which he was a master. The guilds zealously repelled every encroachment by the capital of merchants, the only form of free capital with which they came in contact. A merchant could buy every kind of commodity, but labour as a commodity he could not buy. He existed only on sufferance, as a dealer in the products of the handicrafts. If circumstances called for a further division of labour, the existing guilds split themselves up into varieties, or founded new guilds by the side of the old ones; all this, however, without concentrating various handicrafts in a single workshop. Hence, the guild organization, however much it may have contributed by separating, isolating, and perfecting the handicrafts, to create the material conditions for the existence of manufacture, excluded division of labour in the workshop. On the whole, the labourer and his means of production remained closely united, like the snail with its shell, and thus there was wanting the principal basis of manufacture, the separation of the labourer from his means of production, and the conversion of these means into capital.

While division of labour in society at large, whether such division be brought about or not by exchange of commodities, is common to economical formations of society the most diverse, division of labour in the workshop, as practised by manufacture, is a special creation of the capitalist mode of production alone.

SECTION 5. — THE CAPITALISTIC CHARACTER OF MANUFACTURE.

An increased number of labourers under the control of one capitalist is the natural starting-point, as well of co-operation generally, as of manufacture in particular. But the division of labour in the manufacture makes this

increase in the number of workmen a technical necessity. The minimum number that any given capitalist is bound to employ is here prescribed by the previously established division of labour. On the other hand, the advantages of further division are obtainable only by adding to the number of workmen, and this can be done only by adding multiples of the various detail groups. But an increase in the variable component of the capital employed necessitates an increase in its constant component, too, in the workshops, implements, &c., and, in particular, in the raw material, the call for which grows quicker than the number of workmen. The quantity of it consumed in a given time, by a given amount of labour, increases in the same ratio as does the productive power of that labour in consequence of its division. Hence, it is a law, based on the very nature of manufacture, that the minimum amount of capital, which is bound to be in the hands of each capitalist, must keep increasing; in other words, that the transformation into capital of the social means of production and subsistence must keep extending.

In manufacture, as well as in simple co-operation, the collective working organism is a form of existence of capital. The mechanism that is made up of numerous individual detail labourers belongs to the capitalist. Hence, the productive power resulting from a combination of labourers appears to be the productive power of capital. Manufacture proper not only subjects the previously independent workman to the discipline and command of capital, but, in addition, creates a hierarchic gradation of the workmen themselves. While simple co-operation leaves the mode of working by the individual for the most part unchanged, manufacture thoroughly revolutionises it, and seizes labour-power by its very roots. It converts the labourer into a crippled monstrosity, by forcing his detail dexterity at the expense of a world of productive capabilities and instincts; just as in the States of La Plata they butcher a whole beast for the sake of his hide or his tallow. Not only is the detail work distributed to the different individuals, but the individual himself is made the automatic motor of a fractional operation, and the absurd fable of Menenius Agrippa, which makes man a mere fragment of his own body, becomes realised. If, at first, the workman sells his labour-power to capital, because the material means of producing a commodity fail him, now his very labour-power refuses its services unless it has been sold to capital. Its functions can be exercised only in an environment that exists in the workshop of the capitalist after the sale. By nature unfitted to make

anything independently, the manufacturing labourer develops productive activity as a mere appendage of the capitalist's workshop. As the chosen people bore in their features the sign manual of Jehovah, so division of labour brands the manufacturing workman as the property of capital.

The knowledge, the judgment, and the will, which, though in ever so small a degree, are practised by the independent peasant or handicraftsman, in the same way as the savage makes the whole art of war consist in the exercise of his personal cunning — these faculties are now required only for the workshop as a whole. Intelligence in production expands in one direction, because it vanishes in many others. What is lost by the detail labourers, is concentrated in the capital that employs them. It is a result of the division of labour in manufactures, that the labourer is brought face to face with the intellectual potencies of the material process of production, as the property of another, and as a ruling power. This separation begins in simple co-operation, where the capitalist represents to the single workman, the oneness and the will of the associated labour. It is developed in manufacture which cuts down the labourer into a detail labourer. It is completed in modern industry, which makes science a productive force distinct from labour and presses it into the service of capital.

In manufacture, in order to make the collective labourer, and through him capital, rich in social productive power, each labourer must be made poor in individual productive powers. "Ignorance is the mother of industry as well as of superstition. Reflection and fancy are subject to err; but a habit of moving the hand or the foot is independent of either. Manufactures, accordingly, prosper most where the mind is least consulted, and where the workshop may...be considered as an engine, the parts of which are men." As a matter of fact, some few manufacturers in the middle of the 18th century preferred, for certain operations that were trade secrets, to employ halfidiotic persons.

"The understandings of the greater part of men," says Adam Smith, "are necessarily formed by their ordinary employments. The man whose whole life is spent in performing a few simple operations...has no occasion to exert his understanding.... He generally becomes as stupid and ignorant as it is possible for a human creature to become." After describing the stupidity of the detail labourer he goes on: "The uniformity of his stationary life naturally corrupts the courage of his mind.... It corrupts even the activity of his body and renders him incapable of exerting his strength with vigour and

perseverance in any other employments than that to which he has been bred. His dexterity at his own particular trade seems in this manner to be acquired at the expense of his intellectual, social, and martial virtues. But in every improved and civilised society, this is the state into which the labouring poor, that is, the great body of the people, must necessarily fall.” For preventing the complete deterioration of the great mass of the people by division of labour, A. Smith commends education of the people by the State, but prudently, and in homœopathie doses. G. Garnier, his French translator and commentator, who, under the first French Empire, quite naturally developed into a senator, quite as naturally opposes him on this point. Education of the masses, he urges, violates the first law of the division of labour, and with it “our whole social system would be proscribed.” “Like all other divisions of labour,” he says, “that between hand labour and head labour is more pronounced and decided in proportion as society (he rightly uses this word, for capital, landed property and their State) becomes richer. This division of labour, like every other, is an effect of past, and a cause of future progress...ought the government then to work in opposition to this division of labour, and to hinder its natural course? Ought it to expend a part of the public money in the attempt to confound and blend together two classes of labour, which are striving after division and separation?”

Some crippling of body and mind is inseparable even from division of labour in society as a whole. Since, however, manufacture carries this social separation of branches of labour much further, and also, by its peculiar division, attacks the individual at the very roots of his life, it is the first to afford the materials for, and to give a start to, industrial pathology.

“To subdivide a man is to execute him, if he deserves the sentence, to assassinate him if he does not.... The subdivision of labour is the assassination of a people.”

Co-operation based on division of labour, in other words, manufacture, commences as a spontaneous formation. So soon as it attains some consistence and extension, it becomes the recognised methodical and systematic form of capitalist production. History shows how the division of labour peculiar to manufacture, strictly so called, acquires the best adapted form at first by experience, as it were behind the backs of the actors, and then, like the guild handicrafts, strives to hold fast that form when once found, and here and there succeeds in keeping it for centuries. Any

alteration in this form, except in trivial matters, is solely owing to a revolution in the instruments of labour. Modern manufacture wherever it arises — I do not here allude to modern industry based on machinery — either finds the *disjecta membra poetæ* ready to hand, and only waiting to be collected together, as is the case in the manufacture of clothes in large towns, or it can easily apply the principle of division, simply by exclusively assigning the various operations of a handicraft (such as bookbinding) to particular men. In such cases, a week's experience is enough to determine the proportion between the numbers of the hands necessary for the various functions.

By decomposition of handicrafts, by specialisation of the instruments of labour, by the formation of detail labourers, and by grouping and combining the latter into a single mechanism, division of labour in manufacture creates a qualitative gradation, and a quantitative proportion in the social process of production; it consequently creates a definite organization of the labour of society, and thereby developes at the same time new productive forces in the society. In its specific capitalist form — and under the given conditions, it could take no other form than a capitalistic one — manufacture is but a particular method of begetting relative surplus-value, or of augmenting at the expense of the labourer the self-expansion of capital — usually called social wealth, “Wealth of Nations,” 8c. It increases the social productive power of labour, not only for the benefit of the capitalist instead of for that of the labourer, but it does this by crippling the individual labourers. It creates new conditions for the lordship of capital over labour. If, therefore, on the one hand, it presents itself historically as a progress and as a necessary phase in the economic development of society, on the other hand it is a refined and civilised method of exploitation.

Political economy, which as an independent science, first sprang into being during the period of manufacture, views the social division of labour only from the standpoint of manufacture, and sees in it only the means of producing more commodities with a given quantity of labour, and, consequently, of cheapening commodities and hurrying on the accumulation of capital. In most striking contrast with this accentuation of quantity and exchange-value, is the attitude of the writers of classical antiquity, who hold exclusively by quality and use-value. In consequence of the separation of the social branches of production, commodities are better made, the various bents and talents of men select a suitable field, and

without some restraint no important results can be obtained anywhere. Hence both product and producer are improved by division of labour. If the growth of the quantity produced is occasionally mentioned, this is only done with reference to the greater abundance of use values. There is not a word alluding to exchange-value or to the cheapening of commodities. This aspect, from the standpoint of use-value alone, is taken as well by Plato, who treats division of labour as the foundation on which the division of society into classes is based, as by Xenophon, who with characteristic bourgeois instinct, approaches more nearly to division of labour within the workshop. Plato's Republic, in so far as division of labour is treated in it, as the formative principle of the State, is merely the Athenian idealisation of the Egyptian system of castes, Egypt having served as the model of an industrial country to many of his contemporaries also, amongst others to Isocrates, and it continued to have this importance to the Greeks of the Roman Empire.

During the manufacturing period proper, i.e., the period during which manufacture is the predominant form taken by capitalist production, many obstacles are opposed to the full development of the peculiar tendencies of manufacture. Although manufacture creates, as we have already seen, a simple separation of the labourers into skilled and unskilled, simultaneously with their hierarchic arrangement in classes, yet the number of the unskilled labourers, owing to the preponderating influence of the skilled, remains very limited. Although it adapts the detail operations to the various degrees of maturity, strength, and development of the living instruments of labour, thus conducing to exploitation of women and children, yet this tendency as a whole is wrecked on the habits and the resistance of the male labourers. Although the splitting up of handicrafts lowers the cost of forming the workman, and thereby lowers his value, yet for the more difficult detail work, a longer apprenticeship is necessary, and, even where it would be superfluous, is jealously insisted upon by the workmen. In England, for instance, we find the laws of apprenticeship, with the seven years' probation, in full force down to the end of the manufacturing period; and they are not thrown on one side till the advent of Modern Industry. Since handicraft skill is the foundation of manufacture, and since the mechanism of manufacture as a whole possesses no framework, apart from the labourers themselves, capital is constantly compelled to wrestle with the insubordination of the workmen. "By the infirmity of human nature," says

friend Ure, “it happens that the more skilful the workman, the more self-willed and intractable he is apt to become, and of course the less fit a component of a mechanical system in which...he may do great damage to the whole.” Hence throughout the whole manufacturing period there runs the complaint of want of discipline among the workmen. And had we not the testimony of contemporary writers, the simple facts that, during the period between the 16th century and the epoch of Modern Industry, capital failed to become the master of the whole disposable working-time of the manufacturing labourers, that manufactures are short-lived, and change their locality from one country to another with the emigrating or immigrating workmen, these facts would speak volumes. “Order must in one way or another be established,” exclaims in 1770 the oft-cited author of the “Essay on Trade and Commerce.” “Order,” re-echoes Dr. Andrew Ure 66 years later, “Order” was wanting in manufacture based on “the scholastic dogma of division of labour,” and “Arkwright created order.”

At the same time manufacture was unable, either to seize upon the production of society to its full extent, or to revolutionise that production to its very core. It towered up as an economical work of art, on the broad foundation of the town handicrafts, and of the rural domestic industries. At a given stage in its development, the narrow technical basis on which manufacture rested, came into conflict with requirements of production that were created by manufacture itself.

One of its most finished creations was the workshop for the production of the instruments of labour themselves, including especially the complicated mechanical apparatus then already employed. A machine-factory, says Ure, “displayed the division of labour in manifold gradations — the file, the drill, the lathe, having each its different workman in the order of skill.” (.) This workshop, the product of the division of labour in manufacture, produced in its turn — machines. It is they that sweep away the handicraftsman’s work as the regulating principle of social production. Thus, on the one hand, the technical reason for the life-long annexation of the workman to a detail function is removed. On the other hand, the fetters that this same principle laid on the dominion of capital, fall away.

CHAPTER XV. MACHINERY AND MODERN INDUSTRY.

SECTION 1. — THE DEVELOPMENT OF MACHINERY.

JOHN STUART MILL says in his *Principles of Political Economy*: “It is questionable if all the mechanical inventions yet made have lighted the day’s toil of any human being.” That is, however, by no means the aim of the capitalistic application of machinery. Like every other increase in the productiveness of labour, machinery is intended to cheapen commodities, and, by shortening that portion of the working-day, in which the labourer works for himself, to lengthen the other portion that he gives, without an equivalent, to the capitalist. In short, it is a means for producing surplus-value.

In manufacture, the revolution in the mode of production begins with the labour-power, in modern industry it begins with the instruments of labour. Our first inquiry then is, how the instruments of labour are converted from tools into machines, or what is the difference between a machine and the implements of a handicraft? We are only concerned here with striking and general characteristics; for epochs in the history of society are no more separated from each other by hard and fast lines of demarcation, than are geological epochs.

Mathematicians and mechanics, and in this they are followed by a few English economists, call a tool a simple machine, and a machine a complex tool. They see no essential difference between them, and even give the name of machine to the simple mechanical powers, the lever, the inclined plane, the screw, the wedge, &c. As a matter of fact, every machine is a combination of those simple powers, no matter how they may be disguised. From the economical standpoint this explanation is worth nothing, because the historical element is wanting. Another explanation of the difference between tool and machine is that in the case of a tool, man is the motive power, while the motive power of a machine is something different from man, is, for instance, an animal, water, wind, and so on. According to this, a plough drawn by oxen, which is a contrivance common to the most different epochs, would be a machine, while Claussen’s circular

loom, which, worked by a single labourer, weaves 96,000 picks per minute, would be a mere tool. Nay, this very loom, though a tool when worked by hand, would, if worked by steam, be a machine. And since the application of animal power is one of man's earliest inventions, production by machinery would have preceded production by handicrafts. When in 1735, John Wyalt brought out his spinning machine, and began the industrial revolution of the 18th century, not a word did he say about an ass driving it instead of a man, and yet this part fell to the ass. He described it as a machine "to spin without fingers."

All fully developed machinery consists of three essentially different parts, the motor mechanism, the transmitting mechanism, and finally the tool or working machine. The motor mechanism is that which puts the whole in motion. It either generates its own motive power, like the steam engine, the caloric engine, the electro-magnetic machine, 8c., or it receives its impulse from some already existing natural force, like the water-wheel from a head of water, the wind-mill from wind, 8c. The transmitting mechanism, composed of fly-wheels, shafting, toothed wheels, pullies, straps, ropes, bands, pinions, and gearing of the most varied kinds, regulates the motion, changes its form where necessary, as for instance, from linear to circular, and divides and distributes it among the working machines. These two first parts of the whole mechanism are there, solely for putting the working machines in motion, by means of which motion the subject of labour is seized upon and modified as desired. The tool or working-machine is that part of the machinery with which the industrial revolution of the 18th century started. And to this day it constantly serves as such a starting point, whenever a handicraft, or a manufacture, is turned into an industry carried on by machinery.

On a closer examination of the working-machine proper, we find in it, as a general rule, though often, no doubt, under very altered forms, the apparatus and tools used by the handicraftsman or manufacturing workman; with this difference, that instead of being human implements, they are the implements of a mechanism, or mechanical implements. Either the entire machine is only a more or less altered mechanical edition of the old handicraft tool, as, for instance, the power-loom; or the working parts fitted in the frame of the machine are old acquaintances, as spindles are in a mule, needles in a stocking-loom, saws in a sawing machine, and knives in a

chopping machine. The distinction between these tools and the body proper of the machine, exists from their very birth; for they continue for the most part to be produced by handicraft, or by manufacture, and are afterwards fitted into the body of the machine, which is the product of machinery. The machine proper is therefore a mechanism that, after being set in motion, performs with its tools the same operations that were formerly done by the workman with similar tools. Whether the motive power is derived from man, or from some other machine, makes no difference in this respect. From the moment that the tool proper is taken from man, and fitted into a mechanism, a machine takes the place of a mere implement. The difference strikes one at once, even in those cases where man himself continues to be the prime mover. The number of implements that he himself can use simultaneously, is limited by the number of his own natural instruments of production, by the number of his bodily organs. In Germany, they tried at first to make one spinner work two spinning wheels, that is, to work simultaneously with both hands and both feet. This was too difficult. Later, a treddle spinning wheel with two spindles was invented, but adepts in spinning, who could spin two threads at once, were almost as scarce as two-headed men. The Jenny, on the other hand, even at its very birth, spun with 12-18 spindles, and the stocking-loom knits with many thousand needles at once. The number of tools that a machine can bring into play simultaneously, is from the very first emancipated from the organic limits that hedge in the tools of a handicraftsman.

In many manual implements the distinction between man as mere motive power, and man as the workman or operator properly so-called, is brought into striking contrast. For instance, the foot is merely the prime mover of the spinning wheel, while the hand, working with the spindle, and drawing and twisting, performs the real operation of spinning. It is this last part of the handicraftsman's implement that is first seized upon by the industrial revolution, leaving to the workman, in addition to his new labour of watching the machine with his eyes and correcting its mistakes with his hands, the merely mechanical part of being the moving power. On the other hand, implements, in regard to which man has always acted as a simple motive power, as, for instance, by turning the crank of a mill, by pumping, by moving up and down the arm of a bellows, by pounding with a mortar, &c., such implements soon call for the application of animals, water, and wind as motive powers. Here and there, long before the period of

manufacture, and also, to some extent, during that period, these implements pass over into machines, but without creating any revolution in the mode of production. It becomes evident, in the period of Modern Industry, that these implements, even under their form of manual tools, are already machines. For instance, the pumps with which the Dutch, in 1836-7, emptied the Lake of Harlem, were constructed on the principle of ordinary pumps; the only difference being, that their pistons were driven by cyclopean steam-engines, instead of by men. The common and very imperfect bellows of the blacksmith is, in England, occasionally converted into a blowing-engine, by connecting its arm with a steam-engine. The steam-engine itself, such as it was at its invention, during the manufacturing period at the close of the 17th century, and such as it continued to be down to 1780, did not give rise to any industrial revolution. It was, on the contrary, the invention of machines that made a revolution in the form of steam-engines necessary. As soon as man, instead of working with an implement on the subject of his labour, becomes merely the motive power of an implement-machine, it is a mere accident that motive power takes the disguise of human muscle; and it may equally well take the form of wind, water or steam. Of course, this does not prevent such a change of form from producing great technical alterations in the mechanism that was originally constructed to be driven by man alone. Nowadays, all machines that have their way to make, such as sewing machines, bread-making machines, &c., are, unless from their very nature their use on a small scale is excluded, constructed to be driven both by human and by purely mechanical motive power.

The machine, which is the starting point of the industrial revolution, supersedes the workman, who handles a single tool, by a mechanism operating with a number of similar tools, and set in motion by a single motive power, whatever the form of that power may be. Here we have the machine, but only as an elementary factor of production by machinery.

Increase in the size of the machine, and in the number of its working tools, calls for a more massive mechanism to drive it; and this mechanism requires, in order to overcome its resistance, a mightier moving power than that of man, apart from the fact that man is a very imperfect instrument for producing uniform continued motion. But assuming that he is acting simply as a motor, that a machine has taken the place of his tool, it is evident that he can be replaced by natural forces. Of all the great motors handed down from the manufacturing period, horse-power is the worst, partly because a

horse has a head of his own, partly because he is costly, and the extent to which he is applicable in factories is very restricted. Nevertheless the horse was extensively used during the infancy of Modern Industry. This is proved, as well by the complaints of contemporary agriculturists, as by the term “horse-power,” which has survived to this day as an expression for mechanical force.

Wind was too inconstant and uncontrollable, and besides, in England, the birthplace of Modern Industry, the use of water-power preponderated even during the manufacturing period. In the 17th century attempts had already been made to turn two pairs of millstones with a single water-wheel. But the increased size of the gearing was too much for the water-power, which had now become insufficient, and this was one of the circumstances that led to a more accurate investigation of the laws of friction. In the same way the irregularity caused by the motive power in mills that were put in motion by pushing and pulling a lever, led to the theory, and the application, of the fly-wheel, which afterwards plays so important a part in Modern Industry. In this way, during the manufacturing period, were developed the first scientific and technical elements of Modern Mechanical Industry. Arkwright’s throstle-spinning mill was from the very first turned by water. But for all that, the use of water, as the predominant motive power, was beset with difficulties. It could not be increased at will, it failed at certain seasons of the year, and, above all, it was essentially local. Not till the invention of Watt’s second and so called double-acting steam-engine, was a prime mover found, that begot its own force by the consumption of coal and water, whose power was entirely under man’s control, that was mobile and a means of locomotion, that was urban and not, like the water-wheel, rural, that permitted production to be concentrated in towns instead of, like the water-wheels, being scattered up and down the country, that was of universal technical application, and, relatively speaking, little affected in its choice of residence by local circumstances. The greatness of Watt’s genius showed itself in the specification of the patent that he took out in April, 1784. In that specification his steam-engine is described, not as an invention for a specific purpose, but as an agent universally applicable in Mechanical Industry. In it he points out applications, many of which, as for instance, the steam-hammer, were not introduced till half a century later. Nevertheless he doubted the use of steam-engines in navigation. His successors, Boulton

and Watt, sent to the exhibition of 1851 steam-engines of colossal size for ocean steamers.

As soon as tools had been converted from being manual implements of man into implements of a mechanical apparatus, of a machine, the motive mechanism also acquired an independent form, entirely emancipated from the restraints of human strength. Thereupon the individual machine, that we have hitherto been considering, sinks into a mere factor in production by machinery. One motive mechanism was now able to drive many machines at once. The motive mechanism grows with the number of the machines that are turned simultaneously, and the transmitting mechanism becomes a wide-spreading apparatus.

We now proceed to distinguish the co-operation of a number of machines of one kind from a complex system of machinery.

In the one case, the product is entirely made by a single machine, which performs all the various operations previously done by one handicraftsman with his tool; as, for instance, by a weaver with his loom; or by several handicraftsmen successively, either separately or as members of a system of Manufacture. For example, in the manufacture of envelopes, one man folded the paper with the folder, another laid on the gum, a third turned the flap over, on which the device is impressed, a fourth embossed the device, and so on; and for each of these operations the envelope had to change hands. One single envelope machine now performs all these operations at once, and makes more than 3000 envelopes in an hour. In the London exhibition of 1862, there was an American machine for making paper cornets. It cut the paper, pasted, folded, and finished 300 in a minute. Here, the whole process, which, when carried on as Manufacture, was split up into, and carried out by, a series of operations, is completed by a single machine, working a combination of various tools. Now, whether such a machine be merely a reproduction of a complicated manual implement, or a combination of various simple implements specialised by Manufacture, in either case, in the factory, i.e., in the workshop in which machinery alone is used, we meet again with simple co-operation; and, leaving the workman out of consideration for the moment, this co-operation presents itself to us, in the first instance, as the conglomeration in one place of similar and simultaneously acting machines. Thus, a weaving factory is constituted of a number of power-looms, working side by side, and a sewing factory of a number of sewing machines all in the same building. But there is here a

technical oneness in the whole system, owing to all the machines receiving their impulse simultaneously, and in an equal degree, from the pulsations of the common prime mover, by the intermediary of the transmitting mechanism; and this mechanism, to a certain extent, is also common to them all, since only particular ramifications of it branch off to each machine. Just as a number of tools, then, form the organs of a machine, so a number of machines of one kind constitute the organs of the motive mechanism.

A real machinery system, however, does not take the place of these independent machines, until the subject of labour goes through a connected series of detail processes, that are carried out by a chain of machines of various kinds, the one supplementing the other. Here we have again the co-operation by division of labour that characterises Manufacture; only now, it is a combination of detail machines. The special tools of the various detail workmen, such as those of the beaters, combers, spinners, &c., in the woollen manufacture, are now transformed into the tools of specialised machines, each machine constituting a special organ, with a special function, in the system. In those branches of industry in which the machinery system is first introduced, Manufacture itself furnishes, in a general way, the natural basis for the division, and consequent organisation, of the process of production. Nevertheless an essential difference at once manifests itself. In Manufacture it is the workmen who, with their manual implements, must, either singly or in groups, carry on each particular detail process. If, on the one hand, the workman becomes adapted to the process, on the other, the process was previously made suitable to the workman. This subjective principle of the division of labour no longer exists in production by machinery. Here, the process as a whole is examined objectively, in itself, that is to say, without regard to the question of its execution by human hands, it is analysed into its constituent phases; and the problem, how to execute each detail process, and bind them all into a whole, is solved by the aid of machines, chemistry, &c. But, of course, in this case also, theory must be perfected by accumulated experience on a large scale. Each detail machine supplies raw material to the machine next in order; and since they are all working at the same time, the product is always going through the various stages of its fabrication, and is also constantly in a state of transition, from one phase to another. Just as in Manufacture, the direct co-operation of the detail labourers establishes a

numerical proportion between the special groups, so in an organised system of machinery, where one detail machine is constantly kept employed by another, a fixed relation is established between their numbers, their size, and their speed. The collective machine, now an organised system of various kinds of single machines, and of groups of single machines, becomes more and more perfect, the more the process as a whole becomes a continuous one, i.e., the less the raw material is interrupted in its passage from its first phase to its last; in other words, the more its passage from one phase to another is effected, not by the hand of man, but by the machinery itself. In Manufacture the isolation of each detail process is a condition imposed by the nature of division of labour, but in the fully developed factory the continuity of those processes is, on the contrary, imperative.

A system of machinery, whether it reposes on the mere co-operation of similar machines, as in weaving, or on a combination of different machines, as in spinning, constitutes in itself a huge automaton, whenever it is driven by a self-acting prime mover. But although the factory as a whole be driven by its steam-engine, yet either some of the individual machines may require the aid of the workman for some of their movements (such aid was necessary for the running in of the mule carriage, before the invention of the self-acting mule, and is still necessary in fine-spinning mills); or, to enable a machine to do its work, certain parts of it may require to be handled by the workman like a manual tool; this was the case in machine-makers' workshops, before the conversion of the slide rest into a self-actor. As soon as a machine executes, without man's help, all the movements requisite to elaborate the raw material, needing only attendance from him, we have an automatic system of machinery, and one that is susceptible of constant improvement in its details. Such improvements as the apparatus that stops a drawing frame, whenever a sliver breaks, and the self-acting stop, that stops the power-loom so soon as the shuttle bobbin is emptied of weft, are quite modern inventions. As an example, both of continuity of production, and of the carrying out of the automatic principle, we may take a modern paper mill. In the paper industry generally, we may advantageously study in detail not only the distinctions between modes of production based on different means of production, but also the connexion of the social conditions of production with those modes: for the old German paper-making furnishes us with a sample of handicraft production; that of Holland in the 17th and of France in the 18th century with a sample of manufacturing in the strict

sense; and that of modern England with a sample of automatic fabrication of this article. Besides these, there still exist, in India and China, two distinct antique Asiatic forms of the same industry.

An organised system of machines, to which motion is communicated by the transmitting mechanism from a central automaton, is the most developed form of production by machinery. Here we have, in the place of the isolated machine, a mechanical monster whose body fills whole factories, and whose demon power, at first veiled under the slow and measured motions of his giant limbs, at length breaks out into the fast and furious whirl of his countless working organs.

There were mules and steam-engines before there were any labourers, whose exclusive occupation it was to make mules and steam-engines; just as men wore clothes before there were such people as tailors. The inventions of Vaucanson, Arkwright, Watt, and others, were, however, practicable, only because those inventors found, ready to hand, a considerable number of skilled mechanical workmen, placed at their disposal by the manufacturing period. Some of these workmen were independent handicraftsmen of various trades, others were grouped together in manufactures, in which, as before-mentioned, division of labour was strictly carried out. As inventions increased in number, and the demand for the newly discovered machines grew larger, the machine-making industry split up, more and more, into numerous independent branches, and division of labour in these manufactures was more and more developed. Here, then, we see in Manufacture the immediate technical foundation of Modern Industry. Manufacture produced the machinery, by means of which Modern Industry abolished the handicraft and manufacturing systems in those spheres of production that it first seized upon. The factory system was therefore raised, in the natural course of things, on an inadequate foundation. When the system attained to a certain degree of development, it had to root up this ready-made foundation, which in the meantime had been elaborated on the old lines, and to build up for itself a basis that should correspond to its methods of production. Just as the individual machine retains a dwarfish character, so long as it is worked by the power of man alone, and just as no system of machinery could be properly developed before the steam engine took the place of the earlier motive powers, animals, wind, and even water; so, too, Modern Industry was crippled in its complete development, so long as its characteristic instrument of

production, the machine, owed its existence to personal strength and personal skill, and depended on the muscular development, the keenness of sight, and the cunning of hand, with which the detail workmen in manufactures, and the manual labourers in handicrafts, wielded their dwarfish implements. Thus, apart from the dearness of the machines made in this way, a circumstance that is ever present to the mind of the capitalist, the expansion of industries carried on by means of machinery, and the invasion by machinery of fresh branches of production, were dependent on the growth of a class of workmen, who, owing to the almost artistic nature of their employment, could increase their numbers only gradually, and not by leaps and bounds. But besides this, at a certain stage of its development, Modern Industry became technologically incompatible with the basis furnished for it by handicraft and Manufacture. The increasing size of the prime movers, of the transmitting mechanism, and of the machines proper, the greater complication, multiformity and regularity of the details of these machines, as they more and more departed from the model of those originally made by manual labour, and acquired a form, untrammelled except by the conditions under which they worked, the perfecting of the automatic system, and the use, every day more avoidable, of a more refractory material, such as iron instead of wood — the solution of all these problems, which sprang up by the force of circumstances, everywhere met with a stumbling-block in the personal restrictions which even the collective labourer of Manufacture could not break through, except to a limited extent. Such machines as the modern hydraulic press, the modern powerloom, and the modern carding engine, could never have been furnished by Manufacture.

A radical change in the mode of production in one sphere of industry involves a similar change in other spheres. This happens at first in such branches of industry as are connected together by being separate phases of a process, and yet are isolated by the social division of labour, in such a way, that each of them produces an independent commodity. Thus spinning by machinery made weaving by machinery a necessity, and both together made the mechanical and chemical revolution that took place in bleaching, printing, and dyeing, imperative. So too, on the other hand, the revolution in cotton-spinning called forth the invention of the gin, for separating the seeds from the cotton fibre; it was only by means of this invention, that the production of cotton became possible on the enormous scale at present

required. But more especially, the revolution in the modes of production of industry and agriculture made necessary a revolution in the general conditions of the social process of production, i.e., in the means of communication and of transport. In a society whose pivot, to use an expression of Fourier, was agriculture on a small scale, with its subsidiary domestic industries, and the urban handicrafts, the means of communication and transport were so utterly inadequate to the productive requirements of the manufacturing period, with its extended division of social labour, its concentration of the instruments of labour, and of the workmen, and its colonial markets, that they became in fact revolutionised. In the same way the means of communication and transport handed down from the manufacturing period soon became unbearable trammels on Modern Industry, with its feverish haste of production, its enormous extent, its constant flinging of capital and labour from one sphere of production into another, and its newly-created connexions with the markets of the whole world. Hence, apart from the radical changes introduced in the construction of sailing vessels, the means of communication and transport became gradually adapted to the modes of production of mechanical industry, by the creation of a system of river steamers, railways, ocean steamers, and telegraphs. But the huge masses of iron that had now to be forged, to be welded, to be cut, to be bored, and to be shaped, demanded, on their part, cyclopean machines, for the construction of which the methods of the manufacturing period were utterly inadequate.

Modern Industry had therefore itself to take in hand the machine, its characteristic instrument of production, and to construct machines by machines. It was not till it did this, that it built up for itself a fitting technical foundation, and stood on its own feet. Machinery, simultaneously with the increasing use of it, in the first decades of this century, appropriated, by degrees, the fabrication of machines proper. But it was only during the decade preceding 1866, that the construction of railways and ocean steamers on a stupendous scale called into existence the cyclopean machines now employed in the construction of prime movers.

The most essential condition to the production of machines by machines was a prime mover capable of exerting any amount of force, and yet under perfect control. Such a condition was already supplied by the steam-engine. But at the same time it was necessary to produce the geometrically accurate straight lines, planes, circles, cylinders, cones, and spheres, required in the

detail parts of the machines. This problem Henry Maudsley solved in the first decade of this century by the invention of the slide rest, a tool that was soon made automatic, and in a modified form was applied to other constructive machines besides the lathe, for which it was originally intended. This mechanical appliance replaces, not some particular tool, but the hand itself, which produces a given form by holding and guiding the cutting tool along the iron or other material operated upon. Thus it became possible to produce the forms of the individual parts of machinery “with a degree of ease, accuracy, and speed, that no accumulated experience of the hand of the most skilled workman could give.”

If we now fix our attention on that portion of the machinery employed in the construction of machines, which constitutes the operating tool, we find the manual implements reappearing, but on a cyclopean scale. The operating part of the boring machine is an immense drill driven by a steam-engine; without this machine, on the other hand, the cylinders of large steam-engines and of hydraulic presses could not be made. The mechanical lathe is only a cyclopean reproduction of the ordinary foot-lathe; the planing machine, an iron carpenter, that works on iron with the same tools that the human carpenter employs on wood; the instrument that, on the London wharves, cuts the veneers, is a gigantic razor; the tool of the shearing machine, which shears iron as easily as a tailor’s scissors cut cloth, is a monster pair of scissors; and the steam hammer works with an ordinary hammer head, but of such a weight that not Thor himself could wield it. These steam hammers are an invention of Nasmyth, and there is one that weighs over 6 tons and strikes with a vertical fall of 7 feet, on an anvil weighing 36 tons. It is mere child’s play for it to crush a block of granite into powder, yet it is no less capable of driving, with a succession of light taps, a nail into a piece of soft wood.

The implements of labour, in the form of machinery, necessitate the substitution of natural forces for human force, and the conscious application of science, instead of rule of thumb. In Manufacture, the organisation of the social labour-process is purely subjective; it is a combination of detail labourers; in its machinery system, Modern Industry has a productive organism that is purely objective, in which the labourer becomes a mere appendage to an already existing material condition of production. In simple co-operation, and even in that founded on division of labour, the

suppression of the isolated, by the collective, workman still appears to be more or less accidental. Machinery, with a few exceptions to be mentioned later, operates only by means of associated labour, or labour in common. Hence, the co-operative character of the labour-process is, in the latter case, a technical necessity dictated by the instrument of labour itself.

SECTION 2. — THE VALUE TRANSFERRED BY MACHINERY TO THE PRODUCT

We saw that the productive forces resulting from co-operation and division of labour cost capital nothing. They are natural forces of social labour. So also physical forces, like steam, water, &c., when appropriated to productive processes, cost nothing. But just as a man requires lungs to breathe with, so he requires something that is work of man's hand, in order to consume physical forces productively. A water-wheel is necessary to exploit the force of water, and a steam engine to exploit the elasticity of steam. Once discovered, the law of the deviation of the magnetic needle in the field of an electric current, or the law of magnetisation of iron, around which an electric current circulates, cost never a penny. But the exploitation of these laws for the purposes of telegraphy, &c., necessitates a costly and expensive apparatus. The tool, as we have seen, is not exterminated by the machine. From being a dwarf implement of the human organism, it expands and multiplies into the implement of mechanism created by man. Capital now sets the labourer to work, not with a manual tool, but with a machine which itself handles the tools. Although, therefore, it is clear at the first glance that, by incorporating both stupendous physical forces, and the natural sciences, with the process of production, Modern Industry raises the productiveness of labour to an extraordinary degree, it is by no means equally clear, that this increased productive force is not, on the other hand, purchased by an increased expenditure of labour. Machinery, like every other component of constant capital, creates no new value, but yields up its own value to the product that it serves to beget. In so far as the machine has value, and, in consequence, parts with value to the product, it forms an element in the value of that product. Instead of being cheapened, the product is made dearer in proportion to the value of the machine. And it is clear as noon-day, that machines and systems of machinery, the characteristic instruments of labour of Modern Industry, are incomparably

more loaded with value than the implements used in handicrafts and manufactures.

In the first place, it must be observed that the machinery, while always entering as a whole into the labour-process, enters into the value-begetting process only by bits. It never adds more value than it loses, on an average, by wear and tear. Hence there is a great difference between the value of a machine, and the value transferred in a given time by that machine to the product. The longer the life of the machine in the labour-process, the greater is that difference. It is true, no doubt, as we have already seen, that every instrument of labour enters as a whole into the labour-process, and only piecemeal, proportionally to its average daily loss by wear and tear, into the value-begetting process. But this difference between the instrument as a whole and its daily wear and tear, is much greater in a machine than in a tool, because the machine, being made from more durable material, has a longer life; because its employment, being regulated by strictly scientific laws, allows of greater economy in the wear and tear of its parts, and in the materials it consumes; and lastly, because its field of production is incomparably larger than that of a tool. After making allowance, both in the case of the machine and of the tool, for their average daily cost, that is for the value they transmit to the product by their average daily wear and tear, and for their consumption of auxiliary substances, such as oil, coal, and so on, they each do their work gratuitously, just like the forces furnished by nature without the help of man. The greater the productive power of the machinery compared with that of the tool, the greater is the extent of its gratuitous service compared with that of the tool. In Modern Industry man succeeded for the first time in making the product of his past labour work on a large scale gratuitously, like the forces of nature.

In treating of Co-operation and Manufacture, it was shown that certain general factors of production, such as buildings, are, in comparison with the scattered means of production of the isolated workman, economised by being consumed in common, and that they therefore make the product cheaper. In a system of machinery, not only is the framework of the machine consumed in common by its numerous operating implements, but the prime mover, together with a part of the transmitting mechanism, is consumed in common by the numerous operative machines.

Given the difference between the value of the machinery, and the value transferred by it in a day to the product, the extent to which this latter value

makes the product dearer, depends in the first instance, upon the size of the product; so to say, upon its area. Mr. Baynes, of Blackburn, in a lecture published in 1858, estimates that “each real mechanical horsepower will drive 450 self-acting mule spindles, with preparation, or 200 throstle spindles, or 15 looms for 40 inch cloth with the appliances for warping, sizing, 8c.” In the first case, it is the day’s produce of 450 mule spindles, in the second, of 200 throstle spindles, in the third, of 15 powerlooms, over which the daily cost of one horse-power, and the wear and tear of the machinery set in motion by that power, are spread; so that only a very minute value is transferred by such wear and tear to a pound of yarn or a yard of cloth. The same is the case with the steam-hammer mentioned above. Since its daily wear and tear, its coal-consumption, 8c., are spread over the stupendous masses of iron hammered by it in a day, only a small value is added to a hundredweight of iron; but that value would be very great, if the cyclopean instrument were employed in driving in nails.

Given a machine’s capacity for work, that is, the number of its operating tools, or, where it is a question of force, their mass, the amount of its product will depend on the velocity of its working parts, on the speed, for instance, of the spindles, or on the number of blows given by the hammer in a minute. Many of these colossal hammers strike seventy times in a minute, and Ryder’s patent machine for forging spindles with small hammers gives as many as 700 strokes per minute.

Given the rate at which machinery transfers its value to the product, the amount of value so transferred depends on the total value of the machinery. The less labour it contains, the less value it imparts to the product. The less value it gives up, so much the more productive it is, and so much the more its services approximate to those of natural forces. But the production of machinery by machinery lessens its value relatively to its extension and efficacy.

An analysis and comparison of the prices of commodities produced by handicrafts or manufacturers, and of the prices of the same commodities produced by machinery, shows generally that, in the product of machinery, the value due to the instruments of labour, increases relatively, but decreases absolutely. In other words, its absolute amount decreases, but its amount, relatively to the total value of the product, of a pound of yarn, for instance, increases.

It is evident that whenever it costs as much labour to produce a machine as is saved by the employment of that machine, there is nothing but a transposition of labour; consequently the total labour required to produce a commodity is not lessened or the productiveness of labour is not increased. It is clear, however, that the difference between the labour a machine costs, and the labour it saves, in other words, that the degree of its productiveness does not depend on the difference between its own value and the value of the implement it replaces. As long as the labour spent on a machine, and consequently the portion of its value added to the product, remains smaller than the value added by the workman to the product with his tool, there is always a difference of labour saved in favour of the machine. The productiveness of a machine is therefore measured by the human labour-power it replaces. According to Mr. Baynes, $2\frac{1}{2}$ operatives are required for the 450 mule spindles, inclusive of preparation machinery, that are driven by one-horse power; each self-acting mule spindle, working ten hours, produces 13 ounces of yarn (average number or thickness); consequently $2\frac{1}{2}$ operatives spin weekly $365\frac{5}{8}$ lbs. of yarn. Hence, leaving waste on one side, 366 lbs. of cotton absorb, during their conversion into yarn, only 150 hours' labour, or fifteen days' labour of ten hours each. But with a spinning-wheel, supposing the hand-spinner to produce thirteen ounces of yarn in sixty hours, the same weight of cotton would absorb 2700 days' labour of ten hours each, or 27,000 hours' labour. Where block printing, the old method of printing calico by hand, has been superseded by machine printing, a single machine prints, with the aid of one man or boy, as much calico of four colours in one hour, as it formerly took 200 men to do. Before Eli Whitney invented the cotton-gin in 1793, the separation of the seed from a pound of cotton cost an average day's labour. By means of his invention one negress was enabled to clean 100 lbs. daily; and since then, the efficacy of the gin has been considerably increased. A pound of cotton wool, previously costing 50 cents to produce, included after that invention more unpaid labour, and was consequently sold with greater profit, at 10 cents. In India they employ for separating the wool from the seed, an instrument, half machine, half tool, called a churka; with this one man and a woman can clean 28 lbs. daily. With the churka invented some years ago by Dr. Forbes, one man and a boy produce 250 pounds daily. If oxen, steam, or water, be used for driving it, only a few boys and girls as feeders are required. Sixteen

of these machines driven by oxen do as much work in a day as formerly 750 people did on an average.

As already stated, a steam-plough does as much work in one hour at a cost of threepence, as 66 men at a cost of 15 shillings. I return to this example in order to clear up an erroneous notion. The 15 shillings are by no means the expression in money of all the labour expended in one hour by the 66 men. If the ratio of surplus labour to necessary labour were 100%, these 66 men would produce in one hour a value of 30 shillings, although their wages, 15 shillings, represent only their labour for half an hour. Suppose, then, a machine cost as much as the wages for a year of the 150 men it displaces, say £3000; this £3000 is by no means the expression in money of the labour added to the object produced by these 150 men before the introduction of the machine, but only of that portion of their year's labour which was expended for themselves and represented by their wages. On the other hand, the £3000, the money value of the machine, expresses all the labour expended on its production, no matter in what proportion this labour constitutes wages for the workman, and surplus-value for the capitalist. Therefore, though a machine cost as much as the labour-power displaced by its cost, yet the labour materialised in it is even then much less than the living labour it replaces.

The use of machinery for the exclusive purpose of cheapening the product, is limited in this way, that less labour must be expended in producing the machinery than is displaced by the employment of that machinery. For the capitalist, however, this use is still more limited. Instead of paying for the labour, he only pays the value of the labour-power employed; therefore, the limit to his using a machine is fixed by the difference between the value of the machine and the value of the labour-power replaced by it. Since the division of the day's work into necessary and surplus-labour differs in different countries, and even in the same country at different periods, or in different branches of industry; and further, since the actual wage of the labourer at one time sinks below the value of his labour-power, at another rises above it, it is possible for the difference between the price of the machinery to vary very much, although the difference between the quantity of labour requisite to produce the machine and the total quantity replaced by it, remain constant. But it is the former difference alone that determines the cost, to the capitalist, of producing a commodity, and, through the pressure of competition, influences his action.

Hence the invention now-a-days of machines in England that are employed only in North America; just as in the sixteenth and seventeenth centuries, machines were invented in Germany to be used only in Holland, and just as many a French invention of the eighteenth century was exploited in England alone. In the older countries, machinery, when employed in some branches of industry, creates such a redundancy of labour in other branches that in these latter the fall of wages below the value of labour-power impedes the use of machinery, and, from the standpoint of the capitalist, whose profit comes, not from a diminution of the labour employed, but of the labour paid for, renders that use superfluous and often impossible. In some branches of the woollen manufacture in England the employment of children has during recent years been considerably diminished, and in some cases has been entirely abolished. Why? Because the Factory Acts made two sets of children necessary, one working six hours, the other four, or each working five hours. But the parents refuse to sell the “half-timers” cheaper than the “full-timers.” Hence the substitution of machinery for the “half-timers.” Before the labour of women and of children under 10 years of age was forbidden in mines, capitalists considered the employment of naked women and girls, often in company with men, so far sanctioned by their moral code, and especially by their ledgers, that it was only after the passing of the Act that they had recourse to machinery. The Yankees have invented a stone-breaking machine. The English do not make use of it, because the “wretch” who does this work gets paid for such a small portion of his labour, that machinery would increase the cost of production to the capitalist. In England women are still occasionally used instead of horses for hauling canal boats, because the labour required to produce horses and machines is an accurately known quantity, while that required to maintain the women of the surplus population is below all calculation. Hence nowhere do we find a more shameful squandering of human labour-power for the most despicable purposes than in England, the land of machinery.

SECTION 3. — THE APPROXIMATE EFFECTS OF MACHINERY ON THE WORKMAN.

The starting point of Modern Industry is, as we have shown, the revolution in the instruments of labour, and this revolution attains its most highly developed form in the organised system of machinery in a factory. Before

we inquire how human material is incorporated with this objective organism, let us consider some general effects of this revolution on the labourer himself.

Appropriation of supplementary Labour-power by Capital. The Employment of Women and Children.

In so far as machinery dispenses with muscular power, it becomes a means of employing labourers of slight muscular strength, and those whose bodily development is incomplete, but whose limbs are all the more supple. The labour of women and children was, therefore, the first thing sought for by capitalists who used machinery. That mighty substitute for labour and labourers was forthwith changed into a means for increasing the number of wage-labourers by enrolling, under the direct sway of capital, every member of the work-man's family, without distinction of age or sex. Compulsory work for the capitalist usurped the place, not only of the children's play, but also of free labour at home within moderate limits for the support of the family.

The value of labour-power was determined, not only by the labour-time necessary to maintain the individual adult laborer, but also by that necessary to maintain his family. Machinery, by throwing every member of that family on to the labour market, spreads the value of the man's labour-power over his whole family. It thus depreciates his labour-power. To purchase the labour-power of a family of four workers may, perhaps, cost more than it formerly did to purchase the labour-power of the head of the family, but, in return, four days' labour takes the place of one, and their price falls in proportion to the excess of the surplus-labour of four over the surplus-labour of one. In order that the family may live, four people must now, not only labour, but expend surplus-labor for the capitalist. Thus we see, that machinery, while augmenting the human material that forms the principal object of capital's exploiting power, at the same time raises the degree of exploitation.

Machinery also revolutionises out and out the contract between the labourer and the capitalist, which formally fixes their mutual relations. Taking the exchange of commodities as our basis, our first assumption was that capitalist and labourer met as free persons, as independent owners of commodities; the one possessing money and means of production, the other labour-power. But now the capitalist buys children and young persons under

age. Previously, the workman sold his own labour power, which he disposed of nominally as a free agent. Now he sells wife and child. He has become a slave dealer. The demand for children's labour often resembles in form the inquiries for negro slaves, such as were formerly to be read among the advertisements in American journals. "My attention," says an English factory inspector, "was drawn to an advertisement in the local paper of one of the most important manufacturing towns of my district, of which the following is a copy: Wanted, 12 to 20 young presons, not younger than what can pass for 13 years. Wages, 4 shillings a week. Apply 8c." The phrase "what can pass for 13 years," has reference to the fact, that by the Factory Act, children under 13 years may work only 6 hours. A surgeon official appointed must certify their age. The manufacturer, therefore, asks for children who look as if they were already 13 years old. The decrease, often by leaps and bounds in the number of children under 13 years employed in factories, a decrease that is shown in an astonishing manner by the English statistics of the last 20 years, was for the most part, according to the evidence of the factory inspectors themselves, the work of the certifying surgeons, who overstated the age of the children, agreeably to the capitalist's greed for exploitation, and the sordid trafficking needs of the parents. In the notorious district of Bethnal Green, a public market is held every Monday and Tuesday morning, where children of both sexes from 9 years of age upwards, hire themselves out to the silk manufacturers. "The usual terms are 1s. 8d. a week (this belongs to the parents) and '2d. for myself and tea.' The contract is binding only for the week. The scene and language while this market is going on are quite disgraceful." It has also occurred in England, that women have taken "children from the workhouse and let any one have them out for 2s. 6d. a week." In spite of legislation, the number of boys sold in Great Britain by their parents to act as live chimney-sweeping machines (althought there exist plenty of machines to replace them) exceeds 2000. The revolution effected by machinery in the judicial relations between the buyer and the seller of labour-power, causing the transaction as a whole to lose the appearance of a contract between free persons, afforded the English Parliament an excuse, founded on judicial principles, for the interference of the state with factories. Whenever the law limits the labour of children to 6 hours in industries not before interfered with, the complaints of the manufacturers are always renewed. They allege that numbers of the parents withdraw their children from the industry

brought under the act, in order to sell them where “freedom of labour” still rules i.e., where children under 13 years are compelled to work like grown-up people, and therefore can be got rid of at a higher price. But since capital is by nature a leveller, since it exacts in every sphere of production equality in the conditions of the exploitation of labour, the limitation by law of children’s labour, in one branch of industry, becomes the cause of its limitation in others.

We have already alluded to the physical deterioration as well of the children and young persons as of the women, whom machinery, first directly in the factories that shoot up on its bases, and then indirectly in all the remaining branches of industry, subjects to the exploitation of capital. In this place, therefore, we dwell only on one point, the enormous mortality, during the first few years of their life, of the children of the operatives. In sixteen of the registration districts into which England is divided, there are, for every 100,000 children alive under the age of one year, only 9000 death in the year on an average (in one district only 7047); in 24 districts the deaths are over 10,000, but under 11,000; in 39 districts over 11,000, but under 12,000; in 48 districts over 12,000, but under 13,000; in 22 districts over 20,000; in 25 districts over 21,000; in 17 over 22,000; in 11 over 23,000; in Hoo, Wolverhampton, Ashton-under-Lyne, and Preston, over 24,000; in Nottingham, Stockport, and Bradford, over 25,000; in Wisbeach, 26,000; and in Manchester, 26,125. As was shown by an official medical inquiry in the year 1861, the high death-rates are, apart from local causes, principally due to the employment of the mothers away from their homes, and to the neglect and maltreatment consequent on her absence, such as, amongst others, insufficient nourishment, unsuitable food, and dosing with opiates; beside this, there arises an unnatural estrangement between mother and child, and as a consequence intentional starving and poisoning of the children. In those agricultural districts, “where a minimum in the employment of women exists, the death-rate is on the other hand very low.” The Inquiry-Commission of 1861 led, however, to the unexpected result, that in some purely agricultural districts bordering on the North Sea, the death-rate of children under one year old almost equalled that of the worst factory districts. Dr. Julian Hunter was therefore commissioned to investigate this phenomenon on the spot. His report is incorporated with the “Sixth Report on Public Health.” Up to that time it was supposed, that the children were decimated by malaria, and other diseases peculiar to low-

lying and marshy districts. But the inquiry showed the very opposite, namely, that the same cause which drove away malaria, the conversion of the land, from a morass in winter and a scanty pasture in summer, into fruitful corn land, created the exceptional death-rate of the infants. The 70 medical men, whom Dr. Hunter examined in that district, were “wonderfully in accord” on this point. In fact, the revolution in the mode of cultivation had led to the introduction of the industrial system. Married women, who work in gangs along with boys and girls, are, for a stipulated sum of money, placed at the disposal of the farmer, by a man called “the undertaker,” who contracts for the whole gang. “These gangs will sometimes travel many miles from their own village; they are to be met morning and evening on the roads, dressed in short petticoats, with suitable coats and boots, and sometimes trousers, looking wonderfully strong and healthy, but tainted with a customary immorality, and heedless of the fatal results which their love of this busy and independent life is bringing on their unfortunate offspring who are pining at home.” Every phenomenon of the factory districts is here reproduced, including, but to a greater extent, ill-disguised infanticide, and dosing children with opiates. “My knowledge of such evils,” says Dr. Simon, the medical officer of the Privy Council and editor in chief of the Reports on Public Health, “may excuse the profound misgiving with which I regard any large industrial employment of adult women.” “Happy indeed,” exclaims Mr. Baker, the factory inspector, in his official report, “happy indeed will it be for the manufacturing districts of England, when every married woman having a family is prohibited from working in any textile works at all.”

The moral degradation caused by the capitalistic exploitation of women and children has been so exhaustively depicted by F. Engels in his “*Lage der Arbeitenden Klasse Englands*,” and other writers, that I need only mention the subject in this place. But the intellectual desolation, artificially produced by converting immature human beings into mere machines for the fabrication of surplus-value, a state of mind clearly distinguishable from that natural ignorance which keeps the mind fallow without destroying its capacity for development, its natural fertility, this desolation finally compelled even the English Parliament to make elementary education a compulsory condition to the “productive” employment of children under 14 years, in every industry subject to the Factory Acts. The spirit of capitalist production stands out clearly in the ludicrous wording of the so-called

education clauses in the Factory Acts, in the absence of an administrative machinery, an absence that again makes the compulsion illusory, in the opposition of the manufacturers themselves to these education clauses, and in the tricks and dodges they put in practice for evading them. "For this the legislature is alone to blame, by having passed a delusive law, which, while it would seem to provide that the children employed in factories shall be educated, contains no enactment by which that professed end can be secured. It provides nothing more than that the children shall on certain days of the week, and for a certain number of hours (three) in each day, be inclosed within the four walls of a place called a school, and that the employer of the child shall receive weekly a certificate to that effect signed by a person designated by the subscriber as a schoolmaster or schoolmistress." Previous to the passing of the amended Factory Act, 1844, it happened, not unfrequently, that the certificate of attendance at school were signed by the schoolmaster or schoolmistress with a cross, as they themselves were unable to write. "On one occasion, on visiting a place called a school, from which certificates of school attendance had issued, I was so struck with the ignorance of the master, that I said to him: "Pray, sir, can you read?" His reply was: "Aye, summat!" and as a justification of his right to grant certificates, he added: "At any rate, I am before my scholars." The inspectors, when the Bill of 1844 was in preparation, did not fail to represent the disgraceful state of the places called schools, certificates from which they were obliged to admit as a compliance with the laws, but they were successful only in obtaining thus much, that since the passing of the Act of 1844, the figures in the school certificate must be filled up in the handwriting of the schoolmaster, who must also sign his Christian and surname in full." Sir John Kincaid, factory inspector for Scotland, relates experiences of the same kind. "The first school we visited was kept by a Mrs. Ann Killin. Upon asking her to spell her name, she straightway made a mistake, by beginning with the letter C, but correcting herself immediately, she said her name began with a K. On looking at her signature, however, in the school certificate books, I noticed that she spelt it in various ways, while her handwriting left no doubt as to her unfitness to teach. She herself also acknowledged that she could not keep the register.... In a second school I found the schoolroom 15 feet long, and 10 feet wide, and counted in this space 75 children, who were gabbling something unintelligible." But it is not only in the miserable places above referred to that the children obtained

certificates of school attendance without having received instruction of any value, for in many schools where there is a competent teacher, his efforts are of little avail from the distracting crowd of children of all ages, from infants of 3 years old and upwards; his livelihood, miserable at the best, depending on the pence received from the greatest number of children whom it is possible to cram into the space. To this is to be added scanty school furniture, deficiency of books, and other materials for teaching, and the depressing effect upon the poor children themselves of a close, noisome atmosphere. I have been in many schools, where I have seen rows of children doing absolutely nothing; and this is certified as school attendance, and, in statistical returns, such children are set down as being educated.” In Scotland the manufacturers try all they can to do without the children that are obliged to attend school. “It requires no further argument to prove that the educational clauses of the Factory Act, being held in such disfavour among mill owners tend in a great measure to exclude that class of children alike from the employment and the benefit of education contemplated by this Act.” Horribly grotesque does this appear in print works, which are regulated by a special Act. By that Act, “every child, before being employed in a print work must have attended school for at least 30 days, and not less than 150 hours, during the six months immediately preceding such first day of employment, and during the continuance of its employment in the print works, it must attend for a like period of 30 days, and 150 hours during every successive period of six months.... The attendance at school must be between 8 a.m. and 6 p.m. No attendance of less than 2½ hours, nor more than 5 hours on any one day, shall be reckoned as part of the 150 hours. Under ordinary circumstances the children attend school morning and afternoon for 30 days, for at least 5 hours each day, and upon the expiration of the 30 days, the statutory total of 150 hours having been attained, having, in their language, made up their book, they return to the print work, where they continue until the six months have expired, when another instalment of school attendance becomes due, and they again seek the school until the book is again made up.... Many boys having attended school for the required number of hours, when they return to school after the expiration of their six months’ work in the print work, are in the same condition as when they first attended school as print-work boys, that they have lost all they gained by their previous school attendance.... In other print works the children’s attendance at school is made to depend altogether

upon the exigencies of the work in the establishment. The requisite number of hours is made up each six months, by instalments consisting of from 3 to five hours at a time, spreading over, perhaps, the whole six months.... For instance, the attendance on one day might be from 8 to 11 a.m., on another day from 1 p.m. to 4 p.m., and the child might not appear at school again for several days, when it would attend from 3 p.m. to 6 p.m.; then it might attend for 3 or 4 days consecutively, or for a week, then it would not appear in school for 3 weeks or a month, after that upon some odd days at some odd hours when the operative who employed it chose to spare it; and thus the child was, as it were, buffeted from school to work, from work to school, until the tale of 150 hours was told.”

By the excessive addition of women and children to the ranks of the workers, machinery at last breaks down the resistance which the male operatives in the manufacturing period continued to oppose to the despotism of capital.

Prolongation of the working-day.

If machinery be the most powerful means for increasing the productiveness of labour — i.e., for shortening the working time required in the production of a commodity, it becomes in the hands of capital the most powerful means, in those industries first invaded by it, for lengthening the working day beyond all bounds set by human nature. It creates, on the one hand, new conditions by which capital is enabled to give free scope to this its constant tendency, and on the other hand, new motives with which to whet capital's appetite for the labour of others.

In the first place, in form of machinery, the implements of labour become automatic, things moving and working independent of the workman. They are thenceforth an industrial perpetuum mobile, that would go on producing forever, did it not meet with certain natural obstructions in the weak bodies and the strong wills of its human attendants. The automaton, as capital, and because it is capital, is endowed, in the person of the capitalist, with intelligence and will; it is therefore animated by the longing to reduce to a minimum the resistance offered by that repellant yet elastic natural barrier, man. This resistance is moreover lessened by the apparent lightness of machine work, and by the more pliant and docile character of the women and children employed on it.

The productiveness of machinery is, as we saw, inversely proportional to the value transferred by it to the product. The longer the life of the machine, the greater is the mass of the products over which the value transmitted by the machine is spread, and the less is the portion of that value added to each single commodity. The active lifetime of a machine is, however, clearly dependent on the length of the working day, or on the duration of the daily labour-process multiplied by the number of days for which the process is carried on.

The wear and tear of a machine is not exactly proportional to its working time. And even if it were so, a machine working 16 hours daily for 7½ years, covers as long a working period as, and transmits to the total product no more value than, the same machine would if it worked only 8 hours daily for 15 years. But in the first case the value of the machine would be reproduced twice as quickly as in the latter, and the capitalist would, by this use of the machine, absorb in 7½ years as much surplus-value as in the second case he would in 15.

The material wear and tear of a machine is of two kinds. The one arises from use, as coins wear away by circulating, the other from non-use, as a sword rusts when left in its scabbard. The latter kind is due to the elements. The former is more or less directly proportional, the latter to a certain extent inversely proportional, to the use of the machine.

But in addition to the material wear and tear, a machine also undergoes, what we may call a moral depreciation. It loses exchange-value, either by machines of the same sort being produced cheaper than it, or by better machines entering into competition with it. In both cases, be the machine ever so young and full of life, its value is no longer determined by the labour actually materialised in it, but by the labour-time requisite to reproduce either it or the better machine. It has, therefore, lost value more or less. The shorter the period taken to reproduce its total value, the less is the danger of moral depreciation; and the longer the working day, the shorter is that period. When machinery is first introduced into an industry, new methods of reproducing it more cheaply follow blow upon blow, and so do improvements, that not only affect individual parts and details of the machine, but its entire build. It is, therefore, in the early days of the life of machinery that this special incentive to the prolongation of the working day makes itself felt most acutely.

Given the length of the working day, all other circumstances remaining the same, the exploitation of double the number of workmen demands, not only a doubling of that part of constant capital which is invested in machinery and buildings, but also of that part which is laid out in raw material and auxiliary substances. The lengthening of the working day, on the other hand, allows of production on an extended scale without any alteration in the amount of capital laid out on machinery and buildings. Not only is there, therefore, an increase of surplus-value, but the outlay necessary to obtain it diminishes. It is true that this takes place, more or less, with every lengthening of the working day; but in the case under consideration, the change is more marked, because the capital converted into the instruments of labour preponderates to a greater degree. The development of the factory system fixes a constantly increasing portion of the capital in a form, in which, on the one hand, its value is capable of continual self-expansion, and in which, on the other hand, it loses both use-value and exchange-value whenever it loses contact with living labour. "When a labourer," said Mr. Ashworth, a cotton magnate, to Professor Nassau W. Senior, "lays down his spade, he renders useless, for that period, a capital worth eighteenpence. When one of our people leaves the mill, he renders useless a capital that has cost £100,000." Only fancy! making "useless" for a single moment, a capital that has cost £100,000! It is, in truth, monstrous, that a single one of our people should ever leave the factory! The increased use of our machinery, as Senior after the instruction he received from Ashworth clearly perceives, makes a constantly increasing lengthening of the working day "desirable."

Machinery produces relative surplus-value; not only by directly depreciating the value of labour-power, and by indirectly cheapening the same through cheapening the commodities that enter into its reproduction, but also, when it is first introduced sporadically into an industry, by converting the labour employed by the owner of that machinery, into labour of a higher degree and greater efficacy, by raising the social value of the article produced above its individual value, and thus enabling the capitalist to replace the value of a day's labour-power by a smaller portion of the value of the day's product. During this transition period, when the use of machinery is a sort of monopoly, the profits are therefore exceptional, and the capitalist endeavours to exploit thoroughly "the sunny time of this his

first love,” by prolonging the working day as much as possible. The magnitude of the profit whets his appetite for more profit.

As the use of machinery becomes more general in a particular industry, the social value of the product sinks down to its individual value, and the law that surplus-value does not arise from the labour-power that has been replaced by the machinery, but from the labour-power actually employed in working with the machinery, asserts itself. Surplus-value arises from the variable capital alone, and we saw that the amount of surplus-value depends on two factors, viz., the rate of surplus-value and the number of the workmen simultaneously employed. Given the length of the working day, the rate of surplus-value is determined by the relative duration of the necessary labour and of the surplus-labour in a day. The number of the labourers simultaneously employed depends, on its side, on the ratio of the variable to the constant capital. Now, however much the use of machinery may increase the surplus-labour at the expense of the necessary labour by heightening the productiveness of labour, it is clear that it attains this result, only by diminishing the number of workmen employed by a given amount of capital. It converts what was formerly variable capital, invested in labour-power, into machinery, which, being constant capital, does not produce surplus-value. It is impossible, for instance, to squeeze as much surplus-value out of 2 as out of 24 labourers. If each of these 24 men gives only one hour of surplus-labour in 12, the 24 men give together 24 hours of surplus-labour, while 24 hours is the total labour of the two men. Hence, the application of machinery to the production of surplus-value implies a contradiction which is immanent in it, since, of the two factors of the surplus-value created by a given amount of capital, one, the rate of surplus-value cannot be increased, except by diminishing the other, the number of workmen. This contradiction comes to light, as soon as by the general employment of machinery in a given industry, the value of the machine-produced commodity regulates the value of all commodities of the same sort; and it is this contradiction, that in its turn, drives the capitalist, without his being conscious of the fact, to excessive lengthening of the working day, in order that he may compensate the decrease in the relative number of labourers exploited, by an increase not only of the relative, but of the absolute surplus-labour.

If, then, the capitalistic employment of machinery, on the one hand, supplies new and powerful motives to an excessive lengthening of the

working day, and radically changes, as well the methods of labour, as also the character of the social working organism, in such a manner as to break down all opposition to this tendency, on the other hand it produces, partly by opening out to the capitalist new strata of the working class, previously inaccessible to him, partly by setting free the labourers it supplants, a surplus working population, which is compelled to submit to the dictation of capital. Hence that remarkable phenomenon in the history of Modern Industry, that machinery sweeps away every moral and natural restriction on the length of the working day. Hence, too, the economical paradox, that the most powerful instrument for shortening labour-time, becomes the most unfailing means for placing every moment of the labourer's time and that of his family, at the disposal of the capitalist for the purpose of expanding the value of his capital. "If," dreamed Aristotle, the greatest thinker of antiquity, "if every tool, when summoned, or even of its own accord, could do the work that befits it, just as the creations of Dædalus moved of themselves, or the tripods of Hephæstos went of their own accord to their sacred work, if the weavers' shuttles were to weave of themselves, then there would be no need either of apprentices for the master workers, or of slaves for the lords." And Antiparos, a Greek poet of the time of Cicero, hailed the invention of the water-wheel for grinding corn, an invention that is the elementary form of all machinery, as the giver of freedom to female slaves, and the bringer back of the golden age. Oh! those heathens! They understood, as the learned Bastiat, and before him the still wiser MacCulloch have discovered, nothing of political economy and Christianity. They did not, for example, comprehend that machinery is the surest means of lengthening the working day. They perhaps excused the slavery of one on the ground that it was a means to the full development of another. But to preach slavery of the masses, in order that a few crude and half-educated parvenus, might become "eminent spinners," "extensive sausage-makers," and "influential shoe-black dealers," to do this, they lacked the bump of Christianity.

Intensification of Labour

The immoderate lengthening of the working day, produced by machinery in the hands of capital, leads to a reaction on the part of society, the very sources of whose life are menaced; and, thence, to a normal working day whose length is fixed by law. Thenceforth a phenomenon that we have

already met with, namely, the intensification of labour, develops into great importance. Our analysis of absolute surplus-value had reference primarily to the extension or duration of the labour, its intensity being assumed as given. We now proceed to consider the substitution of a more intensified labour for labour of more extensive duration, and the degree of the former.

It is self-evident, that in proportion as the use of machinery spreads, and the experience of a special class of workmen habituated to machinery accumulates, the rapidity and intensity of labour increase as a natural consequence. Thus in England, during half a century, lengthening of the working day went hand in hand with increasing intensity of factory labour. Nevertheless the reader will clearly see, that where we have labour, not carried on by fits and starts, but repeated day after day with unvarying uniformity, a point must inevitably be reached, where extension of the working day and intensity of the labour mutually exclude one another, in such a way that lengthening of the working day becomes compatible only with a lower degree of intensity, and, a higher degree of intensity, only with a shortening of the working day. So soon as the gradually surging revolt of the working class compelled Parliament to shorten compulsorily the hours of labour, and to begin by imposing a normal working day on factories proper, so soon consequently as an increased production of surplus value by the prolongation of the working day was once for all put a stop to, from that moment capital threw itself with all its might into the production of relative surplus-value, by hastening on the further improvement of machinery. At the same time a change took place in the nature of relative surplus-value. Generally speaking, the mode of producing relative surplus-value consists in raising the productive power of the workman, so as to enable him to produce more in a given time with the same expenditure of labour. Labour-time continues to transmit as before the same value to the total product, but this unchanged amount of exchange value is spread over more use-values; hence the value of each single commodity sinks. Otherwise, however, so soon as the compulsory shortening of the hours of labour takes place. The immense impetus it gives to the development of productive power, and to economy in the means of production, imposes on the workman increased expenditure of labour in a given time, heightened tension of labour-power, and closer filling up of the pores of the working day, or condensation of labour to a degree that is attainable only within the limits of the shortened working day. This condensation of a greater mass of labour into a given

period thenceforward counts for what it really is, a greater quantity of labour. In addition to a measure of its extension, i.e., duration, labour now acquires a measure of its intensity or of the degree of its condensation or density. The denser hour of the ten hours' working-day contains more labour, i.e., expended labour-power, than the more porous hour of the twelve hours' working-day. The product therefore of one of the former hours has as much or more value than has the product of $1\frac{1}{5}$ of the latter hours. Apart from the increased yield of relative surplus-value through the heightened productiveness of labour, the same mass of value is now produced for the capitalist, say, by $3\frac{1}{3}$ hours of surplus labour, and $6\frac{2}{3}$ hours of necessary labour, as was previously produced by four hours of surplus labour and eight hours of necessary labour.

We now come to the question: How is the labour intensified?

The first effect of shortening the working day results from the self-evident law, that the efficiency of labour-power is in an inverse ratio to the duration of its expenditure. Hence, within certain limits what is lost by shortening the duration is gained by the increasing tension of labour-power. That the workman moreover really does expend more labour-power, is ensured by the mode in which the capitalist pays him. In those industries, such as potteries, where machinery plays little or no part, the introduction of the Factory Acts has strikingly shown that the mere shortening of the working-day increases to a wonderful degree the regularity, uniformity, order, continuity, and energy of the labour. It seemed, however, doubtful whether this effect was produced in the factory proper, where the dependence of the workman on the continuous and uniform motion of the machinery had already created the strictest discipline. Hence, when in 1844 the reduction of the working-day to less than twelve hours was being debated, the masters almost unanimously declared "that their overlookers in the different rooms took good care that the hands lost no time," that the "extent of vigilance and attention on the part of the workmen was hardly capable of being increased," and therefore, that the speed of the machinery and other conditions remaining unaltered, "to expect in a well-managed factory any important result from increased attention of the workmen was an absurdity." This assertion was contradicted by experiments. Mr. Robert Gardner reduced the hours of labour in his two large factories at Preston, on and after the 20th April, 1844, from twelve to eleven hours a day. The result of about a year's working was that "the same amount of product for the

same cost was received, and the workpeople as a whole earned in eleven hours as much wages as they did before in twelve.” I pass over the experiments made in the spinning and carding rooms, because they were accompanied by an increase of 2% in the speed of the machines. But in the weaving department, where, moreover, many sorts of figured fancy articles were woven, there was not the slightest alteration in the conditions of the work. The result was: “From 6th January to 20th April, 1844, with a twelve hours’ day, average weekly wages of each hand 10s. 1½d., from 20th April to 29th June, 1844, with day of eleven hours, average weekly wages 10s. 3½d.” Here we have more produced in eleven hours than previously in twelve, and entirely in consequence of more steady application and economy of time by the workpeople. While they got the same wages and gained one hour of spare time, the capitalist got the same amount produced and saved the cost of coal, gas, and other such items, for one hour. Similar experiments, and with the like success, were carried out in the mills of Messrs. Horrocks and Jacson.

The shortening of the hours of labour creates, to begin with, the subjective conditions for the condensation of labour, by enabling the workman to exert more strength in a given time. So soon as that shortening becomes compulsory, machinery becomes in the hands of capital the objective means, systematically employed for squeezing out more labour in a given time. This is effected in two ways: by increasing the speed of the machinery, and by giving the workman more machinery to tend. Improved construction of the machinery is necessary, partly because without it greater pressure cannot be put on the workman, and partly because the shortened hours of labour force the capitalist to exercise the strictest watch over the cost of production. The improvements in the steam-engine have increased the piston speed, and at the same time have made it possible, by means of a greater economy of power, to drive with the same or even a smaller consumption of coal more machinery with the same engine. The improvements in the transmitting mechanism have lessened friction, and, what so strikingly distinguishes modern from the older machinery, have reduced the diameter and weight of the shafting to a constantly decreasing minimum. Finally, the improvements in the operative machines have, while reducing their size, increased their speed and efficiency, as in the modern power-loom; or, while increasing the size of their frame-work, have also increased the extent and number of their working parts, as in spinning

mules, or have added to the speed of these working parts by imperceptible alterations of detail, such as those which ten years ago increased the speed of the spindles in self-acting mules by one-fifth.

The reduction of the working day to 12 hours dates in England from 1832. In 1836 a manufacturer stated: "The labour now undergone in the factories is much greater than it used to be...compared with thirty or forty years ago...owing to the greater attention and activity required by the greatly increased speed which is given to the machinery." In the year 1844, Lord Ashley, now Lord Shaftesbury, made in the House of Commons the following statements, supported by documentary evidence:

"The labour performed by those engaged in the processes of manufacture, is three times as great as in the beginning of such operations. Machinery has executed, no doubt, the work that would demand the sinews of millions of men; but it has also prodigiously multiplied the labour of those who are governed by its fearful movements...In 1815, the labour of following a pair of mules spinning cotton of No.40 — reckoning 12 hours to the working-day — involved a necessity of walking 8 miles. In 1832, the distance travelled in following a pair of mules, spinning cotton yarn of the same number, was 20 miles, and frequently more. In 1835" (query — 1815 or 1825?) "the spinner put up daily, on each of these mules, 820 stretches, making a total of 1,640 stretches in the course of the day. In 1832, the spinner put up on each mule 2,200 stretches, making a total of 4,400. In 1844, 2,400 stretches, making a total of 4,800; and in some cases the amount of labour required is even still greater...I have another document sent to me in 1842, stating that the labour is progressively increasing — increasing not only because the distance to be travelled is greater, but because the quantity of goods produced is multiplied, while the hands are fewer in proportion than before; and, moreover, because an inferior species of cotton is now often spun, which it is more difficult to work...In the carding-room there has also been a great increase of labour. One person there does the work formerly divided between two. In the weaving-room, where a vast number of persons are employed, and principally females...the labour has increased within the last few years fully 10 per cent, owing to the increased speed of the machinery in spinning. In 1838, the number of hanks spun per week was 18,000, in 1843 it amounted to 21,000. In 1819 the number of picks in power-loom-weaving per minute was 60 — in 1842 it was 140, showing a vast increase of labour."

In the face of this remarkable intensity of labour which had already been reached in 1844 under the Twelve Hours' Act, there appeared to be a justification for the assertion made at that time by the English manufacturers, that any further progress in that direction was impossible, and therefore that every further reduction of the hours of labour meant a lessened production. The apparent correctness of their reasons will be best shown by the following contemporary statement by Leonard Horner, the factory inspector, their ever watchful censor.

“Now, as the quantity produced must, in the main, be regulated by the speed of the machinery, it must be the interest of the mill owner to drive it at the utmost rate of speed consistent with these following conditions, viz., the preservation of the machinery from too rapid deterioration; the preservation of the quality of the article manufactured; and the capability of the workman to follow the motion without a greater exertion than he can sustain for a constancy. One of the most important problems, therefore, which the owner of a factory has to solve is to find out the maximum speed at which he can run, with a due regard to the above, conditions. It frequently happens that he finds he has gone too fast, that breakages and bad work more than counterbalance the increased speed, and that he is obliged to slacken his pace. I therefore concluded, that as an active and intelligent millowner would find out the safe maximum, it would not be possible to produce as much in eleven hours as in twelve. I further assumed that the operative-paid by piece work, would exert himself to the utmost consistent with the power of continuing at the same rate.” Horner, therefore, came to the conclusion that a reduction of the working hours below twelve would necessarily diminish production. He himself, ten years later, cites his opinion of 1845 in proof of how much he under-estimated in that year the elasticity of machinery, and of man's labour-power, both of which are simultaneously stretched to an extreme by the compulsory shortening of the working day.

We now come to the period that follows the introduction of the Ten Hours' Act in 1847 into the English cotton, woollen, silk, and flax mills.

“The speed of the spindles has increased upon throstles 500, and upon mules 1000 revolutions a minute, i.e., the speed of the throstle spindle, which in 1839 was 4500 times a minute, is now (1862) 5000; and of the mule spindle, that was 5000, is now 6000 times a minute, amounting in the former case to one-tenth, and in the second case to one-fifth addition

increase.” James Nasmyth, the eminent civil engineer of Patricroft, near Manchester, explained in a letter to Leonard Horner, written in 1852, the nature of the improvements in the steam-engine that had been made between the years 1848 and 1852. After remarking that the horse-power of steam-engines, being always estimated in the official returns according to the power of similar engines in 1828, is only nominal, and can serve only as an index of their real power, he goes on to say: “I am confident that from the same weight of steam-engine machinery, we are now obtaining at least 50 per cent. more duty or work performed on the average, and that in many cases the identical steam-engines which in the days of the restricted speed of 220 feet per minute, yielded 50 horsepower, are now yielding upwards of 100.”.... “The modern steam-engine of 100 horse-power is capable of being driven at a much greater force than formerly, arising from improvements in its construction, the capacity and construction of the boilers, &c.”... “Although the same number of hands are employed in proportion to the horse-power as at former periods, there are fewer hands employed in proportion to the machinery.” “In the year 1850, the factories of the United Kingdom employed 134,217 nominal horse-power to give motion to 25,638,716 spindles and 301,445 looms. The number of spindles and looms in 1856 was respectively 33,503,580 of the former, and 369,205 of the latter, which, reckoning the force of the nominal horse-power required to be the same as in 1850, would require a force equal to 175,000 horses, but the actual power given in the return for 1856 is 161,435, less by above 10,000 horses than, calculating upon the basis of the return of 1850, the factories ought to have required in 1856.” “The facts thus brought out by the Return (of 1856) appear to be that the factory system is increasing rapidly; that although the same number of hands are employed in proportion to the horse-power as at former periods, there are fewer hands employed in proportion to the machinery; that the steam-engine is enabled to drive an increased weight of machinery by economy of force and other methods, and that an increased quantity of work can be turned off by improvements in machinery, and in methods of manufacture, by increase of speed of the machinery, and by a variety of other causes.”

“The great improvements made in machines of every kind have raised their productive power very much. Without any doubt, the shortening of the hours of labour.... gave the impulse to these improvements. The latter, combined with the more intense strain on the workman, have had the effect,

that at least as much is produced in the shortened (by two hours or one-sixth) working-day as was previously produced during the longer one.”

One fact is sufficient to show how greatly the wealth of the manufacturers increased along with the more intense exploitation of labour-power. From 1838 to 1850, the average proportional increase in English cotton and other factories was 32%, while from 1850 to 1856 it amounted to 86%.

But however great the progress of English industry had been during the 8 years from 1848 to 1856 under the influence of a working-day of 10 hours, it was far surpassed during the next period of 6 years from 1856 to 1862. In silk factories, for instance, there were in 1856, spindles 1,093,799; in 1862, 1,388,544; in 1856, looms 9,260; in 1862, 10,709. But the number of operatives was, in 1856, 56,131; in 1862, 52,429. The increase in the spindles was therefore 26.9% and in the looms 15.6%, while the number of the operatives decreased 7%. In the year 1850 there were employed in worsted mills 875,830 spindles; in 1856, 1,324,549 (increase 51.2%), and in 1862, 1,289,172 (decrease 2.7%). But if we deduct the doubling spindles that figure in the numbers for 1856, but not in those for 1862, it will be found that after 1856 the number of spindles remained nearly stationary. On the other hand, after 1850, the speed of the spindles and looms was in many cases doubled. The number of power-looms in worsted mills was in 1850, 32,617; in 1856, 38,956; in 1862, 43,048. The number of the operatives was, in 1850, 79,737; in 1856, 87,794; in 1862, 86,063; included in these, however, the children under 14 years of age were, in 1850, 9,956; in 1856, 11,228; in 1862, 13,178. In spite, therefore, of the greatly increased number of looms in 1862, compared with 1856, the total number of the workpeople employed decreased, and that of the children exploited increased.

On the 27th of April, 1863, Mr. Ferrand said in the House of Commons: “I have been informed by delegates from 16 districts of Lancashire and Cheshire, in whose behalf I speak, that the work in the factories is, in consequence of the improvements in machinery, constantly on the increase. Instead of as formerly one person with two helps tending two looms, one person now tends three looms without helps, and it is no uncommon thing for one person to tend four. Twelve hours’ work, as is evident from the facts adduced, is now compressed into less than 10 hours. It is therefore self-

evident, to what an enormous extent the toil of the factory operative has increased during the last 10 years.”

Although, therefore, the Factory Inspectors unceasingly and with justice, commend the results of the Acts of 1844 and 1850, yet they admit that the shortening of the hours of labour has already called forth such an intensification of the labour as is injurious to the health of the workman and to his capacity for work. “In most of the cotton, worsted, and silk mills, an exhausting state of excitement necessary to enable the workers satisfactorily to mind the machinery, the motion of which has been greatly accelerated within the last few years, seems to me not unlikely to be one of the causes of that excess of mortality from lung disease, which Dr. Greenhow has pointed out in his recent report on this subject.” There cannot be the slightest doubt that the tendency that urges capital as soon as a prolongation of the hours of labour is once for all forbidden, to compensate itself, by a systematic heightening of the intensity of labour, and to convert every improvement in machinery into a more perfect means of exhausting the workman, must soon lead to a state of things in which a reduction of the hours of labour will again be inevitable. On the other hand, the rapid advance of English industry between 1848 and the present time, under the influence of a day of 10 hours, surpasses the advance made between 1833 and 1847, when the day was 12 hours long, by far more than the latter surpasses the advance made during the half century after the first introduction of the factory system, when the working day was without limits.

SECTION IV. — THE FACTORY

At the commencement of this chapter we considered that which we may call the body of the factory, i.e., machinery organised into a system. We there saw how machinery, by annexing the labour of women and children, augments the number of human beings who form the material for capitalistic exploitation, how it confiscates the whole of the workman's disposable time, by immoderate extension of the hours of labour, and how finally its progress, which allows of enormous increase of production in shorter and shorter periods, serves as a means of systematically getting more work done in a shorter time, or in exploiting labour-power more

intensely. We now turn to the factory as a whole, and that in its most perfect form.

Dr. Ure, the Pindar of the automatic factory, describes it, on the one hand as “Combined co-operation of many orders of workpeople, adult and young, in tending with assiduous skill, a system of productive machines, continuously impelled by a central power” (the prime mover); on the other hand, as “a vast automaton, composed of various mechanical and intellectual organs, acting in uninterrupted concert for the production of a common object, all of them being subordinate to a self-regulated moving force.” These two descriptions are far from being identical. In one, the collective labourer, or social body of labour, appears as the dominant subject and the mechanical automaton as the object; in the other, the automaton itself is the subject, and the workmen are merely conscious organs, co-ordinate with the unconscious organs of the automaton, and together with them, subordinated to the central moving-power. The first description is applicable to every possible employment of machinery on a large scale, the second is characteristic of its use by capital, and therefore of the modern factory system. Ure prefers therefore, to describe the central machine, from which the motion comes, not only as an automaton, but as an autocrat. “In these spacious halls the benignant power of steam summons around him his myriads of willing menials.”

Along with the tool, the skill of the workman in handling it passes over to the machine. The capabilities of the tool are emancipated from the restraints that are inseparable from human labour-power. Thereby the technical foundation on which is based the division of labour in Manufacture, is swept away. Hence, in the place of the hierarchy of specialised workmen that characterises manufacture, there steps, in the automatic factory, a tendency to equalise and reduce to one and the same level every kind of work that has to be done by the minders of the machines; in the place of the artificially produced differentiations of the detail workmen, step the natural differences of age and sex.

So far as division of labour re-appears in the factory, it is primarily a distribution of the workmen among the specialised machines; and of masses of workmen, not however organised into groups, among the various departments of the factory, in each of which they work at a number of similar machines placed together; their co-operation, therefore, is only simple. The organised group, peculiar to manufacture, is replaced by the

connexion between the head workman and his few assistants. The essential division is, into workmen who are actually employed on the machines (among whom are included a few who look after the engine), and into mere attendants (almost exclusively children) of these workmen. Among the attendants are reckoned more or less all “Feeders” who supply the machines with the material to be worked. In addition to these two principal classes, there is a numerically unimportant class of persons, whose occupation it is to look after the whole of the machinery and repair it from time to time; such as engineers, mechanics, joiners, 8c. This is a superior class of workmen, some of them scientifically educated, others brought up to a trade; it is distinct from the factory operative class, and merely aggregated to it. This division of labour is purely technical.

To work at a machine, the workman should be taught from childhood, in order that he may learn to adapt his own movements to the uniform and unceasing motion of an automaton. When the machinery, as a whole, forms a system of manifold machines, working simultaneously and in concert, the co-operation based upon it, requires the distribution of various groups of workmen among the different kinds of machines. But the employment of machinery does away with the necessity of crystallizing this distribution after the manner of Manufacture, by the constant annexation of a particular man to a particular function. Since the motion of the whole system does not proceed from the workman, but from the machinery, a change of persons can take place at any time without an interruption of the work. The most striking proof of this is afforded by the relays system, put into operation by the manufacturers during their revolt from 1848-1850. Lastly, the quickness with which machine work is learnt by young people, does away with the necessity of bringing up for exclusive employment by machinery, a special class of operatives. With regard to the work of the mere attendants, it can, to some extent, be replaced in the mill by machines, and owing to its extreme simplicity, it allows of a rapid and constant change of the individuals burdened with this drudgery.

Although then, technically speaking, the old system of division of labour is thrown overboard by machinery, it hangs on in the factory, as a traditional habit handed down from Manufacture, and is afterwards systematically remoulded and established in a more hideous form by capital, as a means of exploiting labour-power. The life-long speciality of handling one and the same tool, now becomes the life-long speciality of serving one and the same

machine. Machinery is put to a wrong use, with the object of transforming the workman, from his very childhood, into a part of a detail-machine. In this way, not only are the expenses of his re-production considerably lessened, but at the same time his helpless dependence upon the factory as a whole, and therefore upon the capitalist, is rendered complete. Here as everywhere else, we must distinguish between the increased productiveness due to the development of the social process of production, and that due to the capitalist exploitation of that process. In handicrafts and manufacture, the workman makes use of a tool, in the factory, the machine makes use of him. There the movements of the instrument of labour proceed from him, here it is the movements of the machine that he must follow. In manufacture the workmen are parts of a living mechanism. In the factory we have a lifeless mechanism independent of the workman, who becomes its mere living appendage. "The miserable routine of endless drudgery and toil in which the same mechanical process is gone through over and over again, is like the labour of Sisyphus. The burden of labour, like the rock, keeps ever falling back on the worn-out labourer." At the same time that factory work exhausts the nervous system to the uttermost, it does away with the many-sided play of the muscles, and confiscates every atom of freedom, both in bodily and intellectual activity. The lightening of the labour, even, becomes a sort of torture, since the machine does not free the labourer from work, but deprives the work of all interest. Every kind of capitalist production in so far as it is not only a labour-process, but also a process of creating surplus-value, has this in common, that it is not the workman that employs the instruments of labour, but the instruments of labour that employ the workman. But it is only in the factory system that this inversion for the first time acquires technical and palpable reality. By means of its conversion into an automaton, the instrument of labour confronts the labourer, during the labour-process, in the shape of capital, of dead labour, that dominates, and pumps dry, living labour-power. The separation of the intellectual powers of production from the manual labour, and the conversion of those powers into the might of capital over labour, is, as we have already shown, finally completed by modern industry erected on the foundation of machinery. The special skill of each individual insignificant factory operative vanishes as an infinitesimal quantity before the science, the gigantic physical forces, and the mass of labour that are embodied in the factory mechanism and, together with that mechanism, constitute the power of the "master." This

“master,” therefore, in whose brain the machinery and his monopoly of it are inseparably united, whenever he falls out with his “hands,” contemptuously tells them: “The factory operatives should keep in wholesome remembrance the fact that theirs is really a low species of skilled labour; and that there is none which is more easily acquired, or of its quality more amply remunerated, or which by a short training of the least expert can be more quickly, as well as abundantly, acquired.... The master’s machinery really plays a far more important part in the business of production than the labour and the skill of the operative, which six months’ education can teach, and a common labourer can learn.” The technical subordination of the workman to the uniform motion of the instruments of labour, and the peculiar composition of the body of workpeople, consisting as it does of individuals of both sexes and of all ages, give rise to a barrack discipline, which is elaborated into a complete system in the factory, and which fully develops the before mentioned labour of overlooking, thereby dividing the workpeople into operatives and overlookers, into private soldiers and sergeants of an industrial army. “The main difficulty [in the automatic factory]...lay...above all in training human beings to renounce their desultory habits of work, and to identify themselves with the unvarying regularity of the complex automaton. To devise and administer a successful code of factory discipline, suited to the necessities of factory diligence, was the Herculean enterprise, the noble achievement of Arkwright! Even at the present day, when the system is perfectly organised and its labour lightened to the utmost, it is found nearly impossible to convert persons past the age of puberty, into useful factory hands.” The factory code in which capital formulates, like a private legislator, and at his own good will, his autocracy over his workpeople, unaccompanied by that division of responsibility, in other matters so much approved of by the bourgeoisie, and unaccompanied by the still more approved representative system, this code is but the capitalistic caricature of that social regulation of the labour-process which becomes requisite in co-operation on a great scale, and in the employment in common, of instruments of labour and especially of machinery. The place of the slave driver’s lash is taken by the overlooker’s book of penalties. All punishments naturally resolve themselves into fines and deductions from wages, and the law-giving talent of the factory Lycurgus so arranges matters, that a violation of his laws is, if possible, more profitable to him than the keeping of them.

We shall here merely allude to the material conditions under which factory labour is carried on. Every organ of sense is injured in an equal degree by artificial elevation of the temperature, by the dust-laden atmosphere, by the deafening noise, not to mention danger to life and limb among the thickly crowded machinery, which, with the regularity of the seasons, issues its list of the killed and wounded in the industrial battle. Economy of the social means of production, matured and forced as in a hothouse by the factory system, is turned, in the hands of capital into systematic robbery of what is necessary for the life of the workman while he is at work, robbery of space, light, air, and of protection to his person against the dangerous and unwholesome accompaniments of the productive process, not to mention the robbery of appliances for the comfort of the workman. Is Fourier wrong when he calls factories “tempered bagnos?”

SECTION 5. — THE STRIFE BETWEEN WORKMAN AND MACHINE

The contest between the capitalist and the wage-labourer dates back to the very origin of capital. It raged on throughout the whole manufacturing period. But only since the introduction of machinery has the workman fought against the instrument of labour itself, the material embodiment of capital. He revolts against this particular form of the means of production, as being the material basis of the capitalist mode of production.

In the 17th century nearly all Europe experienced revolts of the workpeople against the ribbon-loom, a machine for weaving ribbons and trimmings, called in Germany Bandmühle, Schnurmühle, and Mühlenstuhl. These machines were invented in Germany. Abbé Lancellotti, in a work that appeared in Venice in 1636, but which was written in 1579, says as follows: “Anthony Müller of Danzig, says about 50 years ago in that town, a very ingenious machine, which weaves 4 to 6 pieces at once. But the Mayor being apprehensive that this invention might throw a large number of workmen on the streets, caused the inventor to be secretly strangled or drowned.” In Leyden, this machine was not used till 1629; there the riots of the ribbon-weavers at length compelled the Town Council to prohibit it. “In hac urbe,” says Boxhorn (Inst. Pol., 1663), referring to the introduction of this machine in Leyden, “ante hos viginti circiter annos instrumentum

quidam invenerunt textorium, quo solus plus panni et facilius conficere poterat, quam plures aequali tempore. Hinc turbæ ortæ et querulæ textorum, tandemque usus hujus instrumenti a magistratu prohibitus est.” After making various decrees more or less prohibitive against this loom in 1632, 1639, 8c., the States General of Holland at length permitted it to be used, under certain conditions, by the decree of the 15th December, 1661. It was also prohibited in Cologne in 1676, at the same time that its introduction into England was causing disturbances among the workpeople. By an imperial Edict of 19th Feb., 1685, its use was forbidden throughout all Germany. In Hamburg it was burnt in public by order of the Senate. The Emperor Charles VI., on 9th Feb., 1719, renewed the edict of 1685, and not till 1765 was its use openly allowed in the Electorate of Saxony. This machine, which shook Europe to its foundations, was in fact the precursor of the mule and the power-loom, and of the industrial revolution of the 18th century. It enabled a totally inexperienced boy, to set the whole loom with all its shuttles in motion, by simply moving a rod backwards and forwards, and in its improved form produced from 40 to 50 pieces at once.

About 1630, a wind-sawmill, erected near London by a Dutchman, succumbed to the excesses of the populace. Even as late as the beginning of the 18th century, sawmills driven by water overcame the opposition of the people, supported as it was by parliament, only with great difficulty. No sooner had Everet in 1758 erected the first wool-shearing machine that was driven by water-power, than it was set on fire by 100,000 people who had been thrown out of work. Fifty thousand workpeople, who had previously lived by carding wool, petitioned parliament against Arkwright’s scribbling mills and carding engines. The enormous destruction of machinery that occurred in the English manufacturing districts during the first 15 years of this century, chiefly caused by the employment of the power-loom, and known as the Luddite movement, gave the anti-jacobin governments of a Sidmouth, a Castlereagh, and the like, a pretext for the most re-actionary and forcible measures. It took both time and experience before the workpeople learnt to distinguish between machinery and its employment by capital, and to direct their attacks, not against the material instruments of production, but against the mode in which they are used.

The contests about wages in Manufacture, presuppose manufacture, and are in no sense directed against its existence. The opposition against the establishment of new manufactures, proceeds from the guilds and privileged

towns, not from the workpeople. Hence the writers of the manufacturing period treat the division of labour chiefly as a means of virtually supplying a deficiency of labourers, and not as a means of actually displacing those in work. This distinction is self-evident. If it be said that 100 millions of people would be required in England to spin with the old spinning-wheel the cotton that is now spun with mules by 500,000 people, this does not mean that the mules took the place of those millions who never existed. It means only this, that many millions of workpeople would be required to replace the spinning machinery. If, on the other hand, we say, that in England the power-loom threw 800,000 weavers on the streets, we do not refer to existing machinery, that would have to be replaced by a definite number of work-people, but to a number of weavers in existence who were actually replaced or displaced by the looms. During the manufacturing period, handicraft labour, altered though it was by division of labour, was yet the basis. The demands of the new colonial markets could not be satisfied owing to the relatively small number of town operatives handed down from the middle ages, and the manufactures proper opened out new fields of production to the rural population, driven from the land by the dissolution of the feudal system. At that time, therefore, division of labour and co-operation in the workshops, were viewed more from the positive aspect, that they made the workpeople more productive. Long before the period of Modern Industry, co-operation and the concentration of the instruments of labour in the hands of a few, gave rise, in numerous countries where these methods were applied in agriculture, to great, sudden and forcible revolutions in the modes of production, and consequentially, in the conditions of existence, and the means of employment of the rural populations. But this contest at first takes place more between the large and the small landed proprietors, than between capital and wage-labour; on the other hand, when the labourers are displaced by the instruments of labour, by sheep, horses, &c., in this case force is directly resorted to in the first instance as the prelude to the industrial revolution. The labourers are first driven from the land, and then come the sheep. Land grabbing on a great scale, such as was perpetrated in England, is the first step in creating a field for the establishment of agriculture on a great scale. Hence this subversion of agriculture puts on, at first, more the appearance of a political revolution.

The instrument of labour, when it takes the form of a machine, immediately becomes a competitor of the workman himself. The self-

expansion of capital by means of machinery is thenceforward directly proportional to the number of the workpeople, whose means of livelihood have been destroyed by that machinery. The whole system of capitalist production is based on the fact that the workman sells his labour-power as a commodity. Division of labour specialises this labour-power, by reducing it to skill in handling a particular tool. So soon as the handling of this tool becomes the work of a machine, then, with the use-value, the exchange-value too, of the work-man's labour-power vanishes; the workman becomes unsaleable, like paper money thrown out of currency by legal enactment. That portion of the working class, thus by machinery rendered superfluous, i.e., no longer immediately necessary for the self-expansion of capital, either goes to the wall in the unequal contest of the old handicrafts and manufactures with machinery, or else floods all the more easily accessible branches of industry, swamps the labour market, and sinks the price of labour-power below its value. It is impressed upon the workpeople, as a great consolation, first, that their sufferings are only temporary ("a temporary inconvenience"), secondly, that machinery acquires the mastery over the whole of a given field of production, only by degrees, so that the extent and intensity of its destructive effect is diminished. The first consolation neutralizes the second. When machinery seizes on an industry by degrees, it produces chronic misery among the operatives who compete with it. Where the transition is rapid, the effect is acute and felt by great masses. History discloses no tragedy more horrible than the gradual extinction of the English handloom weavers, an extinction that was spread over several decades, and finally sealed in 1838. Many of them died of starvation, many with families vegetated for a long time on 2½ d. a day. On the other hand, the English cotton machinery produced an acute effect in India. The Governor General reported 1834-35. "The misery hardly finds a parallel in the history of commerce. The bones of the cotton-weavers are bleaching the plains of India." No doubt, in turning them out of this "temporal" world, the machinery caused them no more than "a temporary inconvenience." For the rest, since machinery is continually seizing upon new fields of production, its temporary effect is really permanent. Hence, the character of independance and estrangement which the capitalist mode of production as a whole gives to the instruments of labour and to the product, as against the workman, is developed by means of machinery into a thorough antagonism. Therefore, it is with the advent of machinery, that

the workman for the first time brutally revolts against the instruments of labour.

The instrument of labour strikes down the labourer. This direct antagonism between the two comes out most strongly, whenever newly introduced machinery competes with handicrafts or manufactures, handed down from former times. But even in Modern Industry the continual improvement of machinery, and the development of the automatic system, has an analogous effect. "The object of improved machinery is to diminish manual labour, to provide for the performance of a process or the completion of a link in a manufacture by the aid of an iron instead of the human apparatus." "The adaptation of power to machinery heretofore moved by hand, is almost of daily occurrence...the minor improvements in machinery having for their object economy of power, the production of better work, the turning off more work in the same time, or in supplying the place of a child, a female, or a man, are constant, and although sometimes apparently of no great moment, have somewhat important results." "Whenever a process requires peculiar dexterity and steadiness of hand, it is withdrawn, as soon as possible, from the cunning workman, who is prone to irregularities of many kinds, and it is placed in charge of a peculiar mechanism, so self-regulating that a child can superintend it." "On the automatic plan skilled labour gets progressively superseded." "The effect of improvements in machinery, not merely in superseding the necessity for the employment of the same quantity of adult labour as before, in order to produce a given result, but in substituting one description of human labour for another, the less skilled for the more skilled, juvenile for adult, female for male, causes a fresh disturbance in the rate of wages." "The effect of substituting the self-acting mule for the common mule, is to discharge the greater part of the men spinners, and to retain adolescents and children." The extraordinary power of expansion of the factory system owing to accumulated practical experience, to the mechanical means at hand, and to constant technical progress, was proved to us by the giant strides of that system under the pressure of a shortened working day. But who, in 1860, the Zenith year of the English cotton industry, would have dreamt of the galloping improvements in machinery, and the corresponding displacement of working people, called into being during the following 3 years, under the stimulus of the American Civil War? A couple of examples from the Reports of the Inspectors of Factories will suffice on this point. A

Manchester manufacturer states: "We formerly had 75 carding engines, now we have 12, doing the same quantity of work.... We are doing with fewer hands by 14, at a saving in wages of £10 a-week. Our estimated saving in waste is about 10% in the quantity of cotton consumed." "In another fine spinning mill in Manchester, I was informed that through increased speed and the adoption of some self-acting processes, a reduction had been made, in number, for a fourth in one department, and of above half in another, and that the introduction of the combing machine in place of the second carding, had considerably reduced the number of hands formerly employed in the carding room." Another spinning mill is estimated to effect a saving of labour of 10%. The Messrs. Gilmour, spinners at Manchester, state: "In our blowing-room department we consider our expense with new machinery is fully one-third less in wages and hands...in the jack-frame and drawing-frame room, about one-third less in expense, and likewise one-third less in hands; in the spinning-room about one-third less in expenses. But this is not all; when our yarn goes to the manufacturers, it is so much better by the application of our new machinery, that they will produce a greater quantity of cloth, and cheaper than from the yarn produced by old machinery." Mr. Redgrave further remarks in the same Report: "The reduction of hands against increased production is, in fact, constantly taking place; in woollen mills the reduction commenced some time since, and is continuing; a few days since, the master of a school in the neighbourhood of Rochdale said to me, that the great falling off in the girls' school is not only caused by the distress, but by the changes of machinery in the woollen mills, in consequence of which a reduction of 70 short-timers had taken place."

The following table shows the total result of the mechanical improvements in the English cotton industry due to the American civil war.

NUMBER OF FACTORIES.

United Kingdom...	379,213	451,569	401,064

Hence, between 1861 and 1868, 338 cotton factories disappeared, in other words more productive machinery on a larger scale was concentrated in the hands of a smaller number of capitalists. The number of power-loom decreased by 20,663; but since their product increased in the same period, an improved loom must have yielded more than an old one. Lastly the number of spindles increased by 1,612,541, while the number of operatives decreased by 50,505. The “temporary” misery, inflicted on the workpeople by the cotton-crisis, was heightened, and from being temporary made permanent, by the rapid and persistent progress of machinery.

But machinery not only acts as a competitor who gets the better of the workman, and is constantly on the point of making him superfluous. It is also a power inimical to him, and as such capital proclaims it from the roof tops and as such makes use of it. It is the most powerful weapon for repressing strikes, those periodical revolts of the working class against the autocracy of capital. According to Gaskell, the steam engine was from the very first an antagonist of human power, an antagonist that enabled the capitalist to tread under foot the growing claims of the workmen, who threatened the newly born factory system with a crisis. It would be possible to write quite a history of the inventions, made since 1830, for the sole purpose of supplying capital with weapons against the revolts of the working class. At the head of these in importance, stands the self-acting mule, because it opened up a new epoch in the automatic system.

Nasmyth, the inventor of the steam hammer, gives the following evidence before the Trades Union Commission, with regard to the

improvements made by him in machinery and introduced in consequence of the wide-spread and long strikes of the engineers in 1851. "The characteristic feature of our modern mechanical improvements, is the introduction of self-acting tool machinery. What every mechanical workman has now to do, and what every boy can do, is not to work himself but to superintend the beautiful labour of the machine. The whole class of workmen that depend exclusively on their skill, is now done away with. Formerly, I employed four boys to every mechanic. Thanks to these new mechanical combinations, I have reduced the number of grown-up men from 1500 to 750. The result was a considerable increase in my profits."

Ure says of a machine used in calico printing: "At length capitalists sought deliverance from this intolerable bondage" [namely the, in their eyes, burdensome terms of their contracts with the workmen] "in the resources of science, and were speedily re-instated in their legitimate rule, that of the head over the inferior members." Speaking of an invention for dressing warps: "Then the combined malcontents, who fancied themselves impreguably intrenched behind the old lines of division of labour, found their flanks turned and their defences rendered useless by the new mechanical tactics, and were obliged to surrender at discretion." With regard to the invention of the self-acting mule, he says: "A creation destined to restore order among the industrious classes.... This invention confirms the great doctrine already propounded, that when capital enlists science into her service, the refractory hand of labour will always be taught docility." Although Ure's work appeared 30 years ago, at a time when the factory system was comparatively but little developed, it still perfectly expresses the spirit of the factory, not only by its undisguised cynicism, but also by the naïveté with which it blurts out the stupid contradictions of the capitalist brain. For instance, after propounding the "doctrine" stated above, that capital, with the aid of science taken into its pay, always reduces the refractory hand of labour to docility, he grows indignant because "it (physico-mechanical science) has been accused of lending itself to the rich capitalist as an instrument for harrassing the poor." After preaching a long sermon to show how advantageous the rapid development of machinery is to the working classes, he warns them, that by their obstinacy and their strikes they hasten that development. "Violent revulsions of this nature," he says, "display short-sighted man in the contemptible character of a self-tormentor." A few pages before he states the contrary. "Had it not been for

the violent collisions and interruptions resulting from erroneous views among the factory operatives, the factory system would have been developed still more rapidly and beneficially for all concerned.” Then he exclaims again: “Fortunately for the state of society in the cotton districts of Great Britain, the improvements in machinery are gradual.” “It” (improvement in machinery) “is said to lower the rate of earnings of adults by displacing a portion of them, and thus rendering their number superabundant as compared with the demand for their labour. It certainly augments the demand for the labour of children and increases the rate of their wages.” On the other hand, this same dispenser of consolation defends the lowness of the children’s wages on the ground that it prevents parents from sending their children at too early an age into the factory. The whole of his book is a vindication of a working day of unrestricted length; that Parliament should forbid children of 13 years to be exhausted by working 12 hours a day, reminds his liberal soul of the darkest days of the middle ages. This does not prevent him from calling upon the factory operatives to thank Providence, who by means of machinery has given them the leisure to think of their “immortal interests.”

SECTION 6. — THE THEORY OF COMPENSATION AS REGARDS THE WORKPEOPLE DISPLACED BY MACHINERY.

James Mill, MacCulloch, Torrens, Senior, John Stuart Mill, and a whole series besides, of bourgeois political economists, insist that all machinery that displaces workmen, simultaneously and necessarily sets free an amount of capital adequate to employ the same identical workmen.

Suppose a capitalist to employ 100 workmen, at £30 a year each, in a carpet factory. The variable capital annually laid out amounts, therefore, to £3000. Suppose, also, that he discharges 50 of his workmen, and employs the remaining 50 with machinery that costs him £1500. To simplify matters, we take no account of buildings, coal, &c. Further suppose that the raw material annually consumed costs £3000, both before and after the change. Is any capital set free by this metamorphosis? Before the change, the total sum of £6000 consisted half of constant, and half of variable capital. After the change it consists of £4500 constant (£3000 raw material and £1500 machinery), and £1500 variable capital. The variable capital, instead of being one half, is only one quarter, of the total capital. Instead of being set

free, a part of the capital is here locked up in such a way as to cease to be exchanged against labour-power: variable has been changed into constant capital. Other things remaining unchanged, the capital of £6000, can, in future, employ no more than 50 men. With each improvement in the machinery, it will employ fewer. If the newly introduced machinery had cost less than did the labour-power and implements displaced by it, if, for instance, instead of costing £1500, it had cost only £1000, a variable capital of £1000 would have been converted into constant capital, and locked up; and a capital of £500 would have been set free. The latter sum, supposing wages unchanged, would form a fund sufficient to employ about 16 out of the 50 men discharged; nay, less than 16, for, in order to be employed as capital, a part of this £500 must now become constant capital, thus leaving only the remainder to be laid out in labour-power.

But, suppose, besides, that the making of the new machinery affords employment to a greater number of mechanics, can that be called compensation to the carpet makers, thrown on the streets? At the best, its construction employs fewer men than its employment displaces. The sum of £1500 that formerly represented the wages of the discharged carpet-makers, now represents in the shape of machinery: (1) the value of the means of production used in the construction of that machinery, (2) the wages of the mechanics employed in its construction, and (3) the surplus-value falling to the share of their “master.” Further, the machinery need not be renewed till it is worn out. Hence, in order to keep the increased number of mechanics in constant employment, one carpet manufacturer after another must displace workmen by machines.

As a matter of fact, the apologists do not mean this sort of setting free. They have in their minds the means of subsistence of the liberated workpeople. It cannot be denied, in the above instance, that the machinery not only liberates 50 men, thus placing them at others’ disposal, but, at the same time, it withdraws from their consumption, and sets free, means of subsistence to the value of £1500. The simple fact, by no means a new one, that machinery cuts off the workmen from their means of subsistence is, therefore, in economical parlance tantamount to this, that machinery liberates means of subsistence for the workman, or converts those means into capital for his employment. The mode of expression, you see, is everything. *Nominibus mollire licet mala.*

This theory implies that the £1500 worth of means of subsistence was capital that was being expanded by the labour of the 50 men discharged. That, consequently, this capital falls out of employment so soon as they commence their forced holidays, and never rests till it has found a fresh investment, where it can again be productively consumed by these same 50 men. That sooner or later, therefore, the capital and the workmen must come together again, and that, then, the compensation is complete. That the sufferings of the workmen displaced by machinery are therefore as transient as are the riches of this world.

In relation to the discharged workmen, the £1500 worth of means of subsistence never was capital. What really confronted them as capital, was the sum of £1500, afterwards laid out in machinery. On looking closer it will be seen that this sum represented part of the carpets produced in a year by the 50 discharged men, which part they received as wages from their employer in money instead of in kind. With the carpets in the form of money, they bought means of subsistence to the value of £1500. These means, therefore, were to them, not capital, but commodities, and they, as regards these commodities, were not wage-labourers, but buyers. The circumstance that they were “freed” by the machinery, from the means of purchase, changed them from buyers into non-buyers. Hence a lessened demand for those commodities — voilà tout. If this diminution be not compensated by an increase from some other quarter, the market price of the commodities falls. If this state of things lasts for some time, and extends, there follows a discharge of workmen employed in the production of these commodities. Some of the capital that was previously devoted to production of necessary means of subsistence, has to become reproduced in another form. While prices fall, and capital is being displaced, the labourers employed in the production of necessary means of subsistence are in their turn “freed” from a part of their wages. Instead, therefore, of proving that, when machinery frees the workman from his means of subsistence, it simultaneously converts those means into capital for his further employment, our apologists, with their cut-and-dried law of supply and demand, prove, on the contrary, that machinery throws workmen on the streets not only in that branch of production in which it is introduced, but also in those branches in which it is not introduced.

The real facts, which are travestied by the optimism of economists, are as follows: The labourers, when driven out of the workshop by the

machinery, are thrown upon the labour market, and there add to the number of workmen at the disposal of the capitalists. In Part VII. of this book it will be seen that this effect of machinery, which, as we have seen, is represented to be a compensation to the working class, is on the contrary a most frightful scourge. For the present I will only say this: The labourers that are thrown out of work in any branch of industry, can no doubt seek for employment in some other branch. If they find it, and thus renew the bond between them and the means of subsistence, this takes place only by the intermediary of a new and additional capital that is seeking investment; not at all by the intermediary of the capital that formerly employed them and was afterwards converted into machinery. And even should they find employment, what a poor look-out is theirs! Crippled as they are by division of labour, these poor devils are worth so little outside their old trade, that they cannot find admission into any industries, except a few of inferior kind, that are over-supplied with underpaid workmen. Further, every branch of industry attracts each year a new stream of men, who furnish a contingent from which to fill up vacancies, and to draw a supply for expansion. So soon as machinery sets free a part of the workmen employed in a given branch of industry, the reserve men are also diverted into new channels of employment, and become absorbed in other branches; meanwhile the original victims, during the period of transition, for the most part starve and perish.

It is an undoubted fact that machinery, as such, is not responsible for “setting free” the workman from the means of subsistence. It cheapens and increases production in that branch which it seizes on, and at first makes no change in the mass of the means of subsistence produced in other branches. Hence, after its introduction, the society possesses as much, if not more, of the necessities of life than before, for the labourers thrown out of work; and that quite apart from the enormous share of the annual produce wasted by the non-workers. And this is the point relied on by our apologists! The contradictions and antagonisms inseparable from the capitalist employment of machinery, do not exist, they say, since they do not arise out of machinery, as such, but out of its capitalist employment! Since therefore machinery, considered alone, shortens the hours of labour, but, when in the service of capital, lengthens them; since in itself it lightens labour, but when employed by capital, heightens the intensity of labour; since in itself it is a victory of man over the forces of nature, but in the hands of capital, makes

man the slave of those forces; since in itself it increases the wealth of the producers, but in the hands of capital, makes them paupers — for all these reasons and others besides, says the bourgeois economist without more ado, it is clear as noonday that all these contradictions are a mere semblance of the reality, and that, as a matter of fact, they have neither an actual nor a theoretical existence. Thus he saves himself from all further puzzling of the brain, and what is more, implicitly declares his opponent to be stupid enough to contend against, not the capitalistic employment of machinery, but machinery itself.

No doubt he is far from denying that temporary inconvenience may result from the capitalist use of machinery. But where is the medal without its reverse! Any employment of machinery, except by capital, is to him an impossibility. Exploitation of the workman by the machine is therefore, with him, identical with exploitation of the machine by the workman. Whoever, therefore, exposes the real state of things in the capitalistic employment of machinery, is against its employment in any way, and is an enemy of social progress! Exactly the reasoning of the celebrated Bill Sykes. “Gentlemen of the jury, no doubt the throat of this commercial traveller has been cut. But that is not my fault, it is the fault of the knife! Must we, for such a temporary inconvenience, abolish the use of the knife? Only consider! where would agriculture and trade be without the knife? Is it not as salutary in surgery, as it is knowing in anatomy? And in addition a willing help at the festive board? If you abolish the knife — you hurl us back into the depths of barbarism.”

Although machinery necessarily throws men out of work in those industries into which it is introduced, yet it may, notwithstanding this, bring about an increase of employment in other industries. This effect, however, has nothing in common with the so-called theory of compensation. Since every article produced by a machine is cheaper than a similar article produced by hand, we deduce the following infallible law: If the total quantity of the article produced by machinery, be equal to the total quantity of the article previously produced by a handicraft or by manufacture, and now made by machinery, then the total labour expended is diminished. The new labour spent on the instruments of labour, on the machinery, on the coal, and so on, must necessarily be less than the labour displaced by the use of the machinery; otherwise the product of the machine would be as dear, or dearer, than the product of the manual labour. But, as a matter of

fact, the total quantity of the article produced by machinery with a diminished number of workmen, instead of remaining equal to, by far exceeds the total quantity of the hand-made article that has been displaced. Suppose that 400,000 yards of cloth have been produced on power-looms by fewer weavers than could weave 100,000 yards by hand. In the quadrupled product there lies four times as much raw material. Hence the production of raw material must be quadrupled. But as regards the instruments of labour, such as buildings, coal, machinery, and so on, it is different; the limit up to which the additional labour required for their production can increase, varies with the difference between the quantity of the machine-made article, and the quantity of the same article that the same number of workmen could make by hand.

Hence, as the use of machinery extends in a given industry, the immediate effect is to increase production in the other industries that furnish the first with means of production. How far employment is thereby found for an increased number of men, depends, given the length of the working-day and the intensity of labour, on the composition of the capital employed, i.e., on the ratio of its constant to its variable component. This ratio, in its turn, varies considerably with the extent to which machinery has already seized on, or is then seizing on, those trades. The number of the men condemned to work in coal and metal mines increased enormously owing to the progress of the English factory system; but during the last few decades this increase of number has been less rapid, owing to the use of new machinery in mining. A new type of workman springs into life along with the machine, namely, its maker. We have already learnt that machinery has possessed itself even of this branch of production on a scale that grows greater every day. As to raw material, there is not the least doubt that the rapid strides of cotton spinning, not only pushed on with tropical luxuriance the growth of cotton in the United States, and with it the African slave trade, but also made the breeding of slaves the chief business of the border slave-states. When, in 1790, the first census of slaves was taken in the United States, their number was 697,000; in 1861 it had nearly reached four millions. On the other hand, it is no less certain that the rise of the English woollen factories, together with the gradual conversion of arable land into sheep pasture, brought about the superfluity of agricultural labourers that led to their being driven in masses into the towns. Ireland, having during the last twenty years reduced its population by nearly one half, is at this

moment undergoing the process of still further reducing the number of its inhabitants, so as exactly to suit the requirements of its landlords and of the English woollen manufacturers.

When machinery is applied to any of the preliminary or intermediate stages through which the subject of labour has to pass on its way to completion, there is an increased yield of material in those stages, and simultaneously an increased demand for labour in the handicrafts or manufactures supplied by the produce of the machines. Spinning by machinery, for example, supplied yarn so cheaply and so abundantly that the hand-loom weavers were, at first, about to work full time without increased outlay. Their earnings accordingly rose. Hence a flow of people into the cotton-weaving trade, till at length the 800,000 weavers, called into existence by the Jenny, the throstle and the mule, were overwhelmed by the power-loom. So also, owing to the abundance of clothing materials produced by machinery, the number of tailors, seamstresses and needle-women, went on increasing until the appearance of the sewing machine.

In proportion as machinery, with the aid of a relatively small number of workpeople, increases the mass of raw materials, intermediate products, instruments of labour, &c., the working-up of these raw materials and intermediate products becomes split up into numberless branches; social production increases in diversity. The factory system carries the social division of labour immeasurably further than does manufacture, for it increases the productiveness of the industries it seizes upon, in a far higher degree.

The immediate result of machinery is to augment surplus-value and the mass of products in which surplus-value is embodied. And, as the substances consumed by the capitalists and their dependants become more plentiful, so too do these orders of society. Their growing wealth, and the relatively diminished number of workmen required to produce the necessaries of life beget, simultaneously with the rise of new and luxurious wants, the means of satisfying those wants. A larger portion of the produce of society is changed into surplus produce, and a larger part of the surplus produce is supplied for consumption in a multiplicity of refined shapes. In other words, the production of luxuries increases. The refined and varied forms of the products are also due to new relations with the markets of the world, relations that are created by Modern Industry. Not only are greater

quantities of foreign articles of luxury exchanged for home products, but a greater mass of foreign raw materials, ingredients, and intermediate products, are used as means of production in the home industries. Owing to these relations with the markets of the world the demand for labour increases in the carrying trades, which split up into numerous varieties.

The increase of the means of production and subsistence, accompanied by a relative diminution in the number of labourers, causes an increased demand for labour in making canals, docks, tunnels, bridges, and so on, works that can only bear fruit in the far future. Entirely new branches of production, creating new fields of labour, are also formed, as the direct result either of machinery or of the general industrial changes brought about by it. But the place occupied by these branches in the general production is, even in the most developed countries, far from important. The number of labourers that find employment in them is directly proportional to the demand, created by those industries, for the crudest form of manual labour. The chief industries of this kind are, at present, gas works, telegraphs, photography, steam navigation, and railways. According to the census of 1861 for England and Wales, we find in the gas industry (gasworks, production of mechanical apparatus, servants of the gas companies 8c.), 15,211 persons; in telegraphy, 2399; in photography, 2366; steam navigation, 3570; and in railways, 70,599, of whom the unskilled “navvies,” more or less permanently employed, and the whole administrative and commercial staff, make up about 28,000. The total number of persons, therefore, employed in these five new industries amounts to 94,145.

Lastly, the extraordinary productiveness of modern industry, accompanied as it is by both a more extensive and a more intense exploitation of labour-power in all other spheres of production, allows of the unproductive employment of a larger and larger part of the working class, and the consequent reproduction, on a constantly extending scale, of the ancient domestic slaves under the name of a servant class, including men-servants, women-servants, lackeys, 8c. According to the census of 1861, the population of England and Wales was 20,066,244; of these, 9,776,259 males, and 10,289,965 female. If we deduct from this population all who are too old or too young for work, all unproductive women, young persons and children, the “ideological” classes, such as government officials, priests, lawyers, soldiers, 8c.; further, all who have no occupation but to consume the labour of others in the form of rent, interest, 8c.; and,

lastly, paupers, vagabonds, and criminals, there remain in round numbers eight millions of the two sexes of every age, including in that number every capitalist who is in any way engaged in industry, commerce, or finance. Among these, 8 millions are:

PERSONS.

Of these only 177,596 are males above 13 years of age.

Of these, 30,501 are females.

Of these, 137,447 males. None are included in the 1,208,648 who do not serve in private houses. Between 1861 and 1870 the number of male servants nearly doubled itself. It increased to 267,671. In the year 1847 there were 2694 gamekeepers (for the landlords' preserves), in 1869 there were 4921. The young servant girls in the houses of the London lower middle class are in common parlance called "slaveys."

Agricultural labourers (including shepherds, farm servants, and maidservants living in the houses of farmers),	1,098,261
--	-----------

All who are employed in cotton, woollen, worsted, flax, hemp, silk, and jute factories, in stocking making and lace making by machinery,...	642,607
---	---------

All who are employed in coal mines and metal mines,...	565,835
--	---------

All who are employed in metal works (blast-furnaces, rolling mills, &c.), and metal manufactures of every kind,	396,998
---	---------

The servant class,...	1,208,648
-----------------------	-----------

All the persons employed in textile factories and in mines, taken together, number 1,208,442; those employed in textile factories and metal industries, taken together, number 1,039,605; in both cases less than the number of modern domestic slaves. What a splendid result of the capitalist exploitation of machinery!

SECTION 7. — REPULSION AND ATTRACTION OF WORKPEOPLE BY THE FACTORY SYSTEM. CRISIS IN THE COTTON TRADE.

All political economists of any standing admit that the introduction of new machinery has a baneful effect on the workmen in the old handicrafts and manufactures with which this machinery at first competes. Almost all of them bemoan the slavery of the factory operative. And what is the great

trump-card that they play? That machinery, after the horrors of the period of introduction and development have subsided, instead of diminishing, in the long run increases the number of the slaves of labour! Yes, political economy revels in the hideous theory, hideous to every “philanthropist” who believes in the eternal nature-ordained necessity for capitalist production, that after a period of growth and transition, even its crowning success, the factory system based on machinery, grinds down more workpeople than on its first introduction it throws on the streets.

It is true that in some cases, as we saw from instances of English worsted and silk factories, an extraordinary extension of the factory system may, at a certain stage of its development, be accompanied not only by a relative, but by an absolute decrease in the number of operatives employed. In the year 1860, when a special census of all the factories in the United Kingdom was taken by order of Parliament, the factories in those parts of Lancashire, Cheshire, and Yorkshire, included in the district of Mr. Baker, the factory inspector, numbered 652; 570 of these contained 85,622 power-looms, 6,819,146 spindles (exclusive of doubling spindles), employed 27,439 horse-power (steam), and 1390 (water), and 94,119 persons. In the year 1865, the same factories contained, looms 95,163, spindles 7,025,031, had a steam-power of 28,925 horses, and a water-power of 1445 horses, and employed 88,913 persons. Between 1860 and 1865, therefore, the increase in looms was 11%, in spindles 3%, and in engine-power 3%, while the number of persons employed decreased 5½%. Between 1852 and 1862, considerable extension of the English woollen manufacture took place, while the number of hands employed in it remained almost stationary, showing how greatly the introduction of new machines had superseded the labour of preceding periods. In certain cases, the increase in the number of hands employed is only apparent; that is, it is not due to the extension of the factories already established, but to the gradual annexation of connected trades; for instance, the increase in power-looms, and in the hands employed by them between 1838 and 1856, was, in the cotton trade, simply owing to the extension of this branch of industry; but in the other trades to the application of steam-power to the carpet-loom, to the ribbon-loom, and to the linen-loom, which previously had been worked by the power of men. Hence the increase of the hands in these latter trades was merely a symptom of a diminution in the total number employed. Finally, we have considered this question entirely apart from the fact, that everywhere, except in the

metal industries, young persons (under 18), and women and children form the preponderating element in the class of factory hands.

Nevertheless, in spite of the mass of hands actually displaced and virtually replaced by machinery, we can understand how the factory operatives, through the building of more mills and the extension of old ones in a given industry, may become more numerous than the manufacturing workmen and handicraftsmen that have been displaced. Suppose, for example, that in the old mode of production, a capital of £500 is employed weekly, two-fifths being constant and three-fifths variable capital, i.e., £200 being laid out in means of production, and £300, say £1 per man, in labour-power. On the introduction of machinery the composition of this capital becomes altered. We will suppose it to consist of four-fifths constant and one-fifth variable, which means that only £100 is now laid out in labour-power. Consequently, two-thirds of the workmen are discharged. If now the business extends, and the total capital employed grows to £1500 under unchanged conditions, the number of operatives employed will increase to 300, just as many as before the introduction of the machinery. If the capital further grows to £2000, 400 men will be employed, or one-third more than under the old system. Their numbers have, in point of fact, increased by 100, but relatively, i.e., in proportion to the total capital advanced, they have diminished by 800, for the £2000 capital would, in the old state of things, have employed 1200 instead of 400 men. Hence, a relative decrease in the number of hands is consistent with an actual increase. We assumed above that while the total capital increases, its composition remains the same, because the conditions of production remain constant. But we have already seen that, with every advance in the use of machinery, the constant component of capital, that part which consists of machinery, raw material, &c., increases, while the variable component, the part laid out in labour-power, decreases. We also know that in no other system of production is improvement so continuous, and the composition of the capital employed so constantly changing as in the factory system. These changes are, however, continually interrupted by periods of rest, during which there is a mere quantitative extension of the factories on the existing technical basis. During such periods the operatives increase in number. Thus, in 1835, the total number of operatives in the cotton, woollen, worsted, flax, and silk factories in the United Kingdom was only 354,684; while in 1861 the number of the power-loom weavers alone (of both sexes and of all ages,

from eight years upwards), amounted to 230,654. Certainly, this growth appears less important when we consider that in 1838 the hand-loom weavers with their families still numbered 800,000, not to mention those thrown out of work in Asia, and on the Continent of Europe.

In the few remarks I have still to make on this point, I shall refer to some actually existing relations, the existence of which our theoretical investigation has not yet disclosed.

So long as, in a given branch of industry, the factory system extends itself at the expense of the old handicrafts or of manufacture, the result is as sure as is the result of an encounter between any army furnished with breach-loaders, and one armed with bows and arrows. This first period, during which machinery conquers its field of action, is of decisive importance owing to the extraordinary profits that it helps to produce. These profits not only form a source of accelerated accumulation, but also attract into the favoured sphere of production a large part of the additional social capital that is being constantly created, and is ever on the look-out for new investments. The special advantages of this first period of fast and furious activity are felt in every branch of production that machinery invades. So soon, however, as the factory system has gained a certain breadth of footing and a definite degree of maturity, and, especially, so soon as its technical basis, machinery, is itself produced by machinery; so soon as coal mining and iron mining, the metal industries, and the means of transport have been revolutionised; so soon, in short, as the general conditions requisite for production by the modern industrial system have been established, this mode of production acquires an elasticity, a capacity for sudden extension by leaps and bounds that finds no hindrance except in the supply of raw material and in the disposal of the produce. On the one hand, the immediate effect of machinery is to increase the supply of raw material in the same way, for example, as the cotton gin augmented the production of cotton. On the other hand, the cheapness of the articles produced by machinery, and the improved means of transport and communication furnish the weapons for conquering foreign markets. By ruining handicraft production in other countries, machinery forcibly converts them into fields for the supply of its raw material. In this way East India was compelled to produce cotton, wool, hemp, jute, and indigo for Great Britain. By constantly making a part of the hands "super-numerary," modern industry, in all countries where it has taken root, gives a spur to emigration and to the colonization of foreign

lands, which are thereby converted into settlements for growing the raw material of the mother country; just as Australia, for example, was converted into a colony for growing wool. A new and international division of labour, a division suited to the requirements of the chief centres of modern industry springs up, and converts one part of the globe into a chiefly agricultural field of production, for supplying the other part which remains a chiefly industrial field. This evolution hangs together with radical changes in agriculture which we need not here further inquire into.

On the motion of Mr. Gladstone, the House of Commons ordered, on the 17th February, 1867, a return of the total quantities of grain, corn, and flour, of all sorts, imported into, and exported from, the United Kingdom, between the years 1831 and 1866. I give below a summary of the result. The flour is given in quarters of corn.

QUINQUENNIAL PERIODS AND THE YEAR 1866.

ANNUAL AVERAGE.	1831-1835.	1836-1840.	1841-1845.	1846-1850.
Import (Qrs.) - -	1,096,373	2,389,729	2,843,865	8,776,552
Export " - -	225,363	251,770	139,056	155,461
Excess of Import over export - -	871,110	2,137,959	2,704,809	8,621,091
POPULATION.				
Yearly average in each period, - -	24,621,107	25,929,507	27,262,569	27,797,598
Average quantity of corn, &c., in qrs., consumed annu- ally per head over and above the home produce con- sumed, - - - -	0·036	0·082	0·099	0·310

QUINQUENNIAL PERIODS, &c.—(CONTINUED.)

ANNUAL AVERAGE.	1851-1855.	1856-1860.	1861-1865.	1866.
Import (Qrs.) - -	8,345,237	10,912,612	15,009,871	16,457,340
Export " - -	307,491	341,150	302,754	216,218
Excess of Import over export - -	8,037,746	10,572,462	14,707,117	16,241,122
POPULATION.				
Yearly average in each period, - -	27,572,923	28,391,544	29,381,460	29,935,404
Average quantity of corn, &c., in qrs., consumed annu- ally per head over and above the home produce con- sumed,	0.291	0.372	0.543	0.543

The enormous power, inherent in the factory system, of expanding by jumps, and the dependence of that system on the markets of the world, necessarily beget feverish production, followed by over-filling of the markets, whereupon contraction of the markets brings on crippling of production. The life of modern industry becomes a series of periods of moderate activity, prosperity, over-production, crisis and stagnation. The uncertainty and instability to which machinery subjects the employment, and consequently the conditions of existence, of the operatives become normal, owing to these periodic changes of the industrial cycle. Except in the periods of prosperity, there rages between the capitalists the most furious combat for the share of each in the markets. This share is directly proportional to the cheapness of the product. Besides the rivalry that this struggle begets in the application of improved machinery for replacing labour-power, and of new methods of production, there also comes a time in every industrial cycle, when a forcible reduction of wages beneath the value of labour-power, is attempted for the purpose of cheapening commodities.

A necessary condition, therefore, to the growth of the number of factory hands, is a proportionally much more rapid growth of the amount of capital invested in mills. This growth, however, is conditioned by the ebb and flow of the industrial cycle. It is, besides, constantly interrupted by the technical progress that at one time virtually supplies the place of new workmen, at another, actually displaces old ones. This qualitative change in mechanical industry continually discharges hands from the factory, or shuts its doors against the fresh stream of recruits, while the purely quantitative extension of the factories absorbs not only the men thrown out of work, but also fresh contingents. The workpeople are thus continually both repelled and attracted, hustled from pillar to post, while, at the same time, constant changes take place in the sex, age, and skill of the levies.

The lot of the factory operatives will be best depicted by taking a rapid survey of the course of the English cotton industry.

From 1770 to 1815 this trade was depressed or stagnant for 5 years only. During this period of 45 years the English manufacturers had a monopoly of machinery and of the markets of the world. From 1815 to 1821 depression; 1822 and 1823 prosperity; 1824 abolition of the laws against Trades' Unions, great extension of factories everywhere; 1825 crisis; 1826 great misery and riots among the factory operatives; 1827 slight improvement; 1828 great increase in power-looms, and in exports; 1829 exports, especially to India, surpass all former years; 1830 glutted markets, great distress; 1831 to 1833 continued depression, the monopoly of the trade with India and China withdrawn from the East India Company; 1834 great increase of factories and machinery, shortness of hands. The new poor law furthers the migration of agricultural labourers into the factory districts. The country districts swept of children. White slave trade; 1835 great prosperity, contemporaneous starvation of the handloom weavers; 1836 great prosperity; 1837 and 1838 depression and crisis; 1839 revival; 1840 great depression, riots, calling out of the military; 1841 and 1842 frightful suffering among the factory operatives; 1842 the manufacturers lock the hands out of the factories in order to enforce the repeal of the Corn Laws. The operatives stream in thousands into the towns of Lancashire and Yorkshire, are driven back by the military, and their leaders brought to trial at Lancaster; 1843 great misery; 1844 revival; 1845 great prosperity; 1846 continued improvement at first, then reaction. Repeal of the Corn Laws; 1847 crisis, general reduction of wages by 10 and more per cent. in honour

of the “big loaf;” 1848 continued depression; Manchester under military protection; 1849 revival; 1850 prosperity; 1851 falling prices, low wages, frequent strikes; 1852 improvement begins, strikes continue, the manufacturers threaten to import foreign hands; 1853 increasing exports. Strike for 8 months, and great misery at Preston; 1854 prosperity, glutted markets; 1855 news of failures stream in from the United States, Canada, and the Eastern markets; 1856 great prosperity; 1857 crisis; 1858 improvement; 1859 great prosperity, increase in factories; 1860 Zenith of the English cotton trade, the Indian, Australian, and other markets so glutted with goods that even in 1863 they had not absorbed the whole lot; the French Treaty of Commerce, enormous growth of factories and machinery; 1861 prosperity continues for a time, reaction, the American civil war, cotton famine; 1862 to 1863 complete collapse.

The history of the cotton famine is too characteristic to dispense with dwelling upon it for a moment. From the indications as to the condition of the markets of the world in 1860 and 1861, we see that the cotton famine came in the nick of time for the manufacturers, and was to some extent advantageous to them, a fact that was acknowledged in the reports of the Manchester Chamber of Commerce, proclaimed in Parliament by Palmerston and Derby, and confirmed by events. No doubt, among the 2887 cotton mills in the United Kingdom in 1861, there were many of small size. According to the report of Mr. A. Redgrave, out of the 2109 mills included in his district, 392 or 19% employed less than ten horse-power each; 345, or 16% employed 10 H. P., and less than 20 H. P. while 1372 employed upwards of 20 H. P. The majority of the small mills were weaving sheds, built during the period of prosperity after 1858, for the most part by speculators, of whom one supplied the yarn, another the machinery, a third the buildings, and were worked by men who had been overlookers, or by other persons of small means. These small manufacturers mostly went to the wall. The same fate would have overtaken them in the commercial crisis that was staved off only by the cotton famine. Although they formed one-third of the total number of manufacturers, yet their mills absorbed a much smaller part of the capital invested in the cotton trade. As to the extent of the stoppage, it appears from authentic estimates, that in October 1862, 60.3% of the spindles, and 58% of the looms were standing. This refers to the cotton trade as a whole, and, of course, requires considerable modification for individual districts. Only very few mills worked full time

(60 hours a week), the remainder worked at intervals. Even in those few cases where full time was worked, and at the customary rate of piece-wage, the weekly wages of the operatives necessarily shrank, owing to good cotton being replaced by bad, Sea Island by Egyptian (in fine spinning mills), American and Egyptian by Surat, and pure cotton by mixing of waste and Surat. The shorter fibre of the Surat cotton and its dirty condition, the greater fragility of the thread, the substitution of all sorts of heavy ingredients for flour in sizing the warps, all these lessened the speed of the machinery, or the number of looms that could be superintended by one weaver, increased the labour caused by defects in the machinery, and reduced the piece-wage by reducing the mass of the product turned off. Where Surat cotton was used the loss to the operatives when on full time, amounted to 20, 30, and more per cent. But besides this, the majority of the manufacturers reduced the rate of piece-wage by 5, 7½, and 10 per cent. We can therefore conceive the situation of those hands who were employed for only 3, 3½ or 4 days a week, or for only 6 hours a day. Even in 1863, after a comparative improvement had set in, the weekly wages of spinners and of weavers were 3s. 4d., 3s. 10d., 4s. 6d. and 5s. 1d. Even in this miserable state of things, however, the inventive spirit of the master never stood still, but was exercised in making deductions from wages. These were to some extent inflicted as a penalty for defects in the finished article that were really due to his bad cotton and to his unsuitable machinery. Moreover, where the manufacturer owned the cottages of the work-people, he paid himself his rents by deducting the amount from these miserable wages. Mr. Redgrave tells us of self-acting minders (operatives who manage a pair of self-acting mules) “earning at the end of a fortnight’s full work 8s. 11d., and that from this sum was deduced the rent of the house, the manufacturer, however, returning half the rent as a gift. The minders took away the sum of 6s. 11d. In many places the self-acting minders ranged from 5s. to 9s. per week, and the weavers from 2s. to 6s. per week, during the latter part of 1862.” Even when working short time the rent was frequently deducted from the wages of the operatives. No wonder that in some parts of Lancashire a kind of famine fever broke out. But more characteristic than all this, was the revolution that took place in the process of production at the expense of the workpeople. Experimenta in corpore vili, like those of anatomists on frogs, were formally made. “Although,” says Mr. Redgrave, “I have given the actual earnings of the operatives in the several mills, it

does not follow that they earn the same amount week by week. The operatives are subject to great fluctuation from the constant experimentalizing of the manufacturers.... the earnings of the operatives rise and fall with the quality of the cotton mixings; sometimes they have been within 15 per cent. of former earnings, and then, in a week or two, they have fallen off from 50 to 60 per cent.” These experiments were not made solely at the expense of the workman’s means of subsistence. His five senses also had to pay the penalty. “The people who are employed in making up Surat cotton complain very much. They inform me, on opening the bales of cotton there is an intolerable smell, which causes sickness.... In the mixing, scribbling and carding rooms, the dust and dirt which are disengaged, irritate the air passages, and give rise to cough and difficulty of breathing. A disease of the skin, no doubt from the irritation of the dirt contained in the Surat cotton, also prevails...The fibre being so short, a great amount of size, both animal and vegetable, is used.... Bronchitis is more prevalent owing to the dust. Inflammatory sore throat is common, from the same cause. Sickness and dyspepsia are produced by the frequent breaking of the weft, when the weaver sucks the weft through the eye of the shuttle.” On the other hand, the substitutes for flour were a Fortunatus’ purse to the manufacturers, by increasing the weight of the yarn. They caused “15 lbs. of raw material to weigh 26 lbs. after it was woven.” In the Report of Inspectors of Factories for 30th April, 1864, we read as follows: “The trade is availing itself of this resource at present to an extent which is even discreditable. I have heard on good authority of a cloth weighing 8 lbs. which was made of 5½ lbs. cotton and 2¾ lbs. size; and of another cloth weighing 5¼ lbs., of which 2 lbs. was size. These were ordinary export shirtings. In cloths of other descriptions, as much as 50 per cent. size is sometimes added; so that a manufacturer may, and does truly boast, that he is getting rich by selling cloth for less money per pound than he paid for the mere yarn of which they are composed.” But the workpeople had to suffer, not only from the experiments of the manufacturers inside the mills, and of the municipalities outside, not only from reduced wages and absence of work, from want and from charity, and from the eulogistic speeches of lords and commons. “Unfortunate females who, in consequence of the cotton famine, were at its commencement thrown out of employment, and have thereby become outcasts of society; and now though trade has revived, and work is plentiful, continue members of that unfortunate class, and are likely

to continue so. There are also in the borough more youthful prostitutes than I have known for the last 25 years.”

We find then, in the first 45 years of the English cotton trade, from 1770 to 1815, only 5 years of crisis and stagnation; but this was the period of monopoly. The second period from 1815 to 1863 counts, during its 48 years, only 20 years of revival and prosperity against 28 of depression and stagnation. Between 1815 and 1830 the competition with the continent of Europe and with the United States sets in. After 1833, the extension of the Asiatic markets is enforced by “destruction of the human race” (the wholesale extinction of Indian handloom weavers). After the repeal of the Corn Laws, from 1846 to 1863, there are 8 years of moderate activity and prosperity against 9 years of depression and stagnation. The condition of the adult male operatives, even during the years of prosperity, may be judged from the note subjoined.

SECTION 8. — REVOLUTION EFFECTED IN MANUFACTURE, HANDICRAFTS. AND DOMESTIC INDUSTRY BY MODERN INDUSTRY.

Overthrow of Co-operation based on Handicraft and on the Division of Labour.

We have seen how machinery does away with co-operation based on handicrafts, and with manufacture based on the division of handicraft labour. An example of the first sort is the mowing-machine; it replaces co-operation between mowers. A striking example of the second kind, is the needle-making machine. According to Adam Smith, 10 men, in his day, made in co-operation, over 48,000 needles a-day. On the other hand, a single needle-machine makes 145,000 in a working day of 11 hours. One woman or one girl superintends four such machines, and so produces near upon 600,000 needles in a day, and upwards of 3,000,000 in a week. A single machine, when it takes the place of co-operation or of manufacture, may itself serve as the basis of an industry of a handicraft character. Still, such a return to handicrafts is but a transition to the factory system, which, as a rule, makes its appearance so soon as the human muscles are replaced, for the purpose of driving the machines, by a mechanical motive power, such as steam or water. Here and there, but in any case only for a time, an

industry may be carried on, on a small scale, by means of mechanical power. This is effected by hiring steam power, as is done in some of the Birmingham trades, or by the use of small calorie-engines, as in some branches of weaving. In the Coventry silk weaving industry the experiment of "cottage factories" was tried. In the centre of a square surrounded by rows of cottages, an engine-house was built and the engine connected by shafts with the looms in the cottages. In all cases the power was hired at so much per loom. The rent was payable weekly, whether the looms worked or not. Each cottage held from 2 to 6 looms; some belonged to the weaver, some were bought on credit, some were hired. The struggle between these cottage factories and the factory proper, lasted over 12 years. It ended with the complete ruin of the 300 cottage-factories. Wherever the nature of the process did not involve production on a large scale, the new industries that have sprung up in the last few decades, such as envelope making, steel-pen making, 8c., have, as a general rule, first passed through the handicraft stage, and then the manufacturing stage, as short phases of transition to the factory stage. The transition is very difficult in those cases where the production of the article by manufacture consists, not of a series of graduated processes, but of a great number of disconnected ones. This circumstance formed a great hindrance to 15 years ago, a machine was invented that automatically performed 6 separate operations at once. The first steel-pens were supplied by the handicraft system, in the year 1820, at £7 4s, the gross; in 1830 they were supplied by manufacture at 8s., and to-day the factory system supplies them to the trade at from 2s. to 6d. the gross.

Re-action of the Factory System on Manufacture and Domestic Industries.

Along with the development of the factory system and of the revolution in agriculture that accompanies it, production in all the other branches of industry not only extends, but alters its character. The principle, carried out in the factory system, of analysing the process of production into its constituent phases, and of solving the problems thus proposed by the application of mechanics, of chemistry, and of the whole range of the natural sciences, becomes the determining principle everywhere. Hence, machinery squeezes itself into the manufacturing industries first for one detail process, then for another. Thus the solid crystal of their organisation, based on the old division of labour, becomes dissolved, and makes way for

constant changes. Independently of this, a radical change takes place in the composition of the collective labourer, a change of the persons working in combination. In contrast with the manufacturing period, the division of labour is thenceforth based, wherever possible, on the employment of women, of children of all ages, and of unskilled labourers, in one word, on cheap labour, as it is characteristically called in England. This is the case not only with all production on a large scale, whether employing machinery or not, but also with the so-called domestic industry, whether carried on in the houses of the workpeople or in small workshops. This modern so-called domestic industry has nothing, except the name, in common with the old-fashioned domestic industry, the existence of which presupposes independent urban handicrafts, independent peasant farming, and above all, a dwelling-house for the labourer and his family. That old-fashioned industry has now been converted into an outside department of the factory, the manufactory, or the warehouse. Besides the factory operatives, the manufacturing workmen and the handicraftsmen, whom it concentrates in large masses at one spot, and directly commands, capital also sets in motion, by means of invisible threads, another army; that of the workers in the domestic industries, who dwell in the large towns and are also scattered over the face of the country. An example: The shirt factory of Messrs. Tille at Londonderry, which employs 1000 operatives in the factory itself, and 9000 people spread up and down the country and working in their own houses.

The exploitation of cheap and immature labour-power is carried out in a more shameless manner in modern Manufacture than in the factory proper. This is because the technical foundation of the factory system, namely, the substitution of machines for muscular power, and the light character of the labour, is almost entirely absent in Manufacture, and at the same time women and over-young children are subjected, in a most unconscionable way, to the influence of poisonous or injurious substances. This exploitation is more shameless in the so-called domestic industry than in manufactures, and that because the power of resistance in the labourers decreases with their dissemination; because a whole series of plundering parasites insinuate themselves between the employer and the workman; because a domestic industry has always to compete, either with the factory system, or with manufacturing in the same branch of production; because poverty robs the workman of the conditions most essential to his labour, of space, light and

ventilation; because employment becomes more and more irregular; and, finally, because in these the last resorts of the masses made “redundant” by Modern Industry and Agriculture, competition for work attains its maximum. Economy in the means of production, first systematically carried out in the factory system, and there, from the very beginning, coincident with the most reckless squandering of labour-power, and robbery of the conditions normally requisite for labour — this economy now shows its antagonistic and murderous side more and more in a given branch of industry, the less the social productive power of labour and the technical basis for a combination of processes are developed in that branch.

Modern Manufacture.

I now proceed, by a few examples, to illustrate the principles laid down above. As a matter of fact, the reader is already familiar with numerous instances given in the chapter on the working day. In the hardware manufactures of Birmingham and the neighborhood, there are employed, mostly in very heavy work, 30,000 children and young persons, besides 10,000 women. There they are to be seen in the unwholesome brass-foundries, button factories, enamelling, galvanizing, and lackering works. Owing to the excessive labour of their workpeople, both adult and non-adult, certain London houses where newspapers and books are printed have got the ill-omened name of “slaughter-houses.” Similar excesses are practised in bookbinding, where the victims are chiefly women, girls, and children; young persons have to do heavy work in rope-walks and night-work in salt mines, candle manufactories, and chemical works; young people are worked to death at turning the looms in silk weaving, when it is not carried on by machinery. One of the most shameful, the most dirty, and the worst paid kinds of labour, and one on which women and young girls are by preference employed, is the sorting of rags. It is well known that Great Britain, apart from its own immense store of rags, is the emporium for the rag trade of the whole world. They flow in from Japan, from the most remote States of South America, and from the Canary Islands. But the chief sources of their supply are Germany, France, Russia, Italy, Egypt, Turkey, Belgium, and Holland. They are used for manure, for making bed-flocks, for shoddy, and they serve as the raw material of paper. The rag-sorters are the medium for the spread of small-pox and other infectious diseases, and they themselves are the first victims. A classical example of over-work, of hard and inappropriate labour, and of its brutalising effects on

the workman from his childhood upwards, is afforded not only by coal-mining and miners generally, but also by tile and brick making, in which industry the recently invented machinery is, in England, used only here and there. Between May and September the work lasts from 5 in the morning till 8 in the evening, and where the drying is done in the open air, it often lasts from 4 in the morning till 9 in the evening. Work from 5 in the morning till 7 in the evening is considered “reduced” and “moderate.” Both boys and girls of 6 and even of 4 years of age are employed. They work for the same number of hours, often longer, than the adults. The work is hard and the summer heat increases the exhaustion. In a certain tile field at Mosley, e.g., a young woman, 24 years of age, was in the habit of making 2000 tiles a day, with the assistance of 2 little girls, who carried the clay for her, and stacked the tiles. These girls carried daily 10 tons up the slippery sides of the clay pits, from a depth of 30 feet, and then for a distance of 210 feet. “It is impossible for a child to pass through the purgatory of a tile-field without great moral degradation...the low language, which they are accustomed to hear from their tenderest years, the filthy, indecent, and shameless habits, amidst which, unknowing, and half wild, they grow up, make them in after life lawless, abandoned, dissolute.... A frightful source of demoralization is the mode of living. Each moulder, who is always a skilled labourer, and the chief of a group, supplies his 7 subordinates with board and lodging in his cottage. Whether members of his family or not, the men, boys, and girls all sleep in the cottage, which contains generally two, exceptionally 3 rooms, all on the ground floor, and badly ventilated. These people are so exhausted after the day’s work, that neither the rules of health, of cleanliness, nor of decency are in the least observed. Many of these cottages are models of untidiness, dirt, and dust.... The greatest evil of the system that employs young girls on this sort of work, consists in this, that, as a rule, it chains them fast from childhood for the whole of their after-life to the most abandoned rabble. They become rough, foul-mouthed boys, before Nature has taught them that they are women. Clothed in a few dirty rags, the legs naked far above the knees, hair and face besmeared with dirt, they learn to treat all feelings of decency and of shame with contempt. During meal-times they lie at full length in the fields, or watch the boys bathing in a neighboring canal. Their heavy day’s work at length completed, they put on better clothes, and accompany the men to the public houses.” That excessive insobriety is prevalent from childhood upwards among the whole

of this class, is only natural. “The worst is that the brickmakers despair of themselves. You might as well, said one of the better kind to a chaplain of Southallfield, try to raise and improve the devil as a brickie, sir!”

As to the manner in which capital effects an economy in the requisites of labour, in modern Manufacture (in which I include all workshops of larger size, except factories proper), official and most ample material bearing on it is to be found in the Public Health Reports IV. (1863) and VI. (1864). The description of the workshops, more especially those of the London printers and tailors, surpasses the most loathsome phantasies of our romance writers. The effect on the health of the workpeople is self-evident. Dr. Simon, the chief medical officer of the Privy Council and the official editor of the “Public Health Report,” says: “In my fourth Report (1863) I showed, how it is practically impossible for the workpeople to insist upon that which is their first sanitary right, viz., the right that, no matter what the work for which their employer brings them together, the labour, so far as it depends upon him, should be freed from all avoidably unwholesome conditions. I pointed out, that while the workpeople are practically incapable of doing themselves this sanitary justice, they are unable to obtain any effective support from the paid administrations of the sanitary police.... The life of myriads of workmen and workwomen is now uselessly tortured and shortened by the never-ending physical suffering that their mere occupation begets.” In illustration of the way in which the workrooms influence the state of health, Dr. Simon gives the following table of mortality.

Number of persons of all ages employed in the respective industries.	Industries compared as regards health.	Death rate per 100,000 men in the respective industries between the stated ages.		
		Age 25-35.	Age 35-45.	Age 45-55.
958,265	Agriculture in England & Wales	743	805	1,145
22,301 men 12,379 women	London tailors	958	1,282	2,093
13,803	London printers	894	1,747	2,367

Modern Domestic Industry.

I now come to the so-called domestic industry. In order to get an idea of the horrors of this sphere, in which capital conducts its exploitation in the background of modern mechanical industry, one must go to the apparently quiet idyllic trade of nail-making, carried on in a few remote villages of England. In this place, however, it will be enough to give a few examples

from those branches of the lace-making and straw-plaiting industries that are not yet carried on by the aid of machinery, and that as yet do not compete with branches carried on in factories or in manufactories.

Of the 150,000 persons employed in England in the production of lace, about 10,000 fall under the authority of the Factory Act, 1861. Almost the whole of the remaining 140,000 are women, young persons, and children of both sexes, the male sex, however, being weakly represented. The state of health of this cheap material for exploitation will be seen from the following table, computed by Dr. Trueman, physician to the Nottingham General Dispensary. Out of 686 female patients who were lace makers, most of them between the ages of 17 and 24, the number of consumptive ones were:

Ch. Empl. Comm., II. Rep., p. xxii., n. 166.

1852. — 1 in 45.	1855. — 1 in 18.	1858. — 1 in 15.
1853. — 1 in 28.	1856. — 1 in 15.	1859. — 1 in 9.
1854. — 1 in 17.	1857. — 1 in 13.	1860. — 1 in 8.
1861. — 1 in 8.		

This progress in the rate of consumption ought to suffice for the most optimist of progressists, and for the biggest hawker of lies among the Free Trade bagmen of Germany.

The Factory Act of 1861 regulates the actual making of the lace, so far as it is done by machinery, and this is the rule in England. The branches that we are now about to examine, solely with regard to those of the workpeople who work at home, and not those who work in manufactories or warehouses, fall into two divisions, viz., (1), finishing; (2), mending. The former gives the finishing touches to the machine-made lace, and includes numerous sub-divisions.

The lace finishing is done either in what are called “Mistresses’ Houses,” or by women in their own houses, with or without the help of their children. The women who keep the “Mistresses’ Houses” are themselves poor. The workroom is in a private house. The mistresses take orders from manufacturers, or from warehousemen, and employ as many women, girls, and young children as the size of their rooms and the fluctuating demand of the business will allow. The number of the workwomen employed in these workrooms varies from 20 to 40 in some and from 10 to 20 in others. The average age at which the children commence work is six years, but in many cases it is below five. The usual working hours are from 8 in the morning

till eight in the evening, with 1½ hours for meals, which are taken at irregular intervals, and often in the foul workrooms. When business is brisk, the labour frequently lasts from 8 or even 6 o'clock in the morning till 10, 11, or 12 o'clock at night. In English barracks the regulation space allotted to each soldier is 500-600 cubic feet, and in the military hospitals 1200 cubic feet. But in those finishing styes there are but 67 to 100 cubic feet to each person. At the same time the oxygen of the air is consumed by gas-lights. In order to keep the lace clean, and although the floor is tiled or flagged, the children are often compelled, even in winter, to pull off their shoes. "It is not at all uncommon in Nottingham to find 14 to 20 children huddled together in a small room, of, perhaps, not more than 12 feet square, and employed for 15 hours out of the 24, at work that of itself is exhausting, from its weariness and monotony, and is besides carried on under every possible unwholesome condition.... Even the very youngest children work with a strained attention and a rapidity that is astonishing, hardly ever giving their fingers rest or slowing their motion. If a question be asked them, they never raise their eyes from their work for fear of losing a single moment." The "long stick" is used by the mistresses as a stimulant more and more as the working hours are prolonged. "The children gradually tire and becomes as restless as birds towards the end of their long detention at an occupation that is monotonous, eye-straining, and exhausting from the uniformity in the posture of the body. Their work is like slavery." When women and their children work at home, which now-a-days means in a hired room, often in a garret, the state of things is, if possible, still worse. This sort of work is giving out within a circle of 80 miles radius from Nottingham. On leaving the warehouses at 9 or 10 o'clock at night, the children are often given a bundle of lace to take home with them and finish. The Pharise of a capitalist represented by one of his servants, accomplices this action, of course, with the unctuous phrase: "That's for mother," yet he knows well enough that the poor children must sit up and help.

Pillow lace making is chiefly carried on in England in two agricultural districts one, the Honiton lace district, extending from 20 to 30 miles along the south coast of Devonshire, and including a few places in North Devon; the other comprising a great part of the counties of Buckingham, Bedford, and Northampton, and also the adjoining portions of Oxfordshire and Huntingdonshire. The cottages of the agricultural labourers are the places where the work is usually carried on. Many manufacturers employ upwards

of 3000 of these lace makers, who are chiefly children and young persons of the female sex exclusively. The state of things described as incidental to lace finishing is here repeated, save that instead of the “mistresses’ houses,” we find what are called “lace schools,” kept by poor women in their cottages. From their fifth year and often earlier, until their twelfth or fifteenth year, the children work in these schools; during the first year the very young ones work from four to eight hours, and later on, from six in the morning till eight and ten o’clock at night. “The rooms are generally the ordinary living rooms of small cottages, the chimney stopped up to keep out draughts, the inmates kept warm by their own animal heat alone, and this frequently in winter. In other cases, these so-called schoolrooms are like small store-rooms without fire-places.... The overcrowding in these dens and the consequent vitiation of the air are often extreme. Added to this is the injurious effect of drains, privies, decomposing substances, and other filth usual in the purileus of the smaller cottages.” With regard to space: “In one lace school 18 girls and a mistress, 35 cubic feet to each person; in another, where the smell was unbearable, 18 persons and 24½ cubic feet per head. In this industry are to be found employed children of 2 and 2½ years.”

Where lace-making ends in the counties of Buckingham and Bedford, straw-plaiting begins, and extends over a large part of Hertfordshire and the westerly and northerly parts of Essex. In 1861, there were 40,043 persons employed in straw-plaiting and straw-hat making; of these 3815 were males of all ages, the rest females, of whom 14,913, including about 7000 children, were under 20 years of age. In the place of the lace-schools we find here the “straw-plait schools.” The children commence their instruction in straw-plaiting generally in their 4th, often between their 3rd and 4th year. Education, of course, they get none. The children themselves call the elementary schools, “natural schools,” to distinguish them from these blood-sucking institutions, in which they are kept at work simply to get through the task, generally 30 yards daily, prescribed by their half-starved mothers. These same mothers often make them work at home, after school is over, till 10, 11, and 12 o’clock at night. The straw cuts their mouths, with which they constantly moisten it, and their fingers. Dr. Ballard gives it as the general opinion of the whole body of medical officers in London, that 300 cubic feet is the minimum space proper for each person in a bedroom or work-room. But in the straw-plait schools space is more sparingly allotted

than in the lace-schools, “12 2/3, 17, 18½ and below 22 cubic feet for each person.” The smaller of these numbers, says one of the commissioners, Mr. White, represents less space than the half of what a child would occupy if packed in a box measuring 3 feet in each direction. Thus do the children enjoy life till the age of 12 or 14. The wretched half-starved parents think of nothing but getting as much as possible out of their children. The latter, as soon as they are grown up, do not care a farthing, and naturally so, for their parents, and leave them. “It is no wonder that ignorance and vice abound in a population so brought up.... Their morality is at the lowest ebb,...a great number of the women have illegitimate children, and that at such an immature age that even those most conversant with criminal statistics are astounded.” And the native land of these model families is the pattern Christian country of Europe so says at least Count Montalembert, certainly a competent authority on Christianity!

Wages in the above industries, miserable as they are (the maximum wages of a child in the straw-plait schools rising in rare cases to 3 shillings, are reduced far below their nominal amount by the prevalence of the truck system everywhere, but especially in the lace districts.

Passage of modern Manufacture, and Domestic Industry into Modern Mechanical Industry. The hastening of this revolution by the application of the Factory Acts to those Industries.

The cheapening of labour-power, by sheer abuse of the labour of women and children, by sheer robbery of every normal condition requisite for working and living, and by the sheer brutality of over-work and night-work, meets at last with natural obstacles that cannot be overstepped. So also, when based on these methods, do the cheapening of commodities and capitalist exploitation in general. So soon as this point is at last reached — and it takes many years — the hour has struck for the introduction of machinery, and for the thenceforth rapid conversion of the scattered domestic industries and also of manufactures into factory industries.

An example, on the most colossal scale, of this movement is afforded by the production of wearing apparel. This industry, according to the classification of the Childrens’ Employment Commission, comprises straw-hat makers, ladies’-hat makers, cap-makers, tailors, milliners and dressmakers, shirt-makers, corset-makers, glove-makers, shoemakers, besides many minor branches, such as the making of neck-ties, collars, &c. In 1861, the number of females employed in these industries, in England

and Wales, amounted to 586,299, of these 115,242 at the least were under 20, and 16,650 under 15 years of age. The number of these workwomen in the United Kingdom in 1861, was 750,334. The number of males employed in England and Wales, in hat-making, shoe-making, glove-making and tailoring was 437,969; of these 14,964 under 15 years, 89,285 between 15 and 20, and 333,117 over 20 years. Many of the smaller branches are not included in these figures. But take the figures as they stand; we then have for England and Wales alone, according to the census of 1861, a total of 1,024,277 persons, about as many as are absorbed by agriculture and cattle breeding. We begin to understand what becomes of the immense quantities of goods conjured up by the magic of machinery, and of the enormous masses of workpeople, which that machinery sets free.

The production of wearing apparel is carried on partly in manufactories in whose workrooms there is but a reproduction of that division of labour, the *membra disjecta* of which were found ready to hand; partly by small master-handicraftsmen; these, however, do not, as formerly, work for individual consumers, but for manufactories and warehouses, and to such an extent that often whole towns and stretches of country carry on certain branches, such as shoe-making, as a specialty; finally, on a very great scale by the so-called domestic workers, who form an external department of the manufactories, ware-houses, and even of the workshops of the smaller masters.

The raw material, 8c., is supplied by mechanical industry, the mass of cheap human material (*taillable à merci et miséricorde*) is composed of the individuals “liberated” by mechanical industry and improved agriculture. The manufactures of this class owed their origin chiefly to the capitalist’s need of having at hand an army ready equipped to meet any increase of demand. These manufactures, nevertheless, allowed the scattered handicrafts and domestic industries to continue to exist as a broad foundation. The great production of surplus-value in these branches of labour, and the progressive cheapening of their articles, were and are chiefly due to the minimum wages paid, no more than requisite for a miserable vegetation, and to the extension of working time up to the maximum endurable by the human organism. It was in fact by the cheapness of the human sweat and the human blood, which were converted into commodities, that the markets were constantly being extended, and continue daily to be extended; more especially was this the case with

England's colonial markets, where, besides, English tastes and habits prevail. At last the critical point was reached. The basis of the old method, sheer brutality in the exploitation of the workpeople, accompanied more or less by a systematic division of labour, no longer sufficed for the extending markets and for the still more rapidly extending competition of the capitalists. The hour struck for the advent of machinery. The decisively revolutionary machine, the machine which attacks in an equal degree the whole of the numberless branches of this sphere of production, dressmaking, tailoring, shoemaking, sewing, hat-making, and many others, is the sewing-machine.

Its immediate effect on the workpeople is like that of all machinery, which, since the rise of modern industry, has seized upon new branches of trade. Children of too tender an age are sent adrift. The wage of the machine hands rises compared with that of the house-workers, many of whom belong to the poorest of the poor. That of the better situated handicraftsmen, with whom the machine competes, sinks. The new machine hands are exclusively girls and young women. With the help of mechanical force, they destroy the monopoly that male labour had of the heavier work, and they drive off from the lighter work numbers of old women and very young children. The overpowering competition crushes the weakest of the manual labourers. The fearful increase in death from starvation during the last 10 years in London runs parallel with the extension of machine sewing. The new workwomen turn the machine by hand and foot, or by hand alone, sometimes sitting, sometimes standing, according to the weight, size and special make of the machine, and expend a great deal of labour-power. Their occupation is unwholesome, owing to the long hours, although in most cases they are not so long as under the old system. Wherever the sewing machine locates itself in narrow and already over-crowded workrooms, it adds to the unwholesome influences. "The effect," says Mr. Lord, "on entering lowceiled workrooms in which 30 to 40 machine hands are working is unbearable.... The heat, partly due to the gas stoves used for warming the irons, is horrible.... Even when moderate hours of work, i.e., from 8 in the morning till 6 in the evening, prevail in such places, yet 3 or 4 persons fall into a swoon regularly every day."

The revolution in the industrial methods which is the necessary result of the revolution in the instruments of production, is effected by a medley of transition forms. These forms vary according to the extent to which the

sewing machine has become prevalent in one branch of industry or the other, to the time during which it has been in operation, to the previous condition of the workpeople, to the preponderance of manufacture, of handicrafts or of domestic industry, to the rent of the workrooms, 8c. In dressmaking, for instance, where the labour for the most part was already organised, chiefly by simple co-operation, the sewing machine at first formed nearly a new factor in that manufacturing industry. In tailoring, shirtmaking, shoemaking, 8c., all the forms are intermingled. Here the factory system proper. There middlemen receive the raw material from the capitalist en chef, and group around their sewing machines, in “chambers” and “garrets,” from 10 to 50 or more workwomen. Finally, as is always the case with machinery when not organised into a system, and when it can also be used in dwarfish proportions, handicraftsmen and domestic workers, along with their families, or with a little extra labour from without, makes use of their own sewing machines. The system actually prevalent in England is, that the capitalist concentrates a large number of machines on his premises, and then distributes the produce of those machines for further manipulation amongst the domestic workers. The variety of the transition forms, however, does not conceal the tendency to conversion into the factory system proper. This tendency is nurtured by the very nature of the sewing machine, the manifold uses of which push on the concentration, under one roof, and one management, of previously separated branches of a trade. It is also favoured by the circumstance that preparatory needlework, and certain other operations, are most conveniently done on the premises where the machine is at work; as well as by the inevitable expropriation of the hand sewers, and of the domestic workers who work with their own machines. This fate has already in part overtaken them. The constantly increasing amount of capital invested in sewing machines, gives the spur to the production of, and gluts the markets with, machine-made articles, thereby giving the signal to the domestic workers for the sale of their machines. The over-production of sewing machines themselves, causes their producers, in bad want of a sale, to let them out for so much a week, thus crushing by their deadly competition the small owners of machines. Constant changes in the construction of the machines, and their ever-increasing cheapness, depreciate day by day the older makes, and allow of their being sold in great numbers, at absurd prices, to large capitalists, who alone can thus employ them at a profit. Finally, the substitution of the

steam-engine for man gives in this, as in all similar revolutions, the finishing blow. At first, the use of steam power meets with mere technical difficulties, such as unsteadiness in the machines, difficulty in controlling their speed, rapid wear and tear of the lighter machines, &c., all of which are soon overcome by experience. If, on the one hand, the concentration of many machines in large manufactories leads to the use of steam power, on the other hand, the competition of steam with human muscles hastens on the concentration of workpeople and machines in large factories. Thus England is at present experiencing, not only in the colossal industry of making wearing apparel, but in most of the other trades mentioned above, the conversion of manufacture, of handicrafts, and of domestic work into the factory system, after each of those forms of production, totally changed and disorganized under the influence of modern industry, has long ago reproduced, and even overdone, all the horrors of the factory system, without participating in any of the elements of social progress it contains.

This industrial revolution which takes place spontaneously, is artificially helped on by the extension of the Factory Acts to all industries in which women, young persons and children are employed. The compulsory regulation of the working day as regards its length, pauses, beginning and end, the system of relays of children, the exclusion of all children under a certain age, &c., necessitates on the one hand more machinery and the substitution of steam as a motive power in the place of muscles. On the other hand, in order to make up for the loss of time, an expansion occurs of the means of production used in common, of the furnaces, buildings, &c.; in one word, greater concentration of the means of production and a correspondingly greater concourse of workpeople. The chief objection, repeatedly and passionately urged on behalf of each manufacture threatened with the Factory Act, is in fact this, that in order to continue the business on the old scale a greater outlay of capital will be necessary. But as regards labour in the so-called domestic industries and the intermediate forms between them and Manufacture, so soon as limits are put to the working day and to the employment of children, those industries go to the wall. Unlimited exploitation of cheap labour-power is the sole foundation of their power to compete.

One of the essential conditions for the existence of the factory system, especially when the length of the working day is fixed, is certainty in the result, i.e., the production in a given time of a given quantity of

commodities, or of a given useful effect. The statutory pauses in the working day, moreover, imply the assumption that periodical and sudden cessation of the work does no harm to the article undergoing the process of production. This certainty in the result, and this possibility of interrupting the work are, of course, easier to be attained in the purely mechanical industries than in those in which chemical and physical processes play a part; as, for instance, in the earthenware trade, in bleaching, dyeing, baking, and in most of the metal industries. Wherever there is a working day without restriction as to length, wherever there is night work and unrestricted waste of human life, there the slightest obstacle presented by the nature of the work to a change for the better is soon looked upon as an everlasting barrier erected by Nature. No poison kills vermin with more certainty than the Factory Act removes such everlasting barriers. No one made a greater outcry over “impossibilities” than our friends the earthenwares manufacturers. In 1864, however, they were brought under the Act, and within sixteen months every “impossibility” had vanished. “The improved method,” called forth by the Act, “of making slip by pressure instead of by exaporation, the newly-constructed stoves for drying the ware in its green state, &c., are each events of great importances in the pottery art, and mark an advance which the preceding century could not rival....It has even considerably reduced the temperature of the stoves themselves with a considerable saving of fuel, and with a readier effect on the ware.” In spite of every prophecy, the cost price of earthenware did not rise, but the quantity produced did, and to such an extent that the export for the twelve months, ending December, 1865, exceeded in value by £138,628 the average of the preceding three years. In the manufacture of matches it was thought to be an indispensable requirement, that boys, even while bolting their dinner, should go on dipping the matches in melted phosphorus, the poisonous vapour from which rose into their faces. The Factory Act (1864) made the saving of time a necessity, and so forced into existence a dipping machine, the vapour from which could not come in contact with the workers. So, at the present time, in those branches of the lace manufacture not yet subject to the Factory Act, it is maintained that the meal times cannot be regular owing to the different periods required by the various kinds of lace for drying, which periods vary from three minutes up to an hour and more. To this the Children’s Employment Commissioners answer: “The circumstances of this case are precisely analogous to that of

the paper-stainers, dealt with in our first report. Some of the principal manufacturers in the trade urged that in consequence of the nature of the materials used, and their various processes, they would be unable, without serious loss, to stop for meal times at any given moment. But it was seen from the evidence that, by due care and previous arrangement, the apprehended difficulty would be got over; and accordingly, by clause 6 of section 6 of the Factory Acts Extension Act, passed during this Session of Parliament, an interval of eighteen months is given to them from the passing of the Act before they are required to conform to the meal hours, specified by the Factory Acts." Hardly had the Act been passed when our friends the manufacturers found out: "The inconveniences we expected to arise from the introduction of the Factory Acts into our branch of manufacture, I am happy to say, have not arisen. We do not find the production at all interfered with; in short, we produce more in the same time." It is evident that the English legislature, which certainly no one will venture to reproach with being overdosed with genius, has been led by experience to the conclusion that a simple compulsory law is sufficient to enact away all the so-called impediments, opposed by the nature of the process, to the restriction and regulation of the working day. Hence, on the introduction of the Factory Act into a given industry, a period varying from six to eighteen months is fixed within which it is incumbent on the manufacturers to remove all technical impediments to the working of the Act. Mirabeau's "Impossible! ne me dites jamaisce bête de mot!" is particularly applicable to modern technology. But though the Factory Acts thus artificially ripen the material elements necessary for the conversion of the manufacturing system into the factory system, yet at the same time, owing to the necessity they impose for greater outlay of capital, they hasten on the decline of the small masters, and the concentration of capital.

Besides the purely technical impediments that are removable by technical means, the irregular habits of the workpeople people themselves obstruct the regulation of the hours of labour. This is especially the case where piece wage predominates, and where loss of time in one part of the day or week can be made good by subsequent overtime, or by night work, a process which brutalises the adult workman, and ruins his wife and children. Although this absence of regularity in the expenditure of labour-power is a natural and rude reaction against the tedium of monotonous drudgery, it originates, also, to a much greater degree from anarchy in

production, anarchy that in its turn pre-supposes unbridled exploitation of labour-power by the capitalist. Besides the general periodic changes of the industrial cycle, and the special fluctuations in the markets to which each industry is subject, we may also reckon what is called "the season," dependent either on the periodicity of favourable seasons of the year for navigation; or on fashion, and the sudden placing of large orders that have to be executed in the shortest possible time. The habit of giving such orders becomes more frequent with the extension of railways and telegraphs. "The extension of the railway system throughout the country has tended very much to encourage giving short notice. Purchasers now come up from Glasgow, Manchester, and Edinburgh once every fortnight or so to the wholesale city warehouses which we supply, and give small orders requiring immediate execution, instead of buying from stock as they used to do. Years ago we were always able to work in the slack times, so as to meet the demand of the next season, but now no one can say beforehand what will be the demand then."

In those factories and manufactories that are not yet subject to the Factory Acts, the most fearful overwork prevails periodically during what is called the season, in consequence of sudden orders. In the outside department of the factory, of the manufactory, and of the warehouse, the so-called domestic workers, whose employment is at the best irregular, are entirely dependent for their raw material and their orders on the caprice of the capitalist, who, in this industry, is not hampered by any regard for depreciation of his buildings and machinery, and risks nothing by a stoppage of work, but the skin of the worker himself. Here then he sets himself systematically to work to form an industrial reserve force that shall be ready at a moment's notice; during one part of the year he decimates this force by the most inhuman toil, during the other part, he lets it starve for want of work. "The employers avail themselves of the habitual irregularity in the home-work, when any extra work is wanted at a push, so that the work goes on till 11, and 12 p.m. or 2 a.m., or as the usual phrase is, "all hours," and that in localities where "the stench is enough to knock you down, you go to the door, perhaps, and open it, but shudder to go further." "They are curious men," said one of the witnesses, a shoemaker, speaking of the masters, "they think it does a boy no harm to work too hard for half the year, if he is nearly idle for the other half."

In the same way as technical impediments, so too, those “usages which have grown with the growth of trade” were and still are proclaimed by interested capitalists as obstacles due to the nature of the work. This was a favorite cry of the cotton lords at the time they were first threatened with the Factory Acts. Although their industry more than any other depends on navigation, yet experience has given them the lie. Since then, every pretended obstruction to business has been treated by the Factory inspectors as a mere sham. The thoroughly conscientious investigations of the Children’s Employment Commission prove that the effect of the regulation of the hours of work, in some industries, was to spread the mass of labour previously employed more evenly over the whole year; that this regulation was the first rational bridle on the murderous, meaningless caprices of fashion, caprices that consort so badly with the system of modern industry; that the development of ocean navigation and of the means of communication generally, has swept away the technical basis on which season-work was really supported, and that all other so-called unconquerable difficulties vanish before larger buildings, additional machinery, increase in the number of workpeople employed, and the alterations caused by all these in the mode of conducting the wholesale trade. But for all that, capital never becomes reconciled to such changes — and this is admitted over and over again by its own representatives — except “under the pressure of a General Act of Parliament” for the compulsory regulation of the hours of labour.

SECTION 9. — THE FACTORY ACTS. SANITARY AND EDUCATION CLAUSES OF THE SAME. THEIR GENERAL EXTENSION IN ENGLAND.

Factory legislation, that first conscious and methodical reaction of society against the spontaneously developed form of the process of production, is, as we have seen, just as much the necessary product of modern industry as cotton yarn, selfactors, and the electric telegraph. Before passing to the consideration of the extension of that legislation in England, we shall shortly notice certain clauses contained in the Factory Acts, and not relating to the hours of work.

Apart from their wording, which makes it easy for the capitalist to evade them, the sanitary clauses are extremely meagre, and, in fact, limited to

provisions for whitewashing the walls, for insuring cleanliness in some other matters, for ventilation, and for protection against dangerous machinery. In the third book we shall return again to the fanatical opposition of the masters to those clauses which imposed upon them a slight expenditure on appliances for protecting the limbs of their workpeople, an opposition that throws a fresh and glaring light on the free trade dogma, according to which, in a society with conflicting interests, each individual necessarily furthers the common weal by seeking nothing but his own personal advantage! One example is enough. The reader knows that during the last 20 years, the flax industry has very much extended, and that, with that extension, the number of scutching mills in Ireland has increased. In 1864 there were in that country 1800 of these mills. Regularly in autumn and winter women and “young persons,” the wives, sons, and daughters of the neighboring small farmers, a class of people totally unaccustomed to machinery, are taken from field labour to feed the rollers of the scutching mills with flax. The accidents, both as regards number and kind, are wholly unexampled in the history of machinery. In one scutching mill, at Kildinan, near Cork, there occurred between 1852 and 1856, six fatal accidents and sixty mutilations; every one of which might have been prevented by the simplest appliances, at the cost of a few shillings. Dr. W. White, the certifying surgeon for factories at Downpatrick, states in his official report, dated the 15th December, 1865; “The serious accidents at the scutching mills are of the most fearful nature. In many cases a quarter of the body is torn from the trunk, and either involves death, or a future of wretched incapacity and suffering. The increase of mills in the country will, of course, extend these dreadful results, and it will be a great boon if they are brought under the legislature. I am convinced that by proper supervision of scutching mills a vast sacrifice of life and limb would be averted.”

What could possibly show better the character of the capitalist mode of production, than the necessity that exists for forcing upon it, by Acts of Parliament, the simplest appliances for maintaining cleanliness and health? In the potteries the Factory Act of 1864 “has whitewashed and cleansed upwards of 200 workshops, after a period of abstinence from any such cleaning, in many cases of 20 years, and in some, entirely,” (this is the “abstinence” of the capitalist!) “in which were employed 27,800 artisans, hitherto breathing through protracted days and often nights of labour, a mephitic atmosphere, and which rendered an otherwise comparatively

innocuous occupation, pregnant with disease and death, The Act has improved the ventilation very much.” At the same time, this portion of the Act strikingly shows that the capitalist mode of production, owing to its very nature, excludes all rational improvement beyond a certain point. It has been stated over and over again that the English doctors are unanimous in declaring that where the work is continuous, 500 cubic feet is the very least space that should be allowed for each person. Now, if the Factory Acts, owing to their compulsory provisions, indirectly hasten on the conversion of small workshops into factories, thus indirectly attacking the proprietary rights of the smaller capitalists, and assuring a monopoly to the great ones, so, if it were made obligatory to provide the proper space for each workman in every workshop, thousands of small employers would, at one full swoop, be expropriated directly! The very root of the capitalist mode of production, i.e., the self-expansion of all capital, large or small, by means of the “free” purchase and consumption of labour-power, would be attacked. Factory legislation is therefore brought to a dead-lock before these 500 cubic feet of breathing space. The sanitary officers, the industrial inquiry commissioners, the factory inspectors, all harp, over and over again, upon the necessity for those 500 cubic feet, and upon the impossibility of wringing them out of capital. They thus, in fact, declare that consumption and other lung diseases among the workpeople are necessary conditions to the existence of capital.

Paltry as the education clauses of the Act appear on the whole, yet they proclaim elementary education to be an indispensable condition to the employment of children. The success of those clauses proved for the first time the possibility of combining education and gymnastics with manual labour, and, consequently, of combining manual labour with education and gymnastics. The factory inspectors soon found out by questioning the schoolmasters, that the factory children, although receiving only one half the education of the regular day scholars, yet learnt quite as much and often more. “This can be accounted for by the simple fact that, with only being at school for one half of the day, they are always fresh, and nearly always ready and willing to receive instruction. The system on which they work, half manual labour, and half school, renders each employment a rest and a relief to the other; consequently, both are far more congenial to the child, than would be the case were he kept constantly at one. It is quite clear that a boy who has been at school all the morning, cannot (in hot weather particularly) cope with one who comes fresh and bright from his work.”

Further information on this point will be found in Senior's speech at the Social Science Congress at Edinburgh in 1863. He there shows, amongst other things, how the monotonous and uselessly long school hours of the children of the upper and middle classes, uselessly add to the labour of the teacher, "while he not only fruitlessly, but absolutely injuriously, wastes the time, health, and energy of the children." From the Factory system budded, as Robert Owen has shown us in detail, the germ of the education of the future, an education that will, in the case of every child over a given age, combine productive labour with instruction and gymnastics, not only as one of the methods of adding to the efficiency of production, but as the only method of producing fully developed human beings.

Modern Industry, as we have seen, sweeps away by technical means the manufacturing division of labour, under which each man is bound hand and foot for life to a single detail-operation. At the same time, the capitalistic form of that industry reproduces this same division of labour in a still more monstrous shape; in the factory proper, by converting the workman into a living appendage of the machine; and everywhere outside the Factory, partly by the sporadic use of machinery and machine workers, partly by re-establishing the divisions of labour on a fresh basis by the general introduction of the labour of women and children, and of cheap unskilled labour.

The antagonism between the manufacturing division of labour and the methods of Modern Industry makes itself forcibly felt. It manifests itself, amongst other ways, in the frightful fact that a great part of the children employed in modern factories and manufactures, are from their earliest years riveted to the most simple manipulations, and exploited for years, without being taught a single sort of work that would afterwards make them of use, even in the same manufactory or factory. In the English letter press printing trade, for example, there existed formerly a system, corresponding to that in the old manufactures and handicrafts, of advancing the apprentices from easy to more and more difficult work. They went through a course of teaching till they were finished printers. To be able to read and write was for every one of them a requirement of their trade. All this was changed by the printing machine. It employs two sort of labourers, one grown up, tenters, the other, boys mostly from 11 to 17 years of age whose sole business is either to spread the sheets of paper under the machine, or to take from it the printed sheets. They perform this weary task, in London especially, for 14,

15, and 16 hours at a stretch, during several days in the week, and frequently for 36 hours, with only 2 hours' rest for meals and sleep! A great part of them cannot read, and they are, as a rule, utter savages and very extraordinary creatures. "To qualify them for the work which they have to do, they require no intellectual training; there is little room in it for skill, and less for judgment; their wages, though rather high for boys, do not increase proportionately as they grow up, and the majority of them cannot look for advancement to the better paid and more responsible post of machine minder, because while each machine has but one minder, it has at least two, and often four boys attached to it." As soon as they get too old for such child's work, that is about 17 at the latest, they are discharged from the printing establishments. They become recruits of crime. Several attempts to procure them employment elsewhere, were rendered of no avail by their ignorance and brutality, and by their mental and bodily degradation.

As with the division of labour in the interior of the manufacturing workshops, so it is with the division of labour in the interior of society. So long as handicraft and manufacture form the general groundwork of social production, the subjection of the producer to one branch exclusively, the breaking up of the multifariousness of his employment, is a necessary step in the development. On that ground-work each separate branch of production acquires empirically the form that is technically suited to it, slowly perfects it, and, so soon as a given degree of maturity has been reached, rapidly crystallizes that form. The only thing, that here and there causes a change, besides new raw material supplied by commerce, is the gradual alteration of the instruments of labour. But their form, too, once definitely settled by experience, petrifies, as is proved by their being in many cases handed down in the same form by one generation to another during thousands of years. A characteristic feature is, that, even down into the eighteenth century, the different trades were called "mysteries" (mystères); into their secrets none but those duly initiated could penetrate. Modern Industry rent the veil that concealed from men their own social process of production, and that turned the various, spontaneously divided branches of production into so many riddles, not only to outsiders, but even to the initiated. The principle which it pursued, of resolving each process into its constituent movements, without any regard to their possible execution by the hand of man, created the new modern science of technology. The varied, apparently unconnected, and petrified forms of the

industrial processes now resolved themselves into so many conscious and systematic applications of natural science to the attainment of given useful effects. Technology also discovered the few main fundamental forms of motion, which, despite the diversity of the instruments used, are necessarily taken by every productive action of the human body; just as the science of mechanics sees in the most complicated machinery nothing but the continual repetition of the simple mechanical powers.

Modern Industry never looks upon and treats the existing form of a process as final. The technical basis of that industry is therefore revolutionary, while all earlier modes of production were essentially conservative. By means of machinery, chemical processes and other methods, it is continually causing changes not only in the technical basis of production, but also in the functions of the labourer, and in the social combinations of the labour-process. At the same time, it thereby also revolutionizes the division of labour within the society, and incessantly launches masses of capital and of workpeople from one branch of production to another. But if Modern Industry, by its very nature, therefore necessitates variation of labour, fluency of function, universal mobility of the labourer, on the other hand, in its capitalistic form, it reproduces the old division of labour with its ossified particularisations. We have seen how this absolute contradiction between the technical necessities of Modern Industry, and the social character inherent in its capitalistic form, dispels all fixity and security in the situation of the labourer; how it constantly threatens, by taking away the instruments of labour, to snatch from his hands his means of subsistence, and, by suppressing his detail-function, to make him superfluous. We have seen, too, how this antagonism vents its rage in the creation of that monstrosity, an industrial reserve army, kept in misery in order to be always at the disposal of capital; in the incessant human sacrifices from among the working class, in the most reckless squandering of labour-power, and in the devastation caused by a social anarchy which turns every economical progress into a social calamity. This is the negative side. But if, on the one hand, variation of work at present imposes itself after the manner of an overpowering natural law, and with the blindly destructive action of a natural law that meets with resistance, at all points, Modern Industry, on the other hand, through its catastrophes imposes the necessity of recognising, as a fundamental law of production, variation of work, consequently fitness of the labourer for varied work,

consequently the greatest possible development of his varied aptitudes. It becomes a question of life and death for society to adapt the mode of production to the normal functioning of this law, Modern Industry, indeed, compels society, under penalty of death, to replace the detail-worker of to-day, crippled by life-long repetition of one and the same trivial operation, and thus reduced to the mere fragment of a man, by the fully developed individual, fit for a variety of labours, ready to face any change of production, and to whom the different social functions he performs, are but so many modes of giving free scope to his own natural and acquired powers.

One step already spontaneously taken towards effecting this revolution is the establishment of technical and agricultural schools, and of “*écoles d’enseignement professionnel*,” in which the children of the working-men receive some little instruction in technology and in the practical handling of the various implements of labour. Though the Factory Act, that first and meagre concession wrung from capital, is limited to combining elementary education with work in the factory, there can be no doubt that when the working class comes into power, as inevitably it must, technical instruction, both theoretical and practical, will take its proper place in the working-class schools. There is also no doubt that such revolutionary ferments, the final result of which is the abolition of the old division of labour, are diametrically opposed to the capitalist form of production, and to the economic status of the labourer corresponding to that form. But the historical development of the antagonisms, immanent in a given form of production, is the only way in which that form of production can be dissolved and a new form established. “*Ne sutor ultra crepidam*” — this *nec plus ultra* of handicraft wisdom became sheer nonsense, from the moment the watchmaker Watt invented the steam-engine, the barber Arkwright, the throstle, and the working-jeweller, Fulton, the steamship.

So long as Factory legislation is confined to regulating the labour in factories, manufactories, &c., it is regarded as a mere interference with the exploiting rights of capital. But when it comes to regulating the so-called "home-labour," it is immediately viewed as a direct attack on the patria potestas, on parental authority. The tender-hearted English Parliament long affected to shrink from taking this step. The force of facts, however compelled it at last to acknowledge that modern industry, in overturning the economical foundation on which was based the traditional family, and the family labour corresponding to it, had also loosened all traditional family ties. The rights of the children had to be proclaimed. The final report of the Ch. Empl. Comm. of 1866, states: "It is unhappily, to a painful degree, apparent throughout the whole of the evidence, that against no persons do the children of both sexes so much require protection as against their parents." The system of unlimited exploitation of children's labour in general and the so-called home-labour in particular is "maintained only because the parents are able, without check or control, to exercise this arbitrary and mischievous power over their young and tender offspring....Parents must not possess the absolute power of making their children mere 'machines to earn so much weekly wage.'...The children and young persons, therefore, in all such cases may justifiably claim from the legislature, as a natural right, that an exemption should be secured to them, from what destroys prematurely their physical strength, and lowers them in the scale of intellectual and moral beings." It was not, however, the misuse of parental authority that created the capitalistic exploitation, whether direct or indirect, of children's labour; but, on the contrary, it was the capitalistic mode of exploitation which, by sweeping away the economical basis of parental authority, made its exercise degenerate into a mischievous misuse of power. However terrible and disgusting the dissolution, under the capitalist system, of the old family ties may appear, nevertheless, modern industry, by assigning as it does an important part in the process of production, outside the domestic sphere, to women, to young persons, and to children of both sexes, creates a new economical foundation for a higher form of the family and of the relations between the sexes. It is, of course, just as absurd to hold the Teutonic-Christian form of the family to be absolute and final as it would be to apply that character to the ancient Roman, the ancient Greek, or the Eastern forms which, moreover, taken together form a series in historic development. Moreover, it is obvious that

the fact of the collective working group being composed of individuals of both sexes and all ages, must necessarily, under suitable conditions, become a source of humane development; although in its spontaneously developed, brutal, capitalistic form, where the labourer exists for the process of production, and not the process of production for the labourer, that fact is a pestiferous source of corruption and slavery.

The necessity for a generalization of the Factory Acts, for transforming them from an exceptional law relating to mechanical spinning and weaving — those first creations of machinery — into a law affecting social production as a whole, arose, as we have seen, from the mode in which Modern Industry was historically developed. In the rear of that industry, the traditional form of manufacture, of handicraft, and of domestic industry, is entirely revolutionised; manufactures are constantly passing into the factory system, and handicrafts into manufactures; and lastly, the spheres of handicraft and of the domestic industries become, in a, comparatively speaking, wonderfully short time, dens of misery in which capitalistic exploitation obtains free play for the wildest excesses. There are two circumstances that finally turn the scale: first, the constantly recurring experience that capital, so soon as it finds itself subject to legal control at one point, compensates itself all the more recklessly at other points; secondly, the cry of the capitalists for equality in the conditions of competition, i.e., for equal restraint on all exploitation of labour. On this point let us listen to two heart-broken cries. Messrs. Cooksley of Bristol, nail and chain, 8c., manufacturers, spontaneously introduced the regulations of the Factory Act into their business. “As the old irregular system prevails in neighbouring works, the Messrs. Cooksley are subject to the disadvantage of having their boys enticed to continue their labour elsewhere after 6 p.m. ‘This,’ they naturally say, ‘is an injustice and loss to us, as it exhausts a portion of the boy’s strength, of which we ought to have the full benefit.’” Mr. J. Simpson (paper box and bagmaker, London) states before the commissioners of the Ch. Empl. Comm.: “He would sign any petition for it” (legislative interference)...”As it was, he always felt restless at night, when he had closed his place, lest others should be working later than him and getting away his orders.” Summarising, the Ch. Empl. Comm. says: “It would be unjust to the larger employers that their factories should be placed under regulation, while the hours of labour in the smaller places in their own branch of business were under no legislative restriction. And to the

injustice arising from the unfair conditions of competition, in regard to hours, that would be created if the smaller places of work were exempt, would be added the disadvantage to the larger manufacturers, of finding their supply of juvenile and female labour drawn off to the places of work exempt from legislation. Further, a stimulus would be given to the multiplication of the smaller places of work, which are almost invariably the least favourable to the health, comfort, education, and general improvement of the people.”

In its final report the Commission proposes to subject to the Factory Act more than 1,400,000 children, young persons, and women, of which number about one half are exploited in small industries and by the so-called home-work. It says, “But if it should seem fit to Parliament to place the whole of that large number of children, young persons and females under the protective legislation above adverted to...it cannot be doubted that such legislation would have a most beneficent effect, not only upon the young and the feeble, who are its more immediate objects, but upon the still larger body of adult workers, who would in all these employments, both directly and indirectly, come immediately under its influence. It would enforce upon them regular and moderate hours; it would lead to their places of work being kept in a healthy and cleanly state; it would therefore husband and improve that store of physical strength on which their own well-being and that of the country so much depends; it would save the rising generation from that over-exertion at an early age which undermines their constitutions and leads to premature decay; finally, it would ensure them — at least up to the age of 13 — the opportunity of receiving the elements of education, and would put an end to that utter ignorance....so faithfully exhibited in the Reports of our Assistant Commissioners, and which cannot be regarded without the deepest pain, and a profound sense of national degradation.”

The Tory Cabinet announced in the speech from the Throne, on February 5, 1867, that it had formulated the recommendations of the Industrial Commission of Inquiry in “Bills.” A new experiment of 20 years’ duration at the expense of the working class had been necessary to accomplish so much. As early as 1840, a Commission of Parliament had been appointed to inquire into the conditions of child labor. Its report, as Senior remarks, disclosed “the most frightful picture of avarice, selfishness and cruelty on the part of masters and of parents, and of juvenile and infantile misery, degradation and destruction ever presented....It may be supposed that it

describes the horrors of a past age. But there is unhappily evidence that those horrors continue as intense as they were. A pamphlet published by Hardwicke about 2 years ago states that the abuses complained of in 1842, are in full bloom at the present day. It is a strange proof of the general neglect of the morals and health of the children of the working class, that this report lay unnoticed for 20 years, during which the children, ‘bred up without the remotest sign of comprehension as to what is meant by the term morals, who had neither knowledge, nor religion, nor natural affection,’ were allowed to become the parents of the present generation.”

The social conditions having undergone a change, Parliament could not venture to shelve the demands of the Commission of 1862, as it had done those of the Commission of 1840. Hence in 1864, when the Commission had not yet published more than a part of its reports, the earthenware industries (including the potteries, makers of paper-hangings, matches, cartridges, and caps, and fustian cutters were made subject to the Acts in force in the textile industries. In the speech from the Throne, on 5th February, 1867, the Tory Cabinet of the day announced the introduction of Bills, founded on the final recommendations of the Commission, which had completed its labours in 1866.

On the 15th August, 1867, the Factory Acts Extension Act, and on the 21st August, the Workshops’ Regulation Act received the Royal Assent; the former Act having reference to large industries, the latter to small.

The former applies to blast-furnaces, iron and copper mills, foundries, machine shops, metal manufactories, gutta-percha works, paper mills, glass works, tobacco manufactories, letter-press printing (including newspapers) book-binding, in short to all industrial establishments of the above kind, in which 50 individuals or more are occupied simultaneously, and for not less than 100 days during the year.

To give an idea of the extent of the sphere embraced by the Workshops’ Regulation Act in its application, we cite from its interpretation clause, the following passages:

“Handicraft shall mean any manual labour exercised by way of trade, or for purposes of gain, or incidental to, the making any article or part of an article, or in, or incidental to, the altering, repairing, ornamenting, finishing, or otherwise adapting for sale any article.

“Workshop shall mean any room or place whatever in the open air or under cover, in which any handicraft is carried on by any child, young

person, or woman, and to which and over which the person by whom such child, young person, or woman is employed, has the right of access and control.

“Employed shall mean occupied in any handicraft, whether for wages or not, under a master or under a parent as herein defined.

“Parent shall mean parent, guardian, or person, having the custody of, or control over, any...child or young person.”

Clause 7, which imposes a penalty for employment of children, young persons, and women, contrary to the provisions of the Act, subjects to fines, not only the occupier of the workshops, whether parent or not, but even “the parent of, or the person deriving any direct benefit from the labour of, or having the control over, the child, young person or woman.”

The Factory Acts Extension Act, which affects the large establishments, derogates from the Factory Act by a crowd of vicious exceptions and cowardly compromises with the masters.

The Workshops’ Regulation Act, wretched in all its details, remained a dead letter in the hands of the municipal and local authorities who were charged with its execution. When, in 1871, Parliament withdrew from them this power, in order to confer it on the Factory Inspectors, to whose province it thus added by a single stroke more than one hundred thousand workshops, and three hundred brickworks, care was taken at the same time not to add more than eight assistants to their already undermanned staff.

What strikes us, then, in the English legislation of 1867, is, on the one hand, the necessity imposed on the parliament of the ruling classes, of adopting in principle measures so extraordinary, and on so great a scale, against the excesses of capitalistic exploitation; and on the other hand, the hesitation, the repugnance, and the bad faith, with which it lent itself to the task of carrying those measures into practice.

The Inquiry Commission of 1862 also proposed a new regulation of the mining industry, an industry distinguished from others by the exceptional characteristic that the interests of landlord and capitalist there join hands. The antagonism of these two interests had been favourable to Factory legislation, while on the other hand the absence of that antagonism is sufficient to explain the delays and chicanery of the legislation on mines.

The Inquiry Commission of 1840 had made revelations so terrible, so shocking, and creating such a scandal all over Europe, that to salve its

conscience Parliament passed the Mining Act of 1842, in which it limited itself to forbidding the employment underground in mines of children under 10 years of age and females.

Then another Act, The Mines' Inspecting Act of 1860, provides that mines shall be inspected by public officers nominated specially for that purpose, and that boys between the ages of 10 and 12 years shall not be employed, unless they have a school certificate, or go to school for a certain number of hours. This Act was a complete dead letter owing to the ridiculously small number of inspectors, the meagreness of their powers, and other causes that will become apparent as we proceed.

One of the most recent blue books on mines is the "Report from the Select Committee on Mines, together with 8c. Evidence, 23rd July, 1866." This Report is the work of a Parliamentary Committee selected from members of the House of Commons, and authorised to summon and examine witnesses. It is a thick folio volume in which the Report itself occupies only five lines to this effect: that the committee has nothing to say, and that more witnesses must be examined!

The mode of examining the witnesses reminds one of the cross-examination of witnesses in English courts of justice, where the advocate tries, by means of impudent, unexpected, equivocal and involved questions, put without connection, to intimidate, surprise, and confound the witness, and to give a forced meaning to the answers extorted from him. In this inquiry the members of the committee themselves are the cross-examiners, and among them are to be found both mine owners and mine exploiters; the witnesses are mostly working coal-miners. The whole farce is too characteristic of the spirit of capital, not to call for a few extracts from this Report. For the sake of conciseness I have classified them. I may also add that every question and its answer are numbered in the English Blue Books.

EMPLOYMENT IN MINES OF BOYS OF 10 YEARS AND UPWARDS. — In the mines the work, inclusive of going and returning, usually lasts 14 or 15 hours, sometimes even from 3, 4, and 5 o'clock a.m., till 5 and 6 o'clock p.m., (n. 6., 452, 83). The adults work in two shifts, of eight hours each; but there is no alteration with the boys, on account of the expense (n. 80, 203, 204.) The younger boys are chiefly employed in opening and shutting the ventilating doors in the various parts of the mine; the older ones are employed on heavier work, in carrying coal, 8c. (n. 122,

739, 1747). They work these long hours underground until their 18th or 22nd year, when they are put to miners work proper. (n. 161.) Children and young persons are at present worse treated, and harder worked than at any previous period (n. 1663 — 1667). And now Hussey Vivian (himself an exploiter of mines) asks: “Would not the opinion of the workman depend upon the poverty of the workman’s family?” Mr. Bruce: “Do you not think it would be a very hard case, where a parent had been injured, or where he was sickly, or where a father was dead, and there was only a mother, to prevent a child between 12 and 14 earning 1s. 7d. a day for the good of the family?...You must lay down a general rule?...Are you prepared to recommend legislation which would prevent the employment of children under 12 and 14, whatever the state of their parents might be?” “Yes.” (ns. 107-110). Vivian: “Supposing that an enactment were passed preventing the employment of children under the age of 14, would it not be probable that...the parents of children would seek employment for their children in other directions, for instance, in manufacture?” “Not generally I think,” (n. 174). Kinnaird: “Some of the boys are keepers of doors?” “Yes.” “Is there not generally a very great draught every time you open a door or close it?” “Yes, generally there is.” “It sounds a very easy thing, but it is in fact rather a painful one?” “He is imprisoned there just the same as if he was in a cell of a gaol.” Bourgeois Vivian: “Whenever a boy is furnished with a lamp cannot he read?” “Yes, he can read, if he finds himself in candles...I suppose he would be found fault with if he were discovered reading; he is there to mind his business, he has a duty to perform, and he has to attend to it in the first place, and I do not think it would be allowed down the pit.” (ns. 139, 141, 143, 158, 160.)

EDUCATION. — The working miners want a law for the compulsory education of their children, as in factories. They declare the clauses of the Act of 1860, which require a school certificate to be obtained before employing boys of 10 and 12 years of age, to be quite illusory. The examination of the witnesses on this subject is truly droll. “Is it (the Act) required more against the masters or against the parents?” “It is required against both I think.” “You cannot say whether it is required against one more than against the other?” “No; I can hardly answer that question.” (ns. 115, 116.) “Does there appear to be any desire on the part of the employers that the boys should have such hours as to enable them to go to school?” “No; the hours are never shortened for that purpose.” (n. 137.) Mr.

Kinnaird: "Should you say that the colliers generally improve their education; have you any instances of men who have, since they began to work, greatly improved their education, or do they not rather go back, and lose any advantage that they may have gained?" "They generally become worse: they do not improve; they acquire bad habits; they get on to drinking and gambling and such like, and they go completely to wreck," (n. 211). "Do they make any attempt of the kind (for providing instruction) by having schools at night?" "There are few collieries where night schools are held, and perhaps at those collieries a few boys do go to those schools; but they are so physically exhausted that it is to no purpose that they go there." (n. 454.) "You are then," concludes the bourgeois, "against education?" "Most certainly not; but," 8c. (n. 443.) "But are they (the employers) not compelled to demand them" (school certificates)? "By law they are; but I am not aware that they are demanded by the employers." "Then it is your opinion, that this provision of the Act as to requiring certificates, is not generally carried out in the collieries?" "It is not carried out." (ns. 443, 444.) "Do the men take a great interest in this question" (of education)? "The majority of them do." (n. 717.) "Are they very anxious to see the law enforced?" "The majority are." (n. 718.) "Do you think that in this country any law that you pass...can really be effectual unless the population themselves assist in putting it into operation?" "Many a man might wish to object to employing a boy, but he would perhaps become marked by it." (n. 720.) "Marked by whom?" "By his employers." (n. 721.) "Do you think that the employers would find any fault with a man who obeyed the law....?" "I believe they would." (n. 722.) "Have you ever heard of any workman objecting to employ a boy between 10 and 12, who could not write or read?" "It is not left to men's option." (n. 123.) "Would you call for the interference of Parliament?" "I think that if anything effectual is to be done in the education of the colliers' children, it will have to be made compulsory by Act of Parliament." (n. 1634.) "Would you lay that obligation upon the colliers only, of all the work people of Great Britain?" "I came to speak for the colliers." (n. 1636.) "Why should you distinguish them (colliery boys) from other boys?" "Because I think they are an exception to the rule." (n. 1638.) "In what respect?" "In a physical respect." (n. 1639.) "Why should education be more valuable to them than to other classes of lads?" "I do not know that it is more valuable; but through the over-exertion in mines there is less chance for the boys that are employed

there to get education, either at Sunday schools, or at day schools.” (n. 1640.) “It is impossible to look at a question of this sort absolutely by itself?” (n. 1644.) “Is there a sufficiency of schools?”— “No.”... (n. 1646.) “If the state were to require that every child should be sent to school, would there be schools for the children to go to?” “No; but I think if the circumstances were to spring up, the schools would be forthcoming.” (n. 1647.) “Some of them (the boys) cannot read and write at all, I suppose?” “The majority cannot.... The majority of the men themselves cannot.” (ns. 705, 725.)

III. EMPLOYMENT OF WOMEN. — Since 1842 women are no more employed underground, but are occupied on the surface in loading the coal, 8c., in drawing the tubs to the canals and railway waggons, in sorting, 8c. Their numbers have considerably increased during the last three or four years. (n. 1727.) They are mostly the wives, daughters, and widows of the working miners, and their ages range from 12 to 50 or 60 years. (ns. 645, 1779.) “What is the feeling among the working miners as to the employment of women?” “I think they generally condemn it.” (n. 648.) “What objection do you see to it?” “I think it is degrading to the sex.” (n. 649.) “There is a peculiarity of dress?” “Yes...it is rather a man’s dress, and I believe in some cases, it drowns all sense of decency.” “Do the women smoke?” “Some do.” “And I suppose it is very dirty work?” “Very dirty.” “They get black and grimy?” “As black as those who are down the mines...I believe that a woman having children, (and there are plenty on the banks that have) cannot do her duty to her children.” (ns. 650-654, 701.) “Do you think that those widows could get employment anywhere else, which would bring them in as much wages as that (from 8s. to 10s. a week)?” “I cannot speak to that.” (n. 709.) “You would still be prepared, would you,” (flint-hearted fellow!) “to prevent their obtaining a livelihood by these means?” “I would.” (n. 710.) “What is the general feeling in the district...as to the employment of women?” “The feeling is that it is degrading; and we wish as miners to have more respect to the fair sex than to see them placed on the pit bank....Some part of the work is very hard; some of these girls have raised as much as 10 tons of stuff a day.” (ns. 1715, 1717.) “Do you think that the women employed about the collieries are less moral than the women employed in the factories?” “...the percentage of bad ones may be a little more...than with the girls in the factories.” (n. 1237.) “But you are not quite satisfied with the state of morality in the factories?” “No.” (n. 1733.)

“Would you prohibit the employment of women in factories also?” “No, I would not.” (n. 1734.) “Why not?” “I think it a more honourable occupation for them in the mills.” (n. 1735.) “Still it is injurious to their morality, you think?” “Not so much as working on the pit bank; but it is more on the social position I take it; I do not take it on its moral ground alone. The degradation, in its social bearing on the girls, is deplorable in the extreme. When these 400 or 500 girls become colliers’ wives, the men suffer greatly from this degradation, and it causes them to leave their homes and drink.” (n. 1736.) “You would be obliged to stop the employment of women in the ironworks as well, would you not, if you stopped it in the collieries?” “I cannot speak for any other trade.” (n. 1737.) “Can you see any difference in the circumstances of women employed in iron-works, and the circumstances of women employed above ground in collieries?” “I have not ascertained anything as to that.” (n. 1740.) “Can you see anything that makes a distinction between one class and the other?” “I have not ascertained that, but I know from house to house visitation, that it is a deplorable state of things in our district...” (n. 1741.) “Would you interfere in every case with the employment of women where that employment was degrading?” “It would become injurious, I think, in this way: the best feelings of Englishmen have been gained from the instruction of a mother...” (n. 1750.) “That equally applies to agricultural employments, does it not?” “Yes, but that is only for two seasons, and we have work all the four seasons.” (n. 1751.) “They often work day and night, wet through to the skin, their constitution undermined and their health ruined.” “You have not inquired into that subject perhaps?” “I have certainly taken note of it as I have gone along, and certainly I have seen nothing parallel to the effects of the employment of women on the pit bank....It is the work of a man...a strong man.” (ns. 1753, 1793, 1794.) “Your feeling upon the whole subject is that the better class of colliers who desire to raise themselves and humanise themselves, instead of deriving help from the women, are pulled down by them?” “Yes.” (n. 1808.) After some further crooked questions from these bourgeois, the secret of their “sympathy” for widows, poor families, 8c., comes out at last. “The coal proprietor appoints certain gentlemen to take the oversight of the workings, and it is their policy, in order to receive approbation, to place things on the most economical basis they can, and these girls are employed at from 1s. up to 1s. 6d. a day, where a man at the rate of 2s. 6d. a day would have to be employed.” (n. 1816.)

CORONER'S INQUESTS.— “With regard to coroner’s inquests in your district, have the workmen confidence in the proceedings at these inquests when accidents occur?” “No; they have not.” (n. 306.) “Why not?” “Chiefly because the men who are generally chosen, are men who know nothing about mines and such like.” “Are not workmen summoned at all upon the juries?” “Never but as witnesses to my knowledge.” “Who are the people who are generally summoned upon these juries?” “Generally tradesmen in the neighborhood...from their circumstances they are sometimes liable to be influenced by their employers...the owners of the works. They are generally men who have no knowledge, and can scarcely understand the witnesses who are called before them, and the terms which are used and such like.” “Would you have the jury composed of persons who had been employed in mining?” “Yes, partly...they (the workmen) think that the verdict is not in accordance with the evidence given generally. “(ns. 361, 364, 366, 368, 371, 375.) “One great object in summoning a jury is to have an impartial one, is it not?” “Yes, I should think so.” “Do you think that the juries would be impartial if they were composed to a considerable extent of workmen?” “I cannot see any motive which the workmen would have to act partially...they necessarily have a better knowledge of the operations in connection with the mine.” “You do not think there would be a tendency on the part of the workmen to return unfairly severe verdicts?” “No, I think not.” (ns. 378, 379, 380.)

FALSE WEIGHTS AND MEASURES. — The workmen demand to be paid weekly instead of fortnightly, and by weight instead of by cubical contents of the tubs; they also demand protection against the use of false weights, 8c. (n. 1071.) “if the tubs were fraudulently increased, a man could discontinue working by giving 14 days’ notice?” “But if he goes to another place, there is the same thing going on there.” (n. 1071.) “But he can leave that place where the wrong has been committed?” “It is general; wherever he goes, he has to submit to it.” (n. 1072.) “Could a man leave by giving 14 days’ notice?” “Yes,” (n. 1073.) And yet they are not satisfied!

VI. INSPECTION OF MINES. — Casualties from explosions are not the only things the workmen suffer from. (n. 234, sqq.) “Our men complained very much of the bad ventilation of the collieries...the ventilation is so bad in general that the men can scarcely breathe; they are quite unfit for employment of any kind after they have been for a length of time in connection with their work; indeed, just at the part of the mine where I am

working, men have been obliged to leave their employment and come home in consequence of that...some of them have been out of work for weeks just in consequence of the bad state of the ventilation where there is not explosive gas...there is plenty of air generally in the main courses, yet pains are not taken to get air into the workings where men are working.” “Why do you not apply to the inspector?” “To tell the truth there are many men who are timid on that point; there have been cases of men being sacrificed and losing their employment in consequence of applying to the inspector.” “Why; is he a marked man for having complained?” “Yes.” “And he finds it difficult to get employment in another mine?” “Yes.” “Do you think the mines in your neighborhood are sufficiently inspected to insure a compliance with the provisions of the Act?” “No; they are not inspected at all...the inspector has been down just once in the pit, and it has been going seven years....In the district to which I belong there are not a sufficient number of inspectors. We have one old man more than 70 years of age to inspect more than 130 collieries.” “You wish to have a class of sub-inspectors?” “Yes.” (ns. 234, 241, 251, 254, 274, 275, 554, 276, 293.) But do you think it would be possible for government to maintain such an army of inspectors as would be necessary to do all that you want them to do, without information from the men?” “No, I should think it would be next to impossible.”...”It would be desirable the inspectors should come oftener?” “Yes, and without being sent for.” (n. 280, 277.) “Do you not think that the effect of having these inspectors examining the collieries so frequently would be to shift the responsibility (!) of supplying proper ventilation from the owners of the collieries to the Government officials?” “No, I do not think that, I think that they should make it their business to enforce the Acts which are already in existence.” (n. 285.) “When you speak of sub-inspectors, do you mean men at a less salary, and of an inferior stamp to the present inspectors?” “I would not have them inferior, if you could get them otherwise.” (n. 294.) “Do you merely want more inspectors, or do you want a lower class of men as an inspector?” “A man who would knock about, and see that things are kept right; a man who would not be afraid of himself.” (n. 295.) “If you obtained your wish in getting an inferior class of inspectors appointed, do you think there would be no danger from want of skill, 8c.?” “I think not, I think that the Government would see after that, and have proper men in that position.” (n. 297.) This kind of examination becomes at last too much even for the chairman of the committee, and he interrupts

with the observation: “You want a class of men who would look into all the details of the mine, and would go into all the holes and corners, and go into the real facts...they would report to the chief inspector, who would then bring his scientific knowledge to bear on the facts they have stated?” (ns. 298, 299.) “Would it not entail very great expense if all these old workings were kept ventilated?” “Yes, expense might be incurred, but life would be at the same time protected.” (n. 531.) A working miner objects to the 17th section of the Act of 1860; he says, “At the present time, if the inspector of mines finds a part of the mine unfit to work in, he has to report it to the mine owner and the Home Secretary. After doing that, there is given to the owner 20 days to look over the matter; at the end of 20 days he has the power to refuse making any alteration in the mine; but, when he refuses, the mine owner writes to the Home Secretary, at the same time nominating five engineers, and from those five engineers named by the mine owner himself, the Home Secretary appoints one, I think, as arbitrator, or appoints arbitrators from them; now we think in that case the mine owner virtually appoints his own arbitrator.” (n. 581.) Bourgeois examiner, himself a mine owner: “But...is this a merely speculative objection?” (n. 586.) “Then you have a very poor opinion of the integrity of mining engineers?” “It is most certainly unjust and inequitable.” (n. 588.) “Do not mining engineers possess a sort of public character, and do not you think that they are above making such a partial decision as you apprehend?” “I do not wish to answer such a question as that with respect to the personal character of those men. I believe that in many cases they would act very partially indeed, and that it ought not to be in their hands to do so, where men’s lives are at stake.” (n. 589.) This same bourgeois is not ashamed to put this question: “Do you not think that the mine owner also suffers loss from an explosion?” Finally, “Are not you workmen in Lancashire able to take care of your own interests without calling in the Government to help you?” “No.” (n. 1042.)

In the year 1865 there were 3217 coal mines in Great Britain, and 12 inspectors. A Yorkshire mine owner himself calculates (“Times,” 26th January, 1867), that putting on one side their office work, which absorbs all their time, each mine can be visited but once in ten years by an inspector. No wonder that explosions have increased progressively, both in number and extent (sometimes with a loss of 200-300 men), during the last ten years.

The very defective Act, passed in 1872, is the first that regulates the hours of labour of the children employed in mines, and makes exploiters and owners, to a certain extent, responsible for so-called accidents.

The Royal Commission appointed in 1867, to inquire into the employment in agriculture of children, young persons, and women, has published some very important reports. Several attempts to apply the principles of the Factory Acts, but in a modified form, to agriculture have been made, but have so far resulted in complete failure. All that I wish to draw attention to here is the existence of an irresistible tendency towards the general application of those principles.

If the general extension of factory legislation to all trades for the purpose of protecting the working class both in mind and body has become inevitable, on the other hand, as we have already pointed out, that extension hastens on the general conversion of numerous isolated small industries into a few combined industries carried on upon a large scale; it therefore accelerates the concentration of capital and the exclusive predominance of the factory system. It destroys both the ancient and the transitional forms, behind which the dominion of capital is still in part concealed, and replaces them by the direct and open sway of capital; but thereby it also generalises the direct opposition to this sway. While in each individual workshop it enforces uniformity, regularity, order, and economy, it increases by the immense spur which the limitation and regulation of the working day give to technical improvement, the anarchy and the catastrophes of capitalist production as a whole, the intensity of labour, and the competition of machinery with the labourer. By the destruction of petty and domestic industries it destroys the last resort of the “redundant population,” and with it the sole remaining safety-valve of the whole social mechanism. By maturing the material conditions, and the combination on a social scale of the processes of production, it matures the contradictions and antagonisms of the capitalist form of production, and thereby provides, along with the elements for the formation of a new society, the forces for exploding the old one.

SECTION 10. — MODERN INDUSTRY AND AGRICULTURE.

The revolution called forth by modern industry in agriculture, and in the social relations of agricultural producers, will be investigated later on. In this place we shall merely indicate a few results by way of anticipation. If the use of machinery in agriculture is for the most part free from the injurious physical effect it has on the factory operative, its action in superseding the labourers is more intense, and finds less resistance, as we shall see later in detail. In the counties of Cambridge and Suffolk, for example, the area of cultivated land has extended very much within the last 20 years (up to 1868), while in the same period the rural population has diminished, not only relatively, but absolutely. In the United States it is as yet only virtually that agricultural machines replace labourers; in other words, they allow of the cultivation by the farmer of a larger surface, but do not actually expel the labourers employed. In 1861 the number of persons occupied in England and Wales in the manufacture of agricultural machines was 1034, whilst the number of agricultural labourers employed in the use of agricultural machines and steam engines did not exceed 1205.

In the sphere of agriculture, modern industry has a more revolutionary effect than elsewhere, for this reason, that it annihilates the peasant, that bulwark of the old society, and replaces him by the wage labourer. Thus the desire for social changes, and the class antagonisms are brought to the same level in the country as in the towns. The irrational, old fashioned methods of agriculture are replaced by scientific ones. Capitalist production completely tears asunder the old bond of union which held together agriculture and manufacture in their infancy. But at the same time it creates the material conditions for a higher synthesis in the future, viz., the union of agriculture and industry on the basis of the more perfected forms they have each acquired during their temporary separation. Capitalist production, by collecting the population in great centres, and causing an ever increasing preponderance of town population, on the one hand concentrates the historical motive-power of society; on the other hand, it disturbs the circulation of matter between man and the soil, i.e., prevents the return to the soil of its elements consumed by man in the form of food and clothing; it therefore violates the conditions necessary to lasting fertility of the soil. By this action it destroys at the same time the health of the town labourer and the intellectual life of the rural labourer. But while upsetting the naturally grown conditions for the maintenance of that circulation of matter, it imperiously calls for its restoration as a system, as a regulating law of

social production, and under a form appropriate to the full development of the human race. In agriculture as in manufacture, the transformation of production under the sway of capital, means, at the same time, the martyrdom of the producer; the instrument of labour becomes the means of enslaving, exploiting, and impoverishing the labourer; the social combination and organization of labour-processes is turned into an organised mode of crushing out the workman's individual vitality, freedom, and independence. The dispersion of the rural labourers over larger areas breaks their power of resistance while concentration increases that of the town operatives. In modern agriculture, as in the urban industries, the increased productiveness and quantity of the labour set in motion are bought at the cost of laying waste and consuming by disease labour-power itself. Moreover, all progress in capitalistic agriculture is a progress in the art, not only of robbing the labourer, but of robbing the soil; all progress in increasing the fertility of the soil for a given time, is a progress towards ruining the lasting sources of that fertility. The more a country starts its development on the foundation of modern industry, like the United States, for example, the more rapid is this process of destruction. Capitalist production, therefore, develops technology, and the combining together of various processes into a social whole, only by sapping the original sources of all wealth — the soil and the labourer.

**PART V. THE PRODUCTION OF ABSOLUTE
AND OF RELATIVE SURPLUS-VALUE.**

CHAPTER XVI. ABSOLUTE AND RELATIVE SURPLUS-VALUE.

IN considering the labour-process, we began (see Chapter VII.) by treating it in the abstract, apart from its historical forms, as a process between man and nature. We there stated, : “If we examine the whole labour-process, from the point of view of its result, it is plain that both the instruments and the subject of labour are means of production, and that the labour itself is productive labour.” And in Note 2, same page, we further added: “This method of determining, from the standpoint of the labour-process alone, what is productive labour, is by no means directly applicable to the case of the capitalist process of production.” We now proceed to the further development of this subject.

So far as the labour-process is purely individual, one and the same labourer unites in himself all the functions, that later on become separated. When an individual appropriates natural objects for his livelihood, no one controls him but himself. Afterwards he is controlled by others. A single man cannot operate upon nature without calling his own muscles into play under the control of his own brain. As in the natural body head and hand wait upon each other, so the labour-process unites the labour of the hand with that of the head. Later on they part company and even become deadly foes. The product ceases to be the direct product of the individual, and becomes a social product, produced in common by a collective labourer, i.e., by a combination of workmen, each of whom takes only a part, greater or less, in the manipulation of the subject of their labour. As the co-operative character of the labour-process becomes more and more marked, so, as a necessary consequence, does our notion of productive labour, and of its agent the productive labourer, become extended. In order to labour productively, it is no longer necessary for you to do manual work yourself; enough, if you are an organ of the collective labourer, and perform one of its subordinate functions. The first definition given above of productive labour, a definition deduced from the very nature of the production of material objects, still remains correct for the collective labourer, considered as a whole. But it no longer holds good for each member taken individually.

On the other hand, however, our notion of productive labour becomes narrowed. Capitalist production is not merely the production of

commodities, it is essentially the production of surplus-value. The labourer produces, not for himself, but for capital. It no longer suffices, therefore, that he should simply produce. He must produce surplus-value. That labourer alone is productive, who produces surplus-value for the capitalist, and thus works for the self-expansion of capital. If we may take an example from outside the sphere of production of material objects, a schoolmaster is a productive labourer, when, in addition to belabouring the heads of his scholars, he works like a horse to enrich the school proprietor. That the latter has laid out his capital in a teaching factory, instead of in a sausage factory, does not alter the relation. Hence the notion of a productive labourer implies not merely a relation between work and useful effect, between labourer and product of labour, but also a specific, social relation of production, a relation that has sprung up historically and stamps the labourer as the direct means of creating surplus-value. To be a productive labourer is, therefore, not a piece of luck, but a misfortune. In Book IV. which treats of the history of the theory, it will be more clearly seen, that the production of surplus-value has at all times been made, by classical political economists, the distinguishing characteristic of the productive labourer. Hence their definition of a productive labourer changes with their comprehension of the nature of surplus-value. Thus the Physiocrats insist that only agricultural labour is productive, since that alone, they say, yields a surplus-value. And they say so because, with them, surplus-value has no existence except in the form of rent.

The prolongation of the working day beyond the point at which the labourer would have produced just an equivalent for the value of his labour-power, and the appropriation of that surplus-labour by capital, this is production of absolute surplus-value. It forms the general groundwork of the capitalist system, and the starting point for the production of relative surplus-value. The latter presupposes that the working day is already divided into two parts, necessary labour, and surplus-labour. In order to prolong the surplus-labour, the necessary labour is shortened by methods whereby the equivalent for the wages is produced in less time. The production of absolute surplus-value turns exclusively upon the length of the working day; the production of relative surplus-value, revolutionises out and out the technical processes of labour, and the composition of society. It therefore presupposes a specific mode, the capitalist mode of production, a mode which, along with its methods, means, and conditions, arises and

develops itself spontaneously on the foundation afforded by the formal subjection of labour to capital. In the course of this development, the formal subjection is replaced by the real subjection of labour to capital.

It will suffice merely to refer to certain intermediate forms, in which surplus-labour is not extorted by direct compulsion from the producer, nor the producer himself yet formally subjected to capital. In such forms capital has not yet acquired the direct control of the labour-process. By the side of independent producers who carry on their handicrafts and agriculture in the traditional old-fashioned way, there stands the usurer or the merchant, with his usurer's capital or merchant's capital, feeding on them like a parasite. The predominance, in a society, of this form of exploitation excludes the capitalist mode of production; to which mode, however, this form may serve as a transition, as it did towards the close of the Middle Ages. Finally, as is shown by modern "domestic industry," some intermediate forms are here and there reproduced in the background of Modern Industry, though their physiognomy is totally changed.

If, on the one hand, the mere formal subjection of labour to capital suffices for the production of absolute surplus-value, if, e.g., it is sufficient that handicraftsmen who previously worked on their own account, or as apprentices of a master, should become wage labourers under the direct control of a capitalist; so, on the other hand, we have seen, how the methods of producing relative surplus-value, are, at the same time, methods of producing absolute surplus-value. Nay, more, the excessive prolongation of the working day turned out to be the peculiar product of Modern Industry. Generally speaking, the specifically capitalist mode of production ceases to be a mere means of producing relative surplus-value, so soon as that mode has conquered an entire branch of production; and still more so, so soon as it has conquered all the important branches. It then becomes the general, socially predominant form of production. As a special method of producing relative surplus-value, it remains effective only, first, in so far as it seizes upon industries that previously were only formally subject to capital, that is, so far as it is propagandist; secondly, in so far as the industries that have been taken over by it, continue to be revolutionized by changes in the methods of production.

From one standpoint, any distinction between absolute and relative surplus-value appears illusory. Relative surplus-value is absolute, since it compels the absolute prolongation of the working day beyond the labour-

time necessary to the existence of the labourer himself. Absolute surplus-value is relative, since it makes necessary such a development of the productiveness of labour, as will allow of the necessary labour-time being confined to a portion of the working day. But if we keep in mind the behaviour of surplus-value, this appearance of identity vanishes. Once the capitalist mode of production established and become general, the difference between absolute and relative surplus-value makes itself felt, whenever there is a question of raising the rate of surplus-value. Assuming that labour-power is paid for at its value, we are confronted by this alternative: given the productiveness of labour and its normal intensity, the rate of surplus-value can be raised only by the actual prolongation of the working day; on the other hand, given the length of the working day, that rise can be effected only by a change in the relative magnitudes of the components of the working day, viz., necessary labour and surplus-labour; a change, which, if the wages are not to fall below the value of labour-power, presupposes a change either in the productiveness or in the intensity of the labour.

If the labourer wants all his time to produce the necessary means of subsistence for himself and his race, he has no time left in which to work gratis for others. Without a certain degree of productiveness in his labour, he has no such superfluous time at his disposal; without such superfluous time, no surplus-labour, and therefore no capitalists, no slave-owners, no feudal lords, in one word, no class of large proprietors.

Thus we may say that surplus-value rests on a natural basis; but this is permissible only in the very general sense, that there is no natural obstacle absolutely preventing one man from disburdening himself of the labour requisite for his own existence, and burdening another with it, any more, for instance, than unconquerable natural obstacles prevent one man from eating the flesh of another. No mystical ideas must in any way be connected, as sometimes happens, with this historically developed productiveness of labour. It is only after men have raised themselves above the rank of animals, when therefore their labour has been to some extent socialised, that a state of things arises in which the surplus-labour of the one becomes a condition of existence for the other. At the dawn of civilisation the productiveness acquired by labour is small, but so too are the wants which develop with and by the means of satisfying them. Further, at that early period, the portion of society that lives on the labour of others is infinitely

small compared with the mass of direct producers. Along with the progress in the productiveness of labour, that small portion of society increases both absolutely and relatively. Besides, capital with its accompanying relations springs up from an economic soil that is the product of a long process of development. The productiveness of labour that serves as its foundation and starting point, is a gift, not of nature, but of a history embracing thousands of centuries.

Apart from the degree of development, greater or less, in the form of social production, the productiveness of labour is fettered by physical conditions. These are all referable to the constitution of man himself (race, 8c.), and to surrounding nature. The external physical conditions fall into two great economical classes, (1) Natural wealth in means of subsistence, i.e., a fruitful soil, waters teeming with fish, 8c., and (2), natural wealth in the instruments of labour, such as waterfalls, navigable rivers, wood, metal, coal, 8c. At the dawn of civilisation, it is the first class that turns the scale; at a higher stage of development, it is the second. Compare, for example, England with India, or in ancient times, Athens and Corinth with the shores of the Black Sea.

The fewer the number of natural wants imperatively calling for satisfaction, and the greater the natural fertility of the soil and the favourableness of the climate, so much less is the the producer. So much greater therefore can be the excess of labour-time necessary for the maintenance and reproduction of his labour for others over his labour for himself. Diodorus long ago remarked this in relation to the ancient Egyptians. "It is altogether incredible how little trouble and expense the bringing up of their children causes them. They cook for them the first simple food at hand; they also give them the lower part of the papyrus stem to eat, so far as it can be roasted in the fire, and the roots and stalks of marsh plants, some raw, some boiled and roasted. Most of the children go without shoes and unclothed, for the air is so mild. Hence a child, until he is grown up, costs his parents not more, on the whole, than twenty drachmas. It is this, chiefly, which explains why the population of Egypt is so numerous, and, therefore, why so many great works can be undertaken." Nevertheless the grand structures of ancient Egypt are less due to the extent of its population than to the large proportion of it that was freely disposable. Just as the individual labourer can do more surplus-labour in proportion as his necessary labour-time is less, so with regard to the working population.

The smaller the part of it which is required for the production of the necessary means of subsistence, so much the greater is the part that can be set to do other work.

Capitalist production once assumed, then, all other circumstances remaining the same, and given the length of the working day, the quantity of surplus-labour will vary with the physical conditions of labour, especially with the fertility of the soil. But it by no means follows from this that the most fruitful soil is the most fitted for the growth of the capitalist mode of production. This mode is based on the dominion of man over nature. Where nature is too lavish, she “keeps him in hand, like a child in leading-strings.” She does not impose upon him any necessity to develop himself. It is not the tropics with their luxuriant vegetation, but the temperate zone, that is the mother country of capital. It is not the mere fertility of the soil, but the differentiation of the soil, the variety of its natural products, the changes of the seasons, which form the physical basis for the social division of labour, and which, by changes in the natural surroundings, spur man on to the multiplication of his wants, his capabilities, his means and modes of labour. It is the necessity of bringing a natural force under the control of society, of economising, of appropriating or subduing it on a large scale by the work of man’s hand, that first plays the decisive part in the history of industry. Examples are, the irrigation works in Egypt, Lombardy, Holland, or India and Persia where irrigation by means of artificial canals, not only supplies the soil with the water indispensable to it, but also carries down to it, in the shape of sediment from the hills, mineral fertilizers. The secret of the flourishing state of industry in Spain and Sicily under the dominion of the Arabs lay in their irrigation works.

Favourable natural conditions alone, gave us only the possibility, never the reality, of surplus-labour, nor, consequently, of surplus-value and a surplus-product. The result of difference in the natural conditions of labour is this, that the same quantity of labour satisfies, in different countries, a different mass of requirements, consequently, that under circumstances in other respects analogous, the necessary labour-time is different. These conditions affect surplus-labour only as natural limits, i.e., by fixing the points at which labour for others can begin. In proportion as industry advances, these natural limits recede. In the midst of our West European society, where the labourer purchases the right to work for his own livelihood only by paying for it in surplus-labour, the idea easily takes root

that it is an inherent quality of human labour to furnish a surplus-product. But consider, for example, an inhabitant of the eastern islands of the Asiatic Archipelago, where sago grows wild in the forests. "When the inhabitants have convinced themselves, by boring a hole in the tree, that the pith is ripe, the trunk is cut down and divided into several pieces, the pith is extracted, mixed with water and filtered: it is then quite fit for use as sago. One tree commonly yields 300 lbs., and occasionally 500 to 600 lbs. There, then, people go into the forests, and cut bread for themselves, just as with us they cut firewood." Suppose now such an eastern bread-cutter requires 12 working hours a week for the satisfaction of all his wants. Nature's direct gift to him is plenty of leisure time. Before he can apply this leisure time productively for himself, a whole series of historical events is required; before he spends it in surplus-labour for strangers, compulsion is necessary. If capitalist production were introduced, the honest fellow would perhaps have to work six days a week, in order to appropriate to himself the product of one working day. The bounty of Nature does not explain why he would then have to work 6 days a week, or why he must furnish 5 days of surplus-labour. It explains only why his necessary labour-time would be limited to one day a week. But in no case would his surplus-product arise from some occult quality inherent in human labour.

Thus, not only does the historically developed social productiveness of labour, but also its natural productiveness, appear to be productiveness of the capital with which that labour is incorporated.

Ricardo never concerns himself about the origin of surplus-value. He treats it as a thing inherent in the capitalist mode of production, which mode, in his eyes, is the natural form of social production. Whenever he discusses the productiveness of labour, he seeks in it, not the cause of surplus-value, but the cause that determines the magnitude of that value. On the other hand, his school has openly proclaimed the productiveness of labour to be the originating cause of profit (read: Surplus-value). This at all events is a progress as against the mercantilists who, on their side, derived the excess of the price over the cost of production of the product, from the act of exchange, from the product being sold above its value. Nevertheless, Ricardo's school simply shirked the problem, they did not solve it. In fact these bourgeois economists instinctively saw, and rightly so, that it is very dangerous to stir too deeply the burning question of the origin of surplus-

value. But what are we to think of John Stuart Mill, who, half a century after Ricardo, solemnly claims superiority over the mercantilists, by clumsily repeating the wretched evasions of Ricardo's earliest vulgarisers?

Mill says: "The cause of profit is that labour produces more than is required for its support." So far, nothing but the old story; but Mill wishing to add something of his own, proceeds: "To vary the form of the theorem; the reason why capital yields a profit, is because food, clothing, materials and tools, last longer than the time which was required to produce them." He here confounds the duration of labour-time with the duration of its products. According to this view, a baker whose product lasts only a day, could never extract from his workpeople the same profit, as a machine maker whose products endures for 20 years and more. Of course it is very true, that if a bird's nest did not last longer than the time it takes in building, birds would have to do without nests.

This fundamental truth once established, Mill establishes his own superiority over the mercantilists. "We thus see," he proceeds, "that profit arises, not from the incident of exchange, but from the productive power of labour; and the general profit of the country is always what the productive power of labour makes it, whether any exchange takes place or not. If there were no division of employments, there would be no buying or selling, but there would still be profit." For Mill then, exchange, buying and selling, those general conditions of capitalist production, are but an incident, and there would always be profits even without the purchase and sale of labour-power!

"If," he continues, "the labourers of the country collectively produce twenty per cent more than their wages, profits will be twenty per cent, whatever prices may or may not be." This is, on the one hand, a rare bit of tautology; for if labourers produce a surplus-value of 20% for the capitalist, his profit will be to the total wages of the labourers as 20: 100. On the other hand, it is absolutely false to say that "profits will be 20%." They will always be less, because they are calculated upon the sum total of the capital advanced. If, for example, the capitalist have advanced £500, of which £400 is laid out in means of production and £100 in wages, and if the rate of surplus-value be 20%, the rate of profit will be 20:500, i.e., 4% and not 20%.

Then follows a splendid example of Mill's method of handling the different historical forms of social production: "I assume, throughout, the

state of things which, where the labourers and capitalists are separate classes, prevails, with few exceptions, universally; namely, that the capitalist advances the whole expenses, including the entire remuneration of the labourer.” Strange optical illusion to see everywhere a state of things which as yet exist only exceptionally on our earth. But let us finish — Mill is willing to concede, “that he should do so is not a matter of inherent necessity.” On the contrary: “the labourer might wait, until the production is complete, for all that part of his wages which exceeds mere necessities; and even for the whole, if he has funds in hand sufficient for his temporary support. But in the latter case, the labourer is to that extent really a capitalist in the concern, by supplying a portion of the funds necessary for carrying it on.” Mill might have gone further and have added, that the labourer who advances to himself not only the necessities of life but also the means of production, is in reality nothing but his own wage-labourer. He might also have said that the American peasant proprietor is but a serf who does enforced labour for himself instead of for his lord.

After thus proving clearly, that even if capitalist production had no existence, still it would always exist, Mill is consistent enough to show, on the contrary, that it has no existence, even when it does exist. “And even in the former case” (when the workman is a wage labourer to whom the capitalist advances all the necessities of life, he the labourer), “may be looked upon in the same light,” i.e., as a capitalist, “since, contributing his labour at less than the market price, (!) he may be regarded as lending the difference (?) to his employer and receiving it back with interest, 8c.” In reality, the labourer advances his labour gratuitously to the capitalist during, say one week, in order to receive the market price at the end of the week, 8c., and it is this which, according to Mill, transforms him into a capitalist. On the level plain, simple mounds look like hills; and the imbecile flatness of the present bourgeoisie is to be measured by the altitude of its great intellects.

CHAPTER XVII. CHANGES OF MAGNITUDE IN THE PRICE OF LABOUR-POWER AND IN SURPLUS-VALUE.

THE value of labour-power is determined by the value of the necessaries of life habitually required by the average labourer. The quantity of these necessaries is known at any given epoch of a given society, and can therefore be treated as a constant magnitude. What changes, is the value of this quantity. There are, besides, two other factors that enter into the determination of the value of labour-power. One, the expenses of developing that power, which expenses vary with the mode of production; the other, its natural diversity, the difference between the labour-power of men and women, of children and adults. The employment of these different sorts of labour-power, an employment which is, in its turn, made necessary by the mode of production, makes a great difference in the cost of maintaining the family of the labourer, and in the value of the labour-power of the adult male. Both these factors, however, are excluded in the following investigation.

I assume (1) that commodities are sold at their value; (2) that the price of labour-power rises occasionally above its value, but never sinks below it.

On this assumption we have seen that the relative magnitudes of surplus-value and of price of labour-power are determined by three circumstances; (1) the length of the working day, or the extensive magnitude of labour; (2) the normal intensity of labour, its intensive magnitude, whereby a given quantity of labour is expended in a given time; (3) the productiveness of labour, whereby the same quantum of labour yields, in a given time, a greater or less quantum of product, dependent on the degree of development in the conditions of production. Very different combinations are clearly possible, according as one of the three factors is constant and two variable, or two constant and one variable, or lastly, all three simultaneously variable. And the number of these combinations is augmented by the fact that, when these factors simultaneously vary, the amount and direction of their respective variations may differ. In what follows the chief combinations alone are considered.

Length of the working day and intensity of labour constant. Productiveness of labour variable.

On these assumptions the value of labour-power, and the magnitude of surplus-value, are determined by three laws.

A working day of given length always creates the same amount of value, no matter how the productiveness of labour, and, with it, the mass of the product, and the price of each single commodity produced, may vary.

If the value created by a working day of 12 hours be, say, six shillings, then, although the mass of the articles produced varies with the productiveness of labour, the only result is that the value represented by six shillings is spread over a greater or less number of articles.

Surplus-value and the value of labour-power vary in opposite directions. A variation in the productiveness of labour, its increase or diminution, causes a variation in the opposite direction in the value of labour-power, and in the same direction in surplus-value.

The value created by a working day of 12 hours is a constant quantity, say, six shillings. This constant quantity is the sum of the surplus-value plus the value of the labour-power, which latter value the labourer replaces by an equivalent. It is self-evident, that if a constant quantity consist of two parts, neither of them can increase without the other diminishing. Let the two parts at starting be equal; 3 shillings value of labour-power, 3 shillings surplus-value. Then the value of the labour-power cannot rise from three shillings to four, without the surplus-value falling from three shillings to two; and the surplus-value cannot rise from three shillings to four, without the value of labour-power falling from three shillings to two. Under these circumstances, therefore, no change can take place in the absolute magnitude, either of the surplus-value, or of the value of labour-power, without a simultaneous change in their relative magnitudes, i.e., relatively to each other. It is impossible for them to rise or fall simultaneously.

Further, the value of labour-power cannot fall, and consequently surplus-value cannot rise, without a rise in the productiveness of labour. For instance, in the above case, the value of the labour-power cannot sink from three shillings to two, unless an increase in the productiveness of labour makes it possible to produce in 4 hours the same quantity of necessaries as previously required 6 hours to produce. On the other hand, the value of the labour-power cannot rise from three shillings to four, without a decrease in the productiveness of labour, whereby eight hours become requisite to

produce the same quantity of necessaries, for the production of which six hours previously sufficed. It follows from this, that an increase in the productiveness of labour causes a fall in the value of labour-power and a consequent rise in surplus-value, while, on the other hand, a decrease in such productiveness causes a rise in the value of labour-power, and a fall in surplus-value.

In formulating this law, Ricardo overlooked one circumstance; although a change in the magnitude of the surplus-value or surplus-labour causes a change in the opposite direction in the magnitude of the value of labour-power, or in the quantity of necessary labour, it by no means follows that they vary in the same proportion. They do increase or diminish by the same quantity. But their proportional increase or diminution depends on their original magnitudes before the change in the productiveness of labour took place. If the value of the labour-power be 4 shillings, or the necessary labour-time 8 hours, and the surplus-value be 2 shillings, or the surplus-labour 4 hours, and if, in consequence of an increase in the productiveness of labour, the value of the labour-power fall to 3 shillings, or the necessary labour to 6 hours, the surplus-value will rise to 3 shillings, or the surplus-labour to 6 hours. The same quantity, 1 shilling or 2 hours, is added in one case and subtracted in the other. But the proportional change of magnitude is different in each case. While the value of the labour-power falls from 4 shillings to 3, i.e., by $\frac{1}{4}$ or 25%, the surplus-value rises from 2 shillings to 3, i.e., by $\frac{1}{2}$ or 50%. It therefore follows that the proportional increase or diminution in surplus-value, consequent on a given change in the productiveness of labour, depends on the original magnitude of that portion of the working day which embodies itself in surplus-value; the smaller that portion, the greater is the proportional change; the greater that portion, the less is the proportional change.

Increase or diminution in surplus-value is always consequent on, and never the cause of, the corresponding diminution or increase in the value of labour-power.

Since the working-day is constant in magnitude, and is represented by a value of constant magnitude, since, to every variation in the magnitude of surplus-value, there corresponds an inverse variation in the value of labour-power, and since the value of labour-power cannot change, except in consequence of a change in the productiveness of labour, it clearly follows, under these conditions, that every change of magnitude in surplus-value

arises from an inverse change of magnitude in the value of labour-power. If, then, as we have already seen, there can be no change of absolute magnitude in the value of labour-power, and in surplus-value, unaccompanied by a change in their relative magnitudes, so now it follows that no change in their relative magnitudes is possible, without a previous change in the absolute magnitude of the value of labour-power.

According to the third law, a change in the magnitude of surplus-value, presupposes a movement in the value of labour-power, which movement is brought about by a variation in the productiveness of labour. The limit of this change is given by the altered value of labour-power. Nevertheless, even when circumstances allow the law to operate, subsidiary movements may occur. For example: if in consequence of the increased productiveness of labour, the value of labour-power fall from 4 shillings to 3, or the necessary labour-time from 8 hours to 6, the price of labour-power may possibly not fall below 3s. 8d., 3s. 6d., or 3s. 2d., and the surplus-value consequently not rise above 3s. 4d., 3s. 6d., or 3s. 10d. The amount of this fall, the lowest limit of which is 3 shillings (the new value of labour-power), depends on the relative weight, which the pressure of capital on the one side, and the resistance of the labourer on the other, throws into the scale.

The value of labour-power is determined by the value of a given quantity of necessaries. It is the value and not the mass of these necessaries that varies with the productiveness of labour. It is, however, possible that, owing to an increase of productiveness, both the labourer, and the capitalist may simultaneously be able to appropriate a greater quantity of these necessaries, without any change in the price of labour-power or in surplus-value. If the value of labour-power be 3 shillings, and the necessary labour-time amount to 6 hours, if the surplus-value likewise be 3 shillings, and the surplus-labour 6 hours, then if the productiveness of labour were doubled without altering the ratio of necessary labour to surplus-labour, there would be no change of magnitude in surplus-value and price of labour-power. The only result would be that each of them would represent twice as many use-values as before; these use-values being twice as cheap as before. Although labour-power would be unchanged in price, it would be above its value. If, however, the prices of labour-power had fallen, not to 1s. 6d., the lowest possible point consistent with its new value, but to 2s. 10d. or 2s. 6d., still this lower price would represent an increased mass of necessaries. In this way it is possible with an increasing productiveness of labour, for the price

of labour-power to keep on falling, and yet this fall to be accompanied by a constant growth in the mass of the labourer's means of subsistence. But even in such case, the fall in the value of labour-power would cause a corresponding rise of surplus-value, and thus the abyss between the labourer's position and that of the capitalist would keep widening.

Ricardo was the first who accurately formulated the three laws we have above stated. But he falls into the following errors: (1) he looks upon the special conditions under which these laws hold good as the general and sole conditions of capitalist production. He knows no change, either in the length of the working day, or in the intensity of labour; consequently with him there can be only one variable factor, viz., the productiveness of labour; (2), and this error vitiates his analysis much more than (1), he has not, any more than have the other economists, investigated surplus-value as such, i.e., independently of its particular forms, such a profit, rent, &c. He therefore confounds together the laws of the rate of surplus-value and the laws of the rate of profit. The rate of profit is, as we have already said, the ratio of the surplus-value to the total capital advanced; the rate of surplus-value is the ratio of the surplus-value to the variable part of that capital. Assume that a capital C of £500 is made up of raw material, instruments of labour, &c. (c) to the amount of £400; and of wages (v) to the amount of £100; and further, that the surplus-value (s)=£100. Then we have rate of surplus-value $s/v = £100/£100 = 100\%$. But the rate of profit $s/C = £100/£500 = 20\%$. It is, besides, obvious that the rate of profit may depend on circumstances that in no way affect the rate of surplus-value. I shall show in Book III. that, with a given rate of surplus-value, we may have any number of rates of profit, and that various rates of surplus-value may, under given conditions, express themselves in a single rate of profit.

II. Working-day constant. Productiveness of labour constant. Intensity of labour variable.

Increased intensity of labour means increased expenditure of labour in a given time. Hence a working-day of more intense labour is embodied in more products than is one of less intense labour, the length of each day being the same. Increased productiveness of labour also, it is true, will supply more products in a given working-day. But in this latter case, the value of each single product falls, for it costs less labour than before; in the former case, that value remains unchanged, for each article costs the same labour as before. Here we have an increase in the number of products,

unaccompanied by a fall in their individual prices: as their number increases, so does the sum of their prices. But in the case of increased productiveness, a given value is spread over a greater mass of products. Hence the length of the working-day being constant, a day's labour of increased intensity will be incorporated in an increased value, and, the value of money remaining unchanged, in more money. The value created varies with the extent to which the intensity of labour deviates from its normal intensity in the society. A given working-day, therefore, no longer creates a constant, but a variable value; in a day of 12 hours of ordinary intensity, the value created is, say 6 shillings, but with increased intensity, the value created may be 7, 8, or more shillings. It is clear that, if the value created by a day's labour increases from, say, 6 to 8 shillings, then the two parts into which this value is divided, viz., price of labour-power and surplus-value, may both of them increase simultaneously, and either equally or unequally. They may both simultaneously increase from 3 shillings to 4. Here, the rise in the price of labour-power does not necessarily imply that the price has risen above the value of labour-power. On the contrary, the rise in price may be accompanied by a fall in value. This occurs whenever the rise in the price of labour-power does not compensate for its increased wear and tear.

We know that, with transitory exceptions, a change in the productiveness of labour does not cause any change in the value of labour-power, nor consequently in the magnitude of surplus-value, unless the products of the industries affected are articles habitually consumed by the laborers. In the present case this condition no longer applies. For when the variation is either in the duration or in the intensity of labour, there is always a corresponding change in the magnitude of the value created, independently of the nature of the article in which that value is embodied.

If the intensity of labour were to increase simultaneously and equally in every branch of industry, then the new and higher degree of intensity would become the normal degree for the society, and would therefore cease to be taken account of. But still, even then, the intensity of labour would be different in different countries, and would modify the international application of the law of value. The more intense working-day of one nation would be represented by a greater sum of money than would the less intense day of another nation.

III. Productiveness and Intensity of Labour constant. Length of the working-day variable.

The working-day may vary in two ways. It may be made either longer or shorter. From our present data, and within the limits of the assumptions made on we obtain the following laws:

The working-day creates a greater or less amount of value in proportion to its length — thus, a variable and not a constant quantity of value.

(2.) Every change in the relation between the magnitudes of surplus value and of the value of labour-power arises from a change in the absolute magnitude of the surplus-labour, and consequently of the surplus-value.

(3.) The absolute value of labour-power can change only in consequence of the reaction exercised by the prolongation of surplus-value upon the wear and tear of labour-power. Every change in this absolute value is therefore the effect, but never the cause, of a change in the magnitude of surplus-value.

We begin with the case in which the working-day is shortened.

A shortening of the working-day under the conditions given above, leaves the value of labour-power, and with it, the necessary labour-time, unaltered. It reduces the surplus-labour and surplus-value. Along with the absolute magnitude of the latter, its relative magnitude also falls, i.e., its magnitude relatively to the value of labour-power whose magnitude remains unaltered. Only by lowering the price of labour-power below its value could the capitalist save himself harmless.

All the usual arguments against the shortening of the working-day, assume that it takes place under the conditions we have here supposed to exist; but in reality the very contrary is the case: a change in the productiveness and intensity of labour either precedes, or immediately follows, a shortening of the working-day.

(2). Lengthening of the working-day. Let the necessary labour-time be 6 hours, or the value of labour-power 3 shillings; also let the surplus-labour be 6 hours or the surplus-value 3 shillings. The whole working-day then amounts to 12 hours and is embodied in a value of 6 shillings. If, now, the working-day be lengthened by 2 hours and the price of labour-power remain unaltered, the surplus-value increases both absolutely and relatively. Although there is no absolute change in the value of labour-power, it suffers a relative fall. Under the conditions assumed in I. there could not be a change of relative magnitude in the value of labour-power without a change

in its absolute magnitude. Here, on the contrary, the change of relative magnitude in the value of labour-power is the result of the change of absolute magnitude in surplus-value.

Since the value in which a day's labour is embodied, increases with the length of that day, it is evident that the surplus-value and the price of labour-power may simultaneously increase, either by equal or unequal quantities. This simultaneous increase is therefore possible in two cases, one, the actual lengthening of the working-day, the other, an increase in the intensity of labour unaccompanied by such lengthening.

When the working-day is prolonged, the price of labour-power may fall below its value, although that price be nominally unchanged or even rise. The value of a day's labour-power, is, as will be remembered, estimated from its normal average duration, or from the normal duration of life among the labourers, and from corresponding normal transformations of organised bodily matter into motion, in conformity with the nature of man. Up to a certain point, the increased wear and tear of labour-power, inseparable from a lengthened working-day, may be compensated by higher wages. But beyond this point the wear and tear increases in geometrical progression, and every condition suitable for the normal reproduction and functioning of labour-power is suppressed. The price of labour-power and the degree of its exploitation cease to be commensurable quantities.

IV. — Simultaneous variations in the duration, productiveness, and intensity of labour.

It is obvious that a large number of combinations are here possible. Any two of the factors may vary and the third remain constant, or all three may vary at once. They may vary either in the same or in different degrees, in the same or in opposite directions, with the result that the variations counteract one another, either wholly or in part. Nevertheless the analysis of every possible case is easy in view of the results given in I., II., and III. The effect of every possible combination may be found by treating each factor in turn as variable, and the other two constant for the time being. We shall, therefore, notice, and that briefly, but two important cases.

(1). Diminishing productiveness of labour with a simultaneous lengthening of the working-day.

In speaking of diminishing productiveness of labour, we here refer to diminution in those industries whose products determine the value of labour-power; such a diminution, for example, as results from decreasing

fertility of the soil, and from the corresponding dearness of its products. Take the working-day at 12 hours and the value created by it at 6 shillings, of which one half replaces the value of the labour-power, the other forms the surplus-value. Suppose, in consequence of the increased dearness of the products of the soil, that the value of labour-power rises from 3 shillings to 4, and therefore the necessary labour-time from 6 hours to 8. If there be no change in the length of the working-day, the surplus-labour would fall from 6 hours to 4, the surplus-value from 3 shillings to 2. If the day be lengthened by 2 hours, i.e., from 12 hours to 14, the surplus-labour remains at 6 hours, the surplus-value at 6 shillings, but the surplus-value decreases compared with the value of labour-power, as measured by the necessary labour-time. If the day be lengthened by 4 hours, viz., from 12 hours to 16, the proportional magnitudes of surplus-value and value of labour-power, of surplus-labour and necessary labour, continue unchanged, but the absolute magnitude of surplus-value rises from 3 shillings to 4, that of the surplus-labour from 6 hours to 8, an increment of $33\frac{1}{3}\%$. Therefore, with diminishing productiveness of labour and a simultaneous lengthening of the working-day, the absolute magnitude of surplus-value may continue unaltered, at the same time that its relative magnitude diminishes; its relative magnitude may continue unchanged, at the same time that its absolute magnitude increases; and, provided the lengthening of the day be sufficient, both may increase.

In the period between 1799 and 1815 the increasing price of provisions led in England to a nominal rise in wages, although the real wages, expressed in the necessities of life, fell. From this fact West and Ricardo drew the conclusion, that the diminution in the productiveness of agricultural labour had brought about a fall in the rate of surplus-value, and they made this assumption of a fact that existed only in their imaginations, the starting-point of important investigations into the relative magnitudes of wages, profits, and rent. But, as a matter of fact, surplus-value had at that time, thanks to the increased intensity of labour, and to the prolongation of the working-day, increased both in absolute and relative magnitude. This was the period in which the right to prolong the hours of labour to an outrageous extent was established; the period that was especially characterised by an accelerated accumulation of capital here, by pauperism there.

Increasing intensity and productiveness of labour with simultaneous shortening of the working-day.

Increased productiveness and greater intensity of labour, both have a like effect. They both augment the mass of articles produced in a given time. Both, therefore, shorten that portion of the working-day which the labourer needs to produce his means of subsistence or their equivalent. The minimum length of the working-day is fixed by this necessary but contractile portion of it. If the whole working-day were to shrink to the length of this portion, surplus-labour would vanish, a consummation utterly impossible under the régime of capital. Only by suppressing the capitalist form of production could the length of the working-day be reduced to the necessary labour-time. But, even in that case, the latter would extend its limits. On the one hand, because the notion of “means of subsistence” would considerably expand, and the labourer would lay claim to an altogether different standard of life. On the other hand, because a part of what is now surplus-labour, would then count as necessary labour; I mean the labour of forming a fund for reserve and accumulation.

The more the productiveness of labour increases, the more can the working-day be shortened; and the more the working-day is shortened, the more can the intensity of labour increase. From a social point of view, the productiveness increases in the same ratio as the economy of labour, which, in its turn, includes not only economy of the means of production, but also the avoidance of all useless labour. The capitalist mode of production, while on the one hand, enforcing economy in each individual business, on the other hand, begets, by its anarchical system of competition, the most outrageous squandering of labour-power and of the social means of production, not to mention the creation of a vast number of employments, at present indispensable, but in themselves superfluous.

The intensity and productiveness of labour being given, the time which society is bound to devote to material production is shorter, and as a consequence, the time at its disposal for the free development, intellectual and social, of the individual is greater, in proportion as the work is more and more evenly divided among all the able-bodied members of society, and as a particular class is more and more deprived of the power to shift the natural burden of labour from its own shoulders to those of another layer of society. In this direction, the shortening of the working-day finds at last a limit in the generalisation of labour. In capitalist society spare time is

acquired for one class by converting the whole life-time of the masses into labour-time.

CHAPTER XVIII. VARIOUS FORMULÆ FOR THE RATE OF SURPLUS-VALUE.

WE have seen that the rate of surplus-value is represented by the following formulæ.

The two first of these formulæ represent, as a ratio of values, that which, in the third, is represented as a ratio of the times during which those values are produced. These formulæ, supplementary the one to the other, are rigorously definite and correct. We therefore find them substantially, but not consciously, worked out in classical political economy. There we meet with the following derivative formulæ.

One and the same ratio is here expressed as a ratio of labour-times, of the values in which those labour-times are embodied, and of the products in which those values exist. It is of course understood that, by “Value of the Product,” is meant only the value newly created in a working-day, the constant part of the value of the product being excluded.

In all of these formulæ (II.), the actual degree of exploitation of labour, or the rate of surplus-value, is falsely expressed. Let the working-day be 12 hours. Then, making the same assumptions as in former instances, the real degree of exploitation of labour will be represented in the following proportions.

From formulæ II. we get very differently,

These derivative formulæ express, in reality, only the proportion in which the working-day, or the value produced by it, is divided between capitalist and labourer. If they are to be treated as direct expressions of the degree of self-expansion of capital, the following erroneous law would hold good: Surplus-labour or surplus-value can never reach 100%. Since the surplus-labour is only an aliquot part of the working-day, or since surplus-value is only an aliquot part of the value created, the surplus-labour must necessarily be always less than the working-day, or the surplus-value always less than the total value created. In order, however, to attain the ratio

of 100:100 they must be equal. In order that the surplus-labour may absorb the whole day (i.e., an average day of any week or year), the necessary labour must sink to zero. But if the necessary labour vanish, so too does the surplus-labour, since it is only a function of the former. The ratio Surplus-labour/Working-day or Surplus-value/Value created can therefore never reach the limit of 100/100, still less rise to $(100+x)/100$. But not so the rate of surplus-value, the real degree of exploitation of labour. Take, e.g., the estimate of L. de Lavergne, according to which the English agricultural labourer gets only $\frac{1}{4}$, the capitalist (farmer) on the other hand $\frac{3}{4}$ of the product or of its value, apart from the question of how the booty is subsequently divided between the capitalist, the landlord and others. According to this, the surplus-labour of the English agricultural labourer is to his necessary labour as 3:1, which gives a rate of exploitation of 300%.

The favourite method of treating the working-day as constant in magnitude became, through the use of the formulæ II., a fixed usage, because in them surplus-labour is always compared with a working-day of given length. The same holds good when the repartition of the value produced is exclusively kept in sight. The working-day that has already been realised in a given value, must necessarily be a day of given length.

The habit of representing surplus-value and value of labour-power as fractions of the value created — a habit that originates in the capitalist mode of production itself, and whose import will hereafter be disclosed — conceals the very transaction that characterises capital, namely the exchange of variable capital for living labour-power, and the consequent exclusion of the labourer from the product. Instead of the real fact, we have the false semblance of an association, in which labourer and capitalist divide the product in proportion to the different elements which they respectively contribute towards its formation.

Moreover, the formulæ II. can at any time be reconverted into formulæ I. If, for instance, we have (Surplus-labour of 6 hours)/(Working-day of 12 hours) the necessary labour-time being 12 hours less the surplus-labour of 6 hours, we get the following result,

$$(\text{Surplus-labour of 6 hours})/(\text{Necessary-labour of 6 hours}) = 100/100$$

There is a third formula which I have occasionally already anticipated; it is

After the investigations we have given above, it is no longer possible to be misled, by the formula (Unpaid-labour)/(Paid labour), into concluding, that the capitalist pays for labour and not for labour-power. This formula is only a popular expression for (Surplus-labour)/(Necessary labour). The capitalist pays the value, so far as price co-incides with value, of the labour-power, and receives in exchange the disposal of the living labour-power itself. His usufruct is spread over two periods. During one the labourer produces a value that is only equal to the value of his labour-power: he produces its equivalent. Thus the capitalist receives in return for his advance of the price of the labour power, a product of the same price. It is the same as if he had bought the product ready made in the market. During the other period, the period of surplus-labour, the usufruct of the labour-power creates a value for the capitalist, that costs him no equivalent. This expenditure of labour-power comes to him gratis. In this sense it is that surplus-labour can be called unpaid labour.

Capital, therefore, is not only, as Adam Smith says, the command over labour. It is essentially the command over unpaid labour. All surplus-value, whatever particular form (profit, interest, or rent), it may subsequently crystallise into, is in substance the materialisation of unpaid labour. The secret of the self-expansion of capital resolves itself into having the disposal of a definite quantity of other people's unpaid labour.

PART VI. WAGES.

CHAPTER XIX. THE TRANSFORMATION OF THE VALUE (AND RESPECTIVELY THE PRICE) OF LABOUR-POWER INTO WAGES.

ON the surface of bourgeois society the wage of the labourer appears as the price of labour, a certain quantity of money that is paid for a certain quantity of labour. Thus people speak of the value of labour and call its expression in money its necessary or natural price. On the other hand they speak of the market prices of labour, i.e., prices oscillating above or below its natural price.

But what is the value of a commodity? The objective form of the social labour expended in its production. And how do we measure the quantity of this value? By the quantity of the labour contained in it. How then is the value, e.g., of a 12 hours' working day to be determined? By the 12 working hours contained in a working day of 12 hours, which is an absurd tautology.

In order to be sold as a commodity in the market, labour must at all events exist before it is sold. But could the labourer give it an independent objective existence, he would sell a commodity and not labour.

Apart from these contradictions, a direct exchange of money, i.e., of realized labour, with living labour would either do away with the law of value which only begins to develop itself freely on the basis of capitalist production, or do away with capitalist production itself, which rests directly on wage-labour. The working day of 12 hours embodies itself, e.g., in a money value of 6s. Either equivalents are exchanged, and then the labourer receives 6s. for 12 hours' labour; the price of his labour would be equal to the price of his product. In this case he produces no surplus-value, for the buyer of his labour, the 6s. are not transformed into capital, the basis of capitalist production vanishes. But it is on this very basis that he sells his labour and that his labour is wage-labour. Or else he receives for 12 hours' labour less than 6s., i.e., less than 12 hours' labour. Twelve hours labour are exchanged against 10, 6, 8c., hours' labour. This equalisation of unequal quantities not merely does away with the determination of value. Such a self-destructive contradiction cannot be in any way even enunciated or formulated as a law.

It is of no avail to deduce the exchange of more labour against less, from their difference of form, the one being realized, the other living. This is the more absurd as the value of a commodity is determined not by the quantity of labour actually realized in it, but by the quantity of living labour necessary for its production. A commodity represents, say 6 working hours. If an invention is made by which it can be produced in 3 hours, the value, even of the commodity already produced, falls by half. It represents now 3 hours of social labour instead of the 6 formerly necessary. It is the quantity of labour required for its production, not the realized form of that labour, by which the amount of the value of a commodity is determined.

That which comes directly face to face with the possessor of money on the market, is in fact not labour, but the labourer. What the latter sells is his labour-power. As soon as his labour actually begins, it has already ceased to belong to him; it can therefore no longer be sold by him. Labour is the substance, and the immanent measure of value, but has itself no value.

In the expression “value of labour,” the idea of value is not only completely obliterated, but actually reversed. It is an expression as imaginary as the value of the earth. These imaginary expressions, arise, however, from the relations of production themselves. They are categories for the phenomenal forms of essential relations. That in their appearance things often represent themselves in inverted form is pretty well known in every science except political economy.

Classical political economy borrowed from every-day life the category “price of labour” without further criticism, and then simply asked the question, how is this price determined? It soon recognized that the change in the relations of demand and supply explained in regard to the price of labour, as of all other commodities, nothing except its changes, i.e., the oscillations of the market price above or below a certain mean. If demand and supply balance, the oscillation of prices ceases, all other conditions remaining the same. But then demand and supply also cease to explain anything. The price of labour, at the moment when demand and supply are in equilibrium, is its natural price, determined independently of the relation of demand and supply. And how this price is determined, is just the question. Or a larger period of oscillations in the market-price is taken, e.g., a year, and they are found to cancel one the other, leaving a mean average quantity, a relatively constant magnitude. This had naturally to be

determined otherwise than by its own compensating variations. This price which always finally predominates over the accidental market-prices of labour and regulates them, this “necessary price” (physiocrats) or “natural price” of labour (Adam Smith) can, as with all other commodities, be nothing else than its value expressed in money. In this way political economy expected to penetrate athwart the accidental prices of labour, to the value of labour. As with other commodities, this value was determined by the cost of production. But what is the cost of production — of the labourer, i.e., the cost of producing or reproducing the labourer himself? This question unconsciously substituted itself in political economy for the original one; for the search after the cost of production of labour as such turned in a circle and never left the spot. What economists therefore call value of labour, is in fact the value of labour-power, as it exists in the personality of the labourer, which is as different from its function, labour, as a machine is from the work it performs. Occupied with the difference between the market-price of labour and its-so-called value, with the relation of this value to the rate of profit, and to the values of the commodities produced by means of labour, 8c., they never discovered that the course of the analysis had led not only from the market prices of labour to its presumed value, but had led to the resolution of this value of labour itself into the value of labour-power. Classical economy never arrived at a consciousness of the results of its own analysis; it accepted uncritically the categories “value of labour,” “natural price of labour,” 8c., as final and as adequate expressions for the value-relation under consideration, and was thus led, as will be seen later, into inextricable confusion and contradiction, while it offered to the vulgar economists a secure basis of operations for their shallowness, which on principle worships appearances only.

Let us next see how value (and price) of labour-power, present themselves in this transformed condition as wages.

We know that the daily value of labour-power is calculated upon a certain length of the labourer’s life, to which, again, corresponds a certain length of working-day. Assume the habitual working-day as 12 hours, the daily value of labour-power as 3s., the expression in money of a value that embodies 6 hours of labour. If the labourer receives 3s., then he receives the value of his labour-power functioning through 12 hours. If, now, this value of a day’s labour-power is expressed as the value of a day’s labour itself, we have the formula: Twelve hours’ labour has a value of 3s. The value of

labour-power thus determines the value of labour, or, expressed in money, its necessary price. If, on the other hand, the price of labour-power differs from its value, in like manner the price of labour differs from its so-called value.

As the value of labour is only an irrational expression for the value of labour-power, it follows, of course, that the value of labour must always be less than the value it produces, for the capitalist always makes labour-power work longer than is necessary for the reproduction of its own value. In the above example, the value of the labour-power that functions through 12 hours is 3s., a value for the reproduction of which 6 hours are required. The value which the labour-power produces is, on the other hand, 6s., because it, in fact, functions during 12 hours, and the value it produces depends, not on its own value, but on the length of time it is in action. Thus, we have a result absurd at first sight — that labour which creates a value of 6s. possesses a value of 3s.

We see, further: The value of 3s. by which a part only of the working day — i.e., 6 hours' labour — is paid for, appears as the value or price of the whole working-day of 12 hours, which thus includes 6 hours unpaid for. The wage-form thus extinguishes every trace of the division of the working-day into necessary labour and surplus-labour, into paid and unpaid labour. All labour appears as paid labour. In the *corvée*, the labour of the worker for himself, and his compulsory labour for his lord, differ in space and time in the clearest possible way. In slave-labour, even that part of the working-day in which the slave is only replacing the value of his own means of existence, in which, therefore, in fact, he works for himself alone, appears as labour for his master. All the slave's labour appears as unpaid labour. In wage-labour, on the contrary, even surplus labour, or unpaid labour, appears as paid. There the property-relation conceals the labour of the slave for himself; here the money-relation conceals the unrequited labour of the wage-labourer.

Hence, we may understand the decisive importance of the transformation of value and price of labour-power into the form of wages, or into the value and price of labour itself. This phenomenal form, which makes the actual relation invisible, and, indeed, shows the direct opposite of that relation, forms the basis of all the juridical notions of both labourer and capitalist, of all the mystifications of the capitalistic mode of production, of all its illusions as to liberty, of all the apologetic shifts of the vulgar economists.

If history took a long time to get at the bottom of the mystery of wages, nothing, on the other hand, is more easy to understand than the necessity, the *raison d'être*, of this phenomenon.

The exchange between capital and labour at first presents itself to the mind in the same guise as the buying and selling of all other commodities. The buyer gives a certain sum of money, the seller an article of a nature different from money. The jurist's consciousness recognises in this, at most, a material difference, expressed in the juridically equivalent formulae: "Do ut des, do ut facias, facio ut des, facio ut facias."

Further, Exchange-value and use-value, being intrinsically incommensurable magnitudes, the expressions "value of labour," "price of labour," do not seem more irrational than the expressions "value of cotton," "price of cotton." Moreover, the labourer is paid after he has given his labour. In its function of means of payment, money realises subsequently the value or price of the article supplied — i.e., in this particular case, the value or price of the labour supplied. Finally, the use-value supplied by the labourer to the capitalist is not, in fact, his labour-power, but its function, some definite useful labour, the work of tailoring, shoemaking, spinning, &c. That this same labour is, on the other hand, the universal value-creating element, and thus possesses a property by which it differs from all other commodities, is beyond the cognisance of the ordinary mind.

Let us put ourselves in the place of the labourer who receives for 12 hours' labour, say the value produced by 6 hours' labour, say 3s. For him, in fact, his 12 hours' labour is the means of buying the 3s. The value of his labour-power may vary, with the value of his usual means of subsistence, from 3 to 4 shillings, or from 3 to 2 shillings; or, if the value of his labour-power remains constant, its price may, in consequence of changing relations of demand and supply, rise to 4s. or fall to 2s. He always gives 12 hours of labour. Every change in the amount of the equivalent that he receives appears to him, therefore, necessarily as a change in the value or price of his 12 hours' work. This circumstance misled Adam Smith, who treated the working-day as a constant quantity, to the assertion that the value of labour is constant, although the value of the means of subsistence may vary, and the same working-day, therefore, may represent itself in more, or less money for the labourer.

Let us consider, on the other hand, the capitalist. He wishes to receive as much labour as possible for as little money as possible. Practically,

therefore, the only thing that interests him is the difference between the price of labour-power and the value which its function creates. But, then, he tries to buy all commodities as cheaply as possible, and always accounts for his profit by simple cheating, by buying under, and selling over the value. Hence, he never comes to see that, if such a thing as the value of labour really existed, and he really paid this value no capital would exist, his money would not be turned into capital.

Moreover, the actual movement of wages presents phenomena which seem to prove that not the value of labour-power is paid, but the value of its function, of labour itself. We may reduce these phenomena to two great classes: (1.) Change of wages with the changing length of the working-day. One might as well conclude that not the value of a machine is paid, but that of its working, because it costs more to hire a machine for a week than for a day. (2.) The individual difference in the wages of different labourers who do the same kind of work. We find this individual difference, but are not deceived by it, in the system of slavery, where, frankly and openly, without any circumlocution, labour-power itself is sold. Only, in the slave system, the advantage of a labour-power above the average, and the disadvantage of a labour-power below the average, affects the slave-owner; in the wage-labour system it affects the labourer himself, because his labour-power is, in the one case, sold by himself, in the other, by a third person.

For the rest, in respect to the phenomenal form, “value and price of labour,” or “wages,” as contrasted with the essential relation manifested therein, viz., the value and price of labour-power, the same difference holds that holds in respect to all phenomena and their hidden substratum. The former appear directly and spontaneously as current modes of thought; the latter must first be discovered by science. Classical political economy nearly touches the true relation of things, without, however, consciously formulating it. This it cannot so long as it sticks in its bourgeois skin.

CHAPTER XX. TIME-WAGES.

WAGES themselves again take many forms, a fact not recognizable in the ordinary economical treatises which, exclusively interested in the material side of the question, neglect every difference of form. An exposition of all these forms however, belongs to the special study of wage-labour, not therefore to this work. Still the two fundamental forms must be briefly worked out here.

The sale of labour-power, as will be remembered, takes place for a definite period of time. The converted form under which the daily, weekly, 8c., value of labour-power presents itself, is hence that of time-wages, therefore day-wages, 8c.

Next it is to be noted that the laws set forth, in the 17th chapter, on the changes in the relative magnitudes of price of labour-power and surplus-value, pass by a simple transformation of form, into laws of wages. Similarly the distinction between the exchange-value of labour-power, and the sum of the necessaries of life into which this value is converted, now reappears as the distinction between nominal and real wages. It would be useless to repeat here, with regard to the phenomenal form, what has been already worked out in the substantial form. We limit ourselves therefore to a few points characteristic of time-wages.

The sum of money which the labourer receives for his daily or weekly labour, forms the amount of his nominal wages, or of his wages estimated in value. But it is clear that according to the length of the working-day, that is, according to the amount of actual labour daily supplied, the same daily or weekly wage may represent very different prices of labour, i.e., very different sums of money for the same quantity of labour. We must, therefore, in considering time-wages, again distinguish between the sum total of the daily or weekly wages, 8c., and the price of labour. How then to find this price, i.e., the money-value of a given quantity of labour? The average price of labour is found, when the average daily value of the labour-power is divided by the average number of hours in the working-day. If, e.g., the daily value of labour-power is 3 shillings, the value of the product of 6 working hours, and if the working-day is 12 hours, the price of

1 working hour is $3/12$ shillings = 3d. The price of the working-hour thus found serves as the unit measure for the price of labour.

It follows therefore that the daily and weekly wages, 8s., may remain the same, although the price of labour falls constantly. If, e.g., the habitual working-day is 10 hours and the daily value of the labour-power 3s., the price of the working hour is $3 \frac{3}{5}$ d. It falls to 3d. as soon as the working-day rises to 12 hours, to $2 \frac{2}{5}$ d. as soon as it rises to 15 hours. Daily or weekly wages remain, despite all this, unchanged. On the contrary, the daily or weekly wages may rise, although the price of labour remains constant or even falls. If, e.g., the working day is 10 hours, and the daily value of labour-power 3 shillings, the price of one working hour is $3 \frac{3}{5}$ d. If the labourer in consequence of increase of trade works 12 hours, the price of labour remaining the same, his daily wage now rises to 3 shillings $7 \frac{1}{5}$ d. without any variation in the price of labour. The same result might follow if, instead of the extensive amount of labour, its intensive amount increased. The rise of the nominal daily or weekly wages may therefore be accompanied by a price of labour that remains stationary or falls. The same holds as to the income of the labourer's family, as soon as the quantity of labour expended by the head of the family is increased by the labour of the members of his family. There are, therefore, methods of lowering the price of labour independent of the reduction of the nominal daily or weekly wages.

As a general law it follows that, given the amount of daily, weekly labour, 8s., the daily or weekly wages depend on the price of labour which, itself varies either with the value of labour-power, or with the difference between its price and its value. Given, on the other hand, the price of labour, the daily or weekly wages depend on the quantity of the daily or weekly labour.

The unit measure for time-wages, the price of the working hour, is the quotient of the value of a day's labour-power, divided by the number of hours of the average working-day. Let the latter be 12 hours, and the daily value of labour-power 3 shillings, the value of the product of 6 hours of labour. Under these circumstances the price of a working-hour is 3d., the value produced in it is 6d. If the labourer is now employed less than 12 hours (or less than 6 days in the week), e.g., only 6 or 8 hours, he receives, with this price of labour, only 2s. or 1s. 6d. a day. As on our hypothesis he must work on the average 6 hours daily, in order to produce a day's wage

corresponding merely to the value of his labour-power, as according to the same hypothesis he works only half of every hour for himself, and half for the capitalist, it is clear that he cannot obtain for himself the value of the product of 6 hours if he is employed less than 12 hours. In previous chapters we saw the destructive consequences of over-work; here we find the sources of the sufferings that result to the labourer from his insufficient employment.

If the hour's wage is fixed so that the capitalist does not bind himself to pay a day's or a week's wage, but only to pay wages for the hours during which he chooses to employ the labourer, he can employ him for a shorter time than that which is originally the basis of the calculation of the hour-wage, of the unit-measure of the price of labour. Since this unit is determined by the ratio (daily value of labour-power)/(working-day of a given number of hours). it, of course, loses all the meaning as soon as the working day ceases to contain a definite number of hours. The connexion between the paid and the unpaid labour is destroyed. The capitalist can now wring from the labourer a certain quantity of surplus-labour without allowing him the labour-time necessary for his own subsistence. He can annihilate all regularity of employment, and according to his own convenience, caprice, and the interest of the moment, make the most enormous over-work alternate with relative or absolute cessation of work. He can, under the pretence of paying "the normal price of labour," abnormally lengthen the working-day without any corresponding compensation to the labourer. Hence the perfectly rational revolt in 1860 of the London labourers, employed in the building trades, against the attempt of the capitalists to impose on them this sort of wage by the hour. The legal limitation of the working-day puts an end to such mischief, although not, of course, to the diminution of employment caused by the competition of machinery, by changes in the quality of the labourers employed, and by crisis partial or general.

With an increasing daily or weekly wage the price of labour may remain nominally constant, and yet may fall below its normal level. This occurs every time that, the price of labour (reckoned per working hour) remaining constant, the working-day is prolonged beyond its customary length. If in the fraction: (daily value of labour-power)/(working-day) the denominator increases, the numerator increases yet more rapidly. The value of labour-power, as dependent on its wear and tear, increases with the duration of its

functioning, and in more rapid proportion than the increase of that duration. In many branches of industry where time-wage is the general rule without legal limits to the working-time, the habit has, therefore, spontaneously grown up of regarding the working-day as normal only up to a certain point, e.g., up to the expiration of the tenth hour (“normal working-day,” “the day’s work,” “the regular hours of work”). Beyond this limit the working-time is over-time, and is, taking the hour as unit-measure, paid better (“extra pay”), although often in a proportion ridiculously small. The normal working-day exists here as a fraction of the actual working-day, and the latter, often during the whole year, lasts longer than the former. The increase in the price of labour with the extension of the working-day beyond a certain normal limit, takes such a shape in various British industries that the low price of labour during the so-called normal time compels the labourer to work during the better paid over-time, if he wishes to obtain a sufficient wage at all. Legal limitation of the working-day puts an end to these amenities.

It is a fact generally known that, the longer the working-days, in any branch of industry, the lower are the wages. A. Redgrave, factory-inspector, illustrates this by a comparative review of the 20 years from 1839-1859, according to which wages rose in the factories under the 10 hours’ law, whilst they fell in the factories in which the work lasted 14 to 15 hours daily.

From the law: “the price of labour being given, the daily or weekly wage depends on the quantity of labour expended,” it follows, first of all, that, the lower the price of labour, the greater must be the quantity of labour, or the longer must be the working-day for the labourer to secure even a miserable average-wage. The lowness of the price of labour acts here as a stimulus to the extension of the labour-time.

On the other hand, the extension of the working-time produces, in its turn, a fall in the price of labour, and with this a fall in the day’s or week’s wages.

The determination of the price of labour by:

(daily value of labour-power)/(working-day of a given number of hours),
shows that a mere prolongation of the working-day lowers the price of labour, if no compensation steps in. But the same circumstances which allow the capitalist in the long run to prolong the working-day, also allow him first, and compel him finally, to nominally lower the price of labour,

until the total price of the increased number of hours is lowered, and, therefore, the daily or weekly wage. Reference to two circumstances is sufficient here. If one man does the work of $1\frac{1}{2}$ or 2 men, the supply of labour increases, although the supply of labour-power on the market remains constant. The competition thus created between the labourers allows the capitalist to beat down the price of labour, whilst the falling price of labour allows him, on the other hand, to screw up still further the working-time. Soon, however, this command over abnormal quantities of unpaid labour, i.e., quantities in excess of the average social amount, becomes a source of competition amongst the capitalists themselves. A part of the price of the commodity consists of the price of labour. The unpaid part of the labour-price need not be reckoned in the price of the commodity. It may be presented to the buyer. This is the first step to which competition leads. The second step to which it drives, is to exclude also from the selling-price of the commodity, at least a part of the abnormal surplus-value created by the extension of the working-day. In this way an abnormally low selling-price of the commodity arises, at first sporadically, and becomes fixed by degrees; a lower selling price which henceforward becomes the constant basis of a miserable wage for an excessive working-time, as originally it was the product of these very circumstances. This movement is simply indicated here, as the analysis of competition does not belong to this part of our subject. Nevertheless, the capitalist may, for a moment, speak for himself. "In Birmingham there is so much competition of masters one against another, that many are obliged to do things as employers that they would otherwise be ashamed of; and yet no more money is made, but only the public gets the benefit." The reader will remember the two sorts of London bakers, of whom one sold the bread at its full price (the "full-priced" bakers), the other below its normal price ("the underpriced," "the undersellers"). The "full-priced" denounced their rivals before the Parliamentary Committee of Inquiry: "They only exist now by first defrauding the public, and next getting 18 hours' work out of their men for 12 hours' wages.... The unpaid labour of the men was made...the source whereby the competition was carried on, and continues so to this day.... The competition among the master bakers is the cause of the difficulty in getting rid of night-work. An underseller, who sells his bread below the cost price according to the price of flour, must make it up by getting more out of the labour of the men.... If I got only 12 hours' work out of my men, and my

neighbour got 18 or 20, he must beat me in the selling price. If the men could insist on payment for over-work, this would be set right.... A large number of those employed by the undersellers are foreigners, and youths, who are obliged to accept almost any wages they can obtain.”

This jeremiad is also interesting because it shows, how the appearance only of the relations of production mirrors itself in the brain of the capitalist. The capitalist does not know that the normal price of labour also includes a definite quantity of unpaid labour, and that this very unpaid labour is the normal source of his gain. The category, surplus-labour-time, does not exist at all for him, since it is included in the normal working-day, which he thinks he has paid for in the day's wages. But overtime does exist for him, the prolongation of the working day beyond the limits corresponding with the usual price of labour. Face to face with his underselling competitor, he even insists upon extra pay for this overtime. He again does not know that this extra pay includes unpaid labour, just as well as does the price of the customary hour of labour. For example, the price of one hour of the 12 hours' working-day is 3d., say the value-product of half a working-hour, whilst the price of the overtime working-hour is 4d., or the value-product of $\frac{2}{3}$ of a working-hour. In the first case the capitalist appropriates to himself one-half, in the second, one-third of the working-hours without paying for it.

CHAPTER XXI. PIECE-WAGES.

WAGES by the piece are nothing else than a converted form of wages by time, just as wages by time are a converted form of the value or price of labour-power.

In piece-wages it seems at first sight as if the use-value bought from the labourer was, not the function of his labour-power, living labour, but labour already realised in the product, and as if the price of this labour was determined, not as with time-wages, by the fraction, (daily value of labor power)/(working day of given number of hours) but by the capacity for work of the producer.

The confidence that trusts in this appearance ought to receive a first severe shock from the fact that both forms of wages exist side by side, simultaneously, in the same branches of industry; e.g., “the compositors of London, as a general rule, work by the piece, time-work being the exception, while those in the country work by the day, the exception being work by the piece. The shipwrights of the port of London work by the job or piece, while those of all other parts work by the day.”

In the same saddlery shops of London, often for the same work, piece-wages are paid to the French, time-wages to the English. In the regular factories in which throughout piece-wages predominate, particular kinds of work are unsuitable to this form of wage, and are therefore paid by time. But it is moreover self-evident that the difference of form in the payment of wages alters in no way their essential nature, although the one form may be more favorable to the development of capitalist production than the other.

Let the ordinary working day contain 12 hours of which 6 are paid, 6 unpaid. Let its value-product be 6 shillings, that of one hour's labour therefore 6d. Let us suppose that, as the result of experience, a labourer who works with the average amount of intensity and skill, who, therefore, gives in fact only the time socially necessary to the production of an article, supplies in 12 hours 24 pieces, either distinct products or measurable parts of a continuous whole. Then the value of these 24 pieces, after subtraction of the portion of constant capital contained in them, is 6 shillings, and the value of a single piece 3d. The labourer receives 1½d. per piece, and thus earns in 12 hours 3 shillings. Just as, with time-wages, it does not matter

whether we assume that the labourer works 6 hours for himself and 6 hours for the capitalist, or half of every hour for himself, and the other half for the capitalist, so here it does not matter whether we say that each individual piece is half paid, and half unpaid for, or that the price of 12 pieces is the equivalent only of the value of the labour-power, whilst in the other 12 pieces surplus-value is incorporated.

The form of piece-wages is just as irrational as that of time-wages. Whilst in our example two pieces of a commodity, after subtraction of the value of the means of production consumed in them, are worth 6d. as being the product of one hour, the labourer receives for them a price of 3d. Piece-wages do not, in fact, distinctly express any relation of value. It is not, therefore, a question of measuring the value of the piece by the working time incorporated in it, but on the contrary of measuring the working-time the labourer has expended, by the number of pieces he has produced. In time-wages the labour is measured by its immediate duration, in piece-wages by the quantity of products in which the labour has embodied itself during a given time. The price of labour-time itself is finally determined by the equation; value of a day's labour=daily value of labour-power. Piece-wage is, therefore, only a modified form of time-wage.

Let us now consider a little more closely the characteristic peculiarities of piece-wages.

The quality of the labour is here controlled by the work itself, which must be of average perfection if the piece-price is to be paid in full. Piece-wages become, from this point of view, the most fruitful source of reductions of wages and capitalistic cheating.

They furnish to the capitalist an exact measure for the intensity of labour. Only the working-time which is embodied in a quantum of commodities determined beforehand and experimentally fixed, counts as socially necessary working time, and is paid as such. In the larger workshops of the London tailors, therefore, a certain piece of work, a waistcoat e.g., is called an hour, or half an hour, the hour at 6d. By practise it is known how much is the average product of one hour. With new fashions, repairs, etc., a contest arises between master and labourer, whether a particular piece of work is one hour, and so on, until here also experience decides. Similarly in the London furniture workshops, etc. If the labourer does not possess the average capacity, if he cannot in consequence supply a certain minimum of work per day, he is dismissed.

Since the quality and intensity of the work are here controlled by the form of wage itself, superintendence of labour becomes in great part superfluous. Piece-wages therefore lay the foundation of the modern “domestic labour,” described above, as well as of a hierarchically organised system of exploitation and oppression. The latter has two fundamental forms. On the one hand piece-wages facilitate the interposition of parasites between the capitalist and the wage-labourer, the “sub-letting of labour.” The gain of these middle-men comes entirely from the difference between the labour price which the capitalist pays, and the part of that price which they actually allow to reach the labourer. In England this system is characteristically called the “Sweating system.” On the other hand piece-wage allows the capitalist to make a contract for so much per piece with the head labourer — in manufactures with the chief of some group, in mines with the extractor of the coal, in the factory with the actual machine-worker — at a price for which the head labourer himself undertakes the enlisting and payment of his assistant workpeople. The exploitation of the labourer by capital is here effected through the exploitation of the labourer by the labourer.

Given piece-wage, it is naturally the personal interest of the labourer to strain his labour-power as intensely as possible; this enables the capitalist to raise more easily the normal degree of intensity of labour. It is moreover now the personal interest of the labourer to lengthen the working day, since with it his daily or weekly wages rise. This gradually brings on a reaction like that already described in time-wages, without reckoning that the prolongation of the working day, even if the piece-wage remains constant, includes of necessity a fall in the price of the labour.

In time-wages, with few exceptions, the same wage holds for the same kind of work, whilst in piece-wages, though the price of the working time is measured by a certain quantity of product, the day’s or week’s wage will vary with the individual differences of the labourers, of whom one supplies in a given time the minimum of product only, another the average, a third more than the average. With regard to actual receipts there is, therefore, great variety according to the different skill, strength, energy, staying-power, etc., of the individual labourers. Of course this does not alter the general relations between capital and wage-labour. First, the individual differences balance one another in the workshop as a whole, which thus supplies in a given working-time the average product, and the total wages

paid will be the average wages of that particular branch of industry. Second, the proportion between wages and surplus-value remains unaltered, since the mass of surplus-labour supplied by each particular labourer corresponds with the wage received by him. But the wider scope that piece-wage gives to individuality, tends to develop on the one hand that individuality, and with it the sense of liberty, independence, and self-control of the labourers, on the other, their competition one with another. Piece-work has, therefore, a tendency, while raising individual wages above the average, to lower this average itself. But where a particular rate of piece-wage has for a long time been fixed by tradition, and its lowering, therefore, presented especial difficulties, the masters, in such exceptional cases, sometimes had recourse to its compulsory transformation into time-wages. Hence, e.g., in 1860 a great strike among the ribbon-weavers of Coventry. Piece-wage is finally one of the chief supports of the hour-system described in the preceding chapter.

From what has been shown so far, it follows that piece-wage is the form of wages most in harmony with the capitalist mode of production. Although by no means new — it figures side by side with time-wages officially in the French and English labour statutes of the 14th century — it only conquers a larger field for action during the period of Manufacture, properly so-called. In the stormy youth of Modern Industry, especially from 1797 to 1815, it served as a lever for the lengthening of the working day, and the lowering of wages. Very important materials for the fluctuation of wages during that period are to be found in the Blue-books: “Report and Evidence from the Select Committee on Petitions respecting the Corn Laws,” (Parliamentary Session of 1813-14), and “Report from the Lords’ Committee, on the state of the Growth, Commerce, and Consumption of Grain, and all Laws relating thereto,” (Session of 1814-15). Here we find documentary evidence of the constant lowering of the price of labour from the beginning of the Anti-Jacobin War. In the weaving industry, e.g., piece-wages had fallen so low that inspite of the very great lengthening of the working day, the daily wages were then lower than before. “The real earnings of the cotton weaver are now far less than they were; his superiority over the common labourer, which at first was very great, has now almost entirely ceased. Indeed...the difference in the wages of skilful and common labour is far less now than at any former period.” How little the increased intensity and extension of labour through piece-wages benefited the agricultural proletariat, the

following passage borrowed from a work on the side of the landlords and farmers shows: "By far the greater part of agricultural operations is done by people, who are hired for the day or on piece-work. Their weekly wages are about 12s., and although it may be assumed that a man earns on piece-work under the greater stimulus to labour, 1s. or perhaps 2s. more than on weekly wages, yet it is found, on calculating his total income, that his loss of employment, during the year, outweighs this gain...Further, it will generally be found that the wages of these men bear a certain proportion to the price of the necessary means of subsistence, so that a man with two children is able to bring up his family without recourse to parish relief." Malthus at that time remarked with reference to the facts published by Parliament: "I confess that I see, with misgiving, the great extension of the practice of piece-wage. Really hard work during 12 or 14 hours of the day, or for any longer time, is too much for any human being."

In the workshops under the Factory Acts, piece-wage becomes the general rule, because capital can there only increase the efficacy of the working day by intensifying labour.

With the changing productiveness of labour the same quantum of product represents a varying working time. Therefore, piece-wage also varies, for it is the money expression of a determined working time. In our example above, 24 pieces were produced in 12 hours, whilst the value of the product of the 12 hours was 6s., the daily value of the labour-power 3s., the price of the labour-hour 3d., and the wage for one piece 1½d. In one piece half-an-hour's labour was absorbed. If the same working day now supplies, in consequence of the doubled productiveness of labour, 48 pieces instead of 24, and all other circumstances remain unchanged, then the piece-wage falls from 1½d. to ¾d., as every piece now only represents ¼, instead of ½ of a working hour. 24 by 1½d. = 3s., and in like manner 48 by ¾d. = 3s. In other words, piece-wage is lowered in the same proportion as the number of the pieces produced in the same time rises, and therefore as the working time spent on the same piece falls. This change in piece-wage, so far purely nominal, leads to constant battles between capitalist and labour. Either because the capitalist uses it as a pretext for actually lowering the price of labour, or because increased productive power of labour is accompanied by an increased intensity of the same. Or because the labourer takes seriously the appearance of piece-wages, viz., that his product is paid for, and not his labour-power, and therefore revolts against a lowering of

wages, unaccompanied by a lowering in the selling price of the commodity. “The operatives.... carefully watch the price of the raw material and the price of manufactured goods, and are thus enabled to form an accurate estimate of their master’s profits.”

The capitalist rightly knocks on the head such pretensions as gross errors as to the nature of wage-labour. He cries out against this usurping attempt to lay taxes on the advance of industry, and declares roundly that the productiveness of labour does not concern the labourer at all.

CHAPTER XXII. NATIONAL DIFFERENCES OF WAGES.

IN the 17th chapter we were occupied with the manifold combinations which may bring about a change in magnitude of the value of labour-power — this magnitude being considered either absolutely or relatively, i.e., as compared with surplus-value; whilst on the other hand, the quantum of the means of subsistence in which the price of labour is realised might again undergo fluctuations independent of, or different from, the changes of this price. As has been already said, the simple translation of the value or respectively of the price of labour-power into the exoteric form of wages transforms all these laws into laws of the fluctuations of wages. That which appears in these fluctuations of wages within a single country as a series of varying combinations, may appear in different countries as contemporaneous difference of national wages. In the comparison of the wages in different nations, we must therefore take into account all the factors that determine changes in the amount of the value of labour-power; the price and the extent of the prime necessities of life as naturally and historically developed, the cost of training the labourers, the part played by the labour of women and children, the productiveness of labour, its extensive and intensive magnitude. Even the most superficial comparison requires the reduction first of the average day-wage for the same trades, in different countries, to a uniform working day. After this reduction to the same terms of the day-wages, time-wage must again be translated into piece-wage, as the latter only can be a measure both of the productivity and the intensity of labour.

In every country there is a certain average intensity of labour, below which the labour for the production of a commodity requires more than the socially necessary time, and therefore does not reckon as labour of normal quality. Only a degree of intensity above the national average affects, in a given country, the measure of value of the mere duration of the working time. This is not the case on the universal market, whose integral parts are the individual countries. The average intensity of labour changes from country to country; here it is greater, there less. These national averages form a scale, whose unit of measure is the average unit of universal labour.

The more intense national labour, therefore, as compared with the less intense, produces in the same time more value, which expresses itself in more money.

But the law of value in its international application is yet more modified by this, that on the world-market the more productive national labour reckons also as the more intense, so long as the more productive nation is not compelled by competition to lower the selling price of its commodities to the level of their value.

In proportion as capitalist production is developed in a country, in the same proportion do the national intensity and productivity of labour there rise above the international level. The different quantities of commodities of the same kind, produced in different countries in the same working time, have, therefore, unequal international values, which are expressed in different prices, i.e., in sums of money varying according to international values. The relative value of money will, therefore, be less in the nation with more developed capitalist mode of production than in the nation with less developed. It follows, then, that the nominal wages, the equivalent of labour-power expressed in money, will also be higher in the first nation than in the second; which does not at all prove that this holds also for the real wages, i.e., for the means of subsistence placed at the disposal of the labourer.

But even apart from these relative differences of the value of money in different countries, it will be found, frequently, that the daily or weekly, 8c., wage in the first nation is higher than in the second, whilst the relative price of labour, i.e., the price of labour as compared both with surplus-value and with the value of the product, stands higher in the second than in the first.

J. W. Cowell, member of the Factory Commission of 1833, after careful investigation of the spinning trade, came to the conclusion that, “in England wages are virtually lower to the capitalist, though higher to the operative than on the Continent of Europe.” (Ure, .) The English Factory Inspector, Alexander Redgrave, in his Report of Oct. 31st, 1866, proves by comparative statistics with Continental states, that in spite of lower wages and much longer working-time, Continental labour is, in proportion to the product, dearer than English. An English manager of a cotton factory in Oldenburg, declares that the working-time there lasted from 5.30 a.m. to 8 p.m., Saturdays included, and that the workpeople there, when under English overlookers, did not supply during this time quite so much product

as the English in 10 hours, but under German overlookers much less. Wages are much lower than in England, in many cases 50%, but the number of hands in proportion to the machinery was much greater, in certain departments in the proportion of 5:3. — Mr. Redgrave gives very full details as to the Russian cotton factories. The data were given him by an English manager until recently employed there. On this Russian soil, so fruitful of all infamies, the old horrors of the early days of English factories are in full swing. The managers are, of course, English, as the native Russian capitalist is of no use in factory business. Despite all over-work, continued day and night, despite the most shameful under-payment of the workpeople, Russian manufacture manages to vegetate only by prohibition of foreign competition. I give, in conclusion, a comparative table of Mr. Redgrave's, on the average number of spindles per factory and per spinner in the different countries of Europe. He, himself, remarks that he had collected these figures a few years ago, and that since that time the size of the factories and the number of spindles per labourer in England has increased. He supposes, however, an approximately equal progress in the Continental countries mentioned, so that the numbers given would still have their value for purposes of comparison.

AVERAGE NUMBER OF SPINDLES PER FACTORY.

England, average of spindles per factory	12,600
France, average of spindles per factory	1,500
Prussia, average of spindles per factory	1,500
Belgium, average of spindles per factory	4,000
Saxony, average of spindles per factory	4,500
Austria, average of spindles per factory	7,000
Switzerland average of spindles per factory	8,000

AVERAGE NUMBER OF PERSONS EMPLOYED TO SPINDLES.

France,	one person to	14	spindles
Russia,	one person to	28	spindles
Prussia,	one person to	37	spindles
Bavaria,	one person to	46	spindles
Austria,	one person to	49	spindles
Belgium,	one person to	50	spindles
Saxony,	one person to	50	spindles

Switzerland,	one person to	55	spindles
Smaller States of Germany,	one person to	55	spindles
Great Britain,	one person to	74	spindles

“This comparison,” says Mr. Redgrave, “is yet more un-favourable to Great Britain, inasmuch as there is so large a number of factories in which weaving by power is carried on in conjunction with spinning [whilst in the table the weavers are not deducted], and the factories abroad are chiefly spinning factories; if it were possible to compare like with like, strictly, I could find many cotton spinning factories in my district in which mules containing 2,200 spindles are minded by one man (the “minder”) and two assistants only, turning off daily 220 lbs. of yarn, measuring 400 miles in length.” (Reports of Insp. of Fact., 31st Oct., 1866, -33, passim.)

It is well known that in Eastern Europe as well as in Asia, English companies have undertaken the construction of railways, and have, in making them, employed side by side with the native labourers, a certain number of English workingmen. Compelled by practical necessity, they thus have had to take into account the national difference in the intensity of labour, but this has brought them no loss. Their experience shows that even if the height of wages corresponds more or less with the average intensity of labour, the relative price of labour varies generally in the inverse direction.

In an “Essay on the Rate of Wages,” one of his first economic writings, H. Carey tries to prove that the wages of the different nations are directly proportional to the degree of productiveness of the national working days, in order to draw from this international relation, the conclusion that wages everywhere rise and fall in proportion to the productiveness of labour. The whole of our analysis of the production of surplus value shows the absurdity of this conclusion, even if Carey himself had proved his premises, instead of, after his usual uncritical and superficial fashion, shuffling to and fro a confused mass of statistical materials. The best of it is that he does not assert that things actually are as they ought to be according to his theory. For State intervention has falsified the natural economic relations. The different national wages must be reckoned, therefore, as if that part of each that goes to the State in the form of taxes, came to the labourer himself. Ought not Mr. Carey to consider further whether those “State expenses” are not the “natural” fruits of capitalistic development? The reasoning is quite worthy of the man who first declared the relations of capitalist production to

be eternal laws of nature and reason, whose free, harmonious working is only disturbed by the intervention of the State, in order afterwards to discover that the diabolical influence of England on the world-market (an influence which, it appears, does not spring from the natural laws of capitalist production) necessitates State intervention, i.e., the protection of those laws of nature and reason by the State, alias the System of Protection. He discovered further, that the theorems of Ricardo and others, in which existing social antagonisms and contradictions are formulated, are not the ideal product of the real economic movement, but on the contrary, that the real antagonisms of capitalist production in England and elsewhere are the result of the theories of Ricardo and others! Finally, he discovered that it is, in the last resort, commerce that destroys the inborn beauties and harmonies of the capitalist mode of production. A step further, and he will, perhaps, discover that the one evil in capitalist production is capital itself. Only a man with such atrocious want of the critical faculty and such spurious erudition deserved, in spite of his Protectionist heresy, to become the secret source of the harmonious wisdom of a Bastiat, and of all the other Free Trade optimists of to-day.

PART VII. THE ACCUMULATION OF CAPITAL.

THE conversion of a sum of money into means of production and labour-power, is the first step taken by the quantum of value that is going to function as capital. This conversion takes place in the market, within the sphere of circulation. The second step, the process of production, is complete so soon as the means of production have been converted into commodities whose value exceeds that of their component parts, and, therefore, contains the capital originally advanced, plus a surplus-value. These commodities must then be thrown into circulation. They must be sold, their value realised in money, this money afresh converted into capital, and so over and over again. This circular movement, in which the same phases are continually gone through in succession, forms the circulation of capital.

The first condition of accumulation is that the capitalist must have contrived to sell his commodities, and to reconvert into capital the greater part of the money so received. In the following pages we shall assume that capital circulates in its normal way. The detailed analysis of the process will be found in Book II.

The capitalist who produces surplus-value — i.e., who extracts unpaid labour directly from the labourers, and fixes it in commodities, is, indeed, the first appropriator, but by no means the ultimate owner, of this surplus-value. He has to share it with capitalists, with landowners, &c., who fulfill other functions in the complex of social production. Surplus-value, therefore, splits up into various parts. Its fragments fall to various categories of persons, and take various forms, independent the one of the other, such as profit, interest, merchants' profit, rent, &c. It is only in Book III. that we can take in hand these modified forms of surplus-value.

On the one hand, then, we assume that the Capitalist sells at their value the commodities he has produced, without concerning ourselves either about the new forms that capital assumes while in the sphere of circulation, or about the concrete conditions of reproduction hidden under these forms. On the other hand, we treat the capitalist producer as owner of the entire surplus-value, or, better perhaps, as the representative of all the sharers with

him in the booty. We, therefore, first of all consider accumulation from an abstract point of view — i.e., as a mere phase in the actual process of production.

So far as accumulation takes place, the capitalist must have succeeded in selling his commodities, and in reconvertng the sale-money into capital. Moreover, the breaking-up of surplus-value into fragments neither alters its nature nor the conditions under which it becomes an element of accumulation. Whatever be the proportion of surplus-value which the industrial capitalist retains for himself, or yields up to others, he is the one who, in the first instance, appropriates it. We, therefore, assume no more than what actually takes place. On the other hand, the simple fundamental form of the process of accumulation is obscured by the incident of the circulation which brings it about, and by the splitting up of surplus-value. An exact analysis of the process, therefore, demands that we should, for a time, disregard all phenomena that hide the play of its inner mechanism.

CHAPTER XXIII. SIMPLE REPRODUCTION.

WHATEVER the form of the process of production in a society, it must be a continuous process, must continue to go periodically through the same phases. A society can no more cease to produce than it can cease to consume. When viewed, therefore, as a connected whole, and as flowing on with incessant renewal, every social process of production is, at the same time, a process of reproduction.

The conditions of production are also those of reproduction. No society can go on producing, in other words, no society can reproduce, unless it constantly reconverts a part of its products into means of production, or elements of fresh products. All other circumstances remaining the same, the only mode by which it can reproduce its wealth, and maintain it at one level, is by replacing the means of production — i.e., the instruments of labour, the raw material, and the auxiliary substances consumed in the course of the year — by an equal quantity of the same kind of articles; these must be separated from the mass of the yearly products, and thrown afresh into the process of production. Hence, a definite portion of each year's product belongs to the domain of production. Destined for productive consumption from the very first, this portion exists, for the most part, in the shape of articles totally unfitted for individual consumption.

If production be capitalistic in form, so, too, will be reproduction. Just as in the former the labour-process figures but as a means towards the self-expansion of capital, so in the latter it figures but as a means of reproducing as capital — i.e., as self-expanding value, — the value advanced. It is only because his money constantly functions as capital that the economical guise of a capitalist attaches to a man. If, for instance, a sum of £100 has this year been converted into capital, and produced a surplus-value of £20, it must continue during next year, and subsequent years, to repeat the same operation. As a periodic increment of the capital advanced, or periodic fruit of capital in process, surplus-value acquires the form of a revenue flowing out of capital.

If this revenue serve the capitalist only as a fund to provide for his consumption, and be spent as periodically as it is gained, then, *cæteris*

paribus, simple reproduction will take place. And although this reproduction is a mere repetition of the process of production on the old scale, yet this mere repetition, or continuity, gives a new character to the process, or, rather, causes the disappearance of some apparent characteristics which it possessed as an isolated discontinuous process.

The purchase of labour-power for a fixed period is the prelude to the process of production; and this prelude is constantly repeated when the stipulated term comes to an end, when a definite period of production, such as a week or a month, has elapsed. But the labourer is not paid until after he has expended his labour-power, and realised in commodities not only its value, but surplus-value. He has, therefore, produced not only surplus-value, which we for the present regard as a fund to meet the private consumption of the capitalist, but he has also produced, before it flows back to him in the shape of wages, the fund out of which he himself is paid, the variable capital; and his employment lasts only so long as he continues to reproduce this fund. Hence, that formula of the economists, referred to in Chapter XVIII., which represents wages as a share in the product itself. What flows back to the labourer in the shape of wages is a portion of the product that is continuously reproduced by him. The capitalist, it is true, pays him in money, but this money is merely the transmuted form of the product of his labour. While he is converting a portion of the means of production into products, a portion of his former product is being turned into money. It is his labour of last week, or of last year, that pays for his labour-power this week or this year. The illusion begotten by the intervention of money vanishes immediately, if, instead of taking a single capitalist and a single labourer, we take the class of capitalists and the class of labourers as a whole. The capitalist class is constantly giving to the labouring class order-notes, in the form of money, on a portion of the commodities produced by the latter and appropriated by the former. The labourers give these order-notes back just as constantly to the capitalist class, and in this way get their share of their own product. The transaction is veiled by the commodity-form of the product and the money-form of the commodity.

Variable capital is therefore only a particular historical form of appearance of the fund for providing the necessaries of life, or the labour-fund which the labourer requires for the maintenance of himself and family, and which, whatever be the system of social production, he must himself

produce and reproduce. If the labour-fund constantly flows to him in the form of money that pays for his labour, it is because the product he has created moves constantly away from him in the form of capital. But all this does not alter the fact, that it is the labourer's own labour, realised in a product, which is advanced to him by the capitalist. Let us take a peasant liable to do compulsory service for his lord. He works on his own land, with his own means of production, for, say, 3 days a week. The 3 other days he does forced work on the lord's domain. He constantly reproduces his own labour-fund, which never, in his case, takes the form of a money payment for his labour, advanced by another person. But in return, his unpaid forced labour for the lord, on its side, never acquires the character of voluntary paid labour. If one fine morning the lord appropriates to himself the land, the cattle, the seed, in a word, the means of production of this peasant, the latter will thenceforth be obliged to sell his labour-power to the lord. He will, *cæteris paribus*, labour 6 days a week as before, 3 for himself, 3 for his lord, who thenceforth becomes a wages-paying capitalist. As before, he will use up the means of production as means of production, and transfer their value to the product. As before, a definite portion of the product will be devoted to reproduction. But from the moment that the forced labour is changed into wage-labour, from that moment the labour-fund, which the peasant himself continues as before to produce and reproduce, takes the form of a capital advanced in the form of wages by the lord. The bourgeois economist whose narrow mind is unable to separate the form of appearance from the thing that appears, shuts his eyes to the fact, that it is but here and there on the face of the earth, that even now-a-days the labour-fund crops up in the form of capital.

Variable capital, it is true, only then loses its character of a value advanced out of the capitalist's funds, when we view the process of capitalist production in the flow of its constant renewal. But that process must have had a beginning of some kind. From our present stand-point it therefore seems likely that the capitalist, once upon a time, became possessed of money, by some accumulation that took place independently of the unpaid labour of others, and that this was, therefore, how he was enabled to frequent the market as a buyer of labour-power. However this may be, the mere continuity of the process, the simple reproduction, brings about some other wonderful changes, which affect not only the variable, but the total capital.

If a capital of £1000 beget yearly a surplus-value of £200, and if this surplus-value be consumed every year, it is clear that at the end of 5 years the surplus-value consumed will amount to $5 \times £200$ or the £1000 originally advanced. If only a part, say one half, were consumed, the same result would follow at the end of 10 years, since $10 \times £100 = £1000$. General Rule: The value of the capital advanced divided by the surplus-value annually consumed, gives the number of years, or reproduction periods, at the expiration of which the capital originally advanced has been consumed by the capitalist and has disappeared. The capitalist thinks, that he is consuming the produce of the unpaid labour of others, i.e., the surplus-value, and is keeping intact his original capital; but what he thinks cannot alter facts. After the lapse of a certain number of years the capital value he then possesses is equal to the sum total of the surplus-value appropriated by him during those years, and the total value he has consumed is equal to that of his original capital. It is true, he has in hand a capital whose amount has not changed, and of which a part, viz., the buildings, machinery, &c., were already there when the work of his business began. But what we have to do with here, is not the material elements, but the value, of that capital. When a person gets through all his property, by taking upon himself debts equal to the value of that property, it is clear that his property represents nothing but the sum total of his debts. And so it is with the capitalist; when he has consumed the equivalent of his original capital, the value of his present capital represents nothing but the total amount of the surplus-value appropriated by him without payment. Not a single atom of the value of his old capital continues to exist.

Apart then from all accumulation, the mere continuity of the process of production, in other words simple reproduction, sooner or later, and of necessity, converts every capital into accumulated capital, or capitalised surplus-value. Even if that capital was originally acquired by the personal labour of its employer, it sooner or later becomes value appropriated without an equivalent, the unpaid labour of others materialised either in money or in some other object. We saw in chapter IV. that in order to convert money into capital something more is required than the production and circulation of commodities. We saw that on the one side the possessor of value or money, on the other, the possessor of the value-creating substance; on the one side, the possessor of the means of production and subsistence, on the other, the possessor of nothing but labour-power, must

confront one another as buyer and seller. The separation of labour from its product, of subjective labour-power from the objective conditions of labour, was therefore the real foundation in fact, and the starting point of capitalist production.

But that which at first was but a starting point, becomes, by the mere continuity of the process, by simple reproduction, the peculiar result, constantly renewed and perpetuated, of capitalist production. On the one hand, the process of production incessantly converts material wealth into capital, into means of creating more wealth and means of enjoyment for the capitalist. On the other hand the labourer, on quitting the process, is what he was on entering it, a source of wealth, but devoid of all means of making that wealth his own. Since, before entering on the process, his own labour has already been alienated from himself by the sale of his labour-power, has been appropriated by the capitalist and incorporated with capital, it must, during the process, be realised in a product that does not belong to him. Since the process of production is also the process by which the capitalist consumes labour-power, the product of the labourer is incessantly converted, not only into commodities, but into capital, into value that sucks up the value-creating power, into means of subsistence that buy the person of the labourer, into means of production that command the producers. The labourer therefore constantly produces material, objective wealth, but in the form of capital, of an alien power that dominates and exploits him; and the capitalist as constantly produces labour-power, but in the form of a subjective source of wealth, separated from the objects in and by which it can alone be realised; in short he produces the labourer, but as a wage-labourer. This incessant reproduction, this perpetuation of the labourer, is the *sine qua non* of capitalist production.

The labourer consumes in a twofold way. While producing he consumes by his labour the means of production, and converts them into products with a higher value than that of the capital advanced. This is his productive consumption. It is at the same time consumption of his labour-power by the capitalist who bought it. On the other hand, the labourer turns the money paid to him for his labour-power, into means of subsistence: this is his individual consumption. The labourer's productive consumption, and his individual consumption, are therefore totally distinct. In the former, he acts as the motive power of capital, and belongs to the capitalist. In the latter, he belongs to himself, and performs his necessary vital functions outside the

process of production. The result of the one is, that the capitalist lives; of the other, that the labourer lives.

When treating of the working-day, we saw that the labourer is often compelled to make his individual consumption a mere incident of production. In such a case, he supplies himself with necessities in order to maintain his labour-power, just as coal and water are supplied to the steam engine and oil to the wheel. His means of consumption, in that case, are the mere means of consumption required by a means of production; his individual consumption is directly productive consumption. This, however, appears to be an abuse not essentially appertaining to capitalist production.

The matter takes quite another aspect, when we contemplate, not the single capitalist, and the single labourer, but the capitalist class and the labouring class, not an isolated process of production, but capitalist production in full swing, and on its actual social scale. By converting part of his capital into labour-power, the capitalist augments the value of his entire capital. He kills two birds with one stone. He profits, not only by what he receives from, but by what he gives to, the labourer. The capital given in exchange for labour-power is converted into necessities, by the consumption of which the muscles, nerves, bones, and brains of existing labourers are reproduced, and new labourers are begotten. Within the limits of what is strictly necessary, the individual consumption of the working class is, therefore, the reconversion of the means of subsistence given by capital in exchange for labour-power, into fresh labour-power at the disposal of capital for exploitation. It is the production and reproduction of that means of production so indispensable to the capitalist: the labourer himself. The individual consumption of the labourer, whether it proceed within the workshop or outside it, whether it be part of the process of production or not, forms therefore a factor of the production and reproduction of capital; just as cleaning machinery does, whether it be done while the machinery is working or while it is standing. The fact that the labourer consumes his means of subsistence for his own purposes, and not to please the capitalist, has no bearing on the matter. The consumption of food by a beast of burden is none the less a necessary factor in the process of production, because the beast enjoys what it eats. The maintenance and reproduction of the working-class is, and must ever be, a necessary condition to the reproduction of capital. But the capitalist may safely leave its fulfillment to the labourer's instincts of self-preservation and of

propagation. All the capitalist cares for, is to reduce the labourer's individual consumption as far as possible to what is strictly necessary, and he is far away from imitating those brutal South Americans, who force their labourers to take the more substantial, rather than the less substantial, kind of food.

Hence both the capitalist and his ideological representative, the political economist, consider that part alone of the labourer's individual consumption to be productive, which is requisite for the perpetuation of the class, and which therefore must take place in order that the capitalist may have labour-power to consume; what the labourer consumes for his own pleasure beyond that part, is unproductive consumption. If the accumulation of capital were to cause a rise of wages and an increase in the labourer's consumption, unaccompanied by increase in the consumption of labour-power by capital, the additional capital would be consumed unproductively. In reality, the individual consumption of the labourer is unproductive as regards himself, for it reproduces nothing but the needy individual; it is productive to the capitalist and the State, since it is the production of the power that creates their wealth.

From a social point of view, therefore, the working-class, even when not directly engaged in the labour-process, is just as much an appendage of capital as the ordinary instruments of labour. Even its individual consumption is, within certain limits, a mere factor in the process of production. That process, however, takes good care to prevent these self-conscious instruments from leaving it in the lurch, for it removes their product, as fast as it is made, from their pole to the opposite pole of capital. Individual consumption provides, on the one hand, the means for their maintenance and reproduction: on the other hand, it secures by the annihilation of the necessities of life, the continued reappearance of the workman in the labour-market. The Roman slave was held by fetters: the wage-labourer is bound to his owner by invisible threads. The appearance of independence is kept up by means of a constant change of employers, and by the *fictio juris* of a contract.

In former times, capital resorted to legislation, whenever necessary, to enforce its proprietary rights over the free labourer. For instance, down to 1815, the emigration of mechanics employed in machine making was, in England, forbidden, under grievous pains and penalties.

The reproduction of the working class carries with it the accumulation of skill, that is handed down from one generation to another. To what extent the capitalist reckons the existence of such a skilled class among the factors of production that belong to him by right, and to what extent he actually regards it as the reality of his variable capital, is seen so soon as a crisis threatens him with its loss. In consequence of the civil war in the United States and of the accompanying cotton famine, the majority of the cotton operatives in Lancashire were, as is well known, thrown out of work. Both from the working-class itself, and from other ranks of society, there arose a cry for State aid, or for voluntary national subscriptions, in order to enable the “superfluous” hands to emigrate to the colonies or to the United States. Thereupon, the “Times” published on the 24th March, 1863, a letter from Edmund Potter, a former president of the Manchester Chamber of Commerce. This letter was rightly called in the House of Commons, the manufacturers’ manifesto. We cull here a few characteristic passages, in which the proprietary rights of capital over labour-power are unblushingly asserted.

“He” (the man out of work) “may be told the supply of cotton-workers is too large...and...must...in fact be reduced by a third, perhaps, and that then there will be a healthy demand for the remaining two-thirds...Public opinion...urges emigration...The master cannot willingly see his labour supply being removed; he may think, and perhaps justly, that it is both wrong and unsound...But if the public funds are to be devoted to assist emigration, he has a right to be heard, and perhaps to protest.” Mr. Potter then shows how useful the cotton trade is, how the “trade has undoubtedly drawn the surplus-population from Ireland and from the agricultural districts,” how immense is its extent, how in the year 1860 it yielded 5/13ths of the total English exports, how, after a few years, it will again expand by the extension of the market, particularly of the Indian market, and by calling forth a plentiful supply of cotton at 6d. per lb. He then continues: “Some time..., one, two, or three years, it may be, will produce the quantity...The question I would put then is this — Is the trade worth retaining? Is it worth while to keep the machinery (he means the living labour machines) in order, and is it not the greatest folly to think of parting with that? I think it is. I allow that the workers are not a property, not the property of Lancashire and the masters; but they are the strength of both; they are the mental and trained power which cannot be replaced for a

generation; the mere machinery which they work might much of it be beneficially replaced, nay improved, in a twelve-month. Encourage or allow (!) the working-power to emigrate, and what of the capitalist?...Take away the cream of the workers, and fixed capital will depreciate in a great degree, and the floating will not subject itself to a struggle with the short supply of inferior labour.... We are told the workers wish it" (emigration). "Very natural it is that they should do so.... Reduce, compress the cotton trade by taking away its working power and reducing their wages expenditure, say one-fifth, or five millions, and what then would happen to the class above, the small shopkeepers; and what of the rents, the cottage rents.... Trace out the effects upward to the small farmer, the better house-holder, and...the landowner, and say if there could be any suggestion more suicidal to all classes of the country than by enfeebling a nation by exporting the best of its manufacturing population, and destroying the value of some of its most productive capital and enrichment.... I advise a loan (of five or six millions sterling),...extending it may be over two or three years, administered by special commissioners added to the Boards of Guardians in the cotton districts, under special legislative regulations, enforcing some occupation or labour, as a means of keeping up at least the moral standard of the recipients of the loan.... can anything be worse for landowners or masters than parting with the best of the workers, and demoralising and disappointing the rest by an extended depletive emigration, a depletion of capital and value in an entire province?"

Potter, the chosen mouthpiece of the manufacturers, distinguishes two sorts of "machinery," each of which belongs to the capitalist, and of which one stands in his factory, the other at night-time and on Sundays is housed outside the factory, in cottages. The one is inanimate, the other living. The inanimate machinery not only wears out and depreciates from day to day, but a great part of it becomes so quickly super-annuated, by constant technical progress, that it can be replaced with advantage by new machinery after a few months. The living machinery, on the contrary, gets better the longer it lasts, and in proportion as the skill, handed from one generation to another, accumulates. The "Times" answered the cotton lord as follows:

"Mr. Edmund Potter is so impressed with the exceptional and supreme importance of the cotton masters that, in order to preserve this class and perpetuate their profession, he would keep half a million of the labouring class confined in a great moral workhouse against their will. 'Is the trade

worth retaining?’ asks Mr. Potter. ‘Certainly by all honest means it is,’ we answer. ‘Is it worth while keeping the machinery in order?’ again asks Mr. Potter. Here we hesitate. By the ‘machinery’ Mr. Potter means the human machinery, for he goes on to protest that he does not mean to use them as an absolute property. We must confess that we do not think it ‘worth while,’ or even possible, to keep the human machinery in order — that is to shut it up and keep it oiled till it is wanted. Human machinery will rust under inaction, oil and rub it as you may. Moreover, the human machinery will, as we have just seen, get the steam up of its own accord, and burst or run a muck in our great towns. It might, as Mr. Potter says, require some time to reproduce the workers, but, having machinists and capitalists at hand, we could always find thrifty, hard, industrious men wherewith to improvise more master manufacturers than we can ever want. Mr. Potter talks of the trade reviving ‘in one, two, or three years,’ and he asks us not ‘to encourage or allow (!) the working power to emigrate.’ He says that it is very natural the workers should wish to emigrate; but he thinks that in spite of their desire, the nation ought to keep this half million of workers with their 700,000 dependents, shut up in the cotton districts; and as a necessary consequence, he must of course think that the nation ought to keep down their discontent by force, and sustain them by alms — and upon the chance that the cotton masters may some day want them...The time is come when the great public opinion of these islands must operate to save this ‘working power’ from those who would deal with it as they would deal with iron, and coal, and cotton.”

The “Times” article was only a jeu d’esprit. The “great public opinion” was, in fact, of Mr. Potter’s opinion, that the factory operatives are part of the movable fittings of a factory. Their emigration was prevented. They were locked up in that “moral workhouse,” the cotton districts, and they form, as before, “the strength” of the cotton manufacturers of Lancashire.

Capitalist production, therefore, of itself reproduces the separation between labour-power and the means of labour. It thereby reproduces and perpetuates the condition for exploiting the labourer. It incessantly forces him, to sell his labour-power in order to live, and enables the capitalist to purchase labour-power in order that he may enrich himself. It is no longer a mere accident, that capitalist and labourer confront each other in the market as buyer and seller. It is the process itself that incessantly hurls back the labourer on to the market as a vendor of his labour-power, and that

incessantly converts his own product into a means by which another man can purchase him. In reality, the labourer belongs to capital before he has sold himself to capital. His economical bondage is both brought about and concealed by the periodic sale of himself, by his change of masters, and by the oscillations in the market price of labour-power.

Capitalist production, therefore, under its aspect of a continuous connected process, of a process of reproduction, produces not only commodities, not only surplus-value, but it also produces and reproduces the capitalist relation; on the one side the capitalist, on the other the wage-labourer.

CHAPTER XXIV. CONVERSION OF SURPLUS-VALUE INTO CAPITAL.

SECTION I. — CAPITALIST PRODUCTION ON A PROGRESSIVELY INCREASING SCALE. TRANSITION OF THE LAWS OF PROPERTY THAT CHARACTERISE PRODUCTION OF COMMODITIES INTO LAWS OF CAPITALIST APPROPRIATION.

HITHERTO we have investigated how surplus-value emanates from capital; we have now to see how capital arises from surplus-value. Employing surplus-value as capital, reconverting it into capital, is called accumulation of capital.

First let us consider this transaction from the standpoint of the individual capitalist. Suppose a spinner to have advanced a capital of £10,000, of which four-fifths (£8000) are laid out in cotton, machinery, &c., and one-fifth (£2000) in wages. Let him produce 240,000 lbs. of yarn annually, having a value of £12,000. The rate of surplus-value being 100%, the surplus-value lies in the surplus or net product of 40,000 lbs. of yarn, one sixth of the gross product, with a value of £2000 which will be realized by a sale. £2000 is £2000. We can neither see nor smell in this sum of money a trace of surplus-value. When we know that a given value is surplus-value, we know how its owner came by it; but that does not alter the nature either of value or of money.

In order to convert this additional sum of £2000 into capital, the master spinner will, all circumstances remaining as before, advance four-fifths of it (£1600) in the purchase of cotton, &c., and one-fifth (£400) in the purchase of additional spinners, who will find in the market the necessaries of life whose value the master has advanced to them. Then the new capital of £2000 functions in the spinning mill, and brings in, in its turn, a surplus-value of £400.

The capital-value was originally advanced in the money form. The surplus-value on the contrary is, originally, the value of a definite portion of the gross product. If this gross product be sold, converted into money, the capital-value regains its original form. From this moment the capital-value and the surplus-value are both of them sums of money, and their

reconversion into capital takes place in precisely the same way. The one, as well as the other, is laid out by the capitalist in the purchase of commodities that place him in a position to begin afresh the fabrication of his goods, and this time, on an extended scale. But in order to be able to buy those commodities, he must find them ready in the market.

His own yarns circulate, only because he brings his annual product to market, as all other capitalists likewise do with their commodities. But these commodities, before coming to market, were part of the general annual product, part of the total mass of objects of every kind, into which the sum of the individual capitals, i.e., the total capital of society, had been converted in the course of the year, and of which each capitalist had in hand only an aliquot part. The transactions in the market effectuate only the interchange of the individual components of this annual product, transfer them from one hand to another, but can neither augment the total annual production, nor alter the nature of the objects produced. Hence the use that can be made of the total annual product, depends entirely upon its own composition, but in no way upon circulation.

The annual production must in the first place furnish all those objects (use-values) from which the material components of capital, used up in the course of the year, have to be replaced. Deducting these there remains the net or surplus-product, in which the surplus-value lies. And of what does this surplus-product consist? Only of things destined to satisfy the wants and desires of the capitalist class, things which, consequently, enter into the consumption fund of the capitalists? Were that the case, the cup of surplus-value would be drained to the very dregs, and nothing but simple reproduction would ever take place.

To accumulate it is necessary to convert a portion of the surplus-product into capital. But we cannot, except by a miracle, convert into capital anything but such articles as can be employed in the labour-process (i.e., means of production), and such further articles as are suitable for the sustenance of the labourer, (i.e., means of subsistence.) Consequently, a part of the annual surplus-labour must have been applied to the production of additional means of production and subsistence, over and above the quantity of these things required to replace the capital advanced. In one word, surplus-value is convertible into capital solely because the surplus-product, whose value it is, already comprises the material elements of new capital.

Now in order to allow of these elements actually functioning as capital, the capitalist class requires additional labour. If the exploitation of the labourers already employed do not increase, either extensively or intensively, then additional labour-power must be found. For this the mechanism of capitalist production provides beforehand, by converting the working class into a class dependent on wages, a class whose ordinary wages suffice, not only for its maintenance, but for its increase. It is only necessary for capital to incorporate this additional labour-power, annually supplied by the working class in the shape of labourers of all ages, with the surplus means of production comprised in the annual produce, and the conversion of surplus-value into capital is complete. From a concrete point of view, accumulation resolves itself into the reproduction of capital on a progressively increasing scale. The circle in which simple reproduction moves, alters its form, and, to use Sismondi's expression, changes into a spiral.

Let us now return to our illustration. It is the old story: Abraham begat Isaac, Isaac begat Jacob, and so on. The original capital of £10,000 brings in a surplus-value of £2000, which is capitalised. The new capital of £2000 brings in a surplus-value of £400, and this, too, is capitalised, converted into a second additional capital, which, in its turn, produces a further surplus-value of £80. And so the ball rolls on.

We here leave out of consideration the portion of the surplus-value consumed by the capitalist. Just as little does it concern us, for the moment, whether the additional capital is joined on to the original capital, or is separated from it to function independently; whether the same capitalist, who accumulated it, employs it, or whether he hands it over to another. This only we must not forget, that by the side of the newly-formed capital, the original capital continues to reproduce itself, and to produce surplus-value, and that this is also true of all accumulated capital, and the additional capital engendered by it.

The original capital was formed by the advance of £10,000. How did the owner become possessed of it? "By his own labour and that of his forefathers," answer unanimously the spokesmen of political economy. And, in fact, their supposition appears the only one consonant with the laws of the production of commodities.

But it is quite otherwise with regard to the additional capital of £2000. How that originated we know perfectly well. There is not one single atom

of its value that does not owe its existence to unpaid labour. The means of production, with which the additional labour-power is incorporated, as well as the necessities with which the labourers are sustained, are nothing but component parts of the surplus product, of the tribute annually exacted from the working class by the capitalist class. Though the latter with a portion of that tribute purchases the additional labour-power even at its full price, so that equivalent is exchanged for equivalent, yet the transaction is for all that only the old dodge of every conquerer who buys commodities from the conquered with the money he has robbed them of.

If the additional capital employs the person who produced it, this producer must not only continue to augment the value of the original capital, but must buy back the fruits of his previous labour with more labour than they cost. When viewed as a transaction between the capitalist class and the working class, it makes no difference that additional labourers are employed by means of the unpaid labour of the previously employed labourers. The capitalist may even convert the additional capital into a machine that throws the producers of that capital out of work, and that replaces them by a few children. In every case the working class creates by the surplus-labour of one year the capital destined to employ additional labour in the following year. And this is what is called: creating capital out of capital.

The accumulation of the first additional capital of £2000 presupposes a value of £10,000 belonging to the capitalist by virtue of his “primitive labour,” and advanced by him. The second additional capital of £400 presupposes, on the contrary, only the previous accumulation of the £2000, of which the £400 is the surplus-value capitalised. The ownership of past unpaid labour is thenceforth the sole condition for the appropriation of living unpaid labour on a constantly increasing scale. The more the capitalist has accumulated, the more is he able to accumulate.

In so far as the surplus-value, of which the additional capital, No. 1, consists, is the result of the purchase of labour-power with part of the original capital, a purchase that conformed to the laws of the exchange of commodities, and that, from a legal stand-point, presupposes nothing beyond the free disposal, on the part of the labourer, of his own capacities, and on the part of the owner of money or commodities, of the values that belong to him; in so far as the additional capital, No. 2, 8c., is the mere result of No. 1, and, therefore, a consequence of the above condition; in so

far as each single transaction invariably conforms to the laws of the exchange of commodities, the capitalist buying labour-power, the labourer selling it, and we will assume at its real value; in so far as all this is true, it is evident that the laws of appropriation or of private property, laws that are based on the production and circulation of commodities, become by their own inner and inexorable dialectic changed into their very opposite. The exchange of equivalents, the original operation with which we started, has now become turned round in such a way that there is only an apparent exchange. This is owing to the fact, first, that the capital which is exchanged for labour-power is itself but a portion of the product of others' labour appropriated without an equivalent; and, secondly, that this capital must not only be replaced by its producer, but replaced together with an added surplus. The relation of exchange subsisting between capitalist and labourer becomes a mere semblance appertaining to the process of circulation, a mere form, foreign to the real nature of the transaction, and only mystify it. The ever repeated purchase and sale of labour-power is now the mere form; what really takes place is this — the capitalist again and again appropriates, without equivalent, a portion of the previously materialised labour of others, and exchanges it for a greater quantity of living labour. At first the rights of property seemed to us to be based on a man's own labour. At least, some such assumption was necessary since only commodity owners with equal rights confronted each other, and the sole means by which a man could become possessed of the commodities of others, was by alienating his own commodities; and these could be replaced by labour alone. Now, however, property turns out to be the right, on the part of the capitalist, to appropriate the unpaid labour of others or its product and to be the impossibility, on the part of the labourer, of appropriating his own product. The separation of property from labour has become the necessary consequence of a law that apparently originated in their identity.

No matter how severely the capitalist mode of appropriation may seem to slap the face of the fundamental laws of the production of commodities, it does not arise from a violation, but from an application of these laws. A brief retrospect upon the succession of phases, whose climax the capitalist accumulation is, may serve once more to make this clear.

We have seen, in the first place, that the original transformation of a certain quantity of values into capital proceeded strictly according to the

laws of exchange. One of the contracting parties sells his labour-power, the other buys it. The first receives the exchange-value of his commodity, while its use-value, labour, passes into the possession of the other. This second party then converts means of production belonging to him into a new product belonging to him by right through the instrumentality of labour also belonging to him.

The value of this product comprises, in the first place, the value of the consumed means of production. Useful labour cannot consume these means of production without transferring their value to the new product. But in order to be saleable labour-power must be able to furnish useful labour in that line of industry in which it is to be employed.

The value of the new product comprises, furthermore, the equivalent of the value of labour-power and a surplus-value. It does so for the reason that the labour-power sold for a certain length of time, such as a day, a week, etc., has less value than is produced by its employment during that time. The labourer, however, has received the exchange-value of his labour-power and given up its use-value in return, as happens in every sale and purchase.

The fact that this particular commodity labour-power has the peculiar use-value of supplying labour and creating value cannot affect the general law of the production of commodities. Hence, if the sum of values advanced in wages is not merely reproduced in the product, but also increased by a surplus-value, this is not due to an advantage gained over the seller, who received the value of his commodity, but simply to the consumption of this commodity by the buyer.

The law of exchange requires equality only for the exchange-values of the commodities passed from hand to hand. But it requires at the outset a disparity of their use-values, and has nothing to do with their consumption, which does not begin until after the trade has been made.

The original transformation of money into capital proceeds, therefore, in strict compliance with the economic laws of the production of commodities and with the property right derived therefrom. Nevertheless it has the following results:

That the product belongs to the capitalist, not to the labourer;

(2) That the value of this product comprises a surplus-value over and above the value of the advanced capital. This surplus-value has cost the labourer

labour, but the capitalist nothing, yet it becomes the lawful property of the capitalist;

(3) That the labourer has reproduced his labour-power and can sell it once more, if he finds a buyer for it.

Simple reproduction is but a periodical repetition of this first operation. Money is thereby transformed again and again into capital. The general law is not violated thereby, but rather finds an opportunity to manifest itself permanently. "Several successive exchanges have merely made of the last a representative of the first." (Sismondi, l. c., .)

Nevertheless we have seen that this simple reproduction suffices to impregnate this first operation, so far as it was considered an isolated transaction, with a totally different character. "Of those, who divide the national revenue among themselves, some (the labourers) acquire each year a new title to it by new labour, while others (the capitalists) have previously acquired a permanent title to it by primitive work." (Sismondi, l. c., .) The domain of labour is evidently not the only one in which primogeniture accomplishes wonders.

It does not alter matters any, if simple reproduction is replaced by reproduction on an enlarged scale, by accumulation. In the first instance the capitalist consumes the entire surplus-value, in the second he demonstrates his civic virtue by consuming only a part of it and converting the remainder into money.

The surplus-value is his property, it has never belonged to anybody else. If he advances it to production, he makes advances from his own funds just as he did on the day when he first came on the market. That this fund in the present case comes from the unpaid labour of his labourers, does not alter the matter in the least. If labourer B is employed with surplus-values produced by labourer A, then, in the first place, A supplied this surplus-value without having the just price of his commodity reduced by one farthing, and, in the second place, this transaction is none of B's concern. What B demands and has a right to demand is that the capitalist should pay him the value of his labour-power. "Both sides are gainers; the labourer, by having the fruit of his labour advanced to him" (that is, the fruit of the unpaid labour of others) "before he has performed any labour" (that is, before his own labour has borne any fruit); "the master, because the labour

of this labourer was worth more than his wages” (that is, produced a value greater than that of his wages). (Sismondi, l. c., .)

True, the matter assumes an entirely different aspect when we look upon capitalist production in the uninterrupted flow of its reproduction, and when we consider the capitalist class as a whole and its antagonist, the working class, instead of the individual capitalist and the individual labourer. But in so doing we should be applying a standard which is totally foreign to the production of commodities.

In the production of commodities only sellers and buyers, independent of one another, meet. Their mutual relations cease with the termination of their mutual contract. If the transaction is repeated, it is done by a new contract, which has nothing to do with the former one, and only an accident brings the same seller once more together with the same buyer.

Hence, if the production of commodities, or a transaction belonging to it, is to be judged by its own economic laws, we must consider each act of exchange by itself, outside of all connection with the act of exchange preceding it and following it. And since purchases and sales are transacted between individuals, it will not do to seek therein relations between entire classes of society.

No matter how long may be the series of periodical reproductions and former accumulations through which the capital now invested may have passed, it always retains its primal virginity. So long as the laws of exchange are observed in every act of exchange, individually considered, the mode of appropriation may be completely revolutionised without in the least affecting the property right bestowed by the production of commodities. The same right remains in force, whether it be at a time when the product belonged to the producer, and when this producer, exchanging equivalent for equivalent, could enrich himself only by his own labour, or whether it be under capitalism, where the social wealth becomes in an ever increasing degree the property of those, who are in a position to appropriate to themselves again and again the unpaid labour of others.

This result becomes inevitable, as soon as labour-power is sold as a commodity by the “free” labourer himself. It is from that time on that the production of commodities becomes universal and a typical form of production. Henceforth every product is intended at the outset for sale, and all produced wealth passes through the circulation. The production of

commodities does not impose itself upon the whole society, until wage-labour becomes its basis. And only then does it unfold all its powers. To say that the intervention of wage labour adulterates the production of commodities means to say that the production of commodities must not develop, if it wishes to remain unadulterated. To the same extent that it continues to develop by its own inherent laws into a capitalist production, the property laws of the production of commodities are converted into the laws of capitalistic appropriation.

We have seen that even in the case of simple reproduction, all capital, whatever its original source, becomes converted into accumulated capital, capitalised surplus-value. But in the flood of production all the capital originally advanced becomes a vanishing quantity (*magnitudo evanescens*, in the mathematical sense), compared with the directly accumulated capital, i.e., with the surplus-value or surplus product that is reconverted into capital, whether it function in the hands of its accumulator, or in those of others. Hence, political economy describes capital in general as “accumulated wealth” (converted surplus-value or revenue), “that is employed over again in the production of surplus-value,” and the capitalist as “the owner of surplus-value.” It is merely another way of expressing the same thing to say that all existing capital is accumulated or capitalised interest, for interest is a mere fragment of surplus-value.

SECTION 2. — ERRONEOUS CONCEPTION BY POLITICAL ECONOMY OF REPRODUCTION ON A PROGRESSIVELY INCREASING SCALE.

Before we further investigate accumulation or the reversion of surplus-value into capital, we must brush on one side an ambiguity introduced by the classical economists.

Just as little as the commodities that the capitalist buys with a part of the surplus-value for his own consumption, serve the purpose of production and of creation of value, so little is the labour that he buys for the satisfaction of his natural and social requirements, productive labour. Instead of converting surplus-value into capital, he, on the contrary, by the purchase of those commodities and that labour, consumes or expends it as revenue. In the face of the habitual mode of life of the old feudal nobility, which, as Hegel

rightly says, “consists in consuming what is in hand,” and more especially displays itself in the luxury of personal retainers, it was extremely important for bourgeois economy to promulgate the doctrine that accumulation of capital is the first duty of every citizen, and to preach without ceasing, that a man cannot accumulate, if he eats up all his revenue, instead of spending a good part of it in the acquisition of additional productive labourers, who bring in more than they cost. On the other hand the economists had to contend against the popular prejudice, that confuses capitalist production with hoarding, and fancies that accumulated wealth is either wealth that is rescued from being destroyed in its existing form, i.e., from being consumed, or wealth that is withdrawn from circulation. Exclusion of money from circulation would also exclude absolutely its self-expansion as capital, while accumulation of a hoard in the shape of commodities would be sheer tomfoolery. The accumulation of commodities in great masses is the result either of overproduction or of a stoppage of circulation. It is true that the popular mind is impressed by the sight, on the one hand, of the mass of goods that are stored up for gradual consumption by the rich, and on the other hand, by the formation of reserve stocks; the latter, a phenomenon that is common to all modes of production, and on which we shall dwell for a moment, when we come to analyse circulation. Classical economy is therefore quite right, when it maintains that the consumption of surplus-products by productive, instead of by unproductive labourers, is a characteristic feature of the process of accumulation. But at this point the mistakes also begin. Adam Smith has made it the fashion, to represent accumulation as nothing more than consumption of surplus-products by productive labourers, which amounts to saying, that the capitalising of surplus-value consists in merely turning surplus-value into labour-power. Let us see what Ricardo e.g., says: “It must be understood that all the productions of a country are consumed; but it makes the greatest difference imaginable whether they are consumed by those who reproduce, or by those who do not reproduce another value. When we say that revenue is saved, and added to capital, what we mean is, that the portion of revenue, so said to be added to capital, is consumed by productive instead of unproductive labourers. There can be no greater error than in supposing that capital is increased by non-consumption.” There can be no greater error than that which Ricardo and all subsequent economists repeat after A. Smith, viz., that “the part of revenue, of which it is said, it has been added to capital, is

consumed by productive labourers.” According to this, all surplus-value that is changed into capital becomes variable capital. So far from this being the case, the surplus-value, like the original capital, divides itself into constant capital and variable capital, into means of production and labour-power. Labour-power is the form under which variable capital exists during the process of production. In this process the labour-power is itself consumed by the capitalist while the means of production are consumed by the labour-power in the exercise of its function, labour. At the same time, the money paid for the purchase of the labour-power, is converted into necessities, that are consumed, not by “productive labour,” but by the “productive labourer.” Adam Smith, by a fundamentally perverted analysis, arrives at the absurd conclusion, that even though each individual capital is divided into a constant and a variable part, the capital of society resolves itself only into variable capital, i.e., is laid out exclusively in payment of wages. For instance, suppose a cloth manufacturer converts £2000 into capital. One portion he lays out in buying weavers, the other in woollen yarn, machinery, &c. But the people, from whom he buys the yarn and the machinery, pay for labour with a part of the purchase money, and so on until the whole £2000 are spent in the payment of wages, i.e., until the entire product represented by the £2000 has been consumed by productive labourers. It is evident that the whole gist of this argument lies in the words “and so on,” which send us from pillar to post. In truth, Adam Smith breaks his investigation off, just where its difficulties begin.

The annual process of reproduction is easily understood, so long as we keep in view merely the sum total of the year’s production. But every single component of this product must be brought into the market as a commodity, and there the difficulty begins. The movements of the individual capitals, and of the personal revenues, cross and intermingle and are lost in the general change of places, in the circulation of the wealth of society; this dazes the sight, and propounds very complicated problems for solution. In the third part of Book II. I shall give the analysis of the real bearings of the facts. It is one of the great merits of the Physiocrats, that in their *Tableau économique* they were the first to attempt to depict the annual production in the shape in which it is presented to us after passing through the process of circulation.

For the rest, it is a matter of course, that political economy, acting in the interests of the capitalist class, has not failed to exploit the doctrine of Adam Smith, viz., that the whole of that part of the surplus product which is converted into capital, is consumed by the working class.

SECTION 3. — SEPARATION OF SURPLUS-VALUE INTO CAPITAL AND REVENUE. THE ABSTINENCE THEORY.

In the last preceding chapter, we treated surplus-value (or the surplus product) solely as a fund for supplying the individual consumption of the capitalist. In this chapter we have, so far treated it solely as a fund for accumulation. It is, however, neither the one nor the other, but is both together. One portion is consumed by the capitalist as revenue, the other is employed as capital, is accumulated.

Given the mass of surplus-value, then, the larger the one of these parts, the smaller is the other. *Cæteris paribus*, the ratio of these parts determines the magnitude of the accumulation. But it is by the owner of the surplus-value, by the capitalist alone, that the division is made. It is his deliberate act. That part of the tribute exacted by him which he accumulates, is said to be saved by him, because he does not eat it, i.e., because he performs the function of a capitalist, and enriches himself.

Except as personified capital, the capitalist has no historical value, and no right to that historical existence, which, to use an expression of the witty Lichnowsky, “hasn’t got no date,” And so far only is the necessity for his own transitory existence implied in the transitory necessity for the capitalist mode of production. But, so far as he is personified capital, it is not values in use and the enjoyment of them, but exchange-value and its augmentation, that spur him into action. Fanatically bent on making value expand itself, he ruthlessly forces the human race to produce for production’s sake; he thus forces the development of the productive powers of society, and creates those material conditions, which alone can form the real basis of a higher form of society, a society in which the full and free development of every individual forms the ruling principle. Only as personified capital is the capitalist respectable. As such, he shares with the miser the passion for wealth as wealth. But that which in the miser is a mere idiosyncrasy, is, in the capitalist, the effect of the social mechanism, of which he is but one of the wheels. Moreover, the development of capitalist production makes it

constantly necessary to keep increasing the amount of the capital laid out in a given industrial undertaking, and competition makes the immanent laws of capitalist production to be felt by each individual capitalist, as external coercive laws. It compels him to keep constantly extending his capital, in order to preserve it, but extend it he cannot, except by means of progressive accumulation.

So far, therefore, as his actions are a mere function of capital — endowed as capital is, in his person, with consciousness and a will — his own private consumption is a robbery perpetrated on accumulation, just as in book-keeping by double entry, the private expenditure of the capitalist is placed on the debtor side of his account against his capital. To accumulate, is to conquer the world of social wealth, to increase the mass of human beings exploited by him, and thus to extend both the direct and the indirect sway of the capitalist.

But original sin is at work everywhere. As capitalist production, accumulation, and wealth, become developed, the capitalist ceases to be the mere incarnation of capital. He has a fellow-feeling for his own Adam, and his education gradually enables him to smile at the rage for asceticism, as a mere prejudice of the old-fashioned miser. While the capitalist of the classical type brands individual consumption as a sin against his function, and as “abstinence” from accumulating, the modernised capitalist is capable of looking upon accumulation as “abstinence” from pleasure.

“Two souls, alas, do dwell within his breast;
The one is ever parting from the other.”

At the historical dawn of capitalist production, — and every capitalist upstart has personally to go through this historical stage — avarice, and desire to get rich, are the ruling passions. But the progress of capitalist production not only creates a world of delights; it lays open, in speculation and the credit system, a thousand sources of sudden enrichment. When a certain stage of development has been reached, a conventional degree of prodigality, which is also an exhibition of wealth, and consequently a source of credit, becomes a business necessity to the “unfortunate” capitalist. Luxury enters into capital’s expenses of representation. Moreover, the capitalist gets rich, not like the miser, in proportion to his

personal labour and restricted consumption, but at the same rate as he squeezes out the labour-power of others, and enforces on the labourer abstinence from all life's enjoyments. Although, therefore, the prodigality of the capitalist never possesses the bonâ-fide character of the open-handed feudal lord's prodigality, but, on the contrary, has always lurking behind it the most sordid avarice and the most anxious calculation, yet his expenditure grows with his accumulation, without the one necessarily restricting the other. But along with this growth, there is at the same time developed in his breast, a Faustian conflict between the passion for accumulation, and the desire for enjoyment.

Dr. Aikin says in a work published in 1795: "The trade of Manchester may be divided into four periods. First, when manufacturers were obliged to work hard for their livelihood." They enriched themselves chiefly by robbing the parents, whose children were bound as apprentices to them: the parents paid a high premium, while the apprentices were starved. On the other hand, the average profits were low, and to accumulate, extreme parsimony was requisite. They lived like misers, and were far from consuming even the interest on their capital. "The second period, when they had begun to acquire little fortunes, but worked as hard as before," — for direct exploitation of labour costs labour, as every slave-driver knows—"and lived in as plain a manner as before....The third, when luxury began, and the trade was pushed by sending out riders for orders into every market town in the Kingdom....It is probable that few or no capitals of £3000 to £4000 acquired by trade existed here before 1690. However, about that time, or a little later, the traders had got money beforehand, and began to build modern brick houses, instead of those of wood and plaster." Even in the early part of the 18th century, a Manchester manufacturer, who placed a pint of foreign wine before his guests, exposed himself to the remarks and headshakings of all his neighbors. Before the rise of machinery, a manufacturer's evening expenditure at the public-house where they all met, never exceeded sixpence for a glass of punch, and a penny for a screw of tobacco. It was not till 1758, and this marks an epoch, that a person actually engaged in business was seen with an equipage of his own. "The fourth period," the last 30 years of the 18th century, "is that in which expense and luxury have made great progress, and was supported by a trade extended by means of riders and factors through every part of Europe." What would the

good Dr. Aikin say if he could rise from his grave and see the Manchester of to-day?

Accumulate, accumulate! That is Moses and the prophets! "Industry furnishes the material which saving accumulates." Therefore, save, save, i.e., reconvert the greatest possible portion of surplus-value, or surplus-product into capital! Accumulation for accumulation's sake, production for production's sake: by this formula classical economy expressed the historical mission of the bourgeoisie, and did not for a single instant deceive itself over the birth-throes of wealth. But what avails lamentation in then face of historical necessity? If to classical economy, the proletarian is but a machine for the production of surplus-value; on the other hand, the capitalist is in its eyes only a machine for the conversion of this surplus-value into additional capital. Political economy takes the historical function of the capitalist in bitter earnest. In order to charm out of his bosom the awful conflict between the desire for enjoyment and the chase after riches, Malthus, about the year 1820, advocated a division of labour, which assigns to the capitalist actually engaged in production, the business of accumulating, and to the other sharers in surplus-value, to the landlords, the place-men, the beneficed clergy, &c., the business of spending. It is of the highest importance, he says, "to keep separate the passion for expenditure and the passion for accumulation." The capitalists having long been good liveries and men of the world, uttered loud cries. What, exclaimed one of their spokesmen, a disciple of Ricardo, Mr. Malthus preaches high rents, heavy taxes, &c., so that the pressure of the spur may constantly be kept on the industrious by unproductive consumers! By all means, production, production on a constantly increasing scale, runs the shibboleth; but "production will, by such a process, be far more curbed in than spurred on. Nor is it quite fair thus to maintain in idleness a number of persons, only to pinch others, who are likely, from their characters, if you can force them to work, to work with success." Unfair as he finds it to spur on the industrial capitalist, by depriving him of his bread and butter, yet he thinks it necessary to reduce the labourer's wages to a minimum "to keep him industrious." Nor does he for a moment conceal the fact, that the appropriation of unpaid labour is the secret of surplus-value. "Increased demand on the part of the labourers means nothing more than their willingness to take less of their own product for themselves, and leave a greater part of it to their employer; and if it be said, that this begets glut, by lessening consumption" (on the

part of the labourers), “I can only reply that glut is synonymous with large profits.”

The learned disputation, how the booty pumped out of the labourer may be divided, with most advantage to accumulation, between the industrial capitalist and the rich idler, was hushed in face of the revolution of July. Shortly afterwards, the town proletariat at Lyons sounded the tocsin of revolution, and the country proletariat in England began to set fire to farmyards and cornstacks. On this side of the Channel Owenism began to spread; on the other side, St. Simonism and Fourierism. The hour of vulgar economy had struck. Exactly a year before Nassau W. Senior discovered at Manchester, that the profit (including interest) of capital is the product of the last hour of the twelve, he had announced to the world another discovery. “I substitute,” he proudly says, “for the word capital, considered as an instrument of production, the word abstinence.” An unparalleled sample this, of the discoveries of vulgar economy! It substitutes for an economic category, a sycophantic phrase — volia tout. “When the savage,” says Senior, “makes bows, he exercises an industry, but he does not practice abstinence.” This explains how and why, in the earlier states of society, the implements of labour were fabricated without abstinence on the part of the capitalist. “The more society progresses, the more abstinence is demanded,” namely, from those who ply the industry of appropriating the fruits of others’ industry. All the conditions for carrying on the labour-process are suddenly converted into so many acts of abstinence on the part of the capitalist. If the corn is not all eaten, but part of it also sown — abstinence of the capitalist. If the wine gets time to mature — abstinence of the capitalist. The capitalist robs his own self, whenever he “lends (!) the instruments of production to the labourer,” that is, whenever by incorporating labour-power with them, he uses them to extract surplus-value out of that labour-power, instead of eating them up, steam-engines, cotton, railways, manure, horses, and all; or as the vulgar economist childishly puts it, instead of dissipating “their value” in luxuries and other articles of consumption. How the capitalist as a class are to perform that feat, is a secret that vulgar economy has hitherto obstinately refused to divulge. Enough, that the world still jogs on, solely through the self-chastisement of this modern penitent of Vishnu, the capitalist. Not only accumulation, but the simple “conservation of a capital requires a constant effort to resist the temptation of consuming it.” The simple dictates of

humanity therefore plainly enjoin the release of the capitalist from this martyrdom and temptation, in the same way that the Georgian slave-owner was lately delivered, by the abolition of slavery, from the painful dilemma, whether to squander the surplus-product lashed out of his niggers, entirely in champagne, or whether to reconvert a part of it, into more niggers and more land.

In economic forms of society of the most different kinds, there occurs, not only simple reproduction, but, in varying degrees, reproduction on a progressively increasing scale. By degrees more is produced and more consumed, and consequently more products have to be converted into means of production. This process, however, does not present itself as accumulation of capital, nor as the function of a capitalist, so long as the labourer's means of production, and with them, his product and means of subsistence, do not confront him in the shape of capital. Richard Jones, who died a few years ago, and was the successor of Malthus in the chair of political economy at Haileybury College, discusses this point well in the light of two important facts. Since the great mass of the Hindoo population are peasants cultivating their land themselves, their products, their instruments of labour and means of subsistence never take "the shape of a fund saved from revenue, which fund has, therefore, gone through a previous process of accumulation." On the other hand, the non-agricultural labourers in those provinces where the English rule has least disturbed the old system, are directly employed by the magnates, to whom a portion of the agricultural surplus-product is rendered in the shape of tribute or rent. One portion of this product is consumed by the magnates in kind, another is converted, for their use, by the labourers, into articles of luxury and such like things; while the rest forms the wages of the labourers, who own their implements of labour. Here, production and reproduction on a progressively increasing scale, go on their way without any intervention from that queer saint, that knight of the woeful countenance, the capitalist "abstainer."

**SECTION 4. — CIRCUMSTANCES THAT, INDEPENDENTLY OF
THE DIVISION OF SURPLUS-VALUE INTO CAPITAL AND
REVENUE, DETERMINE THE AMOUNT OF ACCUMULATION.
DEGREE OF EXPLOITATION OF LABOUR-POWER.
PRODUCTIVITY OF LABOUR. GROWING DIFFERENCE IN**

AMOUNT BETWEEN CAPITAL EMPLOYED AND CAPITAL CONSUMED. MAGNITUDE OF CAPITAL ADVANCED.

The proportion in which surplus-value breaks up into capital and revenue being given, the magnitude of the capital accumulated clearly depends on the absolute magnitude of the surplus-value. Suppose that 80 per cent. were capitalised and 20 per cent. eaten up, the accumulated capital will be £2,400 or £1,200, according as the total surplus-value has amounted to £3,000 or £1,500. Hence all the circumstances that determine the mass of surplus-value, operate to determine the magnitude of the accumulation. We sum them up once again, but only in so far as they afford new points of view in regard to accumulation.

It will be remembered that the rate of surplus-value depends, in the first place, on the degree of exploitation of labour-power. Political economy values this fact so highly, that it occasionally identifies the acceleration of accumulation due to increased productiveness of labour, with its acceleration due to increased exploitation of the labourer. In the chapters on the production of surplus-value it was constantly presupposed that wages are at least equal to the value of labour-power. Forcible reduction of wages below this value plays, however, in practice too important a part, for us not to pause upon it for a moment. It, in fact, transforms, within certain limits, the labourer's necessary consumption-fund into a fund for the accumulation of capital.

“Wages,” says John Stuart Mill, “have no productive power; they are the price of productive-power. Wages do not contribute, along with labour, to the production of commodities, no more than the price of tools contributes along with the tools themselves. If labour could be had without purchase, wages might be dispensed with.” But if the labourers could live on air they could not be bought at any price. The zero of their cost is therefore a limit in a mathematical sense, always beyond reach, although we can always approximate more and more nearly to it. The constant tendency of capital is to force the cost of labour back towards this zero. A writer of the 18th century, often quoted already, the author of the “Essay on Trade and Commerce,” only betrays the innermost secret soul of English capitalism, when he declares the historic mission of England to be the forcing down of English wages to the level of the French and the Dutch. With other things he says naïvely: “But if our poor” (technical term for labourers) “will live

luxuriously...then labour must, of course, be dear.... When it is considered what luxuries the manufacturing populace consume, such as brandy, gin, tea, sugar, foreign fruit, strong beer, printed linens, snuff, tobacco, &c.” He quotes the work of a Northamptonshire manufacturer, who, with eyes squinting heavenward, moans: “Labour is one-third cheaper in France than in England; for their poor work hard, and fare hard, as to their food and clothing. Their chief diet is bread, fruit, herbs, roots, and dried fish; for they very seldom eat flesh; and when wheat is dear, they eat very little bread.” “To which may be added,” our essayist goes on, “that their drink is either water or other small liquors, so that they spend very little money....These things are very difficult to be brought about; but they are not impracticable, since they have been effected both in France and in Holland.” Twenty years later, an American humbug, the baronised Yankee, Benjamin Thompson (alias Count Rumford) followed the same line of philanthropy to the great satisfaction of God and man. His “Essays” are a cookery book with receipts of all kinds for replacing by some succedaneum the ordinary dear food of the labourer. The following is a particularly successful receipt of this wonderful philosopher: “5 lbs. of barley meal, 7½d.; 5 lbs. of Indian corn, 6¼d.; 3d. worth of red herring, 1d. salt, 1d. vinegar, 2d. pepper and sweet herbs, in all 20¾d.; make a soup for 64 men, and at the medium price of barley and of Indian corn...this soup may be provided at ¼d, the portion of 20 ounces.” With the advance of capitalistic production, the adulteration of food rendered Thompson’s ideal superfluous. At the end of the 18th and during the first ten years of the 19th century, the English farmers and landlords enforced the absolute minimum of wage, by paying the agricultural labourers less than the minimum in the form of wages, and the remainder in the shape of parochial relief. An example of the waggish way in which the English Dogberries acted in their “legal” fixing of a wages tariff: “The squires of Norfolk had dined, says Mr. Burke, when they fixed the rate of wages; the squires of Berks evidently thought the labourers ought not to do so, when they fixed the rate of wages at Speenhamland, 1795.... There they decide that ‘income (weekly) should be 3s. for a man,’ when the gallon or half-peck loaf of 8 lbs. 11 oz. is at 1s., and increase regularly till bread is 1s. 5d.; when it is above that sum, decrease regularly till it be at 2s., and then his food should be 1/5th less.” Before the Committee of Inquiry of the House of Lords, 1814, a certain A. Bennett, a large farmer, magistrate, poor-law guardian, and wage-regulator, was asked: “Has any proportion of

the value of daily labour been made up to the labourers out of the poor's rate?" Answer: "Yes, it has; the weekly income of every family is made up to the gallon loaf (8 lbs. 11 oz.), and 3d. per head!...The gallon loaf per week is what we suppose sufficient for the maintenance of every person in the family for the week; and the 3d. is for clothes, and if the parish think proper to find clothes, the 3d. is deducted. This practice goes through all the western part of Wiltshire, and, I believe, throughout the country." "For years," exclaims a bourgeois author of that time, "they (the farmers) have degraded a respectable class of their countrymen, by forcing them to have recourse to the workhouse...the farmer, while increasing his own gains, has prevented any accumulation on the part of his labouring dependants." The part played in our days by the direct robbery from the labourer's necessary consumption-fund in the formation of surplus-value, and, therefore, of the accumulation fund of capital, the so-called domestic industry has served to show. (Ch. xv., sect. 8, c.) Further facts on this subject will be given later.

Although in all branches of industry that part of the constant capital consisting of instruments of labour must be sufficient for a certain number of labourers (determined by the magnitude of the undertaking), it by no means always necessarily increases in the same proportion as the quantity of labour employed. In a factory, suppose that 100 labourers working 8 hours a day yield 800 working-hours. If the capitalist wishes to raise this sum by one half, he can employ 50 more workers; but then he must also advance more capital, not merely for wages, but for instruments of labour. But he might also let the 100 labourers work 12 hours instead of 8, and then the instruments of labour already on hand would be enough. These would then simply be more rapidly consumed. Thus additional labour, begotten of the greater tension of labour-power, can augment surplus-product and surplus-value (i.e., the subject matter of accumulation), without corresponding augmentation in the constant part of capital.

In the extractive industries, mines, &c., the raw materials form no part of the capital advanced. The subject of labour is in this case not a product of previous labour, but is furnished by Nature gratis, as in the case of metals, minerals, coal, stone, &c. In these cases the constant capital consists almost exclusively of instruments of labour, which can very well absorb an increased quantity of labour (day and night shifts of labourers, e.g.). All other things being equal, the mass and value of the product will rise in direct proportion to the labour expended. As on the first day of production,

the original produce-formers, now turned into the creators of the material elements of capital — man and Nature — still work together. Thanks to the elasticity of labour-power, the domain of accumulation has extended without any previous enlargement of constant capital.

In agriculture the land under cultivation cannot be increased without the advance of more seed and manure. But this advance once made, the purely mechanical working of the soil itself produces a marvellous effect on the amount of the product. A greater quantity of labour, done by the same number of labourers as before, thus increases the fertility, without requiring any new advance in the instruments of labour. It is once again the direct action of man on Nature which becomes an immediate source of greater accumulation, without the intervention of any new capital.

Finally, in what is called manufacturing industry, every additional expenditure of labour presupposes a corresponding additional expenditure of raw materials, but not necessarily of instruments of labour. And as extractive industry and agriculture supply manufacturing industry with its raw materials and those of its instruments of labour, the additional product the former have created without additional advance of capital, tells also in favour of the latter.

General result: by incorporating with itself the two primary creators of wealth, labour-power and the land, capital acquires a power of expansion that permits it to augment the elements of its accumulation beyond the limits apparently fixed by its own magnitude, or by the value and the mass of the means of production, already produced, in which it has its being.

Another important factor in the accumulation of capital is the degree of productivity of social labour.

With the productive power of labour increases the mass of the products, in which a certain value, and therefore, a surplus-value of a given magnitude, is embodied. The rate of surplus-value remaining the same or even falling, so long as it only falls more slowly, than the productive power of labour rises, the mass of the surplus-product increases. The division of this product into revenue and additional capital remaining the same, the consumption of the capitalist may, therefore, increase without any decrease in the fund of accumulation. The relative magnitude of the accumulation fund may even increase at the expense of the consumption fund, whilst the cheapening of commodities places at the disposal of the capitalist as many means of enjoyment as formerly, or even more than formerly. But hand-in-

hand with the increasing productivity of labour, goes, as we have seen, the cheapening of the labourer, therefore a higher rate of surplus-value, even when the real wages are rising. The latter never rise proportionally to the productive power of labour. The same value in variable capital therefore sets in movement more labour-power, and, therefore, more labour. The same value in constant capital is embodied in more means of production, i.e., in more instruments of labour, materials of labour and auxiliary materials; it therefore also supplies more elements for the production both of use-value and of value, and with these more absorbers of labour. The value of the additional capital, therefore, remaining the same or even diminishing, accelerated accumulation still takes place. Not only does the scale of reproduction materially extend, but the production of surplus-value increases more rapidly than the value of the additional capital.

The development of the productive power of labour reacts also on the original capital already engaged in the process of production. A part of the functioning constant capital consists of instruments of labour such as machinery, &c., which are not consumed, and therefore not reproduced, or replaced by new ones of the same kind, until after long periods of time. But every year a part of these instruments of labour perishes or reaches the limit of its productive function. It reaches, therefore, in that year, the time for its periodical reproduction, for its replacement by new ones of the same kind. If the productiveness of labour has, during the using up of these instruments of labour, increased (and it develops continually with the uninterrupted advance of science and technology), more efficient and (considering their increased efficiency), cheaper machines, tools, apparatus, &c., replace the old. The old capital is reproduced in a more productive form, apart from the constant detail improvements in the instruments of labour already in use. The other part of the constant capital, raw material and auxiliary substances, is constantly reproduced in less than a year; those produced by agriculture, for the most part annually. Every introduction of improved methods, therefore, works almost simultaneously on the new capital and on that already in action. Every advance in Chemistry not only multiplies the number of useful materials and the useful applications of those already known, thus extending with the growth of capital its sphere of investment. It teaches at the same time how to throw the excrements of the processes of production and consumption back again into the circle of the process of reproduction, and thus, without any previous outlay of capital, creates new

matter for capital. Like the increased exploitation of natural wealth by the mere increase in the tension of labour-power, science and technology give capital a power of expansion independent of the given magnitude of the capital actually functioning. They react at the same time on that part of the original capital which has entered upon its stage of renewal. This, in passing into its new shape, incorporates gratis the social advance made while its old shape was being used up. Of course, this development of productive power is accompanied by a partial depreciation of functioning capital. So far as this depreciation makes itself acutely felt in competition, the burden falls on the labourer, in the increased exploitation of whom the capitalist looks for his indemnification.

Labour transmits to its product the value of the means of production consumed by it. On the other hand, the value and mass of the means of production set in motion by a given quantity of labour increase as the labour becomes more productive. Though the same quantity of labour adds always to its products only the same sum of new value, still the old capital-value, transmitted by the labour to the products, increases with the growing productivity of labour.

An English and Chinese spinner, e.g., may work the same number of hours with the same intensity; then they will both in a week create equal values. But in spite of this equality, an immense difference will obtain between the value of the week's product of the Englishman, who works with a mighty automaton, and that of the Chinaman, who has but a spinning wheel. In the same time as the Chinaman spins one pound of cotton, the Englishman spins several hundreds of pounds. A sum, many hundred times as great, of old values swells the value of his product, in which those reappear in a new, useful form, and can thus function anew as capital. "In 1782," as Frederick Engels teaches us, "all the wool crop in England of the three preceding years, lay untouched for want of labourers, and so it must have lain, if newly invented machinery had not come to its aid and spun it." Labour embodied in the form of machinery of course did not directly force into life a single man, but it made it possible for a smaller number of labourers, with the addition of relatively less living labour, not only to consume the wool productively, and put into it new value, but to preserve in the form of yarn, &c., its old value. At the same time, it caused and stimulated increased reproduction of wool. It is the natural property of living labour, to transmit old value, whilst it creates new. Hence, with the

increase in efficacy, extent and value of its means of production, consequently with the accumulation that accompanies the development of its productive power, labour keeps up and eternises an always increasing capital-value in a form ever new. This natural power of labour takes the appearance of an intrinsic property of capital, in which it is incorporated, just as the productive forces of social labour take the appearance of inherent properties of capital, and as the constant appropriation of surplus-labour by the capitalists, takes that of a constant self-expansion of capital.

With the increase of capital, the difference between the capital employed and the capital consumed increases. In other words, there is increase in the value and the material mass of the instruments of labour, such as buildings, machinery, drain-pipes, working-cattle, apparatus of every kind that function for a longer or shorter time in processes of production constantly repeated, or that serve for the attainment of particular useful effects, whilst they themselves only gradually wear out, therefore only lose their value piecemeal, therefore transfer that value of the product only bit by bit. In the same proportion as these instruments of labour serve as product-formers without adding value to the product, i.e., in the same proportion as they, are wholly employed but only partly consumed, they perform, as we saw earlier, the same gratuitous service as the natural forces, water, steam, air, electricity, etc. This gratuitous service of past labour, when seized and filled with a soul by living labour, increases with the advancing stages of accumulation.

Since past labour always disguises itself as capital, i.e., since the passive of the labour of A, B, C, etc., takes the form of the active of the non-labourer X, bourgeois and political economists are full of praises of the services of dead and gone labour, which, according to the Scotch genius M'Culloch, ought to receive a special remuneration in the shape of interest, profit, etc. The powerful and ever-increasing assistance given by past labour to the living labour process under the form of means of production, is therefore, attributed to that form of past labour in which it is alienated, as unpaid labour, from the worker himself, i.e., to its capitalistic form. The practical agents of capitalistic production and their pettifogging ideologists are as unable to think of the means of production as separate from the antagonistic social mask they wear to-day, as a slave-owner to think of the worker himself as distinct from his character as a slave.

With a given degree of exploitation of labour-power, the mass of the surplus-value produced is determined by the number of workers simultaneously exploited; and this corresponds, although in varying proportions, with the magnitude of the capital. The more, therefore, capital increases by means of successive accumulations, the more does the sum of the value increase that is divided into consumption-fund and accumulation-fund. The capitalist can therefore, live a more jolly life, and at the same time show more “abstinence.” And, finally, all the springs of production act with greater elasticity, the more its scale extends with the mass of the capital advanced.

SECTION 5. — THE SO-CALLED LABOUR FUND.

It has been shown in the course of this inquiry that capital is not a fixed magnitude, but is a part of social wealth, elastic and constantly fluctuating with the division of fresh surplus-value into revenue and additional capital. It has been seen further that, even with a given magnitude of functioning capital, the labour-power, the science, and the land (by which are to be understood, economically, all conditions of labour furnished by Nature independently of man), embodied in it, from elastic powers of capital, allowing it, within certain limits, a field of action independent of its own magnitude. In this inquiry we have neglected all effects of the process of circulation, effects which may produce very different degrees of efficiency in the same mass of capital. And as we presupposed the limits set by capitalist production, that is to say, pre-supposed the process of social production in a form developed by purely spontaneous growth, we neglected any more rational combination, directly and systematically practicable with the means of production, and the mass of labour-power at present disposable. Classical economy always loved to conceive social capital as a fixed magnitude of a fixed degree of efficiency. But this prejudice was first established as a dogma by the arch-Philistine, Jeremy Bentham, that insipid, pedantic, leather-tongued oracle of the ordinary bourgeois intelligence of the 19th century. Bentham is among philosophers what Martin Tupper is among poets. Both could only have been manufactured in England. In the light of his dogma the commonest phenomena of the process of production, as, e.g., its sudden expansions and contractions, nay, even accumulation itself, become perfectly inconceivable.

The dogma was used by Bentham himself, as well as by Malthus, James Mill, M'Culloch, etc., for an apologetic purpose, and especially in order to represent one part of capital, namely, variable capital, or that part convertible into labour-power, as a fixed magnitude. The material of variable capital, i.e., the mass of the means of subsistence it represents for the labourer, or the so-called labour fund, was fabled as a separate part of social wealth, fixed by natural laws and unchangeable. To set in motion the part of social wealth which is to function as constant capital, or, to express it in a material form, as means of production, a definite mass of living labour is required. This mass is given technologically. But neither is the number of labourers required to render fluid this mass of labour-power given (it changes with the degree of exploitation of the individual labour-power), nor is the price of this labour-power given, but only its minimum limit, which is moreover very variable. The facts that lie at the bottom of this dogma are these: on the one hand, the labourer has no right to interfere in the division of social wealth into means of enjoyment for the non-labourer and means of production. On the other hand, only in favourable and exceptional cases, has he the power to enlarge the so-called labour-fund at the expense of the "revenue" of the wealthy.

What silly tautology results from the attempt to represent the capitalistic limits of the labour-fund as its natural and social limits may be seen, e.g., in Professor Fawcett. "The circulating capital of a country," he says, "is its wage-fund. Hence, if we desire to calculate the average money wages received by each labourer, we have simply to divide the amount of this capital by the number of the labouring population." That is to say we first add together the individual wages actually paid, and then we affirm that the sum thus obtained, forms the total value of the "labour-fund" determined and vouchsafed to us by God and Nature. Lastly, we divide the sum thus obtained by the number of labourers to find out again how much may come to each on the average. An un-commonly knowing dodge this. It did not prevent Mr. Fawcett saying in the same breath: "The aggregate wealth which is annually saved in England, is divided into two portions; one portion is employed as capital to maintain our industry, and the other portion is exported to foreign countries.... Only a portion, and perhaps, not a large portion of the wealth which is annually saved in this country, is invested in our own industry."

The greater part of the yearly accruing surplus-product, embezzled, because abstracted without return of an equivalent, from the English labourer, is thus used as capital, not in England, but in foreign countries. But with the additional capital thus exported, a part of the “labour-fund” invented by God and Bentham is also exported.

CHAPTER XXV. THE GENERAL LAW OF CAPITALIST ACCUMULATION.

SECTION 1. — THE INCREASED DEMAND FOR LABOUR-POWER THAT ACCOMPANIES ACCUMULATION, THE COMPOSITION OF CAPITAL REMAINING THE SAME.

IN this chapter we consider the influence of the growth of capital on the lot of the labouring class. The most important factor in this inquiry, is the composition of capital and the changes it undergoes in the course of the process of accumulation.

The composition of capital is to be understood in a twofold sense. On the side of value, it is determined by the proportion in which it is divided into constant capital or value of the means of production, and variable capital or value of labour-power, the sum total of wages. On the side of material, as it functions in the process of production, all capital is divided into means of production and living labour-power. This latter composition is determined by the relation between the mass of the means of production employed, on the one hand, and the mass of labour necessary for their employment on the other. I call the former the value-composition, the latter the technical composition of capital. Between the two there is a strict correlation. To express this, I call the value-composition of capital, in so far as it is determined by its technical composition and mirrors the changes of the latter, the organic composition of capital. Wherever I refer to the composition of capital, without further qualification, its organic composition is always understood.

The many individual capitals invested in a particular branch of production have, one with another, more or less different compositions. The average of their individual compositions gives us the composition of the total capital in this branch of production. Lastly, the average of these averages, in all branches of production, gives us the composition of the total social capital of a country, and with this alone are we, in the last resort, concerned in the following investigation.

Growth of capital involves growth of its variable constituent or of the part invested in labour-power. A part of the surplus-value turned into

additional capital must always be retransformed into variable capital, or additional labour-fund. If we suppose that, all other circumstances remaining the same, the composition of capital also remains constant (i.e., that a definite mass of means of production constantly needs the same mass of labour-power to set in motion,) then the demand for labour and the subsistence-fund of the labourers clearly increase in the same proportion as the capital, and the more rapidly, the more rapidly the capital increases. Since the capital produces yearly a surplus-value, of which one part is yearly added to the original capital; since this increment itself grows yearly along with the augmentation of the capital already functioning; since lastly, under special stimulus to enrichment, such as the opening of new markets, or of new spheres for the outlay of capital in consequence of newly developed social wants, &c., the scale of accumulation may be suddenly extended, merely by a change in the division of the surplus-value or surplus-product into capital and revenue, the requirements of accumulating capital may exceed the increase of labour-power or of the number of labourers; the demand for labourers may exceed the supply, and, therefore, wages may rise. This must, indeed, ultimately be the case if the conditions supposed above continue. For since in each year more labourers are employed than in its predecessor, sooner or later a point must be reached, at which the requirements of accumulation begin to surpass the customary supply of labour, and, therefore, a rise of wages takes place. A lamentation on this score was heard in England during the whole of the fifteenth, and the first half of the eighteenth centuries. The more or less favourable circumstances in which the wage-working class supports and multiplies itself, in no way alter the fundamental character of capitalist production. As simple reproduction constantly reproduces the capital-relation itself, i.e., the relation of capitalists on the one hand, and wage-workers on the other, so reproduction on a progressive scale, i.e., accumulation, reproduces the capital-relation on a progressive scale, more capitalists or larger capitalists at this pole, more wage-workers at that. The reproduction of a mass of labour-power, which must incessantly re-incorporate itself with capital for that capital's self-expansion; which cannot get free from capital, and whose enslavement to capital is only concealed by the variety of individual capitalists to whom it sells itself, this reproduction of labour-power forms, in fact, an essential of the reproduction of capital itself. Accumulation of capital is, therefore, increase of the proletariat.

Classical economy grasped this fact so thoroughly that Adam Smith, Ricardo, &c., as mentioned earlier, inaccurately identified accumulation with the consumption, by the productive labourers, of all the capitalised part of the surplus-product, or with its transformation into additional wage-labourers. As early as 1696 John Bellers says: "For if one had a hundred thousand acres of land and as many pounds of money, and as many cattle, without a labourer, what would the rich man be, but a labourer? And as the labourers make men rich, so the more labourers, there will be the more rich men...the labour of the poor being the mines of the rich." So also Bernard de Mandeville at the beginning of the eighteenth century: "It would be easier, where property is well secured, to live without money than without poor; for who would do the work?...As they [the poor] ought to be kept from starving, so they should receive nothing worth saving. If here and there one of the lowest class by uncommon industry, and pinching his belly, lifts himself above the condition he was brought up in, nobody ought to hinder him; nay, it is undeniably the wisest course for every person in the society, and for every private family to be frugal; but it is the interest of all rich nations, that the greatest part of the poor should almost never be idle, and yet continually spend what they get.... Those that get their living by their daily labour...have nothing to stir them up to be serviceable but their wants which it is prudence to relieve, but folly to cure. The only thing then that can render the labouring man industrious, is a moderate quantity of money, for as too little will, according as his temper is, either dispirit or make him desperate, so too much will make him insolent and lazy.... From what has been said, it is manifest, that, in a free nation, where slaves are not allowed of, the surest wealth consists in a multitude of laborious poor; for besides, that they are the never-failing nursery of fleets and armies, without them there could be no enjoyment, and no product of any country could be valuable. To make the society" [which of course consists of non-workers] "happy and people easier under the meanest circumstances, it is requisite that great numbers of them should be ignorant as well as poor; knowledge both enlarges and multiplies our desires, and the fewer things a man wishes for, the more easily his necessities may be supplied." What Mandeville, an honest, clear-headed man, had not yet seen, is that the mechanism of the process of accumulation itself increases, along with the capital, the mass of "labouring poor," i.e., the wage-labourers, who turn their labour-power into an increasing power of self-expansion of the growing capital, and even by

doing so must eternize their dependent relation on their own product, as personified in the capitalists. In reference to this relation of dependence, Sir F. M. Eden in his "The State of the Poor, an History of the Labouring Classes in England," says "the natural produce of our soil is certainly not fully adequate to our subsistence; we can neither be clothed, lodged nor fed but in consequence of some previous labour. A portion at least of the society must be indefatigably employed.... There are others who, though they 'neither toil nor spin,' can yet command the produce of industry, but who owe their exemption from labour solely to civilisation and order.... They are peculiarly the creatures of civil institutions, which have recognised that individuals may acquire property by various other means besides the exertion of labour.... Persons of independent fortune...owe their superior advantages by no means to any superior abilities of their own, but almost entirely...to the industry of others. It is not the possession of land, or of money, but the command of labour which distinguishes the opulent from the labouring part of the community.... This [scheme approved by Eden] would give the people of property sufficient (but by no means too much) influence and authority over those who...work for them; and it would place such labourers, not in an abject or servile condition, but in such a state of easy and liberal dependence as all who know human nature, and its history, will allow to be necessary for their own comfort." Sir F. M. Eden, it may be remarked in passing, is the only disciple of Adam Smith during the eighteenth century that produced any work of importance.

Under the conditions of accumulation supposed thus far, which conditions are those most favourable to the labourers, their relation of dependence upon capital takes on a form endurable, or, as Eden says: "easy and liberal." Instead of becoming more intensive with the growth of capital, this relation of dependence only becomes more extensive, i.e., the sphere of capital's exploitation and rule merely extends with its own dimensions and the number of its subjects. A larger part of their own surplus-product, always increasing and continually transformed into additional capital, comes back to them in the shape of means of payment, so that they can extend the circle of their enjoyments; can make some additions to their consumption-fund of clothes, furniture, &c., and can lay by small reserve-funds of money. But just as little as better clothing, food, and treatment, and a larger peculium, do away with the exploitation of the slave, so little do

they set aside that of the wage-worker. A rise in the price of labour, as a consequence of accumulation of capital, only means, in fact, that the length and weight of the golden chain the wage-worker has already forged for himself, allow of a relaxation of the tension of it. In the controversies on this subject the chief fact has generally been overlooked, viz., the *differentia specifica* of capitalistic production. Labour-power is sold to-day, not with a view of satisfying, by its service or by its product, the personal needs of the buyer. His aim is augmentation of his capital, production of commodities containing more labour than he pays for, containing therefore a portion of value that costs him nothing, and that is nevertheless realised when the commodities are sold. Production of surplus-value is the absolute law of this mode of production. Labour-power is only saleable so far as it preserves the means of production in their capacity of capital, reproduces its own value as capital, and yields in unpaid labour a source of additional capital. The conditions of its sale, whether more or less favourable to the labourer, include therefore the necessity of its constant re-selling, and the constantly extended reproduction of all wealth in the shape of capital. Wages, as we have seen, by their very nature, always imply the performance of a certain quantity of unpaid labour on the part of the labourer. Altogether, irrespective of the case of a rise of wages with a falling price of labour, &c., such an increase only means at best a quantitative diminution of the unpaid labour that the worker has to supply. This diminution can never reach the point at which it would threaten the system itself. Apart from violent conflicts as to the rate of wages (and Adam Smith has already shown that in such a conflict, taken on the whole, the master is always master), a rise in the price of labour resulting from accumulation of capital implies the following alternative:

Either the price of labour keeps on rising, because its rise does not interfere with the progress of accumulation. In this there is nothing wonderful, for, says Adam Smith, “after these (profits) are diminished, stock may not only continue to increase, but to increase much faster than before.... A great stock, though with small profits, generally increases faster than a small stock with great profits.” (l. c. ii., .) In this case it is evident that a diminution in the unpaid labour in no way interferes with the extension of the domain of capital. — Or, on the other hand, accumulation slackens in consequence of the rise in the price of labour, because the stimulus of gain is blunted. The rate of accumulation lessens; but with its

lessening, the primary cause of that lessening vanishes, i.e., the disproportion between capital and exploitable labour-power. The mechanism of the process of capitalist production removes the very obstacles that it temporarily creates. The price of labour falls again to a level corresponding with the needs of the self-expansion of capital, whether the level be below, the same as, or above the one which was normal before the rise of wages took place. We see thus: In the first case, it is not the diminished rate either of the absolute, or of the proportional, increase in labour-power, or labouring population, which causes capital to be in excess, but conversely the excess of capital that makes exploitable labour-power insufficient. In the second case, it is not the increased rate either of the absolute, or of the proportional, increase in labour-power, or labouring population, that makes capital insufficient; but, conversely, the relative diminution of capital that causes the exploitable labour-power, or rather its price, to be in excess. It is these absolute movements of the accumulation of capital which are reflected as relative movements of the mass of exploitable labour-power, and therefore seem produced by the latter's own independent movement. To put it mathematically: the rate of accumulation is the independent not the dependent, variable; the rate of wages, the dependent, not the independent, variable. Thus, when the industrial cycle is in the phase of crisis, a general fall in the price of commodities is expressed as a rise in the value of money, and, in the phase of prosperity, a general rise in the price of commodities, as a fall in the value of money. The so-called currency school concludes from this that with high prices too little, with low prices too much money is in circulation. Their ignorance and complete mis-understanding of facts are worthily paralleled by the economists, who interpret the above phenomena of accumulation by saying that there are now too few, now too many wage labourers.

The law of capitalist production, that is at the bottom of the pretended "natural law of population," reduces itself simply to this: The correlation between accumulation of capital and rate of wages is nothing else than the correlation between the unpaid labour transformed into capital, and the additional paid labour necessary for the setting in motion of this additional capital. It is therefore in no way a relation between two magnitudes, independent one of the other: on the one hand, the magnitude of the capital; on the other, the number of the labouring population; it is rather, at bottom, only the relation between the unpaid and the paid labour of the same

labouring population. If the quantity of unpaid labour supplied by the working-class, and accumulated by the capitalist class, increases so rapidly that its conversion into capital requires an extraordinary addition of paid labour, then wages rise, and, all other circumstances remaining equal, the unpaid labour diminishes in proportion. But as soon as this diminution touches the point at which the surplus-labour that nourishes capital is no longer supplied in normal quantity, a reaction sets in: a smaller part of revenue is capitalised, accumulation lags, and the movement of rise in wages receives a check. The rise of wages therefore is confined within limits that not only leave intact the foundations of the capitalistic system, but also secure its reproduction on a progressive scale. The law of capitalistic accumulation, metamorphosed by economists into a pretended law of nature, in reality merely states that the very nature of accumulation excludes every diminution in the degree of exploitation of labour, and every rise in the price of labour, which could seriously imperil the continual reproduction, on an ever enlarging scale, of the capitalistic relation. It cannot be otherwise in a mode of production in which the labourer exists to satisfy the needs of self-expansion of existing values, instead of on the contrary, material wealth existing to satisfy the needs of development on the part of the labourer. As, in religion, man is governed by the products of his own brain, so in capitalistic production, he is governed by the products of his own hand.

SECTION 2. — RELATIVE DIMINUTION OF THE VARIABLE PART OF CAPITAL SIMULTANEOUSLY WITH THE PROGRESS OF ACCUMULATION AND OF THE CONCENTRATION THAT ACCOMPANIES IT.

According to the economists themselves, it is neither the actual extent of social wealth, nor the magnitude of the capital already functioning, that lead to a rise of wages, but only the constant growth of accumulation and the degree of rapidity of that growth. (Adam Smith, Book I., chapter 8.) So far, we have only considered one special phase of this process, that in which the increase of capital occurs along with a constant technical composition of capital. But the process goes beyond this phase.

Once given the general basis of the capitalistic system, then, in the course of accumulation, a point is reached at which the development of the

productivity of social labour becomes the most powerful lever of accumulation. “The same cause,” says Adam Smith, “which raises the wages of labour, the increase of stock, tends to increase its productive powers, and to make a smaller quantity of labour produce a greater quantity of work.”

Apart from natural conditions, such as fertility of the soil, 8c., and from the skill of independent and isolated producers (shown rather qualitatively in the goodness than quantitatively in the mass of their products), the degree of productivity of labour, in a given society, is expressed in the relative extent of the means of production that one labourer, during a given time, with the same tension of labour-power, turns into products. The mass of the means of production which he thus transforms, increases with the productiveness of his labour. But those means of production play a double part. The increase of some is a consequence, that of the others a condition of the increasing productivity of labour. E.g., with the division of labour in manufacture, and with the use of machinery, more raw material is worked up in the same time, and, therefore, a greater mass of raw material and auxiliary substances enter into the labour-process. That is the consequence of the increasing productivity of labour. On the other hand, the mass of machinery, beasts of burden, mineral manures, drainpipes, 8c., is a condition of the increasing productivity of labour. So also is it with the means of production concentrated in buildings, furnaces, means of transport, 8c. But whether condition or consequence, the growing extent of the means of production, as compared with the labour-power incorporated with them, is an expression of the growing productiveness of labour. The increase of the latter appears, therefore, in the diminution of the mass of labour in proportion to the mass of means of production moved by it, or in the diminution of the subjective factor of the labour process as compared with the objective factor.

This change in the technical composition of capital, this growth in the mass of means of production, as compared with the mass of the labour-power that vivifies them, is reflected again in its value-composition, by the increase of the constant constituent of capital at the expense of its variable constituent. There may be, e.g., originally 50 per cent. of a capital laid out in means of production, and 50 per cent. in the labour-power; later on, with the development of the productivity of labour, 80 per cent. in means of production, 20 per cent. in labour-power, and so on. This law of the

progressive increase in constant capital, in proportion to the variable, is confirmed at every step (as already shown) by the comparative analysis of the prices of commodities, whether we compare different economic epochs or different nations in the same epoch. The relative magnitude of the element of price, which represents the value of the means of production only, or the constant part of capital consumed, is in direct, the relative magnitude of the other element of price that pays labour (the variable part of capital) is in inverse proportion to the advance of accumulation.

This diminution in the variable part of capital as compared with the constant, or the altered value-composition of the capital, however, only shows approximately the change in the composition of its material constituents. If, e.g., the capital-value employed to-day in spinning is $\frac{7}{8}$ constant and $\frac{1}{8}$ variable, whilst at the beginning of the 18th century it was $\frac{1}{2}$ constant and $\frac{1}{2}$ variable, on the other hand, the mass of raw material, instruments of labour, &c., that a certain quantity of spinning labour consumes productively to-day, is many hundred times greater than at the beginning of the 18th century. The reason is simply that, with the increasing productivity of labour, not only does the mass of the means of production consumed by it increase, but their value compared with their mass diminishes. Their value therefore rises absolutely, but not in proportion to their mass. The increase of the difference between constant and variable capital is, therefore, much less than that of the difference between the mass of the means of production into which the constant, and the mass of the labour-power into which the variable, capital is converted. The former difference increases with the latter, but in a smaller degree.

But, if the progress of accumulation lessens the relative magnitude of the variable part of capital, it by no means, in doing this, excludes the possibility of a rise in its absolute magnitude. Suppose that a capital-value at first is divided into 50 per cent. of constant and 50 per cent. of variable capital; later into 80 per cent. of constant and 20 per cent. of variable. If in the meantime the original capital, say £6,000, has increased to £18,000, its variable constituent has also increased. It was £3,000, it is now £3,600. But whereas formerly an increase of capital by 20 per cent. would have sufficed to raise the demand for labour 20 per cent., now this latter rise requires a tripling of the original capital.

In Part IV. it was shown, how the development of the productiveness of social labour presupposes co-operation on a large scale; how it is only upon this supposition that division and combination of labour can be organised, and the means of production economised by concentration on a vast scale; how instruments of labour which, from their very nature, are only fit for use in common, such as a system of machinery, can be called into being; how huge natural forces can be pressed into the service of production; and how the transformation can be effected of the process of production into a technological application of science. On the basis of the production of commodities, where the means of production are the property of private persons, and where the artisan therefore either produces commodities, isolated from and independent of others, or sells his labour-power as a commodity, because he lacks the means for independent industry, co-operation on a large scale can realise itself only in the increase of individual capitals, only in proportion as the means of social production and the means of subsistence are transformed into the private property of capitalists. The basis of the production of commodities can admit of production on a large scale in the capitalistic form alone. A certain accumulation of capital, in the hands of individual producers of commodities, forms therefore the necessary preliminary of the specifically capitalistic mode of production. We had, therefore, to assume that this occurs during the transition from handicraft to capitalistic industry. It may be called primitive accumulation, because it is the historic basis, instead of the historic result of specifically capitalist production. How it itself originates, we need not here inquire as yet. It is enough that it forms the starting-point. But all methods for raising the social productive power of labour that are developed on this basis, are at the same times methods for the increased production of surplus-value or surplus-product. which in its turn is the formative element of accumulation. They are, therefore, at the same time methods of the production of capital by capital, or methods of its accelerated accumulation. The continual re-transformation of surplus-value into capital now appears in the shape of the increasing magnitude of the capital that enters into the process of production. This in turn is the basis of an extended scale of production, of the methods for raising the productive power of labour that accompany it, and of accelerated production of surplus-value. If, therefore, a certain degree of accumulation of capital appears as a condition of the specifically capitalist mode of production, the latter causes conversely an accelerated

accumulation of capital. With the accumulation of capital, therefore, the specifically capitalistic mode of production develops, and with the capitalist mode of production the accumulation of capital. Both these economic factors bring about, in the compound ratio of the impulses they reciprocally give one another, that change in the technical composition of capital by which the variable constituent becomes always smaller and smaller as compared with the constant.

Every individual capital is a larger or smaller concentration of means of production, with a corresponding command over a larger or smaller labour-army. Every accumulation becomes the means of new accumulation. With the increasing mass of wealth which functions as capital, accumulation increases the concentration of that wealth in the hands of individual capitalists, and thereby widens the basis of production on a large scale and of the specific methods of capitalist production. The growth of social capital is effected by the growth of many individual capitals. All other circumstances remaining the same, individual capitals, and with them the concentration of the means of production, increases in such proportion as they form aliquot parts of the total social capital. At the same time portions of the original capitals disengage themselves and function as new independent capitals. Besides other causes, the division of property, within capitalist families, plays a great part in this. With the accumulation of capital, therefore, the number of capitalists grows to a greater or less extent. Two points characterise this kind of concentration which grows directly out of, or rather is identical with, accumulation. First: The increasing concentration of the social means of production in the hands of individual capitalists is, other things remaining equal, limited by the degree of increase of social wealth. Second: The part of social capital domiciled in each particular sphere of production is divided among many capitalists who face one another as independent commodity-producers competing with each other. Accumulation and the concentration accompanying it are, therefore, not only scattered over many points, but the increase of each functioning capital is thwarted by the formation of new and the subdivision of old capitals. Accumulation, therefore, presents itself on the one hand as increasing concentration of the means of production, and of the command over labour; on the other, as repulsion of many individual capitals one from another.

This splitting-up of the total social capital into many individual capitals or the repulsion of its fractions one from another, is counteracted by their attraction. This last does not mean that simple concentration of the means of production and of the command over labour, which is identical with accumulation. It is concentration of capitals already formed, destruction of their individual independence, expropriation of capitalist by capitalist, transformation of many small into few large capitals. This process differs from the former in this, that it only presupposes a change in the distribution of capital already to hand, and functioning; its field of action is therefore not limited by the absolute growth of social wealth, by the absolute limits of accumulation. Capital grows in one place to a huge mass in a single hand, because it has in another place been lost by many. This is centralisation proper, as distinct from accumulation and concentration.

The laws of this centralisation of capitals, or of the attraction of capital by capital, cannot be developed here. A brief hint at a few facts must suffice. The battle of competition is fought by cheapening of commodities. The cheapness of commodities depends, *ceteris paribus*, on the productiveness of labour, and this again on the scale of production. Therefore, the larger capitals beat the smaller. It will further be remembered that, with the development of the capitalist mode of production, there is an increase in the minimum amount of individual capital necessary to carry on a business under its normal conditions. The smaller capitals, therefore, crowd into spheres of production which Modern Industry has only sporadically or incompletely got hold of. Here competition rages in direct proportion to the number, and in inverse proportion to the magnitudes, of the antagonistic capitals. It always ends in the ruin of many small capitalists, whose capitals partly pass into the hand of their conquerors, partly vanish. Apart from this, with capitalist production an altogether new force comes into play — the credit system.

In its beginnings, the credit system sneaks in as a modest helper of accumulation and draws by invisible threads the money resources scattered all over the surface of society into the hands of individual or associated capitalists. But soon it becomes a new and formidable weapon in the competitive struggle, and finally it transforms itself into an immense social mechanism for the centralisation of capitals.

Competition and credit, the two most powerful levers of competition, develop in proportion as capitalist production and accumulation do. At the

same time the progress of accumulation increases the matter subject to centralisation, that is, the individual capitals, while the expansion of capitalist production creates the social demand here, the technical requirements there, for those gigantic industrial enterprises, which depend for their realisation on a previous centralisation of capitals. Nowadays, then, the mutual attraction of individual capitals and the tendency to centralisation are stronger than ever before. However, while the relative expansion and energy of the centralisation movement is determined to a certain degree by the superiority of the economic mechanism, yet the progress of centralisation is by no means dependent upon the positive growth of the volume of social capital. This is the particular distinction between centralisation and concentration, the latter being but another expression for reproduction on an enlarged scale. Centralisation may take place by a mere change in the distribution of already existing capitals, a simple change in the quantitative arrangement of the components of social capital. Capital may in that case accumulate in one hand in large masses by withdrawing it from many individual hands. Centralisation in a certain line of industry would have reached its extreme limit, if all the individual capitals invested in it would have been amalgamated into one single capital.

This limit would not be reached in any particular society until the entire social capital would be united, either in the hands of one single capitalist, or in those of one single corporation.

Centralisation supplements the work of accumulation, by enabling the industrial capitalists to expand the scale of their operations. The economic result remains the same, whether this consummation is brought about by accumulation or centralisation, whether centralisation is accomplished by the violent means of annexation, by which some capitals become such overwhelming centers of gravitation for others as to break their individual cohesion and attracting the scattered fragments, or whether the amalgamation of a number of capitals, which already exist or are in process of formation, proceeds by the smoother road of forming stock companies. The increased volume of industrial establishments forms everywhere the point of departure for a more comprehensive organisation of the co-operative labor of many, for a wider development of their material powers, that is, for the progressive transformation of isolated processes of production carried on in accustomed ways into socially combined and scientifically managed processes of production.

It is evident, however, that accumulation, the gradual propagation of capital by a reproduction passing from a circular into a spiral form, is a very slow process as compared with centralisation, which needs but to alter the quantitative grouping of the integral parts of social capital. The world would still be without railroads, if it had been obliged to wait until accumulation should have enabled a few individual capitals to undertake the construction of a railroad. Centralisation, on the other hand, accomplished this by a turn of the hand through stock companies. Centralisation, by thus accelerating and intensifying the effects of accumulation, extends and hastens at the same time the revolutions in the technical composition of capital, which increase its constant part at the expense of its variable part and thereby reduce the relative demand for labor.

The masses of capital amalgamated overnight by centralisation reproduce and augment themselves like the others, only faster, and thus become new and powerful levers of social accumulation. Hence, if the progress of social accumulation is mentioned nowadays, it comprises as a matter of course the effects of centralisation. The additional capitals formed in the course of normal accumulation (see chapter XXIV, 1.) serve mainly as vehicles for the exploitation of new inventions and discoveries, or of industrial improvements in general. However, the old capital likewise arrives in due time at the moment when it must renew its head and limbs, when it casts off its old skin and is likewise born again in its perfected industrial form, in which a smaller quantity of labor suffices to set in motion a larger quantity of machinery and raw materials. The absolute decrease of the demand for labor necessarily following therefrom will naturally be so much greater, the more these capitals going through the process of rejuvenation have become accumulated in masses by means of the movement of centralisation.

On the one hand, therefore, the additional capital formed in the course of accumulation attracts fewer and fewer labourers in proportion to its magnitude. On the other hand, the old capital periodically reproduced with change of composition, repels more and more of the labourers formerly employed by it.

SECTION 3. — PROGRESSIVE PRODUCTION OF A RELATIVE SURPLUS-POPULATION OR INDUSTRIAL RESERVE ARMY.

The accumulation of capital, though originally appearing as its quantitative extension only, is effected, as we have seen, under a progressive qualitative change in its composition, under a constant increase of its constant, at the expense of its variable constituent.

The specifically capitalist mode of production, the development of the productive power of labour corresponding to it, and the change thence resulting in the organic composition of capital, do not merely keep pace with the advance of accumulation, or with the growth of social wealth. They develop at a much quicker rate, because mere accumulation, the absolute increase of the total social capital, is accompanied by the centralisation of the individual capitals of which that total is made up; and because the change in the technological composition of the additional capital goes hand in hand with a similar change in the technological composition of the original capital. With the advance of accumulation, therefore, the proportion of constant to variable capital changes. If it was originally say 1:1, it now becomes successively 2:1, 3:1, 4:1, 5:1, 7:1, 8c., so that, as the capital increases, instead of $\frac{1}{2}$ of its total value, only $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$, $\frac{1}{8}$, 8c., is transformed into labour-power, and, on the other hand, $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$, $\frac{5}{6}$, $\frac{7}{8}$ into means of production. Since the demand for labour is determined not by the amount of capital as a whole, but by its variable constituent alone, that demand falls progressively with the increase of the total capital, instead of, as previously assumed, rising in proportion to it. It falls relatively to the magnitude of the total capital, and at an accelerated rate, as this magnitude increases. With the growth of the total capital, its variable constituent or the labour incorporated in it, also does increase, but in a constantly diminishing proportion. The intermediate pauses are shortened, in which accumulation works as simple extension of production, on a given technical basis. It is not merely that an accelerated accumulation of total capital, accelerated in a constantly growing progression, is needed to absorb an additional number of labourers, or even, on account of the constant metamorphosis of old capital, to keep employed those already functioning. In its turn, this increasing accumulation and centralisation becomes a source of new changes in the composition of capital, of a more accelerated diminution of its variable, as compared with its constant constituent. This accelerated relative diminution of the variable constituent, that goes along with the accelerated increase of the total capital, and moves more rapidly than this increase, takes the inverse form, at the other pole, of an apparently absolute

increase of the labouring population, an increase always moving more rapidly than that of the variable capital or the means of employment. But in fact, it is capitalistic accumulation itself that constantly produces, and produces in the direct ratio of its own energy and extent, a relatively redundant population of labourers, i.e., a population of greater extent than suffices for the average needs of the self-expansion of capital, and therefore a surplus-population.

Considering the social capital in its totality, the movement of its accumulation now causes periodical changes, affecting it more or less as a whole, now distributes its various phases simultaneously over the different spheres of production. In some spheres a change in the composition of capital occurs without increase of its absolute magnitude, as a consequence of simple centralisation; in others the absolute growth of capital is connected with absolute diminution of its variable constituent, or of the labour-power absorbed by it; in others again, capital continues growing for a time on its given technical basis, and attracts additional labour-power in proportion to its increase, while at other times it undergoes organic change, and lessens its variable constituent; in all spheres, the increase of the variable part of capital, and therefore of the number of labourers employed by it, is always connected with violent fluctuations and transitory production of surplus-population, whether this takes the more striking form of the repulsion of labourers already employed, or the less evident but not less real form of the more difficult absorption of the additional labouring population through the usual channels. With the magnitude of social capital already functioning, and the degree of its increase, with the extension of the scale of production, and the mass of the labourers set in motion, with the development of the productiveness of their labour, with the greater breadth and fulness of all sources of wealth, there is also an extension of the scale on which greater attraction of labourers by capital is accompanied by their greater repulsion; the rapidity of the change in the organic composition of capital, and in its technical form increases, and an increasing number of spheres of production becomes involved in this change, now simultaneously, now alternately. The labouring population therefore produces, along with the accumulation of capital produced by it, the means by which itself is made relatively superfluous, is turned into a relative surplus population; and it does this to an always increasing extent. This is a law of population peculiar to the capitalist mode of production; and in fact

every special historic mode of production has its own special laws of population, historically valid within its limits alone. An abstract law of population exists for plants and animals only, and only in so far as man has not interfered with them.

But if a surplus labouring population is a necessary product of accumulation or of the development of wealth on a capitalist basis, this surplus population becomes, conversely, the lever of capitalistic accumulation, nay, a condition of existence of the capitalist mode of production. It forms a disposable industrial reserve army, that belongs to capital quite as absolutely as if the latter had bred it at its own cost. Independently of the limits of the actual increase of population, it creates, for the changing needs of the self-expansion of capital, a mass of human material always ready for exploitation. With accumulation, and the development of the productiveness of labour that accompanies it, the power of sudden expansion of capital grows also; it grows, not merely because the elasticity of the capital already functioning increases, not merely because the absolute wealth of society expands, of which capital only forms an elastic part, not merely because credit, under every special stimulus, at once places an unusual part of this wealth at the disposal of production in the form of additional capital; it grows, also, because the technical, conditions of the process of production themselves — machinery, means of transport, 8c. — now admit of the rapidest transformation of masses of surplus product into additional means of production. The mass of social wealth, over-flowing with the advance of accumulation, and transformable into additional capital, thrusts itself frantically into old branches of production, whose market suddenly expands, or into newly formed branches, such as railways, 8c., the need for which grows out of the development of the old ones. In all such cases, there must be the possibility of throwing great masses of men suddenly on the decisive points without injury to the scale of production in other spheres. Over-population supplies these masses. The course characteristic of modern industry, viz., a decennial cycle (interrupted by smaller oscillations), of periods of average activity, production at high pressure, crisis and stagnation, depends on the constant formation, the greater or less absorption, and the re-formation of the industrial reserve army of surplus population. In their turn, the varying phases of the industrial cycle recruit the surplus population, and become one of the most energetic agents of its reproduction. This peculiar course of modern

industry, which occurs in no earlier period of human history, was also impossible in the childhood of capitalist production. The composition of capital changed but very slowly. With its accumulation, therefore, there kept pace, on the whole, a corresponding growth in the demand for labour. Slow as was the advance of accumulation compared with that of more modern times, it found a check in the natural limits of the exploitable labouring population, limits which could only be got rid of by forcible means to be mentioned later. The expansion by fits and starts of the scale of production is the preliminary to its equally sudden contraction; the latter again evokes the former, but the former is impossible without disposable human material, without an increase in the number of labourers independently of the absolute growth of the population. This increase is effected by the simple process that constantly “sets free” a part of the labourers; by methods which lessen the number of labourers employed in proportion to the increased production. The whole form of the movement of modern industry depends, therefore, upon the constant transformation of a part of the labouring population into unemployed or half-employed hands. The superficiality of Political Economy shows itself in the fact that it looks upon the expansion and contraction of credit, which is a mere symptom of the periodic changes of the industrial cycle, as their cause. As the heavenly bodies, once thrown into a certain definite motion, always repeat this, so is it with social production as soon as it is once thrown into this movement of alternate expansion and contraction. Effects, in their turn, become causes, and the varying accidents of the whole process, which always reproduces its own conditions, take on the form of periodicity. When this periodicity is once consolidated, even Political Economy then sees that the production of a relative surplus population — i.e., surplus with regard to the average needs of the self-expansion of capital — is a necessary condition of modern industry.

“Suppose,” says H. Marivale, formerly Professor of Political Economy at Oxford, subsequently employed in the English Colonial Office, “suppose that, on the occasion of some of these crises, the nation were to rouse itself to the effort of getting rid by emigration of some hundreds of thousands of superfluous arms, what would be the consequence? That, at the first returning demand for labour, there would be a deficiency. However rapid reproduction may be, it takes, at all events, the space of a generation to replace the loss of adult labour. Now, the profits of our manufacturers

depend mainly on the power of making use of the prosperous moment when demand is brisk, and thus compensating themselves for the interval during which it is slack. This power is secured to them only by the command of machinery and of manual labour. They must have hands ready by them, they must be able to increase the activity of their operations when required, and to slacken it again, according to the state of the market, or they cannot possibly maintain the pre-eminence in the race of competition on which the wealth of the country is founded.” Even Malthus recognises over-population as a necessity of modern industry, though, after his narrow fashion, he explains it by the absolute over-growth of the labouring population, not by their becoming relatively supernumerary. He says: “Prudential habits with regard to marriage, carried to a considerable extent among the labouring class of a country mainly depending upon manufactures and commerce, might injure it.... From the nature of a population, an increase of labourers cannot be brought into market in consequence of a particular demand till after the lapse of 16 or 18 years, and the conversion of revenue into capital, by saving, may take place much more rapidly; a country is always liable to an increase in the quantity of the funds for the maintenance of labour faster than the increase of population.” After Political Economy has thus demonstrated the constant production of a relative surplus-population of labourers to be a necessity of capitalistic accumulation, she very aptly, in the guise of an old maid, puts in the mouth of her “beau ideal” of a capitalist the following words addressed to those supernumeraries thrown on the streets by their own creation of additional capital:— “We manufacturers do what we can for you, whilst we are increasing that capital on which you must subsist, and you must do the rest by accommodating your numbers to the means of subsistence.”

Capitalist production can by no means content itself with the quantity of disposable labour-power which the natural increase of population yields. It requires for its free play an industrial reserve army independent of these natural limits.

Up to this point it has been assumed that the increase or diminution of the variable capital corresponds rigidly with the increase or diminution of the number of labourers employed.

The number of labourers commanded by capital may remain the same, or even fall, while the variable capital increases. This is the case if the individual labourer yields more labour, and therefore his wages increase

and this although the price of labour remains the same or even falls, only more slowly than the mass of labour rises. Increase of variable capital, in this case, becomes an index of more labour, but not of more labourers employed. It is the absolute interest of every capitalist to press a given quantity of labour out of a smaller, rather than a greater number of labourers, if the cost is about the same. In the latter case, the outlay of constant capital increases in proportion to the mass of labour set in action; in the former that increase is much smaller. The more extended the scale of production, the stronger this motive. Its force increases with the accumulation of capital.

We have seen that the development of the capitalist mode of production and of the productive power of labour — at once the cause and effect of accumulation — enables the capitalist, with the same outlay of variable capital, to set in action more labour by greater exploitation (extensive or intensive) of each individual labour-power. We have further seen that the capitalist buys with the same capital a greater mass of labour-power, as he progressively replaces skilled labourers by less skilled, mature labour-power by immature, male by female, that of adults by that of young persons or children.

On the one hand, therefore, with the progress of accumulation, a larger variable capital sets more labour in action without enlisting more labourers; on the other, a variable capital of the same magnitude sets in action more labour with the same mass of labour-power; and, finally, a greater number of inferior labour-power by displacement of higher.

The production of a relative surplus-population, or the setting free of labourers, goes on therefore yet more rapidly than the technical revolution of the process of production that accompanies, and is accelerated by, the advances of accumulation; and more rapidly than the corresponding diminution of the variable part of capital as compared with the constant. If the means of production, as they increase in extent and effective power, become to a less extent means of employment of labourers, this state of things is again modified by the fact that in proportion as the productiveness of labour increases, capital increases its supply of labour more quickly than its demand for labourers. The over-work of the employed part of the working class swells the ranks of the reserve, whilst conversely the greater pressure that the latter by its competition exerts on the former, forces these to submit to over-work and to subjugation under the dictates of capital. The

condemnation of one part of the working-class to enforced idleness by the over-work of the other part, and the converse, becomes a means of enriching the individual capitalists, and accelerates at the same time the production of the industrial reserve army on a scale corresponding with the advance of social accumulation. How important is this element in the formation of the relative surplus-population, is shown by the example of England. Her technical means for saving labour are colossal. Nevertheless, if to-morrow morning labour generally were reduced to a rational amount, and proportioned to the different sections of the working-class according to age and sex, the working population to hand would be absolutely insufficient for the carrying on of national production on its present scale. The great majority of the labourers now “unproductive” would have to be turned into “productive” ones.

Taking them as a whole, the general movements of wages are exclusively regulated by the expansion and contraction of the industrial reserve army, and these again correspond to the periodic changes of the industrial cycle. They are, therefore, not determined by the variations of the absolute number of the working population, but by the varying proportions in which the working class is divided into active and reserve army, by the increase or diminution in the relative amount of the surplus-population, by the extent to which it is now absorbed, now set free. For Modern Industry with its decennial cycles and periodic phases, which, moreover, as accumulation advances, are complicated by irregular oscillations following each other more and more quickly, that would indeed be a beautiful law, which pretends to make the action of capital dependent on the absolute variation of the population, instead of regulating the demand and supply of labour by the alternate expansion and contraction of capital, the labour-market now appearing relatively under-full, because capital is expanding, now again over-full, because it is contracting. Yet this is the dogma of the economists. According to them, wages rise in consequence of accumulation of capital. The higher wages stimulate the working population to more rapid multiplication, and this goes on until the labour-market becomes too full, and therefore capital, relatively to the supply of labour, becomes insufficient. Wages fall, and now we have the reverse of the medal. The working population is little by little decimated as the result of the fall in wages, so that capital is again in excess relatively to them, or, as others

explain it, falling wages and the corresponding increase in the exploitation of the labourer again accelerates accumulation, whilst, at the same time, the lower wages hold the increase of the working-class in check. Then comes again the time, when the supply of labour is less than the demand, wages rise, and so on. A beautiful mode of motion this for developed capitalist production! Before, in consequence of the rise of wages, any positive increase of the population really fit for work could occur, the time would have been passed again and again, during which the industrial campaign must have been carried through, the battle fought and won.

Between 1849 and 1859, a rise of wages practically insignificant, though accompanied by falling prices of corn, took place in the English agricultural districts. In Wiltshire, e.g., the weekly wages rose from 7s. to 8s.; in Dorsetshire from 7s. or 8s., to 9s., 8c. This was the result of an unusual exodus of the agricultural surplus-population caused by the demands of war, the vast extension of railroads, factories, mines, &c. The lower the wages, the higher is the proportion in which ever so insignificant a rise of them expresses itself. If the weekly wage, e.g., is 20s. and it rises to 22s., that is a rise of 10 per cent.; but if it is only 7s. and it rises to 9s., that is a rise of $28\frac{4}{7}$ per cent., which sounds very fine. Everywhere the farmers were howling, and the “London Economist,” with reference to these starvation-wages, prattled quite seriously of “a general and substantial advance.” What did the farmers do now? Did they wait until, in consequence of this brilliant remuneration, the agricultural labourers, had so increased and multiplied that their wages must fall again, as prescribed by the dogmatic economic brain? They introduced more machinery, and in a moment the labourers were redundant again in a proportion satisfactory even to the farmers. There was now “more capital” laid out in agriculture than before, and in a more productive form. With this the demand for labour fell, not only relatively, but absolutely.

The above economic fiction confuses the laws that regulate the general movement of wages, or the ratio between the working-class — i.e., the total labour-power — and the total social capital, with the laws that distribute the working population over the different spheres of production. If, e.g., in consequence of favourable circumstances, accumulation in a particular sphere of production becomes especially active, and profits in it, being greater than the average profits, attract additional capital, of course the demand for labour rises and wages also rise. The higher wages draw a

larger part of the working population into the more favoured sphere, until it is glutted with labour-power, and wages at length fall again to their average level or below it, if the pressure is too great. Then, not only does the immigration of labourers into the branch of industry in question cease; it gives place to their emigration. Here the political economist thinks he sees the why and wherefore of an absolute increase of workers accompanying an increase of wages, and of a diminution of wages accompanying an absolute increase of labourers. But he sees really only the local oscillation of the labour-market in a particular sphere of production — he sees only the phenomena accompanying the distribution of the working population into the different spheres of outlay of capital, according to its varying needs.

The industrial reserve army, during the periods of stagnation and average prosperity, weighs down the active labour-army; during the periods of over-production and paroxysm, it holds its pretensions in check. Relative surplus-population is therefore the pivot upon which the law of demand and supply of labour works. It confines the field of action of this law within the limits absolutely convenient to the activity of exploitation and to the domination of capital.

This is the place to return to one of the grand exploits of economic apologetics. It will be remembered that if through the introduction of new, or the extension of old, machinery, a portion of variable capital is transformed into constant, the economic apologist interprets this operation which “fixes” capital and by that very act set labourers “free,” in exactly the opposite way, pretending that it sets free capital for the labourers. Only now can one fully understand the effrontery of these apologists. What are set free are not only the labourers immediately turned out by the machines, but also their future substitutes in the rising generation, and the additional contingent, that with the usual extension of trade on the old basis would be regularly absorbed. They are now all “set free,” and every new bit of capital looking out for employment can dispose of them. Whether it attracts them or others, the effect on the general labour demand will be nil, if this capital is just sufficient to take out of the market as many labourers as the machines threw upon it. If it employs a smaller number, that of the supernumeraries increases; if it employs a greater, the general demand for labour only increases to the extent of the excess of the employed over those “set free.” The impulse that additional capital, seeking an outlet, would otherwise have given to the general demand for labour, is therefore in every

case neutralised to the extent of the labourers thrown out of employment by the machine. That is to say, the mechanism of capitalistic production so manages matters that the absolute increase of capital is accompanied by no corresponding rise in the general demand for labour. And this the apologist calls a compensation for the misery, the sufferings, the possible death of the displaced labourers during the transition period that banishes them into the industrial reserve army! The demand for labour is not identical with increase of capital, nor supply of labour with increase of the working class. It is not a case of two independent forces working on one another. Les dés sont pipés. Capital works on both sides at the same time. If its accumulation, on the one hand, increases the demand for labour, it increases on the other the supply of labourers by the “setting free of them, whilst at the same time the pressure of the unemployed compels those that are employed to furnish more labour, and therefore makes the supply of labour, to a certain extent, independent of the supply of labourers. The action of the law of supply and demand of labour on this basis completes the despotism of capital. As soon, therefore, as the labourers learn the secret, how it comes to pass that in the same measure as they work more, as they produce more wealth for others, and as the productive power of their labour increases, so in the same measure even their function as a means of the self-expansion of capital becomes more and more precarious for them; as soon as they discover that the degree of intensity of the competition among themselves depends wholly on the pressure of the relative surplus-population; as soon as, by Trades’ Unions, &c., they try to organise a regular co-operation between employed and unemployed in order to destroy or to weaken the ruinous effects of this natural law of capitalistic production on their class, so soon capital and its sycophant, political economy, cry out at the infringement of the “eternal” and so to say “sacred” law of supply and demand. Every combination of employed and unemployed disturbs the “harmonious” action of this law. But, on the other hand, as soon as (in the colonies, e.g.,) adverse circumstances prevent the creation of an industrial reserve army and, with it, the absolute dependence of the working class upon the capitalist class, capital, along with its commonplace Sancho Panza, rebels against the “sacred” law of supply and demand, and tries to check its inconvenient action by forcible means and State interference.

SECTION 4. — DIFFERENT FORMS OF THE RELATIVE SURPLUS-POPULATION. THE GENERAL LAW OF CAPITALISTIC ACCUMULATION.

The relative surplus population exists in every possible form. Every labourer belongs to it during the time when he is only partially employed or wholly unemployed. Not taking into account the great periodically recurring forms that the changing phases of the industrial cycle impress on it, now an acute form during the crisis, then again a chronic form during dull times — it has always three forms, the floating, the latent, the stagnant.

In the centres of modern industry — factories, manufacturers, ironworks, mines, &c. — the labourers are sometimes repelled, sometimes attracted again in greater masses, the number of those employed increasing on the whole, although in a constantly decreasing proportion to the scale of production. Here the surplus population exists in the floating form.

In the automatic factories, as in all the great workshops, where machinery enters as a factor, or where only the modern divisions of labour is carried out, large numbers of boys are employed up to the age of maturity. When this term is once reached, only a very small number continue to find employment in the same branches of industry, whilst the majority are regularly discharged. This majority forms an element of the floating surplus-population, growing with the extension of those branches of industry. Part of them emigrates, following in fact capital that has emigrated. One consequence is that the female population grows more rapidly than the male, teste England. That the natural increase of the number of labourers does not satisfy the requirements of the accumulation of capital, and yet all the time is in excess of them, is a contradiction inherent to the movement of capital itself. It wants larger numbers of youthful labourers, a smaller number of adults. The contradiction is not more glaring than that other one that there is a complaint of the want of hands, while at the same time many thousands are out of work, because the division of labour chains them to a particular branch of industry.

The consumption of labour-power by capital is, besides, so rapid that the labourer, half-way through his life, has already more or less completely lived himself out. He falls into the ranks of the supernumeraries, or is thrust down from a higher to a lower step in the scale. It is precisely among the work-people of modern industry that we meet with the shortest duration of

life. Dr. Lee, Medical Officer of Health for Manchester, stated “that the average age at death of the Manchester...upper middle class was 38 years, while the average age at death of the labouring class was 17; while at Liverpool those figures were represented as 35 against 15. It thus appeared that the well-to-do classes had a lease of life which was more than double the value of that which fell to the lot of the less favoured citizens.” In order to conform to these circumstances, the absolute increase of this section of the proletariat must take place under conditions that shall swell their numbers, although the individual elements are used up rapidly. Hence, rapid renewal of the generations of labourers (this law does not hold for the other classes of the population). This social need is met by early marriages, a necessary consequence of the conditions in which the labourers of modern industry live, and by the premium that the exploitation of children sets on their production.

As soon as capitalist production takes possession of agriculture, and in proportion to the extent to which it does so, the demand for an agricultural labouring population falls absolutely, while the accumulation of the capital employed in agriculture advances, without this repulsion being, as in non-agricultural industries, compensated by a greater attraction. Part of the agricultural population is therefore constantly on the point of passing over into an urban or manufacturing proletariat, and on the look-out for circumstances favourable to this transformation. (Manufacture is used here in the sense of all non-agricultural industries). This source of relative surplus-population is thus constantly flowing. But the constant flow towards the towns presupposes, in the country itself, a constant latent surplus-population, the extent of which becomes evident only when its channels of outlet open to exceptional width. The agricultural labourer is therefore reduced to the minimum of wages, and always stands with one foot already in the swamp of pauperism.

The third category of the relative surplus-population, the stagnant, forms a part of the active labour army, but with extremely irregular employment. Hence it furnishes to capital an inexhaustible reservoir of disposable labour-power. Its conditions of life sink below the average normal level of the working class; this makes it at once the broad basis of special branches of capitalist exploitation. It is characterized by maximum of working time, and minimum of wages. We have learnt to know its chief form under the rubric of “domestic industry.” It recruits itself constantly from the

supernumerary forces of modern industry and agriculture, and specially from those decaying branches of industry where handicraft is yielding to manufacture, manufacture to machinery. Its extent grows, as with the extent and energy of accumulation, the creation of a surplus population advances. But it forms at the same time a self-reproducing and self-perpetuating element of the working class, taking a proportionally greater part in the general increase of that class than the other elements. In fact, not only the number of births and deaths, but the absolute size of the families stand in inverse proportion to the height of wages, and therefore to the amount of means of subsistence of which the different categories of labourers dispose. This law of capitalistic society would sound absurd to savages, or even civilized colonists. It calls to mind the boundless reproduction of animals individually weak and constantly hunted down.

The lowest sediment of the relative surplus-population finally dwells in the sphere of pauperism. Exclusive of vagabonds, criminals, prostitutes, in a word, the “dangerous” classes, this layer of society consists of three categories. First, those able to work. One need only glance superficially at the statistics of English pauperism to find that the quantity of paupers increases with every crisis, and diminishes with every revival of trade. Second, orphans and pauper children. These are candidates for the industrial reserve-army, and are, in times of great prosperity, as 1860, e.g., speedily and in large numbers enrolled in the active army of labourers. Third, the demoralized and ragged, and those unable to work, chiefly people who succumb to their incapacity for adaptation, due to the division of labour; people who have passed the normal age of the labourer; the victims of industry, whose number increases with the increase of dangerous machinery, of mines, chemical works, &c., the mutilated, the sickly, the widows, &c. Pauperism is the hospital of the active labour-army and the dead weight of the industrial reserve-army. Its production is included in that of the relative surplus-population, its necessity in theirs; along with the surplus-population, pauperism forms a condition of capitalist production, and of the capitalist development of wealth. It enters into the faux frais of capitalist production; but capital knows how to throw these, for the most part, from its own shoulders on to those of the working-class and the lower middle class.

The greater the social wealth, the functioning capital, the extent and energy of its growth, and, therefore, also the absolute mass of the proletariat

and the productiveness of its labour, the greater is the industrial reserve-army. The same causes which develop the expansive power of capital, develop also the labour-power at its disposal. The relative mass of the industrial reserve-army increases therefore with the potential energy of wealth. But the greater this reserve-army in proportion to the active labour-army, the greater is the mass of a consolidated surplus-population, whose misery is in inverse ratio to its torment of labour. The more extensive, finally, the layers of the working-class, and the industrial reserve-army, the greater is official pauperism. This is the absolute general law of capitalist accumulation. Like all other laws it is modified in its working by many circumstances, the analysis of which does not concern us here.

The folly is now patent of the economic wisdom that preaches to the labourers the accommodation of their number to the requirements of capital. The mechanism of capitalist production and accumulation constantly effects this adjustment. The first word of this adaptation is the creation of a relative surplus-population, or industrial reserve-army. Its last word is the misery of constantly extending strata of the active army of labour, and the dead weight of pauperism.

The law by which a constantly increasing quantity of means of production, thanks to the advance in the productiveness of social labour, may be set in movement by a progressively diminishing expenditure of human power, this law, in a capitalist society — where the labourer does not employ the means of production, but the means of production employ the labourer — undergoes a complete inversion and is expressed thus: the higher the productiveness of labour, the greater is the pressure of the labourers on the means of employment, the more precarious, therefore, becomes their condition of existence, viz., the sale of their own labour-power for the increasing of another's wealth, or for the self-expansion of capital. The fact that the means of production, and the productiveness of labour, increase more rapidly than the productive population, expresses itself, therefore, capitalistically in the inverse form that the labouring population always increases more rapidly than the conditions under which capital can employ this increase for its own self-expansion.

We saw in Part IV., when analysing the production of relative surplus-value: within the capitalist system all methods for raising the social productiveness of labour are brought about at the cost of the individual

labourer; all means for the development of production transform themselves into means of domination over, and exploitation of, the producers; they mutilate the labourer into a fragment of a man, degrade him to the level of an appendage of a machine, destroy every remnant of charm in his work and turn it into a hated toil; they estrange from him the intellectual potentialities of the labour-process in the same proportion as science is incorporated in it as an independent power; they distort the conditions under which he works, subject him during the labour-process to a despotism the more hateful for its meanness; they transform his life-time into working-time, and drag his wife and child beneath the wheels of the Juggernaut of capital, But all methods for the production of surplus value are at the same time methods of accumulation; and every extension of accumulation becomes again a means for the development of those methods. It follows therefore that in proportion as capital accumulates, the lot of the labourer, be his payment high or low, must grow worse. The law, finally, that always equilibrates the relative surplus-population, or industrial reserve army, to the extent and energy of accumulation, this law rivets the labourer to capital more firmly than the wedges of Vulcan did Prometheus to the rock. It establishes an accumulation of misery, corresponding with accumulation of capital. Accumulation of wealth at one pole is, therefore, at the same time accumulation of misery, agony of toil, slavery, ignorance, brutality, mental degradation, at the opposite pole, i.e., on the side of the class that produces its own product in the form of capital.

This antagonistic character of capitalistic accumulation is enunciated in various forms by political economists, although by them it is confounded with phenomena, certainly to some extent analogous, but nevertheless essentially distinct, and belonging to precapitalistic modes of production.

The Venetian monk Ortes, one of the great economic writers of the 18th century, regards the antagonism of capitalist production as a general natural law of social wealth. "In the economy of a nation, advantages and evils always balance one another (*il bene ed il male economico in una nazione sempre all, istessa misura*): the abundance of wealth with some people, is always equal to the want of it with others (*la copia dei beni in alcuni sempre eguale alla mancanza di essi in altri*): the great riches of a small number are always accompanied by the absolute privation of the first necessities of life for many others. The wealth of a nation corresponds with its population, and its misery corresponds with its wealth. Diligence in some compels

idleness in others. The poor and idle are a necessary consequence of the rich and active,” 8c. In a thoroughly brutal way about 10 years after Ortes, the Church of England parson, Townsend, glorified misery as a necessary condition of wealth. “Legal constraint (to labour) is attended with too much trouble, violence, and noise,...whereas hunger is not only a peaceable, silent, unremitted pressure, but at the most natural motive to industry and labour, it calls forth the most powerful exertions.” Everything therefore depends upon making hunger permanent among the working class, and for this, according to Townsend, the principle of population, especially active among the poor, provides. “It seems to be a law of nature that the poor should be to a certain degree improvident.” [i.e., so improvident as to be born without a silver spoon in the mouth], “that there may always be some to fulfil the most servile, the most sordid, and the most ignoble offices in the community. The stock of human happiness is thereby much increased, whilst the more delicate are not only relieved from drudgery...but are left at liberty without interruption to pursue those callings which are suited to their various dispositions...it [the Poor Law] tends to destroy the harmony and beauty, the symmetry and order of that system which God and Nature have established in the world.” If the Venetian monk found in the fatal destiny that makes misery eternal, the *raison d’être* of Christian charity, celibacy, monasteries and holy houses, the Protestant prebendary finds in it a pretext for condemning the laws in virtue of which the poor possessed a right to a miserable relief.

“The progress of social wealth,” says Storch, “begets this useful class of society...which performs the most wearisome, the vilest, the most disgusting functions, which takes, in a word, on its shoulders all that is disagreeable and servile in life, and procures thus for other classes leisure, serenity of mind and conventional [*c’est bon!*] dignity of character.” Storch asks himself in what then really consist the progress of this capitalistic civilization with its misery and its degradation of the masses, as compared with barbarism. He finds but one answer: security!

“Thanks to the advance of industry and science,” says Sismondi, “every labourer can produce every day much more than his consumption requires. But at the same time, whilst his labour produces wealth, that wealth would, were he called on to consume it himself, make him less fit for labour.” According to him, “men,” [i.e., non-workers] “would probably prefer to do

without all artistic perfection, and all the enjoyments that manufacturers procure for us, if it were necessary that all should buy them by constant toil like that of the labourer.... Exertion to-day is separated from its recompense; it is not the same man that first works, and then reposes; but it is because the one works that the other rests.... The indefinite multiplication of the productive powers of labour can then only have for result the increase of luxury and enjoyment of the idle rich.”

Finally Destutt de Tracy, the fish-blooded bourgeois doctrinaire, blurts out brutally: “In poor nations the people are comfortable, in rich nations they are generally poor.”

SECTION 5. — ILLUSTRATIONS OF THE GENERAL LAW OF CAPITALIST ACCUMULATION.

England from 1846-1866.

No period of modern society is so favourable for the study of capitalist accumulation as the period of the last 20 years. It is as if this period had found Fortunatus’ purse. But of all countries England again furnishes the classical example, because it holds the foremost place in the world-market, because capitalist production is here alone completely developed, and lastly, because the introduction of the Free Trade millennium since 1846 has cut off the last retreat of vulgar economy. The titanic advance of production — the latter half of the 20 years period again far surpassing the former — has been already pointed out sufficiently in Part IV.

Although the absolute increase of the English population in the last half century was very great, the relative increase or rate of growth fell constantly, as the following table borrowed from the census shows.

Annual increase per cent. of the population of England and Wales in decimal numbers:

1811-1821	1.533 per cent.
1821-1831	1.446 per cent.
1831-1841	1.326 per cent.
1841-1851	1.216 per cent.
1851-1861	1.141 per cent.

Let us now, on the other hand, consider the increase of wealth. Here the movement of profit, rent of land, &c., that come under the income tax, furnishes the surest basis. The increase of profits liable to income tax

(farmers and some other categories not included) in Great Britain from 1853 to 1864 amounted to 50.47% or 4.58% as the annual average, that of the population during the same period to about 12%. The augmentation of the rent of land subject to taxation (including houses, railways, mines, fisheries, &c.), amounted for 1853 to 1864 to 38% or 3 5/12% annually. Under this head the following categories show the greatest increase:

Ibidem.

Houses, 38.60%	3.50%
Quarries, 84.76%	7.70%
Mines, 68.85%	6.26%
Iron-works, 39.92%	3.63%
Fisheries, 57.37%	5.21%
Gasworks, 126.02%	11.45%
Railways, 83.29%	7.57%

If we compare the years from 1853 to 1864 in three sets of four consecutive years each, the rate of augmentation of the income increases constantly. It is, e.g., for that arising from profits between 1853 to 1857, 1.73% yearly; 1857-1861, 2.74%, and for 1861-64, 9.30% yearly. The sum of the incomes of the United Kingdom that come under the income tax was in 1856 £307,068,898; in 1859, £328,127,416; in 1862, £351,745,241; in 1863, £359,142,897; in 1864, £362,462,279; in 1865, £385,530,020.

The accumulation of capital was attended at the same time by its concentration and centralisation. Although no official statistics of agriculture existed for England (they did for Ireland), they were voluntarily given in 10 counties. These statistics gave the result that from 1851 to 1861 the number of farms of less than 100 acres had fallen from 31,583 to 26,597, so that 5016 had been thrown together into larger farms. From 1815 to 1825 no personal estate of more than £1,000,000 came under the succession duty; from 1825 to 1855, however, 8 did; and 4 from 1856 to June, 1859, i.e., in 4½ years. The centralisation will, however, be best seen from a short analysis of the Income Tax Schedule D (profits, exclusive of farms, &c.), in the years 1864 and 1865. I note beforehand that incomes from this source pay income tax on everything over £60. These incomes liable to taxation in England, Wales, and Scotland, amounted in 1864 to £95,844,222, in 1865 to £105,435,579. The number of persons taxed were in 1864, 308,416, out of a population of 23,891,009; in 1865, 332,431 out

of a population of 24,127,003. The following table shows the distribution of these incomes in the two years:

YEAR ENDING APRIL 5TH, 1864.		YEAR ENDING APRIL 5TH, 1865.	
INCOME FROM PROFITS.	PERSONS.	INCOME FROM PROFITS.	PERSONS.
Total Income £95,844,222	308,416	Total Income £105,435,738	332,431
of these 57,028,289	23,334	of these 64,554,297	24,265
" 36,415,225	3,619	" 42,535,576	4,021
" 22,809,781	832	" 27,655,313	973
" 8,744,762	91	" 11,077,238	107

In 1855 there were produced in the United Kingdom 61,453,079 tons of coal, of value £16,113,167; in 1864, 92,787,873 tons, of value £23,197,968; in 1855, 3,218,154 tons of pig-iron, of value £8,045,385; 1864, 4,767,951 tons, of value £11,919,877. In 1854 the length of the railroads worked in the United Kingdom was 8054 miles, with a paid-up capital of £286,068,794; in 1864 the length was 12,789 miles, with capital paid up of £425,719,613. In 1854 the total sum of the exports and imports of the United Kingdom was £268,210,145; in 1865, £489,923,285. The following table shows the movement of the exports:

At this moment, March, 1867, the Indian and Chinese market is again overstocked by the consignments of the British cotton manufacturers. In 1806 a reduction in wages of 5 per cent. took place amongst the cotton operatives. In 1867, as consequence of a similar operation, there was a strike of 20,000 men at Preston. Note to the 4th German edition. — This was a prelude to the crisis, which, broke out soon afterwards. — F. E.

1846	£58,842,377
1849	63,596,052
1856	115,826,948
1860	135,842,817
1865	165,862,402
1866	188,917,563

After these few examples one understands the cry of triumph of the Registrar-General of the British people: "Rapidly as the population has increased, it has not kept pace with the progress of industry and wealth."

Let us turn now to the direct agents of this industry, or the producers of this wealth, to the working class. "It is one of the most melancholy features

in the social state of this country,” says Gladstone, “that while there was a decrease in the consuming powers of the people, and while there was an increase in the privations and distress of the labouring class and operatives, there was at the same time a constant accumulation of wealth in the upper classes, and a constant increase of capital.” Thus spake this unctuous minister in the House of Commons on February 13th, 1843. On April 16th, 1863, 20 years later, in the speech in which he introduced his Budget: “From 1842 to 1852 the taxable income of the country increased by 6 per cent.... In the 8 years from 1853 to 1861 it had increased from the basis taken in 1853 by 20 per cent! The fact is so astonishing as to be almost incredible...this intoxicating augmentation of wealth and power...entirely confined to classes of property...must be of indirect benefit to the labouring population, because it cheapens the commodities of general consumption. While the rich have been growing richer, the poor have been growing less poor. At any-rate, whether the extremes of poverty are less, I do not presume to say.” How lame an anti-climax! If the working-class has remained “poor,” only “less poor” in proportion as it produces for the wealthy class “an intoxicating augmentation of wealth and power,” then it has remained relatively just as poor. If the extremes of poverty have not lessened, they have increased, because the extremes of wealth have. As to the cheapening of the means of subsistence, the official statistics, e.g., the accounts of the London Orphan Asylum, show an increase in price of 20% for the average of the three years 1860-1862, compared with 1851-1853. In the following three years, 1863-1865, there was a progressive rise in the price of meat, butter, milk, sugar, salt, coals, and a number of other necessary means of subsistence. Gladstone’s next Budget speech of April 7th, 1864, is a Pindaric dithy-rambus on the advance of surplus-value-making and the happiness of the people tempered by “poverty.” He speaks of masses “on the border” of pauperism, of branches of trade in which “wages have not increased,” and finally sums up the happiness of the working class in the words: “human life is but, in nine cases out of ten, a struggle for existence.” Professor Fawcett, not bound like Gladstone by official considerations, declares roundly: “I do not, of course, deny that money wages have been augmented by this increase of capital (in the last ten years), but this apparent advantage is to a great extent lost, because many of the necessities of life are becoming dearer” (he believes because of the fall in value of the precious metals)...“the rich grow rapidly richer,

whilst there is no perceptible advance in the comfort enjoyed by the industrial classes.... They (the labourers) become almost the slaves of the tradesman, to whom they owe money.”

In the chapters on the “working day” and “machinery,” the reader has seen under what circumstances the British working-class created an “intoxicating augmentation of wealth and power” for the propertied classes. There we were chiefly concerned with the social functioning of the labourer. But for a full elucidation of the law of accumulation, his condition outside the workshop must also be looked at, his condition as to food and dwelling. The limits of this book compel us to concern ourselves chiefly with the worst paid part of the industrial proletariat, and with the agricultural labourers, who together form the majority of the working-class.

But first, one word on official pauperism, or on that part of the working-class which has forfeited its condition of existence (the sale of labour-power), and vegetates upon public alms. The official list of paupers numbered in England 851,369 persons; in 1856, 977,767; in 1865, 971,433. In consequence of the cotton famine, it grew in the years 1863 and 1864 to 1,079,382 and 1,014,978. The crisis of 1866, which fell most heavily on London, created in this centre of the world-market, more populous than the kingdom of Scotland, an increase of pauperism for the year 1866 of 19.5% compared with 1865, and of 24.4% compared with 1864, and a still greater increase for the first months of 1867 as compared with 1866. From the analysis of the statistics of pauperism, two points are to be taken. On the one hand, the fluctuation up and down of the number of paupers, reflects the periodic changes of the industrial cycle. On the other, the official statistics become more and more misleading as to the actual extent of pauperism in proportion as, with the accumulation of capital, the class-struggle, and, therefore, the class-consciousness of the working-men, develop. E.g., the barbarity in the treatment of the paupers, at which the English Press (The Times, Pall Mall Gazette, etc.) have cried out so loudly during the last two years, is of ancient date. F. Engels showed in 1844 exactly the same horrors, exactly the same transient canting outcries of “sensational literature.” But frightful increase of “deaths by starvation” in London during the last ten years proves beyond doubt the growing horror in which the working-people hold the slavery of the workhouse, that place of punishment for misery.

(b). The badly paid Strata of the British Industrial Class.

During the Cotton famine of 1862, Dr. Smith was charged by the Privy Council with an inquiry into the conditions of nourishment of the distressed operatives in Lancashire and Cheshire. His observations during many preceding years had led him to the conclusion that “to avert starvation diseases,” the daily food of an average woman ought to contain at least 3,900 grains of carbon with 180 grains of nitrogen; the daily food of an average man, at least 4,300 grains of carbon with 200 grains of nitrogen; for women, about the same quantity of nutritive elements as are contained in 2 lbs of good wheaten bread, for men 1-9 more; for the weekly average of adult men and women, at least 28,600 grains of carbon and 1,330 grains of nitrogen. His calculation was practically confirmed in a surprising manner by its agreement with the miserable quantity of nourishment to which want had forced down the consumption of the cotton operatives. This was, in December, 1862, 29,211 grains of carbon, and 1,295 grains of nitrogen weekly.

In the year 1863, the Privy Council ordered an inquiry into the state of distress of the worst-nourished part of the English working-class. Dr. Simon, medical officer to the Privy Council, chose for this work the above-mentioned Dr. Smith. His inquiry ranges on the one hand over the agricultural labourers, on the other, over silk-weavers, needle-women, kid-glovers, stocking-weavers, glove-weavers, and shoe-makers. The latter categories are, with the exception of the stocking-weavers, exclusively town-dwellers. It was made a rule in the inquiry to select in each category the most healthy families, and those comparatively in the best circumstances.

As a general result it was found that “in only one of the examined classes of in-door operatives did the average nitrogen-supply just exceed, while in another it nearly reached, the estimated standard of bare sufficiency [i.e., sufficient to avert starvation diseases], and that in two classes there was defect — in one a very large defect — of both nitrogen and carbon. Moreover, as regards the examined families of the agricultural population, it appeared that more than a fifth were with less than the estimated sufficiency of carbonaceous food, that more than one third were with less than the estimated sufficiency of nitrogeneous food, and that in three counties (Berkshire, Oxfordshire, and Somersetshire), insufficiency of nitrogenous food was the average local diet.” Among the Agricultural labourers, those of England, the wealthiest part of the United Kingdom, were the worst fed.

The insufficiency of food among the agricultural labourers, fell, as a rule, chiefly on the women and children, for “the man must eat to do his work.” Still greater penury ravaged the town-workers examined. “They are so ill fed that assuredly among them there must be many cases of severe and injurious privation.” (“Privation” of the capitalist all this! i.e., “abstinence” from paying for the means of subsistence absolutely necessary for the mere vegetation of his hands.”)

The following table shows the conditions of nourishment of the above-named categories of purely town-dwelling work-people, as compared with the minimum assumed by Dr. Smith, and with the food-allowance of the cotton operatives during the time of their greatest distress:

BOTH SEXES.	AVERAGE WEEKLY CARBON.	AVERAGE WEEKLY NITROGEN.
Five in-door occupations . . .	28,876 grains	1,192 grains
Unemployed Lancashire Operatives	28,211 „	1,295 „
Minimum quantity to be allowed to the Lancashire Operatives, equal number of males and females,	28,600 „	1,330 „ ¹

¹ L. C., Appendix p. 232.

One half, or 60/125 of the industrial labour categories investigated, had absolutely no beer, 28% no milk. The weekly average of the liquid means of nourishment in the families varied from seven ounces in the needle-women to 24¾ ounces in the stocking-makers. The majority of those who did not obtain milk were needle-women in London. The quantity of bread-stuffs consumed weekly varied from 7¾ lbs for the needle-women to 11½ lbs for the shoemakers, and gave a total average of 99 lbs. per adult weekly. Sugar (treacle, etc.) varied from 4 ounces weekly for the kid-glovers to 11 ounces for the stocking-makers; and the total average per week for all categories was 8 ounces per adult weekly. Total weekly average of butter (fat, etc.) 5 ounces per adult. The weekly average of meat (bacon, etc.) varied from 7¼ ounces for the silk-weavers, to 18¼ ounces for the kid-glovers; total average for the different categories 13.6 ounces. The weekly cost of food per adult, gave the following average figures; silk-weavers 2s 2½d., needle-women 2s. 7d., kid-glovers 2s. 9½d., shoemakers 2s 7¾d., stocking weavers 2s. 6¼d. For the silk-weavers of Macclesfield the average was only 1s.

8½d. The worst categories were the needle-women, silk-weavers and kid-glovers. Of these facts, Dr. Simon in his General Health Report says: "That cases are innumerable in which defective diet is the cause or the aggravator of disease, can be affirmed by any one who is conversant with poor law medical practice, or with the ward and out-patient rooms of hospitals.... Yet in this point of view, there is, in my opinion, a very important sanitary context to be added. It must be remembered that privation of food is very reluctantly borne, and that as a rule great poorness of diet will only come when other privations have preceded it. Long before insufficiency of diet is a matter of hygienic concern, long before the physiologist would think of counting the grains of nitrogen and carbon which intervene between life and starvation, the household will have been utterly destitute of material comfort; clothing and fuel will have been even scantier than food — against inclemencies of weather there will have been no adequate protection — dwelling space will have been stinted to the degree in which overcrowding produces or increases disease; of household utensils and furniture there will have been scarcely any — even cleanliness will have been found costly or difficult, and if there still be self-respectful endeavours to maintain it, every such endeavour will represent additional pangs of hunger. The home, too, will be where shelter can be cheapest bought; in quarters where commonly there is least fruit of sanitary supervision, least drainage, least scavenging, least suppression of public nuisances, least or worst water supply, and, if in town, least light and air. Such are the sanitary dangers to which poverty is almost certainly exposed, when it is poverty enough to imply scantiness of food. And while the sum of them is of terrible magnitude against life, the mere scantiness of food is in itself of very serious moment.... These are painful reflections, especially when it is remembered that the poverty to which they advert is not the deserved poverty of idleness. In all cases it is the poverty of working populations. Indeed, as regards the indoor operatives, the work which obtains the scanty pittance of food, is for the most part excessively prolonged. Yet evidently it is only in a qualified sense that the work can be deemed self-supporting.... And on a very large scale the nominal self-support can be only a circuit, longer or shorter, to pauperism."

The intimate connexion between the pangs of hunger of the most industrious layers of the working class, and the extravagant consumption, coarse or refined, of the rich, for which capitalist accumulation is the basis,

reveals itself only when the economic laws are known. It is otherwise with the "housing of the poor." Every unprejudiced observer sees that the greater the centralisation of the means of production, the greater is the corresponding heaping together of the labourers, within a given space; that therefore the swifter capitalistic accumulation, the more miserable are the dwellings of the working-people. "Improvements" of towns, accompanying the increase of wealth, by the demolition of badly built quarters, the erection of palaces for banks, warehouses, &c., the widening of streets for business traffic, for the carriages of luxury, and for the introduction of tramways, &c., drive away the poor into even worse and more crowded hiding places. On the other hand, every one knows that the dearness of dwellings is in inverse ratio to their excellence, and that the mines of misery are exploited by house speculators with more profit or less cost than ever were the mines of Potosi. The antagonistic character of capitalist accumulation, and therefore of the capitalistic relations of property generally, is here so evident, that even the official English reports on this subject teem with heterodox onslaughts on "property and its rights." With the development of industry, with the accumulation of capital, with the growth and "improvement of towns, the evil makes such progress that the mere fear of contagious diseases which do not spare even "respectability," brought into existence from 1847 to 1864 no less than 10 Acts of Parliament on sanitation, and that the frightened bourgeois in some towns, as Liverpool, Glasgow, &c., took strenuous measures through their municipalities. Nevertheless Dr. Simon, in his report of 1865, says: "Speaking generally it may be said that the evils are uncontrolled in England." By order of the Privy Council in 1864, an inquiry was made into the conditions of the housing of the agricultural labourers, in 1865 of the poorer classes in the towns. The results of the admirable work of Dr. Julian Hunter are to be found in the seventh (1865) and eighth (1866) reports on "Public Health." To the agricultural labourers, I shall come later. On the condition of town dwellings, I quote, as preliminary, a general remark of Dr. Simon. "Although my official point of view," he says, "is one exclusively physical, common humanity requires that the other aspect of this evil should not be ignored.... In its higher degrees it [i.e., overcrowding] almost necessarily involves such negation of all delicacy, such unclean confusion of bodies and bodily functions, such exposure of animal and sexual nakedness, as is rather bestial than human., To be subject to these influences

is a degradation which must become deeper and deeper for those on whom it continues to work. To children who are born under its curse, it must often be a very baptism into infamy. And beyond all measure hopeless is the wish that persons thus circumstanced should ever in other respects aspire to that atmosphere of civilization which has its essence in physical and moral cleanliness.”

London takes the first place in overcrowded habitations, absolutely unfit for human beings. “He feels clear,” says Dr. Hunter, “on two points; first, that there are about 20 large colonies in London, of about 10,000 persons each, whose miserable condition exceeds almost anything he has seen elsewhere in England, and is almost entirely the result of their bad house accommodation; and second, that the crowded and delapidated condition of the houses of these colonies is much worse than was the case 20 years ago.” “It is not too much to say that life in parts of London and Newcastle is infernal.”

Further, the better-off part of the working class, together with the small shopkeepers and other elements of the lower middle class, falls in London more and more under the curse of these vile conditions of dwelling, in proportion as “improvements,” and with them the demolition of old streets and houses, advance, as factories and the afflux of human beings grow in the metropolis, and finally as house rents rise with the ground rents. “Rents have become so heavy that few labouring men can afford more than one room.” There is almost no house-property in London that is not overburdened with a number of middlemen. For the price of land in London is always very high in comparison with its yearly revenue, and therefore every buyer speculates on getting rid of it again at a jury price (the expropriation valuation fixed by jurymen), or on pocketing an extraordinary increase of value arising from the neighbourhood of some large establishment. As a consequence of this there is a regular trade in the purchase of “fag-ends of leases.” Gentlemen in this business may be fairly expected to do as they do — get all they can from the tenants while they have them, and leave as little as they can for their successors.”

The rents are weekly, and these gentlemen run no risk. In consequence of the making of railroads in the City, “the spectacle has lately been seen in the East of London of a number of families wandering about some Saturday night with their scanty worldly goods on their backs, without any resting place but the workhouse.” The workhouses are already over crowded, and

the “improvements” already sanctioned by Parliament are only just begun. If labourers are driven away by the demolition of their old houses, they do not leave their old parish, or at most they settle down on its borders, as near as they can get to it. “They try, of course, to remain as near as possible to their workshops. The inhabitants do not go beyond the same or the next parish, parting their two-room tenements into single rooms, and crowding even those.... Even at an advanced rent, the people who are displaced will hardly be able to get an accommodation so good as the meagre one they have left.... Half the workmen...of the Strand...walked two miles to their work.” This same Strand, a main thoroughfare which gives strangers an imposing idea of the wealth of London, may serve as an example of the packing together of human beings in that town. In one of its parishes, the Officer of Health reckoned 581 persons per acre, although half the width of the Thames was reckoned in. It will be self-understood that every sanitary measure, which, as has been the case hitherto in London, hunts the labourers from one quarter, by demolishing uninhabitable houses, serves only to crowd them together yet more closely in another. “Either,” says Dr. Hunter, “the whole proceeding will of necessity stop as an absurdity, or the public compassion (!) be effectually aroused to the obligation which may now be without exaggeration called national, of supplying cover to those who by reason of their having no capital, cannot provide it for themselves, though they can by periodical payments reward those who will provide it for them.” Admire this capitalistic justice! The owner of land, of houses, the business man, when expropriated by “improvements” such as railroads, the building of new streets, &c., not only receives full indemnity. He must, according to law, human and divine, be comforted for his enforced “abstinence” over and above this by a thumping profit. The labourer, with his wife and child and chattels, is thrown out into the street, and — if he crowds in too large numbers towards quarters of the town where the vestries insist on decency, he is prosecuted in the name of sanitation!

Except London, there was at the beginning of the 19th century no single town in England of 100,000 inhabitants. Only five had more than 50,000. Now there are 28 towns with more than 50,000 inhabitants. “The result of this change is not only that the class of town people is enormously increased, but the old close-packed little towns are now centres, built round on every side, open nowhere to air, and being no longer agreeable to the rich are abandoned by them for the pleasanter outskirts. The successors of

these rich are occupying the larger houses at the rate of a family to each room [...and find accommodation for two or three lodgers...] and a population, for which the houses were not intended, and quite unfit, has been created, whose surroundings are truly degrading to the adults and ruinous to the children.” The more rapidly capital accumulates in an industrial or commercial town, the more rapidly flows the stream of exploitable human material, the more miserable are the improvised dwellings of the labourers.

Newcastle-on-Tyne, as the centre of a coal and iron district of growing productiveness, takes the next place after London in the housing inferno. Not less than 34,000 persons live there in single rooms. Because of their absolute danger to the community, houses in great numbers have lately been destroyed by the authorities in Newcastle and Gateshead. The building of new houses progresses very slowly, business very quickly. The town was, therefore, in 1865, more full than ever. Scarcely a room was to let. Dr. Embleton, of the Newcastle Fever Hospital, says: “There can be little doubt that the great cause of the continuance and spread of the typhus has been the overcrowding of human beings, and the uncleanness of their dwellings. The rooms, in which labourers in many cases live, are situated in confined and unwholesome yards or courts, and for space, light, air, and cleanliness, are models of insufficiency and insalubrity, and a disgrace to any civilised community; in them men, women, and children lie at night huddled together; and as regards the men, the night-shift succeed the day-shift, and the day-shift the night-shift in unbroken series for some time together, the beds having scarcely time to cool; the whole house badly supplied with water, and worse with privies; dirty, unventilated, and pestiferous.” The price per week of such lodgings ranges from 8d. to 3s. “The town of Newcastle-on-Tyne,” says Dr. Hunter, “contains a sample of the finest tribe of our countrymen, often sunk by external circumstances of house and street into an almost savage degradation.”

As result of the ebbing and flowing of capital and labour, the state of the dwellings of an industrial town may to-day be bearable, to-morrow hideous. Or the ædileship of the town may have pulled itself together for the removal of the most shocking abuses. To-morrow, like a swarm of locusts, come crowding in masses of ragged Irishmen or decayed English agricultural labourers. They are stowed away in cellars and lofts, or the hitherto

respectable labourer's dwelling is transformed into a lodging-house, whose personnel changes as quickly as the billets in the 30 years' war. Example: Bradford (Yorkshire). There the municipal philistine was just busied with urban improvements. Besides, there were still in Bradford, in 1861, 1751 uninhabited houses. But now comes that revival of trade which the mildly liberal Mr. Forster, the negro's friend, recently crowed over with so much grace. With the revival of trade came of course an overflow from the waves of the ever fluctuating "reserve-army" or "relative surplus population." The frightful cellar habitations and rooms registered in the list, which Dr. Hunter obtained from the agent of an Insurance Company, were for the most part inhabited by well-paid labourers. They declared that they would willingly pay for better dwellings if they were to be had. Meanwhile, they become degraded, they fall ill, one and all, whilst the mildly liberal Forster, M.P., sheds tears over the blessings of free-trade, and the profits of the eminent men of Bradford who deal in worsted. In the Report of September, 1865, Dr. Bell, one of the poor law doctors of Bradford, ascribes the frightful mortality of fever-patients in his district to the nature of their dwellings. "In one small cellar measuring 1500 cubic feet...there are ten persons.... Vincent Street, Green Aire Place, and the Leys include 223 houses having 1.450 inhabitants, 435 beds, and 36 privies.... The beds — and in that term I include any roll of dirty old rags, or an armful of shavings — have an average of 3.3 person to each, many have 5 and 6 persons to each, and some people, I am told, are absolutely without beds; they sleep in their ordinary clothes, on the bare boards — young men and women, married and unmarried, all together. I need scarcely add that many of these dwellings are dark, damp, dirty, stinking holes, utterly unfit for human habitations; they are the centres from which disease and death are distributed amongst those in better circumstances, who have allowed them to fester in our midst."

Bristol takes the third place after London in the misery of its dwellings. "Bristol, where the blankest poverty and domestic misery abound in the wealthiest town of Europe."

The Nomad Population.

We turn now to a class of people whose origin is agricultural, but whose occupation is in great part industrial. They are the light infantry of capital, thrown by it, according to its needs, now to this point, now to that. When they are not on the march, they "camp." Nomad labour is used for various operation of building and draining, brick-making, lime-burning, railway-

making, 8c. A flying column of pestilence, it carries into the places in whose neighbourhood it pitches its camp, small-pox, typhus, cholera, scarlet fever, 8c. In undertakings that involve much capital outlay, such as railways, 8c., the contractor himself generally provides his army with wooden huts and the like, thus improvising villages without any sanitary provisions, outside the control of the local boards, very profitable to the contractor, who exploits the labourers in two-fold fashion — as soldiers of industry and as tenants. According as the wooden hut contains 1, 2, or 3 holes, its inhabitant, navvy, or whatever he may be, has to pay 1, 3, or 4 shillings weekly. One example will suffice. In September, 1864, Dr. Simon reports that the Chairman of the Nuisances Removal Committee of the parish of Sevenoaks sent the following denunciation to Sir George Grey, Home Secretary:— “Small-pox cases were rarely heard of in this parish until about twelve months ago. Shortly before that time, the works for a railway from Lewisham to Tunbridge were commenced here, and, in addition to the principal works being in the immediate neighbourhood of this town, here was also established the depot for the whole of the works, so that a large number of persons was of necessity employed here. As cottage accommodation could not be obtained for them all, huts were built in several places along the line of the works by the contractor, Mr. Jay, for their especial occupation. These huts possessed no ventilation nor drainage, and, besides, were necessarily overcrowded, because each occupant had to accommodate lodgers, whatever the number in his own family might be, although there were only two rooms to each tenement. The consequences were, according to the medical report we received, that in the night-time these poor people were compelled to endure all the horror of suffocation to avoid the pestiferous smells arising from the filthy, stagnant water, and the privies close under the windows. Complaints were at length made to the Nuisances Removal Committee by a medical gentleman who had occasion to visit these huts, and he spoke of their condition as dwellings in the most severe terms, and he expressed his fears that some very serious consequences might ensue, unless some sanitary measures were adopted. About a year ago, Mr. Jay promised to appropriate a hut, to which persons in his employ, who were suffering from contagious diseases, might at once be removed. He repeated that promise on the 23rd July last, but although since the date of the last promise there have been several cases of small-pox in his huts, and two deaths from the same disease, yet he has taken no steps

whatever to carry out his promise. On the 9th September instant, Mr. Kelson, surgeon, reported to me further cases of small-pox in the same huts, and he described their condition as most disgraceful. I should add, for your (the Home Secretary's information that) an isolated house, called the Pest-house, which is set apart for parishioners who might be suffering from infectious diseases, has been continually occupied by such patients for many months past, and is also now occupied; that in one family five children died from small-pox and fever; that from the 1st April to the 1st September this year, a period of five months, there have been no fewer than ten deaths from small-pox in the parish, four of them being in the huts already referred to; that it is impossible to ascertain the exact number of persons who have suffered from that disease, although they are known to be many, from the fact of the families keeping it as private as possible."

The labourers in coal and other mines belong to the best paid categories of the British proletariat. The price at which they buy their wages was shown on an earlier page. Here I merely cast a hurried glance over the conditions of their dwellings. As a rule, the exploiter of a mine, whether its owner or his tenant, builds a number of cottages for his hands. They receive cottages and coal for firing "for nothing" — i.e., these form part of their wages, paid in kind. Those who are not lodged in this way receive in compensation £4 per annum. The mining districts attract with rapidity a large population, made up of the miners themselves, and the artisans, shopkeepers, &c., that group themselves around them. The ground-rents are high, as they are generally where population is dense. The master tries, therefore, to run up, within the smallest space possible at the mouth of the pit, just so many cottages as are necessary to pack together his hands and their families. If new mines are opened in the neighbourhood, or old ones are again set working, the pressure increases. In the construction of the cottages, only one point of view is of moment, the "abstinence" of the capitalist from all expenditure that is not absolutely unavoidable. "The lodging which is obtained by the pitmen and other labourers connected with the collieries of Northumberland and Durham," says Dr. Julian Hunter, "is perhaps, on the whole, the worst and the dearest of which any large specimens can be found in England, the similar parishes of Monmouthshire excepted.... The extreme badness is in the high number of men found in one room, in the smallness of the ground-plot on which a great number of houses are thrust, the want of water, the absence of privies, and the frequent

placing of one house on the top of another, or distribution into flats,...the lessee acts as if the whole colony were encamped, not resident.”

“In pursuance of my instructions,” says Dr. Stevens, “I visited most of the large colliery villages in the Durham Union.... With very few exceptions, the general statement that no means are taken to secure the health of the inhabitants would be true of all of them.... All colliers are bound [‘bound,’ an expression which, like bondage, dates from the age of serfdom] to the colliery lessee or owner for twelve months.... If the colliers express discontent, or in any way annoy the ‘viewer,’ a mark or memorandum is made against their names, and, at the annual ‘binding,’ such men are turned off....It appears to me that no part of the ‘truck system’ could be worse than what obtains in these densely-populated districts. The collier is bound to take as part of his hiring a house surrounded with pestiferous influences; he cannot help himself, and it appears doubtful whether anyone else can help him except his proprietor (he is, to all intents and purposes, a serf), and his proprietor first consults his balance-sheet, and the result is tolerably certain. The collier is also often supplied with water by the proprietor, which, whether it be good or bad, he has to pay for, or rather he suffers a deduction for from his wages.”

In conflict with “public opinion,” or even with the Officers of Health, capital makes no difficulty about “justifying” the conditions partly dangerous, partly degrading, to which it confines the working and domestic life of the labourer, on the ground that they are necessary for profit. It is the same thing when capital “abstains” from protective measures against dangerous machinery in the factory, from appliances for ventilation and for safety in mines, &c. It is the same here with the housing of the miners. Dr. Simon, medical officer of the Privy Council, in his official Report says: “In apology for the wretched household accommodation...it is alleged that mines are commonly worked on lease; that the duration of the lessee’s interest (which in collieries is commonly for 21 years), is not so long that he should deem it worth his while to create good accommodation for his labourers, and for the tradespeople and others whom the work attracts; that even if he were disposed to act liberally in the matter, this disposition would commonly be defeated by his landlord’s tendency to fix on him, as ground rent, an exorbitant additional charge for the privilege of having on the surface of the ground the decent and comfortable village which the labourers of the subterranean property ought to inhabit, and that prohibitory

price (if not actual prohibition) equally excludes others who might desire to build. It would be foreign to the purpose of this report to enter upon any discussion of the merits of the above apology. Nor here is it even needful to consider where it would be that, if decent accommodation were provided, the cost...would eventually fall — whether on landlord, or lessee, or labourer, or public. But in presence of such shameful facts as are vouched for in the annexed reports [those of Dr. Hunter, Dr. Stevens, 8c.] a remedy may well be claimed....Claims of landlordship are being so used as to do great public wrong. The landlord in his capacity of mine-owner invites an industrial colony to labour on his estate, and then in his capacity of surface-owner makes it impossible that the labourers whom he collects, should find proper lodging where they must live. The lessee [the capitalist exploiter] meanwhile has no pecuniary motive for resisting that division of the bargain; well knowing that if its latter conditions be exorbitant, the consequences fall, not on him, that his labourers on whom they fall have not education enough to know the value of their sanitary rights, that neither obscenest lodging nor foulest drinking water will be appreciable inducements towards a ‘strike.’”

(d). Effect of Crises on the best paid part of the Working Class.

Before I turn to the regular agricultural labourers, I may be allowed to show, by one example, how industrial revulsions affect even the best-paid, the aristocracy, of the working-class. It will be remembered that the year 1857 brought one of the great crises with which the industrial cycle periodically ends. The next termination of the cycle was due in 1866. Already discounted in the regular factory districts by the cotton famine, which threw much capital from its wonted sphere into the great centres of the money-market, the crisis assumed, at this time, an especially financial character. Its outbreak in 1866 was signalled by the failure of a gigantic London Bank, immediately followed by the collapse of countless swindling companies. One of the great London branches of industry involved in the catastrophe was iron shipbuilding. The magnates of this trade had not only over-produced beyond all measure during the overtrading time, but they had, besides, engaged in enormous contracts on the speculation that credit would be forthcoming to an equivalent extent. Now, a terrible reaction set in, that even at this hour (the end of March, 1867) continues in this and other London industries. To show the condition of the labourers, I quote the following from the circumstantial report of a correspondent of the “Morning

Star,” who, at the end of 1866, and beginning of 1867, visited the chief centres of distress: “In the East End districts of Poplar, Millwall, Greenwich, Deptford, Limehouse and Canning Town, at least 15,000 workmen and their families were in a state of utter destitution, and 3000 skilled mechanics were breaking stones in the workhouse yard (after distress of over half a year’s duration)....I had great difficulty in reaching the workhouse door, for a hungry crowd besieged it....They were waiting for their tickets, but the time had not yet arrived for the distribution. The yard was a great square place with an open shed running all round it, and several large heaps of snow covered the paving-stones in the middle. In the middle, also, were little wicker-fenced spaces, like sheep pens, where in finer weather the men worked; but on the day of my visit the pens were so snowed up that nobody could sit in them. Men were busy, however, in the open shed breaking paving-stones into macadam. Each man had a big paving-stone for a seat, and he chipped away at the rime-covered granite with a big hammer until he had broken up, and think! five bushels of it, and then he had done his day’s work, and got his day’s pay — threepence and an allowance of food. In another part of the yard was a rickety little wooden house, and when we opened the door of it, we found it filled with men who were huddled together shoulder to shoulder, for the warmth of one another’s bodies and breath. They were picking oakum and disputing the while as to which could work the longest on a given quantity of food — for endurance was the point of honour. Seven thousand...in this one workhouse...were recipients of relief...many hundreds of them...it appeared, were, six or eight months ago, earning the highest wages paid to artisans....Their number would be more than doubled by the count of those who, having exhausted all their savings, still refuse to apply to the parish, because they have a little left to pawn. Leaving the workhouse, I took a walk through the streets, mostly of little one-storey houses, that abound in the neighbourhood of Poplar. My guide was a member of the Committee of the Unemployed....My first call was on an ironworker who had been seven and twenty weeks out of employment. I found the man with his family sitting in a little back room. The room was not bare of furniture, and there was a fire in it. This was necessary to keep the naked feet of the young children from getting frost bitten, for it was a bitterly cold day. On a tray in front of the fire lay a quantity of oakum, which the wife and children were picking in return for their allowance from the parish. The man worked in the stone yard of the

workhouse for a certain ratio of food, and three pence per day. He had now come home to dinner quite hungry, as he told us with a melancholy smile, and his dinner consisted of a couple of slices of bread and dripping, and a cup of milkless tea....The next door at which we knocked was opened by a middle-aged woman, who, without saying a word, led us into a little back parlour, in which sat all her family, silent and fixedly staring at a rapidly dying fire. Such desolation, such hopelessness was about these people and their little room, as I should not care to witness again. ‘Nothing have they done, sir,’ said the woman, pointing to her boys, ‘for six and twenty weeks; and all our money gone — all the twenty pounds that me and father saved when times were better, thinking it would yield a little to keep us when we got past work. Look at it,’ she said, almost fiercely, bringing out a bank book with all its well-kept entries of money paid in, and money taken out, so that we could see how the little fortune had begun with the first five shilling deposit, and had grown by little and little to be twenty pounds, and how it had melted down again till the sum in hand got from pounds to shillings, and the last entry made the book as worthless as a blank sheet. This family received relief from the workhouse, and it furnished them with just one scanty meal per day....Our next visit was to an iron labourer’s wife, whose husband had worked in the yards. We found her ill from want of food, lying on a mattress in her clothes, and just covered with a strip of carpet, for all the bedding had been pawned. Two wretched children were tending her, themselves looking as much in need of nursing as their mother. Nineteen weeks of enforced idleness had brought them to this pass, and while the mother told the history of that bitter past, she moaned as if all her faith in a future that should atone for it were dead....On getting outside a young fellow came running after us, and asked us to step inside his house and see if anything could be done for him. A young wife, two pretty children, a cluster of pawn-tickets, and a bare room were all he had to show.”

On the after pains of the crisis of 1866, the following extract from a Tory newspaper. It must not be forgotten that the East-end of London, which is here dealt with, is not only the seat of the iron shipbuilding mentioned above, but also of a so-called “home-industry” always underpaid. “A frightful spectacle was to be seen yesterday in one part of the metropolis. Although the unemployed thousands of the East End did not parade with their black flags en masse, the human torrent was imposing enough. Let us

remember what these people suffer. They are dying of hunger. That is the simple and terrible fact. There are 40,000 of them....In our presence, in one quarter of this wonderful metropolis, are packed — next door to the most enormous accumulation of wealth the world ever saw — cheek by jowel with this are 40,000 helpless, starving people. These thousands are now breaking in upon the other quarters, always half-starving, they cry their misery in our ears, they cry to Heaven, they tell us from their miserable dwellings, that it is impossible for them to find work, and useless for them to beg. The local ratepayers themselves are driven by the parochial charges to the verge of pauperism.” — (“Standard,” 5th April, 1866.)

As it is the fashion amongst English capitalists to quote Belgium as the Paradise of the labourer because “freedom of labour,” or what is the same thing, “freedom of capital,” is there limited neither by the despotism of Trade’s Unions, nor by Factory Acts, a word or two on the “happiness” of the Belgian labourer. Assuredly no one was more thoroughly initiated in the mysteries of this happiness than the late M. Ducpétiaux, inspector-general of Belgian prisons and charitable institutions, and member of the central commission of Belgian statistics. Let us take his work: “Budgets économiques des classes ouvrières de la Belgique, Bruxelles, 1855.” Here we find among other matters, a normal Belgian labourer’s family, whose yearly income and expenditure he calculates on very exact data, and whose conditions of nourishment are then compared with those of the soldier, sailor, and prisoner. The family “consists of father, mother, and four children.” Of these 6 persons “four may be usefully employed the whole year through.” It is assumed that “there is no sick person nor one incapable of work, among them,” nor are there “expenses for religious, moral, and intellectual purposes, except a very small sum for church sittings,” nor “contributions to savings banks or benefit societies,” nor “expenses due to luxury or the result of improvidence.” The father and eldest son, however, allow themselves “the use of tobacco,” and on Sundays “go to the cabaret,” for which a whole 86 centimes a week are reckoned. “From a general compilation of wages allowed to the labourers in different trades, it follows that the highest average of daily wage is 1 franc 56c., for men, 89 centimes for women, 56 centimes for boys, and 55 centimes for girls. Calculated at this rate, the resource of the family would amount, at the maximum, to 1068 francs a-year. ...In the family...taken as typical we have calculated all possible resources. But in ascribing wages to the mother of the family we

raise the question of the direction of the household. How will its internal economy be cared for? Who will look after the young children? Who will get ready the meals, do the washing and mending? This is the dilemma incessantly presented to the labourers.”

According to this the budget of the family is:

The father 300 working days at fr. 1.56...	fr. 468
The mother 300 working days at fr. 89...	fr. 267
The boy 300 working days at fr. 56...	fr. 168
The girl 300 working days at fr. 55...	fr. 165
Total	fr. 1,068

The annual expenditure of the family would cause a deficit upon the hypothesis that the labourer has the food of:

The man of war's man fr. 1828...	Deficit fr. 760
The soldier fr. 1473...	Deficit fr. 405
The prisoner fr. 1112...	Deficit fr. 44

“We see that few labouring families can reach, we will not say the average of the sailor or soldier, but even that of the prisoner. The general average (of the cost of each prisoner in the different prisons during the period 1847-1849), has been 63 centimes for all prisons. This figure, compared with that of the daily maintenance of the labourer, shows a difference of 13 centimes. It must be remarked further, that if in the prisons it is necessary to set down in the account the expenses of administration and surveillance on the other hand, the prisoners have not to pay for their lodging; that the purchases they make at the canteens are not included in the expenses of maintenance, and that these expenses are greatly lowered in consequence of the large number of persons that make up the establishments, and of contracting for or buying wholesale, the food and other things that enter into their consumption. ...How comes it, however, that a great number, we might say, a great majority, of labourers, live in a more economical way? It is...by adopting expedients, the secret of which only the labourer knows; by reducing his daily rations; by substituting rye-bread for wheat; by eating less meat, or even none at all, and the same with butter and condiments; by contenting themselves with one or two rooms where the family is crammed together, where boys and girls sleep side by side, often on the same pallet; by economy of clothing, washing, decency; by giving up the Sunday diversions; by, in short, resigning themselves to the

most painful privations. Once arrived at this extreme limit, the least rise in the price of food, stoppage of work, illness, increases the labourer's distress and determines his complete ruin; debts accumulate, credit fails, the most necessary clothes and furniture are pawned, and finally, the family asks to be enrolled on the list of paupers." (Ducpétiaux, l. c., p, 154, 155.) In fact, in this "Paradise of capitalists" there follows, on the smallest change in the price of the most essential means of subsistence, a change in the number of deaths and crimes! (See Manifesto of the Maatschappij: De Vlamingen Vooruit! Brussels, 1860, p, 16.) In all Belgium are 930,000 families, of whom, according to the official statistics, 90,000 are wealthy and on the list of voters =450,000 persons; 190,000 families of the lower middle-class in towns and villages, the greater part of them constantly sinking into the proletariat,=1,950,000 persons. Finally, 450,000 working-class families=2,250,000 persons of whom the model ones enjoy the happiness depicted by Ducpétiaux. Of the 450,000 working-class families, over 200,000 are on the pauper list.

(e.) The British Agricultural Proletariat.

Nowhere does the antagonistic character of capitalistic production and accumulation assert itself more brutally than in the progress of English agriculture (including cattle-breeding) and the retrogression of the English agricultural labourer. Before I turn to his present situation, a rapid retrospect: Modern agriculture dates in England from the middle of the 18th century, although the revolution in landed property, from which the changed mode of production starts as a basis, has a much earlier date.

If we take the statements of Arthur Young, a careful observer, though a superficial thinker, as to the agricultural labourer of 1771, the latter plays a very pitiable part compared with his predecessor of the end of the 14th century, "when the labourer...could live in plenty, and accumulate wealth," not to speak of the 15th century, "the golden age of the English labourer in town and country." We need not, however, go back so far. In a very instructive work of the year 1777 we read: "The great farmer is nearly mounted to a level with him [the gentleman]; while the poor labourer is depressed almost to the earth. His unfortunate situation will fully appear, by taking a comparative view of it, only forty years ago, and at present....Landlord and tenant...have both gone hand in hand in keeping the labourer down." It is then proved in detail that the real agricultural wages between 1737 and 1777 fell nearly $\frac{1}{4}$ or 25 per cent. "Modern policy," says

Dr. Richard Price also, “is, indeed, more favourable to the higher classes of people; and the consequences may in time prove that the whole kingdom will consist of only gentry and beggars, or of grandees and slaves.”

Nevertheless, the position of the English agricultural labourer from 1770 to 1780, with regard to his food and dwelling, as well as to his self-respect, amusements, &c., is an ideal never attained again since that time. His average wage expressed in pints of what was from 1770 to 1771, 90 pints, in Eden’s time (1797) only 65, in 1808 but 60.

The state of the agricultural labourer at the end of the Anti-Jacobin war, during which landed proprietors, farmers, manufacturers, merchants, bankers, stockbrokers, army-contractors, &c., enriched themselves so extraordinarily, has been already indicated above. The nominal wages rose in consequence partly of the bank-note depreciation, partly of a rise in the price of the primary means of subsistence independent of this depreciation. But the actual wage-variation can be evidenced in a very simple way, without entering into details that are here unnecessary. The Poor Law and its administration were in 1795 and 1814 the same. It will be remembered how this law was carried out in the country districts: in the form of alms the parish made up the nominal wage to the nominal sum required for the simple vegetation of the labourer. The ratio between the wages paid by the farmer, and the wage-deficit made good by the parish, shows us two things. First, the falling of wages below their minimum; second, the degree in which the agricultural labourer was a compound of wage-labourer and pauper, or the degree in which he had been turned into a serf of his parish. Let us take one county that represents the average condition of things in all counties. In Northamptonshire, in 1795, the average weekly wage was 7s. 6d.; the total yearly expenditure of a family of 6 persons, £36 12s. 5d.; their total income, £29 18s.; deficit made good by the parish, £6 14s. 5d. In 1814, in the same county, the weekly wage was 12s. 2d.; the total yearly expenditure of a family of 5 persons, £54 18s. 4d.; their total income, £36 2s.; deficit made good by the parish, £18 6s. 4d. In 1795 the deficit was less than $\frac{1}{4}$ the wage, in 1814, more than half. It is self-evident that, under these circumstances, the meagre comforts that Eden still found in the cottage of the agricultural labourer, had vanished by 1814. Of all the animals kept by the farmer, the labourer, the instrumentum vocale, was, thenceforth, the most oppressed, the worst nourished, the most brutally treated.

The same state of things went on quietly until “the Swing riots, in 1830, revealed to us [i.e., the ruling classes] by the light of blazing corn-stacks, that misery and black mutinous discontent smouldered quite as fiercely under the surface of agricultural as of manufacturing England.” At this time, Sadler, in the House of Commons, christened the agricultural labourers “white slaves,” and a Bishop echoed the epithet in the Upper House. The most notable political economist of that period — E.g. Wakefield — says: “The peasant of the South of England...is not a freeman, nor is he a slave; he is a pauper.

The time just before the repeal of the Corn Laws threw new light on the condition of the agricultural labourers. On the one hand, it was to the interest of the middle-class agitators to prove how little the Corn Laws protected the actual producers of the corn. On the other hand, the industrial bourgeoisie foamed with sullen rage at the denunciations of the factory system by the landed aristocracy, at the pretended sympathy with the woes of the factory operatives, of those utterly corrupt, heartless, and genteel loafers, and at their “diplomatic zeal” for factory legislation. It is an old English proverb that “when thieves fall out, honest men come by their own,” and, in fact, the noisy, passionate quarrel between the two fractions of the ruling class about the question, which of the two exploited the labourers the more shamefully, was on each hand the midwife of the truth. Earl Shaftesbury, then Lord Ashley, was commander-in-chief in the aristocratic, philanthropic, anti-factory campaign. He was, therefore, in 1845, a favourite subject in the revelations of the “Morning Chronicle” on the condition of the agricultural labourers. This journal, then the most important Liberal organ, sent special commissioners into the agricultural districts, who did not content themselves with mere general descriptions and statistics, but published the names both of the labouring families examined and of their landlords. The following list gives the wages paid in three villages in the neighborhood of Blandford, Wimbourne, and Poole. The villages are the property of Mr. G. Bankes and of the Earl of Shaftesbury. It will be noted that, just like Bankes, this “low church pope,” this head of English pietists, pockets a great part of the miserable wages of the labourers under the pretext of house-rent: —

The repeal of the Corn Laws gave a marvellous impulse to English agriculture. Drainage on the most extensive scale, new methods of stall-feeding, and of the artificial cultivation of green crops, introduction of

mechanical manuring apparatus, new treatment of clay soils, increased use of mineral manures, employment of the steam-engine, and of all kinds of new machinery, more intensive cultivation generally, characterised this epoch. Mr. Pusey, Chairman of the Royal Agricultural Society, declares that the (relative) expenses of farming have been reduced nearly one-half by the introduction of new machinery. On the other hand, the actual return of the soil rose rapidly. Greater outlay of capital per acre, and, as a consequence, more rapid concentration of farms, were essential conditions of the new method. At the same time, the area under cultivation increased, from 1846 to 1856, by 464,119 acres, without reckoning the great area in the Eastern Counties which was transformed from rabbit warrens and poor pastures into magnificent cornfields. It has already been seen that, at the same time, the total number of persons employed in agriculture fell. As far as the actual agricultural labourers of both sexes and of all ages are concerned, their number fell from 1,241,396, in 1851, to 1,163,217 in 1861. If the English Registrar-General, therefore, rightly remarks: "The increase of farmers and farm-labourers, since 1801, bears no kind of proportion...to the increase of agricultural produce," this disproportion obtains much more for the last period, when a positive decrease of the agricultural population went hand in hand with increase of the area under cultivation, with more intensive cultivation, unheard-of accumulation of the capital incorporated with the soil, and devoted to its working, an augmentation in the products of the soil without parallel in the history of English agriculture, plethoric rent-rolls of landlords, and growing wealth of the capitalist farmers. If we take this, together with the swift, unbroken extension of the markets, viz., the towns, and the reign of Free Trade, then the agricultural laborer was at last, *post tot discrimina rerum*, placed in circumstances that ought, *secundum artem*, to have made him drunk with happiness.

But Professor Rogers comes to the conclusion that the lot of the English agricultural labourer of to-day, not to speak of his predecessor in the last half on the 14th and in the 15th century, but only compared with his predecessor from 1770 to 1780, has changed for the worse to an extraordinary extent, that "the peasant has again become a serf," and a serf worse fed and worse clothed. Dr. Julian Hunter, in his epoch-making report on the dwellings of the agricultural labourers, says: "The cost of the hind" (a name for the agricultural labourer, inherited from time of serfdom) "is fixed at the lowest possible amount on which he can live...the supplies of

wages and shelter are not calculated on the profit to be derived from him. He is a zero in farming calculations. ...The means [of subsistence] being always supposed to be a fixed quantity. As to any further reduction of his income, he may say, nihil habeo nihil curo. He has no fears for the future, because he has now only the spare supply necessary to keep him. He has reached the zero from which are dated the calculations of the farmer. Come what will, he has no share either in prosperity or adversity.”

In the year 1863, an official inquiry took place into the conditions of nourishment and labour of the criminals condemned to transportation and penal servitude. The results are recorded in two voluminous blue books. Among other things it is said: “From an elaborate comparison between the diet of convicts in the convict prisons in England, and that of paupers in workhouses and of free labourers in the same country...it certainly appears that the former are much better fed than either of the two other classes,” whilst “the amount of labour required from an ordinary convict under penal servitude is about one half of what would be done by an ordinary day labourer.” A few characteristic depositions of witnesses: John Smith, governor of the Edinburgh prison, deposes: No. 5056. “The diet of the English prisons [is] superior to that of ordinary labourers in England.” No. 50. “It is the fact...that the ordinary agricultural labourers in Scotland very seldom get any meat at all.” Answer No. 3047. “Is there anything that you are aware of to account for the necessity of feeding them very much better than ordinary labourers? — Certainly not.” No. 3048. “Do you think that further experiments ought to be made in order to ascertain whether a dietary might not be hit upon for prisoners employed on public works nearly approaching to the dietary of free labourers? ...”He [the agricultural labourer] might say: ‘I work hard, and have not enough to eat, and when in prison I did not work harder where I had plenty to eat, and therefore it is better for me to be in prison again than here.’” From the tables appended to the first volume of the Report I have compiled the annexed comparative summary.

WEEKLY AMOUNT OF NUTRIMENT.

	Quantity of Nitro- genous In- gredients.	Quantity of Non-Nitro- genous In- gredients.	Quantity of Mineral Matter.	Total.
	Ounces	Ounces	Ounces	Ounces
Portland (convict	28·95	150·08	4·68	103·69
Sailor in the Navy	29·63	152·91	4·52	187·06
Soldier	25·55	114·49	3·94	14·98
Working Coachmaker	24·53	162·06	4·23	190·82
Compositor	21·24	100·83	3·12	125·19
Agricultural labourer	17·73	118·06	3·29	139·08

The general result of the inquiry by the medical commission of 1863, on the food of the lowest fed classes, is already known to the reader. He will remember that the diet of a great part of the agricultural labourer's families is below the minimum necessary "to arrest starvation diseases." This is especially the case in all the purely rural districts of Cornwall, Devon, Somerset, Wilts, Stafford, Oxford, Berks, and Herts. "The nourishment obtained by the labourer himself," says Dr. E. Smith, "is larger than the average quantity indicates, since he eats a larger share...necessary to enable him to perform his labour...of food than the other members of the family, including in the poorer districts nearly all the meat and bacon.... The quantity of food obtained by the wife and also by the children at the period of rapid growth, is in many cases, in almost every county, deficient, and particularly in nitrogen." The male and female servants living with the farmers themselves are sufficiently nourished. Their number fell from 288,277 in 1851, to 204,962 in 1861. "The labour of women in the fields," says Dr. Smith, "whatever may be its disadvantages,...is under present circumstances of great advantage to the family, since it adds that amount of income which...provides shoes and clothing and pays the rent, and thus enables the family to be better fed." One of the most remarkable results of

the inquiry was that the agricultural labourer of England, as compared with other parts of the United Kingdom, “is considerably the worst fed,” as the appended table shows:

Quantities of Carbon and Nitrogen weekly consumed by an average agricultural adult.

Carbon, grains.

Nitrogen, grains.

1. c. . The English agricultural labourer receives only $\frac{1}{4}$ as much milk and $\frac{1}{2}$ as much bread as the Irish. Arthur Young in his “Tour through Ireland,” at the beginning of this century, already noticed the better nourishment of the latter. The reason is simply this, that poor Irish farmer is incomparably more humane than the rich English. As regards Wales, that which is said in the text holds only for the south-west. All the doctors there agree that the increase of the deathrate through tuberculosis, scrofula, etc., increases in intensity with the deterioration of the physical condition of the population, and all ascribe this deterioration to poverty. “His (the farm labourer’s) keep is reckoned at about five pence a day, but in many districts it was said to be of much less cost to the farmer,” [himself very poor].... “A morsel of the salt meat or bacon,.... salted and dried to the texture of mahogany, and hardly worth the difficult process of assimilation.... is used to flavour a large quantity of broth or gruel, of meal and leeks, and day after day this is the labourer’s dinner.” The advance of industry resulted for him, in this harsh and damp climate, in “the abandonment of the solid homespun clothing in favour of the cheap and so-called cotton goods,” and of stronger drinks for so-called tea. “The agriculturist, after several hours’ exposure to wind and rain, gains his cottage to sit by a fire of peat or of balls of clay and small coal kneaded together, from which volumes of carbonic and sulphurous acids are poured forth. His walls are of mud and stones, his floor the bare earth which was there before the but was built, his roof a mass of loose and sodden thatch. Every crevice is stopped to maintain warmth, and in an atmosphere of diabolic odour, with a mud floor, with his only clothes drying on his back, he often sups and sleeps with his wife and children. Obstetricians who have passed parts of the night in such cabins have described how they found their feet sinking in the mud of the floor, and they were forced (easy task) to drill a hole through the wall to effect a little private respiration. It was attested by numerous witnesses in various grades of life, that to these insanitary influences, and many more,

the underfed peasant was nightly exposed, and of the result, a debilitated and scrofulous people, there was no want of evidence.... The statements of the relieving officers of Carmarthenshire and Cardiganshire show in a striking way the same state of things. There is besides “a plague more horrible still, the great number of idiots.” Now a word on the climatic conditions. “A strong south-west wind blows over the whole country for 8 or 9 months in the year, bringing with it torrents of rain, which discharge principally upon the western slopes of the hills. Trees are rare, except in sheltered places, and where not protected, are blown out of all shape. The cottages generally crouch under some bank, or often in a ravine or quarry, and none but the smallest sheep and native cattle can live on the pastures.... The young people migrate to the eastern mining districts of Glamorgan and Monmouth. Carmarthenshire is the breeding ground of the mining population and their hospital. The population can therefore barely maintain its numbers.” Thus in Cardiganshire:

Scotland	48.980	2.348
Ireland	43.366	2.434.

“To the insufficient quantity and miserable quality of the house accommodation generally had,” says Dr. Simon, in his official Health Report, “by our agricultural labourers, almost every page of Dr. Hunter’s report bears testimony. And gradually, for many years past, the state of the labourer in these respects has been deteriorating, house-room being now greatly more difficult for him to find, and, when found, greatly less suitable to his needs than, perhaps, for centuries had been the case. Especially within the last twenty or thirty years, the evil has been in very rapid increase, and the household circumstances of the labourer are now in the highest degree deplorable. Except in so far as they whom his labour enriches, see fit to treat him with a kind of pitiful indulgence, he is quite peculiarly helpless in the matter. Whether he shall find house-room on the land which he contributes to till, whether the house-room which he gets shall be human or swineish, whether he shall have the little space of garden that so vastly lessens the pressure of his poverty — all this does not depend on his willingness and ability to pay reasonable rent for the decent accommodation he requires, but depends on the use which others may see fit to make of their ‘right to do as they will with their own.’ However large may be a farm, there is no law that a certain proportion of labourers’ dwellings (much less of decent dwellings) shall be upon it; nor does any law reserve for the labourer ever so little right in that soil to which his industry is as needful as sun and rain.... An extraneous element weighs the balance heavily against him....the influence of the Poor Law in its provisions concerning settlement and chargeability. Under this influence, each parish has a pecuniary interest in reducing to a minimum the number of its resident labourers: — for, unhappily, agricultural labour instead of implying a safe and permanent independence for the hard-working labourer and his family, implies for the most part only a longer or shorter circuit to eventual pauperism — a pauperism which, during the whole circuit, is so near, that any illness or temporary failure of occupation necessitates immediate recourse to parochial relief — and thus all residence of agricultural population in a parish is glaringly an addition to its poor rates.... Large proprietors ...have but to resolve that there shall be no labourers’ dwellings on their estates, and their estates will thenceforth be virtually free from half their responsibility for the poor. How far it has been intended, in the English constitution and law, that this kind of unconditional property in

land should be acquirable, and that a landlord, 'doing as he wills with his own,' should be able to treat the cultivators of the soil as aliens, whom he may expel from his territory, is a question which I do not pretend to discuss....for that (power) of eviction...does not exist only in theory. On a very large scale it prevails in practice — prevails...as a main governing condition in the household circumstances of agricultural labour.... As regards the extent of the evil, it may suffice to refer to the evidence which Dr. Hunter has compiled from the last census, that destruction of houses, notwithstanding increased local demands for them, had, during the last ten years, been in progress in 821 separate parishes or townships of England, so that irrespectively of persons who had been forced to become non-resident (that is in the parishes in which they work), these parishes and townships were receiving in 1861, as compared with 1851, a population $5\frac{1}{3}$ per cent. greater, into house-room $4\frac{1}{2}$ per cent. less.... When the process of depopulation has completed itself, the result, says Dr. Hunter, is a showvillage where the cottages have been reduced to a few, and where none but persons who are needed as shepherds, gardeners, or game-keepers, are allowed to live; regular servants who receive the good treatment usual to their class. But the land requires cultivation, and it will be found that the labourers employed upon it are not the tenants of the owner, but that they come from a neighboring open village, perhaps three miles off, where a numerous small proprietary had received them when their cottages were destroyed in the close villages around. Where things are tending to the above result, often the cottages which stand, testify, in their unrepaired and wretched condition, to the extinction to which they are doomed. They are seen standing in the various stages of natural decay. While the shelter holds together, the labourer is permitted to rent it, and glad enough he will often be to do so, even at the price of decent lodging. But no repair, no improvement shall it receive, except such as its penniless occupants can supply. And when at last it becomes quite uninhabitable — uninhabitable even to the humblest standard of serfdom — it will be but one more destroyed cottage, and future poor-rates will be somewhat lightened. While great owners are thus escaping from poor-rates through the depopulation of lands over which they have control, the nearest town or open village receive the evicted labourers: the nearest, I say, but this "nearest" may mean three or four miles distant from the farm where the labourer has his daily toil. To that daily toil there will then have to be added, as though it were nothing,

the daily need of walking six or eight miles for power of earning his bread. And whatever farm-work is done by his wife and children, is done at the same disadvantage. Nor is this nearly all the toil which the distance occasions him. In the open village, cottage-speculators bus scraps of land, which they throng as densely as they can with the cheapest of all possible hovels. And into those wretched habitations (which, even if they adjoin the open country, have some of the worst features of the worst town residences) crowd the agricultural labourers of England. ...Nor on the other hand must it be supposed that even when the labourer is housed upon the lands which he cultivates, his household circumstances are generally such as his life of productive industry would seem to deserve. Even on princely estates...his cottage...may be of the meanest description. There are landlords who deem any style good enough for their labourer and his family, and who yet do not disdain to drive with him the hardest possible bargain for rent. It may be but a ruinous one-bedroomed hut, having no fire-grate, no privy, no opening window, no water supply but the ditch, no garden — but the labourer is helpless against the wrong.... And the Nuisances Removal Acts...are...a mere dead letter...in great part dependent for their working on such cottage owners as the one from whom his (the labourer's) hovel is rented.... From brighter, but exceptional scenes, it is requisite in the interests of justice, that attention should again be drawn to the overwhelming preponderance of facts which are a reproach to the civilization of England. Lamentable indeed, must be the case, when, notwithstanding all that is evident with regard to the quality of the present accommodation, it is the common conclusion of competent observers that even the general badness of dwellings is an evil infinitely less urgent than their mere numerical insufficiency. For years the overcrowding of rural labourer's dwellings has been a matter of deep concern, not only to persons who care for sanitary good, but to persons who care for decent and moral life. For again and again in phrases so uniform that they seem stereotyped, reporters on the spread of epidemic disease in rural districts, have insisted on the extreme importance of that over-crowding, as an influence which renders it a quite hopeless task, to attempt the limiting of any infection which is introduced. And again and again it has been pointed out that, notwithstanding the many salubrious influences which there are in country life, the crowding which so favours the extension of contagious disease, also favours the origination of disease which is not contagious. And those who have denounced the over-crowded

state of our rural population have not been silent as to a further mischief. Even where their primary concern has been only with the injury to health, often almost perforce they have referred to other relations on the subject. In showing how frequently it happens that adult persons of both sexes, married and unmarried, are huddled together in single small sleeping rooms, their reports have carried the conviction that, under the circumstances they describe, decency must always be outraged, and morality almost of necessity must suffer. Thus, for instance, in the appendix of my last annual report, Dr. Ord, reporting on an outbreak of fever at Wing, in Buckinghamshire, mentions how a young man who had come thither from Wingrave with fever, "in the first days of his illness slept in a room with nine other persons. Within a fortnight several of these persons were attacked, and in the course of a few weeks five out of the nine had fever, and one died."...From Dr. Harvey, of St. George's Hospital, who, on private professional business, visited Wing during the time of the epidemic, I received information exactly in the sense of the above report.... "A young woman having fever, lay at night in a room occupied by her father and mother, her bastard child, two young men (her brothers), and her two sisters, each with a bastard child — 10 persons in all. A few weeks ago 13 persons slept in it."

Dr. Hunter investigated 5,375 cottages of agricultural labourers, not only in the purely agricultural districts, but in all counties of England. Of these, 2,195 had only one bedroom (often at the same time used as living-room), 2,930 only two, and 250, more than two. I will give a few specimens culled from a dozen counties.

BEDFORDSHIRE.

Wrestlingworth. Bedrooms about 12 feet long and 10 broad, although many are smaller than this. The small, one-storied cots are often divided by partitions into two bedrooms, one bed frequently in a kitchen, 5 feet 6 inches in height. Rent, £3 a year. The tenants have to make their own privies, the landlord only supplies a hole. As soon as one has made a privy, it is made use of by the whole neighborhood. One house, belonging to a family called Richardson, was of quite unapproachable beauty. "Its plaster walls bulged very like a lady's dress in a curtsey. One gable end was convex, the other concave, and on this last, unfortunately, stood the chimney, a curved tube of clay and wood like an elephant's trunk. A long

stick served as prop to prevent the chimney from falling. The doorway and window were rhomboidal." Of 17 houses visited, only 4 had more than one bedroom, and those four overcrowded. The cots with one bedroom sheltered 3 adults and 3 children, a married couple with 6 children, 8c.

Dunton. High rents, from £4 to £5; weekly wages of the man, 10s. They hope to pay the rent by the straw-plaiting of the family. The higher the rent, the greater the number that must work together to pay it. Six adults, living with 4 children in one sleeping apartment, pay £3 10s. for it. The cheapest house in Dunton, 15 feet long externally, 10 broad, let for £3. Only one of the houses investigated had 2 bedrooms. A little outside the village, a house whose "tenants dinged against the house-side," the lower 9 inches of the door eaten away through sheer rottenness; the doorway, a single opening closed at night by a few bricks, ingeniously pushed up after shutting and covered with some matting. Half a window, with glass and frame, had gone the way of all flesh. Here, without furniture, huddled together, were 3 adults and 5 children. Dunton is not worse than the rest of Biggleswade Union.

BERKSHIRE.

Beenham. In June, 1864, a man, his wife and 4 children lived in a cot (one-storied cottage). A daughter came home from service with scarlet fever. She died. One child sickened and died. The mother and one child were down with typhus when Dr. Hunter was called in. The father and one child slept outside, but the difficulty of securing isolation was seen here, for in the crowded market of the miserable village lay the linen of the fever-stricken household, waiting for the wash. The rent of H.'s house, 1s. a week; one bedroom for man, wife, and 6 children. One house let for 8d. a-week, 14 feet 6 inches long, 7 feet broad; kitchen, 6 feet high; the bedroom without window, fire-place, door, or opening, except into the lobby; no garden. A man lived here for a little while, with two grown-up daughters and one grown-up son; father and son slept on the bed, the girls in the passage. Each of the latter had a child while the family was living here, but one went to the workhouse for her confinement and then came home.

BUCKINGHAMSHIRE.

30 cottages — on 1,000 acres of land — contained here about 130-140 persons. The parish of Bradenham comprises 1,000 acres; it numbered, in 1851, 36 houses and a population of 84 males and 54 females. This inequality of the sexes was partly remedied in 1861, when they numbered

98 males and 87 females; increase in 10 years of 14 men and 33 women. Meanwhile, the number of houses was one less.

Winslow. Great part of this newly built in good style; demand for houses appears very marked, since very miserable cots let at 1s. to 1s. 3d. per week.

Water Eaton. Here the landlords, in view of the increasing population, have destroyed about 20 per cent. of the existing houses. A poor labourer, who had to go about 4 miles to his work, answered the question, whether he could not find a cot nearer: "No; they know better than to take a man in with my large family."

Tinker's End, near Winslow. A bedroom in which were 4 adults and 4 children; 11 feet long, 9 feet broad, 6 feet 5 inches high at its highest part; another 11 feet 3 inches by 9 feet, 5 feet 10 inches high, sheltered 6 persons. Each of these families had less space than is considered necessary for a convict. No house had more than one bedroom, not one of them a back-door; water very scarce; weekly rent from 1s. 4d. to 2s. In 16 of the houses visited, only 1 man that earned 10s. a week. The quantity of air for each person under the circumstances just described corresponds to that which he would have if he were shut up in a box of 4 feet measuring each way, the whole night. But then, the ancient dens afforded a certain amount of unintentional ventilation.

CAMBRIDGESHIRE.

Gamblingay belongs to several landlords. It contains the wretchedest cots to be found anywhere. Much straw-plaiting. "A deadly lassitude, a hopeless surrendering up to filth," reigns in Gamblingay. The neglect in its centre, becomes mortification at its extremities, north and south, where the houses are rotting to pieces. The absentee landlords bleed this poor rookery too freely. The rents are very high; 8 or 9 persons packed in one sleeping apartment, in 2 cases 6 adults, each with 1 or 2 children in one small bedroom.

ESSEX.

In this county, diminutions in the number of persons and of cottages go, in many parishes, hand in hand. In not less than 22 parishes, however, the destruction of houses has not prevented increase of population, or has not brought about that expulsion which, under the name "migration to towns," generally occurs. In Fingringhoe, a parish of 3443 acres, were in 1851, 145 houses; in 1861, only 110. But the people did not wish to go away, and

managed even to increase under these circumstances. In 1851, 252 persons inhabited 61 houses, but in 1861, 262 persons were squeezed into 49 houses. In Basilden, in 1851, 157 persons lived on 1827 acres, in 35 houses; at the end of ten years, 180 persons in 27 houses. In the parishes of Fingringhoe, South Farnbridge, Widford, Basilden, and Ramsden Craggs, in 1851, 1392 persons were living on 8449 acres in 316 houses; in 1861, on the same area, 1473 persons in 249 houses.

HEREFORDSHIRE.

This little county has suffered more from the “eviction-spirit” than any other in England. At Nadby, over-crowded cottages generally, with only 2 bedrooms, belonging for the most part to the farmers. They easily let them for £3 or £4 a-year, and paid a weekly wage of 9s.

HUNTINGDON.

Hartford had, in 1851, 87 houses; shortly after this, 19 cottages were destroyed in this small parish of 1720 acres; population in 1831, 452; in 1852, 832; and in 1861, 341. 14 cottages, each with 1 bedroom, were visited. In one, a married couple, 3 grown-up sons, 1 grown-up daughter, 4 children — in all 10; in another, 3 adults, 6 children. One of these rooms, in which 8 people slept, was 12 feet 10 inches long, 12 feet 2 inches broad, 6 feet 9 inches high: the average, without making any deduction for projections into the apartment, gave about 130 cubic feet per head. In the 14 sleeping rooms, 34 adults and 33 children. These cottages are seldom provided with gardens, but many of the inmates are able to farm small allotments at 10s. or 12s. per rood. These allotments are at a distance from the houses, which are without privies. The family “must either go to the allotment to deposit their ordures,” or, as happens in this place, saving your presence, “use a closet with a trough set like a drawer in a chest of drawers, and drawn out weekly and conveyed to the allotment to be emptied where its contents were wanted.” In Japan, the circle of life-conditions moves more decently than this.

LINCOLNSHIRE.

Langtoft. A man lives here, in Wright’s house, with his wife, her mother, and 5 children; the house has a front kitchen, scullery, bedroom over the front kitchen; front kitchen and bedroom, 12 feet 2 inches by 9 feet 5 inches; the whole ground floor, 21 feet 2 inches by 9 feet 5 inches. The bedroom is a garret; the walls run together into the roof like a sugar-loaf, a

dormer-window opening in front. "Why did he live here? On account of the garden? No; it is very small. Rent? High, 1s. 3d. per week. Near his work? No; 6 miles away, so that he walks daily, to and fro, 12 miles. He lived there, because it was a tenantable cot," and because he wanted to have a cot for himself alone, anywhere, at any price, and in any conditions. The following are the statistics of 12 houses in Langtoft, with 12 bedrooms, 38 adults, and 36 children.

TWELVE HOUSES IN LANGTOFT.

Houses.	Bedrooms.	Adults.	Children.	Number of persons.	Houses.	Bedrooms.	Adults.	Children.	Number of persons.
No. 1.	1	3	5	8	No. 7.	1	3	3	6

" 5.	1	2	2	4	" 11.	1	3	3	6
" 6.	1	5	3	8	" 12.	1	2	4	6

KENT.

Kennington, very seriously over-populated in 1859, when diphtheria appeared, and the parish doctor instituted a medical inquiry into the condition of the poorer classes. He found that in this locality, where much labour is employed, various cots had been destroyed and no new ones built. In one district stood four houses, named birdcages; each had 4 rooms of the following dimensions in feet and inches:

Kitchen; 9 ft. by 58 ft. 11 by 6 ft. 6

Scullery: 8 ft. 6 by 4 ft. 6 by 6 ft. 6.

Bedroom: 8 ft. 5 by 5 ft. 10 by 6 ft. 3.

Bedroom: 8 ft. 3 by 8 ft. 4 by 6 ft. 3.

NORTHAMPTONSHIRE.

Brinworth, Pickford and Floore: in these villages in the winter 20-30 men were lounging about the streets from want of work. The farmers do not always till sufficiently the corn and turnip lands, and the landlord has found it best to throw all his farms together into 2 or 3. Hence want of employment. Whilst on one side of the wall, the land calls for labour, on the other side the defrauded labourers are casting at it longing glances. Feverishly overworked in summer, and half-starved in winter, it is no wonder if they say in their peculiar dialect, "the parson and gentlefolk seem frit to death at them."

At Floore, instances, in one bedroom of the smallest size, of couples with 4, 5, 6 children; 3 adults with 5 children; a couple with grandfather and 6 children down with scarlet fever, 8c.; in two houses with two bedrooms, two families of 8 and 9 adults respectively.

WILTSHIRE.

Stratton. 31 houses visited, 8 with only one bedroom, Pentill, in the same parish: a cot let at 1s. 3d. weekly with 4 adults and 4 children, had nothing good about it, except the walls, from the floor of rough-hewn pieces of stones to the roof of worn-out thatch.

WORCESTERSHIRE.

House-destruction here not quite so excessive; yet from 1851 to 1861, the number of inhabitants to each house on the average, has risen from 4.2 to 4.6.

Badsey. Many cots and little gardens here. Some of the farmers declare that the cots are "a great nuisance here, because they bring the poor." On the statement of one gentleman: "The poor are none the better for them; if you build 500 they will let fast enough, in fact, the more you build, the more they want," (according to him the houses give birth to the inhabitants, who then by a law of Nature press on "the means of housing"). Dr. Hunter remarks: "Now these poor must come from somewhere, and as there is no particular attraction, such as doles, at Badsey, it must be repulsion from some other unfit place, which will send them here. If each could find an allotment near his work, he would not prefer Badsey, where he pays for his scrap of ground twice as much as the farmer pays for his."

The continual emigration to the towns, the continual formation of surplus-population in the country through the concentration of farms,

conversion of arable land into pasture, machinery, &c., and the continual eviction of the agricultural population by the destruction of their cottages, go hand in hand. The more empty the district is of men, the greater is its “relative surplus-population,” the greater is their pressure on the means of employment, the greater is the absolute excess of the agricultural population over the means for housing it, the greater, therefore, in the villages is the local surplus-population and the most pestilential packing together of human beings. The packing together of knots of men in scattered little villages and small country towns corresponds to the forcible draining of men from the surface of the land. The continuous superseding of the agricultural labourers, in spite of their diminishing number and the increasing mass of their products, gives birth to their pauperism. Their pauperism is ultimately a motive to their eviction and the chief source of their miserable housing which breaks down their last power of resistance, and makes them mere slaves of the landed proprietors and the farmers. Thus the minimum of wages becomes a law of Nature to them. On the other hand, the land, in spite of its constant “relative surplus-population,” is at the same time under-populated. This is seen, not only locally at the points where the efflux of men to towns, mines, railroad-making, &c., is most marked. It is to be seen everywhere, in harvest-time as well as in spring and summer, at those frequently recurring times when English agriculture, so careful and intensive, wants extra hands. There are always too many agricultural labourers for the ordinary, and always too few for the exceptional or temporary needs of the cultivation of the soil. Hence we find in the official documents contradictory complaints from the same places of deficiency and excess of labour simultaneously. The temporary or local want of labour brings about no rise in wages, but a forcing of the women and children into the fields, and exploitation at an age constantly lowered. As soon as the exploitation of the women and children takes place on a larger scale, it becomes in turn a new means of making a surplus-population of the male agricultural labourer and of keeping down his wage. In the east of England thrives a beautiful fruit of this vicious circle — the so-called gang-system, to which I must briefly return here.

The gang-system obtains almost exclusively in the counties of Lincoln, Huntingdon, Cambridge, Norfolk, Suffolk, and Nottingham, here and there in the neighbouring counties of Northampton, Bedford, and Rutland. Lincolnshire will serve us as an example. A large part of this country is new

land. marsh formerly, or even, as in others of the eastern counties just named, won lately from the sea. The steam-engine has worked wonders in the way of drainage. What were once fens and sandbanks, bear now a luxuriant sea of corn and the highest of rents. The same thing holds of the alluvial lands won by human endeavor, as in the island of Axholme and other parishes on the banks of the Trent. In proportion as the new farms arose, not only were no new cottages built: old ones were demolished, and the supply of labour had to come from open villages, miles away, by long roads that wound along the sides of the hills. There alone had the population formerly found shelter from the incessant floods of the wintertime. The labourers that dwell on the farms of 400-1000 acres (they are called "confined labourers") are solely employed on such kinds of agricultural work as is permanent, difficult, and carried on by aid of horses. For every 100 acres there is, on an average, scarcely one cottage. A fen farmer, e.g., gave evidence before the Commission of Inquiry: "I farm 320 acres, all arable land. I have not one cottage on my farm. I have only one labourer on my farm now. I have four horsemen lodging about. We get light work done by gangs." The soil requires much light field labour, such as weeding, hoeing, certain processes of manuring, removing of stones, &c. This is done by the gangs, or organised bands that dwell in the open villages.

The gang consists of 10 to 40 or 50 persons, women, young persons of both sexes (13-18 years of age, although the boys are for the most part eliminated at the age of 13), and children of both sexes (6-13 years of age). At the head is the gang-master, always an ordinary agricultural labourer, generally what is called a bad lot, a scapegrace, unsteady, drunken, but with a dash of enterprise and savior faire. He is the recruiting-sergeant for the gang, which works under him, not under the farmer. He generally arranges with the latter for piece-work, and his income, which on the average is not very much above that of an ordinary agricultural labourer, depends almost entirely upon the dexterity with which he manages to extract within the shortest time the greatest possible amount of labour from his gang. The farmers have discovered that women work steadily only under the direction of men, but that women and children, once set going, impetuously spend their life-force — as Fourier knew — while the adult male labourer is shrewd enough to economise his as much as he can. The gang-master goes from one farm to another, and thus employs his gang from 6 to 8 months in

the year. Employment by him is, therefore, much more lucrative and more certain for the labouring families, than employment by the individual farmer, who only employs children occasionally. This circumstance so completely rivets his influence in the open villages that children are generally only to be hired through his instrumentality. The lending out of these individually, independently of the gang, is his second trade.

The “drawbacks” of the system are the over-work of the children and young persons, the enormous marches that they make daily to and from the farms, 5, 6, and sometimes 7 miles distant, finally, the demoralisation of the gang. Although the gangmaster, who, in some districts is called “the driver,” is armed with a long stick, he uses it but seldom, and complaints of brutal treatment are exceptional. He is a democratic emperor, or a kind of Pied Piper of Hamelin. He must therefore be popular with his subjects, and he binds them to himself by the charms of the gipsy life under his direction. Coarse freedom, a noisy jollity, and obscenest impudence give attractions to the gang. Generally the gangmaster pays up in a public house; then he returns home at the head of the procession reeling drunk, propped up right and left by a stalwart virago, while children and young persons bring up the rear, boisterous, and singing chaffing and bawdy songs. On the return journey what Fourier calls “phanerogamie,” is the order of the day. The getting with child of girls of 13 and 14 by their male companions of the same age, is common. The open villages which supply the contingent of the gang, become Sodoms and Gomorrahs, and have twice as high a rate of illegitimate births as the rest of the kingdom. The moral character of girls bred in these schools, when married women, was shown above. Their children, when opium does not give them the finishing stroke, are born recruits of the gang.

The gang in its classical form just described, is called the public, common, or tramping gang. For there are also private gangs. These are made up in the same way as the common gang, but count fewer members, and work, not under a gangmaster, but under some old farm servant, whom the farmer does not know how to employ in any better way. The gipsy fun has vanished here, but according to all witnesses, the payment and treatment of the children is worse.

The gang-system, which during the last years has steadily increased, clearly does not exist for the sake of the gangmaster. It exists for the enrichment of the large farmers, and indirectly of the landlords. For the

farmer there is no more ingenious method of keeping his labourers well below the normal level, and yet of always having an extra hand ready for extra work, of extracting the greatest possible amount of labour with the least possible amount of money, and of making adult male labour “redundant.” From the exposition already made, it will be understood why, on the one hand, a greater or less lack of employment for the agricultural labourer is admitted, while on the other, the gang-system is at the same time declared “necessary” on account of the want of adult male labour and its migration to the towns. The cleanly weeded land, and the uncleanly human weeds, of Lincolnshire, are pole and counterpole of capitalistic production.

(f.) IRELAND.

In concluding this section, we must travel for a moment to Ireland. First, the main facts of the case.

The population of Ireland had, in 1841, reached 8,222,664; in 1851, it had dwindled to 6,623,985; in 1861, to 5,850,309; in 1866, to 5½ millions, nearly to its level in 1801. The diminution began with the famine year, 1846, so that Ireland, in less than twenty years, lost more than 5/16 ths of its people.

Table A.

LIVE STOCK.

Year.	HORSES.		CATTLE.		
	Total Number.	Decrease.	Total Number.	Decrease.	Increase.
1860	619,811		3,606,374		
1861	614,232	5,993	3,471,688	138,316	
1862	602,894	11,338	3,254,890	216,798	
1863	579,978	22,916	3,144,231	110,695	
1864	562,158	17,820	3,262,294		118,063
1865	547,867	14,291	3,493,414		231,120

Its total emigration from May, 1851, to July, 1865, numbered 1,591,487: the emigration during the years 1861-1865 was more than half-a-million. The number of inhabited houses fell, from 1851-1861, by 52,990. From 1851-1861, the number of holdings of 15 to 30 acres increased 61,000, that of holdings over 30 acres, 109,000, whilst the total number of all farms fell 120,000, a fall, therefore, solely due to the suppression of farms under 15 acres — i.e., to their centralisation.

Year.	SHEEP.			PIGS.		
	Total Number.	Decrease.	Increase.	Total Number.	Decrease.	Increase.
1860	3,542,080			1,271,072		
1861	3,556,050		13,970	1,102,042	169,030	
1862	3,456,132	99,918		1,154,324		52,282
1863	3,308,204	147,982		1,067,458	86,866	
1864	3,366,941		58,737	1,058,480	8,978	
1865	3,688,742		321,801	1,299,893		241,413

The decrease of the population was naturally accompanied by a decrease in the mass of products. For our purpose, it suffices to consider the 5 years from 1861-1865 during which over half-a-million emigrated, and the absolute number of people sank by more than 1/3 of a million.

From the above tables it results: —

HORSES.	CATTLE.	SHEEP.	Pigs.
Absolute Decrease.	Absolute Decrease.	Absolute Increase.	Absolute Increase.
72,358	110,626	146,608	28,819 ¹

¹ The result would be found yet more unfavourable if we went further back. Thus: Sheep in 1865, 3,688,742, but in 1866, 3,694,294. Pigs in 1865, 1,290,898, but in 1866, 1,409,683.

Let us now turn to agriculture, which yields the means of subsistence for cattle and for men. In the following table is calculated the decrease or increase for each separate year, as compared with its immediate predecessor. The Cereal Crops include wheat, oats, barley, rye, beans and peas; the Green Crops, potatoes, turnips, mangolds, beet-root, cabbages, carrots, parsnips, vetches, &c.

Table B.

**INCREASE OR DECREASE IN THE AREA UNDER CROPS AND
GRASS IN ACREAGE.**

Year.	Cereal Crops.	Green Crops.		Grass and Clover.		Flax.		Total Cultivated Land.	
	Decrease.	Decrease.	Increase.	Decrease.	Increase.	Decrease.	Increase.	Decrease.	Increase.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
1861	15,701	86,974		47,969			19,271	81,973	
1862	72,734	74,735			8,623		2,055	188,841	
1863	144,719	19,858			7,724		63,922	92,431	
1864	122,487	2,817			47,466		87,761		10,468
1865	72,450		25,241		68,970	50,159		29,215	
1861-65	488,041	107,984			82,834		122,850	830,890	

In the year 1865, 127,470 additional acres came under the heading "grass land," chiefly because the area under the heading of "bog and waste unoccupied," decreased by 101,543 acres. If we compare 1865 with 1864, there is a decrease in cereals of 246,667 qrs., of which 48,999 were wheat, 160,605 oats, 29,892 barley, &c.: the decrease in potatoes was 446,398 tons, although the area of their cultivation increased in 1865.

¹Tenth Report of the Commissioners of Inland Revenue. Lond. 1866.

Under Schedule D. the average annual increase of income from 1853-1864 was only 0.93; whilst, in the same period, in Great Britain, it was 4.58. Table E, , shows the distribution of the profits (with the exception of those of farmers) for the years 1864 and 1865.

England, a country with fully developed capitalist production, and pre-eminently industrial, would have bled to death with such a drain of population as Ireland has suffered. But Ireland is at present only an agricultural district of England, marked off by a wide channel from the country to which it yields corn, wool, cattle, industrial and military recruits.

Table E.

SCHEDULE D. INCOME FROM PROFITS (OVER £60) IN
IRELAND.

The depopulation of Ireland has thrown much of the land out of cultivation, has greatly diminished the produce of the soil, and, in spite of the greater area devoted to cattle breeding, has brought about, in some of its branches, an absolute diminution, in others, an advance scarcely worthy of mention, and constantly interrupted by retrogressions. Nevertheless, with the fall in numbers of the population, rents and farmers' profits rose, although the latter not as steadily as the former. The reason of this is easily comprehensible. On the one hand, with the throwing of small holdings into large ones, and the change of arable into pasture land, a larger part of the whole produce was transformed into surplus produce. The surplus produce increased, although the total produce, of which it formed a fraction, decreased. On the other hand, the money-value of this surplus produce increased yet more rapidly than its mass, in consequence of the rise in the

English market-price of meat, wool, 8c., during the last 20, and especially during the last 10, years.

The scattered means of production that serve the producers themselves as means of employment and subsistence, without expanding their own value by the incorporation of the labour of others, are no more capital than a product consumed by its own producer is a commodity. If, with the mass of the population, that of the means of production employed in agricultural also diminished, the mass of the capital employed in agriculture increased, because a part of the means of production that were formerly scattered, was concentrated and turned into capital.

The total capital of Ireland outside agriculture, employed in industry and trade, accumulated during the last two decades slowly, and with great and constantly recurring fluctuations; so much the more rapidly did the concentration of its individual constituents develop. And, however small its absolute increase, in proportion to the dwindling population it had increased largely.

Here, then, under our own eyes and on a large scale, a process is revealed, than which nothing more excellent could be wished for by orthodox economy for the support of its dogma: that misery springs from absolute surplus-population, and that equilibrium is re-established by depopulation. This is a far more important experiment than was the plague in the middle of the 14th century so belauded of Malthusians. Note further: If only the naïveté of the schoolmaster could apply, to the conditions of production and population of the nineteenth century, the standard of the 14th, this naïveté, into the bargain, overlooked the fact that whilst, after the plague and the decimation that accompanied it, followed on this side of the channel, in England, enfranchisement and enrichment of the agricultural population, on that side, in France, followed greater servitude and more misery.

The Irish famine of 1846 killed more than 1,000,000 people, but it killed poor devils only. To the wealth of the country it did not the slightest damage. The exodus of the next 20 years, an exodus still constantly increasing did not, as, e.g., the thirty years' war, decimate, along with the human beings, their means of production. Irish genius discovered an altogether new way of spiriting a poor people thousands of miles away from the scene of its misery. The exiles transplanted to the United States, send home sums of money every year as travelling expenses for those left

behind. Every troop that emigrates one year, draws another after it the next. Thus, instead of costing Ireland anything, emigration forms one of the most lucrative branches of its export trade. Finally, it is a systematic process, which does not simply make a passing gap in the population, but sucks out of it every year more people than are replaced by the births, so that the absolute level of the population falls year by year.

What were the consequences for the Irish labourers left behind and freed from the surplus-population? That the relative surplus-population is to-day as great as before 1846; that wages are just as low, that the oppression of the labourers has increased, that misery is forcing the country towards a new crisis. The facts are simple. The revolution in agriculture has kept pace with emigration. The production of relative surplus population has more than kept pace with the absolute depopulation. A glance at table C shows that the change of arable to pasture land must work yet more acutely in Ireland than in England. In England the cultivation of green crops increases with the breeding of cattle; in Ireland, it decreases. Whilst large number of acres, that were formerly tilled, lie idle or are turned permanently into grassland, a great part of the waste land and peat bogs that were unused formerly, become of service for the extension of cattle-breeding. The smaller and medium farmers — I reckon among these all who do not cultivate more than 100 acres — still make up about 8/10 ths of the whole number. They are, one after the other, and with a degree of force unknown before, crushed by the competition of an agriculture managed by capital, and therefore they continually furnish new recruits to the class of wage-labourers. The one great industry of Ireland, linen-manufacture, requires relatively few adult men and only employs altogether, in spite of its expansion since the price of cotton rose in 1861-1866, a comparatively insignificant part of the population. Like all the other great modern industries, it constantly produces, by incessant fluctuations, a relative surplus-population within its own sphere, even with an absolute increase in the mass of human beings absorbed by it. The misery of the agricultural population forms the pedestal for gigantic shirt-factories, whose armies of labourers are, for the most part, scattered over the country. Here, we encounter again the system described above of domestic industry, which in under-payment and over-work, possesses its own systematic means for creating supernumerary labourers. Finally, although the depopulation has not such destructive consequences as would result in a country with fully developed capitalistic production, it

does not go on without constant reaction upon the home-market. The gap which emigration causes here, limits not only the local demand for labour, but also the incomes of small shopkeepers, artisans, tradespeople generally. Hence the diminution in incomes between £60 and £100 in table E.

A clear statement of the condition of the agricultural labourers in Ireland is to be found in the Reports of the Irish Poor Law Inspectors (1870). Officials of a government which is maintained only by bayonets and by a state of siege, now open, now disguised, they have to observe all the precautions of language that their colleagues in England disdain. In spite of this, however, they do not let their government cradle itself in illusions. According to them the rate of wages in the country, still very low, has within the last 20 years risen 50-60 per cent., and stands now, on the average, at 6s. to 9s. per week. But behind this apparent rise, is hidden an actual fall in wages, for it does not correspond at all to the rise in price of the necessary means of subsistence that has taken place in the meantime. For proof, the following extract from the official accounts of an Irish workhouse.

AVERAGE WEEKLY COST PER HEAD.

Year ended	Provisions and Necessaries.	Clothing.	Total.
29th Sept. 1849	1s. 3½d.	3d.	1s. 6½d.
" 1869	2s. 7½d.	6d.	3s. 1½d.

The price of the necessary means of subsistence is therefore fully twice, and that of clothing exactly twice, as much as they were 20 years before.

Even apart from this disproportion, the mere comparison of the rate of wages expressed in gold would give a result far from accurate. Before the famine, the great mass of agricultural wages were paid in kind, only the smallest part in money; to-day, payment in money is the rule. From this it follows that, whatever the amount of the real wage, its money rate must rise. "Previous to the famine, the labourer enjoyed his cabin...with a rood, or half-acre or acre of land, and facilities for.... a crop of potatoes. He was able to rear his pig and keep fowl.... But they now have to buy bread, and they have no refuse upon which they can feed a pig or fowl, and they have

consequently no benefit from the sale of a pig, fowl, or eggs.” In fact, formerly, the agricultural labourers were but the smallest of the small farmers, and formed for the most part a kind of rearguard of the medium and large farms on which they found employment. Only since the catastrophe of 1846 have they begun to form a fraction of the class of purely wage-labourers, a special class, connected with its wage-masters only by monetary relations.

We know what were the conditions of their dwellings in 1846. Since then they have grown yet worse. A part of the agricultural labourers, which, however, grows less day by day, dwells still on the holdings of the farmers in over-crowded huts, whose hideousness far surpasses the worst that the English agricultural labourers offered us in this way. And this holds generally with the exception of certain tracts of Ulster; in the south, in the counties of Cork, Limerick, Kilkenny, 8c.; in the east, in Wicklow, Wexford, 8c.; in the centre of Ireland, in King’s and Queen’s County, Dublin, 8c.; in the west, in Sligo, Roscommon, Mayo, Galway, 8c. “The agricultural labourers’ huts,” an inspector cries out, “are a disgrace to the Christianity and to the civilisation of this country.” In order to increase the attractions of these holes for the labourers, the pieces of land belonging thereto from time immemorial, are systematically confiscated. “The mere sense that they exist subject to this species of ban, on the part of the landlords and their agents, has...given birth in the minds of the labourers to corresponding sentiments of antagonism and dissatisfaction towards those by whom they are thus led to regard themselves as being treated as...a proscribed race.”

The first act of the agricultural revolution was to sweep away the huts situated on the field of labour. This was done on the largest scale, and as if in obedience to a command from on high. Thus many labourers were compelled to seek shelter in villages and towns. There they were thrown like refuse into garrets, holes, cellars and corners, in the worst back slums. Thousands of Irish families, who according to the testimony of the English, eaten up as these are with national prejudice, are notable for their rare attachment to the domestic hearth, for their gaiety and the purity of their home-life, found themselves suddenly transplanted into hotbeds of vice. The men are now obliged to seek work of the neighboring farmers and are only hired by the day, and therefore under the most precarious forms of wage. Hence “they sometimes have long distances to go to and from work,

often get wet, and suffer much hardship, not unfrequently ending in sickness, disease and want.”

“The towns have had to receive from year to year what was deemed to be the surplus-labour of the rural division;” and then people still wonder “there is still a surplus of labour in the towns and villages, and either a scarcity or a threatened scarcity in some of the country divisions.” The truth is that this want only becomes perceptible “in harvest-time, or during spring, or at such times as agricultural operations are carried on with activity; at other periods of the year many hands are idle;” that “from the digging out of the main crop of potatoes in October until the early spring following...there is no employment for them;” and further, that during the active times they “are subject to broken days and to all kinds of interruptions.”

These results of the agricultural revolution — i.e., the change of arable into pasture land, the use of machinery, the most rigorous economy of labour, &c., are still further aggravated by the model landlords, who, instead of spending their rents in other countries, condescend to live in Ireland on their demesnes. In order that the law of supply and demand may not be broken, these gentlemen draw their “labour-supply...chiefly from their small tenants, who are obliged to attend when required to do the landlord’s work, at rates of wages, in many instances, considerably under the current rates paid to ordinary labourers, and without regard to the inconvenience or loss to the tenant of being obliged to neglect his own business at critical periods of sowing or reaping.”

The uncertainty and irregularity of employment, the constant return and long duration of gluts of labour, all these symptoms of a relative surplus-population, figure therefore in the reports of the Poor Law administration, as so many hardships of the agricultural proletariat. It will be remembered that we met, in the English agricultural proletariat, with a similar spectacle. But the difference is that in England, an industrial country, the industrial reserve recruits itself from the country districts, whilst in Ireland, an agricultural country, the agricultural reserve recruits itself from the towns, the cities of refuge of the expelled agricultural labourers. In the former, the supernumeraries of agriculture are transformed into factory-operatives; in the latter, those forced into the towns, whilst at the same time they press on the wages in towns, remain agricultural labourers, and are constantly sent back to the country districts in search of work.

The official inspectors sum up the material condition of the agricultural labourer as follows: "Though living with the strictest frugality, his own wages are barely sufficient to provide food for an ordinary family and pay his rent, and he depends upon other sources for the means of clothing himself, his wife, and children...The atmosphere of these cabins, combined with the other privations they are subjected to, has made this class particularly susceptible to low fever and pulmonary consumption." After this, it is no wonder that, according to the unanimous testimony of the inspectors, a sombre discontent runs through the ranks of this class, that they long for the return of the past, loathe the present, despair of the future, give themselves up to "to the evil influence of agitators," and have only one fixed idea, to emigrate to America. This is the land of Cockaigne, into which the great Malthusian panacea, depopulation, has transformed green Erin.

What a happy life the Irish factory operative leads, one example will show: "On my recent visit to the North of Ireland," says the English Factory Inspector, Robert Baker, "I met with the following evidence of effort in an Irish skilled workman to afford education to his children; and I give his evidence verbatim, as I took it from his mouth. That he was a skilled factory hand, may be understood when I say that he was employed on goods for the Manchester market. 'Johnson. — I am a beetler and work from 6 in the morning till 11 at night, from Monday till Friday. Saturday we leave off at 6 p.m., and get three hours of it (for meals and rest). I have five children in all. For this work I get 10s. 6d. a week; my wife works here also, and gets 5s. a week. The oldest girl who is 12, minds the house. She is also cook, and all the servant we have. She gets the young ones ready for school. A girl going past the house wakes me at half past five in the morning. My wife gets up and goes along with me. We get nothing (to eat) before we come to work. The child of 12 takes care of the little children all the day, and we get nothing till breakfast at eight. At eight we go home. We get tea once a week; at other times we get stirabout, sometimes of oatmeal, sometimes of Indian meal, as we are able to get it. In the winter we get a little sugar and water to our Indian meal. In the summer we get a few potatoes, planting a small patch ourselves; and when they are done we get back to stirabout. Sometimes we get a little milk as it may be. So we go on from day to day, Sunday and week day, always the same the year round. I am always very much tired when I have done at night. We may see a bit of flesh meat

sometimes, but very seldom. Three of our children attend school, for whom we pay 1d. a week a head. Our rent is 9d. a week. Peat for firing costs 1s. 6d. a fortnight at the very lowest.” Such are Irish wages, such is Irish life!

In fact the misery of Ireland is again the topic of the day in England. At the end of 1866 and the beginning of 1867, one of the Irish land magnates, Lord Dufferin, set about its solution in the “Times.” “Wie menschlich von solch grossem Herrn!”

From Table E. we saw that, during 1864, of £4,368,610 of total profits, three surplus-value makers pocketed only £262,610; that in 1865, however, out of £4,669,979 total profits, the same three virtuosi of “abstinence” pocketed £274,448; in 1864, 26 surplus-value makers reached to £646,377; in 1865, 28 surplus-value makers reached to £736,448; in 1864, 121 surplus-value makers, £1,066,912; in 1865, 186 surplus-value makers, £1,320,996; in 1864, 1131 surplus-value makers £2,150,818, nearly half of the total annual profit; in 1865, 1194 surplus-value makers £2,418,933, more than half of the total annual profit. But the lion’s share, which an inconceivably small number of land magnates in England, Scotland and Ireland swallow up of the yearly national rental, is so monstrous that the wisdom of the English state does not think fit to afford the same statistical materials about the distribution of rents as about the distribution of profits. Lord Dufferin is one of those land magnates. That rent-rolls and profits can ever be “excessive,” or that their plethora is in any way connected with plethora of the people’s misery is, an idea as “disreputable” as “unsound.” He keeps to facts. The fact is that, as the Irish population diminishes, the Irish rent-rolls swell; that depopulation benefits the landlords, therefore also benefits the soil, and, therefore the people, that were accessory of the soil. He declares, therefore, that Ireland is still over-populated, and the stream of emigration still flows too lazily. To be perfectly happy, Ireland must get rid of at least one-third of a million of labouring men. Let no man imagine that this lord, poetic into the bargain, is a physician of the school of Sangrado, who as often as he did not find his patient better, ordered phlebotomy and again phlebotomy, until the patient lost his sickness at the same time as his blood. Lord Dufferin demands a new blood-letting of one-third of a million only, instead of about two millions; in fact, without the getting rid of these, the millennium in Erin is not to be. The proof is easily given.

Centralisation has from 1851 to 1861 destroyed principally farms of the first three categories, under 1 and not over 15 acres. These above all must disappear. This gives 307,058

NUMBER AND EXTENT OF FARMS IN IRELAND IN 1864.

(1) Farms not over 1 acre.		(2) Farms over 1, not over 5 acres.		(3) Farms over 5, not over 15 acres.		(4) Farms over 15, not over 30 acres.	
No.	Acres.	No.	Acres.	No.	Acres.	No.	Acres.
48,633	25,394	82,037	236,916	175,368	1,386,310	136,673	3,061,348

(5) Farms over 30, not over 50 acres.		(6) Farms over 50, not over 100 acres.		(7) Farms over 100 acres.		(8) Total area.
No.	Acres.	No.	Acres.	No.	Acres.	Acres.
71,961	2,906,273	54,247	3,963,680	31,927	8,227,907	26,319,924

“supernumerary” farmers, and reckoning the families the low average of 4 persons 1,228,232 persons. On the extravagant supposition that, after the agricultural revolution is complete, one-fourth of these are again absorbable, there remain for emigration 921,174 persons. Categories, 4, 5, 6, of over 15 and not over 100 acres, are, as was known long since in England, too small for capitalistic cultivation of corn, and for sheep-breeding are almost vanishing quantities. On the same supposition as before, therefore, there are further 788,761 persons to emigrate; total, 1,709,532. And as l'appétit vient en mangeant, Rent-roll's eyes will soon discover that Ireland, with 3½ millions, is still always miserable because she is overpopulated. Therefore her depopulation must go yet further, that thus she may fulfill her true destiny, that of an English sheep walk and cattle-pasture.

Like all good things in this bad world, this profitable method has its drawbacks. With the accumulation of rents in Ireland, the accumulation of the Irish in America keeps pace. The Irishman, banished by sheep and ox, reappears on the other side of the ocean as a Fenian, and face to face with the old queen of the sea rises, threatening and more threatening, the young giant Republic:

Acerba fata Romanos agunt
Scelusque fraternæ necis.

PART VIII. THE SO-CALLED PRIMITIVE ACCUMULATION.

CHAPTER XXVI. THE SECRET OF PRIMITIVE ACCUMULATION.

WE have seen how money is changed into capital; how through capital surplus-value is made, and from surplus-value more capital. But the accumulation of capital presupposes surplus-value; surplus-value presupposes capitalistic production; capitalistic production presupposes the preexistence of considerable masses of capital and of labour-power in the hands of producers of commodities. The whole movement, therefore, seems to turn in a vicious circle, out of which we can only get by supposing a primitive accumulation (previous accumulation of Adam Smith) preceding capitalistic accumulation; an accumulation not the result of the capitalist mode of production, but its starting point.

This primitive accumulation plays in Political Economy about the same part as original sin in theology. Adam bit the apple, and thereupon sin fell on the human race. Its origin is supposed to be explained when it is told as an anecdote of the past. In times long gone by there were two sorts of people; one, the diligent, intelligent, and, above all, frugal élite; the other, lazy rascals, spending their substance, and more, in riotous living. The legend of the logical original sin tells us certainly how man came to be condemned to eat his bread in the sweat of his brow; but the history of economic original sin reveals to us that there are people to whom this is by no means essential. Never mind! Thus it came to pass that the former sort accumulated wealth, and the latter sort had at last nothing to sell except their own skins. And from this original sin dates the poverty of the great majority that, despite all its labour, has up to now nothing to sell but itself, and the wealth of the few that increases constantly although they have long ceased to work. Such insipid childishness is every day preached to us in the defence of property. M. Thiers, e.g., had the assurance to repeat it with all the solemnity of a states-man, to the French people, once so spirituel. But as soon as the question of property crops up, it becomes a sacred duty to proclaim the intellectual food of the infant as the one thing fit for all ages and for all stages of development. In actual history it is notorious that conquest, enslavement, robbery, murder, briefly force, play the great part. In the tender annals of Political Economy, the idyllic reigns from all time immemorial. Right and “labour” were from all time the sole means of

enrichment, the present year of course always excepted. As a matter of fact, the methods of primitive accumulation are anything but idyllic.

In themselves, money and commodities are no more capital than are the means of production and of subsistence. They want transforming into capital. But this transformation itself can only take place under certain circumstances that centre in this, viz., that two very different kinds of commodity-possessors must come face to face and into contact; on the one hand, the owners of money, means of production, means of subsistence, who are eager to increase the sum of values they possess, by buying other people's labour-power; on the other hand, free labourers, the sellers of their own labour-power, and therefore the sellers of labour. Free labourers, in the double sense that neither they themselves form part and parcel of the means of production, as in the case of slaves, bondsmen, &c., nor do the means of production belong to them, as in the case of peasant-proprietors; they are, therefore, free from, unencumbered by, any means of production of their own. With this polarisation of the market for commodities, the fundamental conditions of capitalist production are given. The capitalist system presupposes the complete separation of the labourers from all property in the means by which they can realise their labour. As soon as capitalist production is once on its own legs, it not only maintains this separation, but reproduces it on a continually extending scale. The process, therefore, that clears the way for the capitalist system, can be none other than the process which takes away from the labourer the possession of his means of production; a process that transforms, on the one hand, the social means of subsistence and of production into capital, on the other, the immediate producers into wage-labourers. The so-called primitive accumulation, therefore, is nothing else than the historical process of divorcing the producer from the means of production. It appears as primitive, because it forms the pre-historic stage of capital and of the mode of production corresponding with it.

The economic structure of capitalistic society has grown out of the economic structure of feudal society. The dissolution of the latter set free the elements of the former.

The immediate producer, the labourer, could only dispose of his own person after he had ceased to be attached to the soil and ceased to be the slave, serf, or bondman of another. To become a free seller of labour-power, who carries his commodity wherever he finds a market, he must further

have escaped from the regime of the guilds, their rules for apprentices and journeymen, and the impediments of their labour regulations. Hence, the historical movement which changes the producers into wage-workers, appears, on the one hand, as their emancipation from serfdom and from the fetters of the guilds, and this side alone exists for our bourgeois historians. But, on the other hand, these new freedmen became sellers of themselves only after they had been robbed of all their own means of production, and of all the guarantees of existence afforded by the old feudal arrangements. And the history of this, their expropriation, is written in the annals of mankind in letters of blood and fire.

The industrial capitalists, these new potentates, had on their part not only to displace the guild masters of handicrafts, but also the feudal lords, the possessors of the sources of wealth. In this respect their conquest of social power appears as the fruit of a victorious struggle both against feudal lordship and its revolting prerogatives, and against the guilds and the fetters they laid on the free development of production and the free exploitation of man by man. The chevaliers d'industrie, however, only succeed in supplanting the chevaliers of the sword by making use of events of which they themselves were wholly innocent. They have risen by means as vile as those by which the Roman freed-man once on a time made himself the master of his patronus.

The starting-point of the development that gave rise to the wage-labourer as well as to the capitalist, was the servitude of the labourer. The advance consisted in a change of form of this servitude, in the transformation of feudal exploitation into capitalist exploitation. To understand its march, we need not go back very far. Although we come across the first beginnings of capitalist production as early as the 14th or 15th century, sporadically, in certain towns of the Mediterranean, the capitalistic era dates from the 16th century. Wherever it appears, the abolition of serfdom has been long effected, and the highest development of the middle ages, the existence of sovereign towns, has been long on the wane.

In the history of primitive accumulation, all revolutions are epoch-making that act as levers for the capitalist class in course of formation; but, above all, those moments when great masses of men are suddenly and forcibly torn from their means of subsistence, and hurled as free and "unattached" proletarians on the labour market. The expropriation of the agricultural producer, of the peasant, from the soil, is the basis of the whole

process. The history of this expropriation, in different countries, assumes different aspects, and runs through its various phases in different orders of succession, and at different periods. In England alone, which we take as our example, has it the classic form.

CHAPTER XXVII. EXPROPRIATION OF THE AGRICULTURAL POPULATION FROM THE LAND.

IN England, serfdom had practically disappeared in the last part of the 14th century. The immense majority of the population consisted then, and to a still larger extent, in the 15th century, of free peasant proprietors, whatever was the feudal title under which their right of property was hidden. In the larger seignorial domains, the old bailiff, himself a serf, was displaced by the free farmer. The wage-labourers of agriculture consisted partly of peasants, who utilised their leisure time by working on the large estates, partly of an independent special class of wage-labourers, relatively and absolutely few in numbers. The latter also were practically at the same time peasant farmers, since, besides their wages, they had allotted to them arable land to the extent of 4 or more acres, together with their cottages. Besides they, with the rest of the peasants, enjoyed the usufruct of the common land, which gave pasture to their cattle, furnished them with timber, fire-wood, turf, &c. In all countries of Europe, feudal production is characterised by division of the soil amongst the greatest possible number of sub-feudatories. The might of the feudal lord, like that of the sovereign, depended not on the length of his rent roll, but on the number of his subjects, and the latter depended on the number of peasant proprietors. Although, therefore, the English land, after the Norman conquest, was distributed in gigantic baronies, one of which often included some 900 of the old Anglo-Saxon lordships, it was bestrewn with small peasant properties, only here and there interspersed with great seignorial domains. Such conditions, together with the prosperity of the towns so characteristic of the 15th century, allowed of that wealth of the people which Chancellor Fortescue so eloquently paints in his "*Laudes legum Angliæ*;" but it excluded the possibility of capitalistic wealth.

The prelude of the revolution that laid the foundation of the capitalist mode of production, was played in the last third of the 15th, and the first decade of the 16th century. A mass of free proletarians was hurled on the labour-market by the breaking-up of the bands of feudal retainers, who, as Sir James Steuart well says, "everywhere uselessly filled house and castle."

Although the royal power, itself a product of bourgeois development, in its strife after absolute sovereignty forcibly hastened on the dissolution of these bands of retainers, it was by no means the sole cause of it. In insolent conflict with king and parliament, the great feudal lords created an incomparably larger proletariat by the forcible driving of the peasantry from the land, to which the latter had the same feudal right as the lord himself, and by the usurpation of the common lands. The rapid rise of the Flemish wool manufactures, and the corresponding rise in the price of wool in England, gave the direct impulse to these evictions. The old nobility had been devoured by the great feudal wars. The new nobility was the child of its time, for which money was the power of all powers. Transformation of arable land into sheep-walks was, therefore, its cry. Harrison, in his "Description of England, prefixed to Holinshed's Chronicle," describes how the expropriation of small peasants is ruining the country. "What care our great encroachers?" The dwellings of the peasants and the cottages of the labourers were razed to the ground or doomed to decay. "If," says Harrison, "the old records of euerie manour be sought...it will soon appear that in some manour seventeene, eighteene, or twentie houses are shrunk...that England was neuer less furnished with people than at the present...Of cities and townes either utterly decaied or more than a quarter or half diminished, though some one be a little increased here or there; of townes pulled downe for sheepe-walks, and no more but the lordships now standing in them...I could saie somewhat." The complaints of these old chroniclers are always exaggerated, but they reflect faithfully the impression made on contemporaries by the revolution in the conditions of production. A comparison of the writings of Chancellor Fortescue and Thomas More reveals the gulf between the 15th and 16th century. As Thornton rightly has it, the English working-class was precipitated without any transition from its golden into its iron age.

Legislation was terrified at this revolution. It did not yet stand on that height of civilisation where the "wealth of the nation" (i.e., the formation of capital, and the reckless exploitation and impoverishing of the mass of the people) figure as the ultima Thule of all state-craft. In his history of Henry VII., Bacon says: "Inclosures at that time (1489) began to be more frequent, whereby arable land (which could not be manured without people and families) was turned into pasture, which was easily rid by a few herdsmen; and tenancies for years, lives, and at will (whereupon much of the

yeomanry lived) were turned into demenses. This bred a decay of people, and (by consequence) a decay of towns, churches, tithes, and the like...In remedying of this inconvenience the king's wisdom was admirable, and the parliament at that time...they took a course to take away depopulating inclosures, and depopulating pasturage." An Act of Henry VII., 1489, ca, forbad the destruction of all "houses of husbandry" to which at least 20 acres of land belonged. By an Act, 25 Henry VIII., the same law was renewed. It recites, among other things, that many farms and large flocks of cattle, especially of sheep, are concentrated in the hands of a few men, whereby the rent of land has much risen and tillage has fallen off, churches and houses have been pulled down, and marvellous numbers of people have been deprived of the means wherewith to maintain themselves and their families. The Act, therefore, ordains the rebuilding of the decayed farmsteads, and fixes a proportion between corn land and pasture land, 8c. An Act of 1533 recites that some owners possess 24,000 sheep, and limits the number to be owned to 2000. The cry of the people and the legislation directed, for 150 years after Henry VII., against the appropriation of the small farmers and peasants, were alike fruitless. The secret of their inefficiency Bacon, without knowing it, reveals to us. "The device of King Henry VII.," says Bacon, in his "Essays, Civil and Moral," Essay 29, "was profound and admirable, in making farms and houses of husbandry of a standard; that is, maintained with such a proportion of land unto them as may breed a subject to live in convenient plenty, and no servile condition, and to keep the plough in the hands of the owners and not mere hirelings." What the capital system demanded was, on the other hand, a degraded and almost servile condition of the mass of the people, the transformation of them into mercenaries, and of their means of labour into capital. During this transformation period, legislation also strove to retain the 4 acres of land by the cottage of the agricultural wage-labourer, and forbad him to take lodgers into his cottage. In the reign of James I. 1627, Roger Crocker of Front Mill, was condemned for having built a cottage on the manor of Front Mill without. 4 acres of land attached to the same in perpetuity. As late as Charles I.'s reign, 1638, a royal commission was appointed to enforce the carrying out of the old laws, especially that referring to the 4 acres of land. Even in Cromwell's time, the building of a house within 4 miles of London was forbidden unless it was endowed with 4 acres of land. As late as the first half of the 18th century complaint is made if the cottage of the

agricultural labourer has not an adjunct of one or two acres of land. Nowadays he is lucky if it is furnished with a little garden, or if he may rent, far away from his cottage, a few roods. "Landlords and farmers," says Dr. Hunter, "work here hand in hand. A few acres to the cottage would make the labourers too independent."

The process of forcible expropriation of the people received in the 16th century a new and frightful impulse from the Reformation, and from the consequent colossal spoliation of the church property. The Catholic church was, at the time of the Reformation, feudal proprietor of a great part of the English land. The suppression of the monasteries, 8c., hurled their inmates into the proletariat. The estates of the church were to a large extent given away to rapacious royal favourites, or sold at a nominal price to speculating farmers and citizens, who drove out, en masse, the hereditary sub-tenants and threw their holdings into one. The legally guaranteed property of the poorer folk in a part of the church's tithes was tacitly confiscated. "Pauper ubique jacet," cried Queen Elizabeth, after a journey through England. In the 43rd year of her reign the nation was obliged to recognise pauperism officially by the introduction of a poor-rate. "The authors of this law seem to have been ashamed to state the grounds of it, for [contrary to traditional usage] it has no preamble whatever." By the 16th of Charles I., ch. 4, it was declared perpetual, and in fact only in 1834 did it take a new and harsher form. These immediate results of the Reformation were not its most lasting ones. The property of the church formed the religious bulwark of the traditional conditions of landed property. With its fall these were no longer tenable.

Even in the last decade of the 17th century, the yeomanry, the class of independent peasants, were more numerous than the class of farmers. They had formed the backbone of Cromwell's strength, and, even according to the confession of Macaulay, stood in favourable contrast to the drunken squires and to their servants, the country clergy, who had to marry their master's cast-off mistresses. About 1750, the yeomanry had disappeared, and so had, in the last decade of the 18th century, the last trace of the common land of the agricultural labourer. We leave on one side here the purely economic causes of the agricultural revolution. We deal only with the forcible means employed.

After the restoration of the Stuarts, the landed proprietors carried, by legal means, an act of usurpation, effected every-where on the Continent

without any legal formality. They abolished the feudal tenure of land, i.e., they got rid of all its obligations to the State, “indemnified” the State by taxes on the peasantry and the rest of the mass of the people, vindicated for themselves the rights of modern private property in estates to which they had only a feudal title, and, finally, passed those laws of settlement, which, *mutatis mutandis*, had the same effect on the English agricultural labourer, as the edict of the Tartar Boris Godunof on the Russian peasantry.

The “glorious Revolution” brought into power, along with William of Orange, the landlord and capitalist appropriators of surplus-value. They inaugurated the new era by practising on a colossal scale thefts of state lands, thefts that had been hitherto managed more modestly. These estates were given away, sold at a ridiculous figure, or even annexed to private estates by direct seizure. All this happened without the slightest observation of legal etiquette. The crown lands thus fraudulently appropriated, together with the robbery of the Church estates, as far as these had not been lost again during the republican revolution, form the basis of the to-day princely domains of the English oligarchy. The bourgeois capitalists favoured the operation with the view, among others, to promoting free trade in land, to extending the domain of modern agriculture on the large farm-system, and to increasing their supply of the free agricultural proletarians ready to hand. Besides, the new landed aristocracy was the natural ally of the new bankocracy, of the newly-hatched haute finance, and of the large manufacturers, then depending on protective duties. The English bourgeoisie acted for its own interest quite as wisely as did the Swedish bourgeoisie who, reversing the process, hand in hand with their economic allies, the peasantry, helped the kings in the forcible resumption of the Crown lands from the oligarchy. This happened since 1604 under Charles X. and Charles XI.

Communal property — always distinct from the State property just dealt with — was an old Teutonic institution which lived on under cover of feudalism. We have seen how the forcible usurpation of this, generally accompanied by the turning of arable into pasture land, begins at the end of the 15th and extends into the 16th century. But, at that time, the process was carried on by means of individual acts of violence against which legislation, for a hundred and fifty years, fought in vain. The advance made by the 18th century shows itself in this, that the law itself becomes now the instrument of the theft of the people’s land, although the large farmers make use of

their little independent methods as well. The parliamentary form of the robbery is that of Acts for enclosures of Commons, in other words, decrees by which the landlords grant themselves the people's land as private property, decrees of expropriation of the people. Sir F. M. Eden refutes his own crafty special pleading, in which he tries to represent communal property as the private property of the great landlords who have taken the place of the feudal lords, when he, himself, demands a "general "Act of Parliament for the enclosure of Commons," (admitting thereby that a parliamentary coup d'état is necessary for its transformation into private property), and moreover calls on the legislature for the indemnification for the expropriated poor.

Whilst the place of the independent yeoman was taken by tenants at will, small farmers on yearly leases, a servile rabble dependent on the pleasure of the landlords, the systematic robbery of the Communal lands helped especially, next to the theft of the State domains, to swell those large farms, that were called in the 18th century capital farms or merchant farms, and to "set free" the agricultural populations as proletarians for manufacturing industry.

The 18th century, however, did not yet recognise as fully as the 19th, the identity between national wealth and the poverty of the people. Hence the most vigorous polemic, in the economic literature of that time, on the "enclosure of commons." From the mass of materials that lie before me, I give a few extracts that will throw a strong light on the circumstances of the time. "In several parishes of Hertfordshire," writes one indignant person, "24 farms, numbering on the average 50-150 acres, have been melted up into three farms." "In Northamptonshire and Leicestershire the enclosure of common lands has taken place on a very large scale, and most of the new lordships, resulting from the enclosure, have been turned into pasturage, in consequence of which many lordships have not now 50 acres ploughed yearly, in which 1500 were ploughed formerly. The ruins of former dwelling-houses, barns, stables, 8c.," are the sole traces of the former inhabitants. "An hundred houses and families have in some open field villages...dwindled to eight or ten...The land-holders in most parishes that have been enclosed only 15 or 20 years, are very few in comparison of the numbers who occupied them in their open-field state. It is no uncommon thing for 4 or 5 wealthy graziers to engross a large enclosed lordship which

was before in the hands of 20 or 30 farmers, and as many smaller tenants and proprietors. All these are hereby thrown out of their livings with their families and many other families who were chiefly employed and supported by them.” It was not only the land that lay waste, but often land cultivated either in common or held under a definite rent paid to the community, that was annexed by the neighbouring landlords under pretext of enclosure. “I have here in view enclosures of open fields and lands already improved. It is acknowledged by even the writers in defence of enclosures that these diminished villages increase the monopolies of farms, raise the prices of provisions, and produce depopulation...and even the enclosure of waste lands (as now carried on) bears hard on the poor, by depriving them of a part of their subsistence, and only goes towards increasing farms already too large. “When,” says Dr. Price, “this land gets into the hands of a few great farmers, the consequence must be that the little farmers” (earlier designated by him “a multitude of little proprietors and tenants, who maintain themselves and families by the produce of the ground they occupy by sheep kept on a common, by poultry, hogs, &c., and who therefore have little occasion to purchase any of the means of subsistence”) “will be converted into a body of men who earn their subsistence by working for others, and who will be under a necessity of going to market for all they want...There will, perhaps, be more labour, because there will be more compulsion to it...Towns and manufacturers will increase, because more will be driven to them in quest of places and employment. This is the way in which the engrossing of farms naturally operates. And this is the way in which, for many years, it has been actually operating in this kingdom. He sums up the effect of the enclosures thus: “Upon the whole, the circumstances of the lower ranks of men are altered in almost every respect for the worse. From little occupiers of land, they are reduced to the state of day-labourers and hirelings; and, at the same time, their subsistence in that state has become more difficult.” In fact, usurpation of the common lands and the revolution in agriculture accompanying this, told so acutely on the agricultural labourers that, even according to Eden, between 1765 and 1780, their wages began to fall below the minimum, and to be supplemented by official poor-law relief. Their wages, he says, “were not more than enough for the absolute necessities of life.”

Let us hear for a moment a defender of enclosures and an opponent of Dr. Price. “Nor is it a consequence that there must be depopulation, because

men are not seen wasting their labour in the open field...If, by converting the little farmers into a body of men who must work for others, more labour is produced, it is an advantage which the nation" (to which, of course, the "converted" ones do not belong) "should wish for...the produce being greater when their joint labours are employed on one farm, there will be a surplus for manufactures, and by this means manufactures, one of the mines of the nation, will increase, in proportion to the quantity of corn produced."

The stoical peace of mind with which the political economist regards the most shameless violation of the "sacred rights of property" and the grossest acts of violence to persons, as soon as they are necessary to lay the foundations of the capitalistic mode of production, is shown by Sir. F. M. Eden, philanthropist and tory, to boot. The whole series of thefts, outrages, and popular misery, that accompanied the forcible expropriation of the people, from the last third of the 15th to the end of the 18th century, lead him merely to the comfortable conclusion: "The due proportion between arable land and pasture had to be established. During the whole of the 14th and the greater part of the 15th century, there was one acre of pasture to 2, 3 and even 4 of arable land. About the middle of the 16th century the proportion was changed to 2 acres of pasture to 2, later on, of 2 acres of pasture to one of arable, until at last the just proportion of 3 acres of pasture to one of arable land was attained."

In the 19th century, the very memory of the connexion between the agricultural labourer and the communal property had, of course, vanished. To say nothing of more recent times, have the agricultural population received a farthing of compensation for the 3,511,770 acres of common land which between 1801 and 1831 were stolen from them and by parliamentary devices presented to the landlords by the landlords?

The last process of wholesale expropriation of the agricultural population from the soil is, finally, the so-called clearing of estates, i.e., the sweeping men off them. All the English methods hitherto considered culminated in "clearing." As we saw in the picture of modern conditions given in a former chapter, where there are no more independent peasants to get rid of, the "clearing" of cottages begins; so that the agricultural labourers do not find on the soil cultivated by them even the spot necessary for their own housing. But what "clearing of estates" really and properly signifies, we learn only in the promised land of modern romance, the Highlands of Scotland. There the process is distinguished by its systematic character, by

the magnitude of the scale on which it is carried out at one blow (in Ireland landlords have gone to the length of sweeping away several villages at once; in Scotland areas as large as German principalities are dealt with), finally by the peculiar form of property, under which the embezzled lands were held.

The Highland Celts were organised in clans, each of which was the owner of the land on which it was settled. The representative of the clan, its chief or “great man,” was only the titular owner of this property, just as the Queen of England is the titular owner of all the national soil. When the English government succeeded in suppressing the intestine wars of these “great men,” and their constant incursions into the Lowland plains, the chiefs of the clans by no means gave up their time-honoured trade as robbers; they only changed its form. On their own authority they transformed their nominal right into a right of private property, and as this brought them into collision with their clansmen, resolved to drive them out by open force. “A king of England might as well claim to drive his subjects into the sea,” says Professor Newman. This revolution, which began in Scotland after the last rising of the followers of the Pretender, can be followed through its first phases in the writings of Sir James Steuart and James Anderson. In the 18th century the hunted-out Gaels were forbidden to emigrate from the country, with a view to driving them by force to Glasgow and other manufacturing towns. As an example of the method obtaining in the 19th century, the “clearing” made by the Duchess of Sutherland will suffice here. This person, well instructed in economy, resolved, on entering upon her government, to effect a radical cure, and to turn the whole country, whose population had already been, by earlier processes of the like kind, reduced to 15,000, into a sheep-walk. From 1814 to 1820 these 15,000 inhabitants, about 3000 families, were systematically hunted and rooted out. All their villages were destroyed and burnt, all their fields turned into pasturage. British soldiers enforced this eviction, and came to blows with the inhabitants. One old woman was burnt to death in the flames of the hut, which she refused to leave. Thus this fine lady appropriated 794,000 acres of land that had from time immemorial belonged to the clan. She assigned to the expelled inhabitants about 6000 acres on the sea-shore — 2 acres per family. The 6000 acres had until this time lain waste, and brought in no income to their owners. The Duchess, in the nobility of her heart, actually went so far as to let these at an average

rent of 2s. 6d. per acre to the clansmen, who for centuries had shed their blood for her family. The whole of the stolen clan-land she divided into 29 great sheep farms, each inhabited by a single family, for the most part imported English farmservants. In the year 1835 the 15,000 Gaels were already replaced by 131,000 sheep. The remnant of the aborigines flung on the sea-shore, tried to live by catching fish. They became amphibious and lived, as an English author says, half on land and half on water, and withal only half on both.

But the brave Gaels must expiate yet more bitterly their idolatry, romantic and of the mountains, for the “great men” of the clan. The smell of their fish rose to the noses of the great men. They scented some profit in it, and let the seashore to the great fishmongers of London. For the second time the Gaels were hunted out.

But, finally, part of the sheep-walks are turned into deer preserves. Every one knows that there are no real forests in England. The deer in the parks of the great are demurely domestic cattle, fat as London aldermen. Scotland is therefore the last refuge of the “noble passion.” “In the Highlands,” says Somers in 1848, “new forests are springing up like mushrooms. Here, on one side of Gaick, you have the new forest of Glenfeshie; and there on the other you have the new forest of Ardverikie. In the same line you have the Black Mount, an immense waste also recently erected. From east to west — from the neighbourhood of Aberdeen to the crags of Oban — you have now a continuous line of forests; while in other parts of the Highlands there are the new forests of Loch Archaig, Glengarry, Glenmoriston, &c. Sheep were introduced into glens which had been the seats of communities of small farmers; and the latter were driven to seek subsistence on coarser and more sterile tracks of soil. Now deer are supplanting sheep; and these are once more dispossessing the small tenants, who will necessarily be driven down upon still coarser land and to more grinding penury. Deer forests and the people cannot co-exist. One or other of the two must yield. Let the forests be increased in number and extent during the next quarter of a century, as they have been in the last, and the Gaels will perish from their native soil.... This movement among the Highland proprietors is with some a matter of ambition...with some love of sport...while others, of a more practical cast, follow the trade in deer with an eye solely to profit. For it is a fact, that a mountain range laid out in forest is, in many cases, more profitable to the

proprietor than when let as a sheep walk.... The huntsman who wants a deer-forest limits his offers by no other calculation than the extent of his purse.... Sufferings have been inflicted in the Highlands scarcely less severe than those occasioned by the policy of the Norman kings. Deer have received extended ranges, while men have been hunted within a narrower and still narrower circle.... One after one the liberties of the people have been cloven down.... And the oppressions are daily on the increase.... The clearance and dispersion of the people is pursued by the proprietors as a settled principle, as an agricultural necessity, just as trees and brushwood are cleared from the wastes of America or Australia; and the operation goes on in a quiet, business-like way, &c.”

The spoliation of the church's property, the fraudulent alienation of the State domains, the robbery of the common lands, the usurpation of feudal and clan property, and its transformation into modern private property under circumstances of reckless terrorism, were just so many idyllic methods of primitive accumulation. They conquered the field for capitalistic agriculture, made the soil part and parcel of capital, and created for the town industries the necessary supply of a “free” and outlawed proletariat.

CHAPTER XXVIII. BLOODY LEGISLATION AGAINST THE EXPROPRIATED, FROM THE END OF THE 15TH CENTURY. FORCING DOWN OF WAGES BY ACTS OF PARLIAMENT.

THE proletariat created by the breaking up of the bands of feudal retainers and by the forcible expropriation of the people from the soil, this “free” proletariat could not possibly be absorbed by the nascent manufactures as fast as it was thrown upon the world. On the other hand, these men, suddenly dragged from their wanted mode of life, could not as suddenly adapt themselves to the discipline of their new condition. They were turned en masse into beggars, robbers, vagabonds, partly from inclination, in most cases from stress of circumstances. Hence at the end of the 15th and during the whole of the 16th century, throughout Western Europe a bloody legislation against vagabondage. The fathers of the present working-class were chastised for their enforced transformation into vagabonds and paupers. Legislation treated them as “voluntary” criminals, and assumed that it depended on their own goodwill to go on working under the old conditions that no longer existed.

In England this legislation began under Henry VII.

Henry VIII. 1530: Beggars old and unable to work receive a beggar’s licence. On the other hand, whipping and imprisonment for sturdy vagabonds. They are to be tied to the carttail and whipped until the blood streams from their bodies, then to swear an oath to go back to their birthplace or to where they have lived the last three years and to “put themselves to labour.” What grim irony! In 27 Henry VIII. the former statute is repeated, but strengthened with new clauses. For the second arrest for vagabondage the whipping is to be repeated and half the ear sliced off; but for the third relapse the offender is to be executed as a hardened criminal and enemy of the common weal.

Edward VI.: A statute of the first year of his reign, 1547, ordains that if anyone refuses to work, he shall be condemned as a slave to the person who has denounced him as an idler. The master shall feed his slave on bread and

water, weak broth and such refuse meat as he thinks fit. He has the right to force him to do any work, no matter how disgusting, with whip and chains. If the slave is absent a fortnight, he is condemned to slavery for life and is to be branded on forehead or back with the letter S; if he runs away thrice, he is to be executed as a felon. The master can sell him, bequeath him, let him out on hire as a slave, just as any other personal chattel or cattle. If the slaves attempt anything against the masters, they are also to be executed. Justices of the peace, on information, are to hunt the rascals down. If it happens that a vagabond has been idling about for three days, he is to be taken to his birthplace, branded with a redhot iron with the letter V on the breast and be set to work, in chains, in the streets or at some other labour. If the vagabond gives a false birthplace, he is then to become the slave for life of this place, of its inhabitants, or its corporation, and to be branded with an S. All persons have the right to take away the children of the vagabonds and to keep them as apprentices, the young men until the 24th year, the girls until the 20th. If they run away, they are to become up to this age the slaves of their masters, who can put them in irons, whip them, 8c., if they like. Every master may put an iron ring round the neck, arms or legs of his slave, by which to know him more easily and to be more certain of him. The last part of the statute provides, that certain poor people may be employed by a place or by persons, who are willing to give them food and drink and to find them work. This kind of parish-slaves was kept up in England until far into the 19th century under the name of "roundsmen."

Elizabeth, 1572: Unlicensed beggars above 14 years of age are to be severely flogged and branded on the left ear unless some one will take them into service for two years; in case of a repetition of the offence, if they are over 18, they are to be executed, unless some one will take them into service for two years; but for the third offence they are to be executed without mercy as felons. Similar statutes: 18 Elizabeth, c. 13, and another of 1597.

James I: Any one wandering about and begging is declared a rogue and a vagabond. Justices of the peace in petty sessions are authorised to have them publicly whipped and for the first offence to imprison them for 6 months, for the second for 2 years. Whilst in prison they are to be whipped as much and as often as the justices of the peace think fit...Incorrigible and dangerous rogues are to be branded with an R on the left shoulder and set to hard labour, and if they are caught begging again, to be executed without

mercy. These statutes, legally binding until the beginning of the 18th century, were only repealed by 12 Ann, c. 23.

Similar laws in France, where by the middle of the 17th century a kingdom of vagabonds (truands) was established in Paris. Even at the beginning of Louis XVI.'s reign (Ordinance of July 13th, 1777) every man in good health from 16 to 60 years of age, if without means of subsistence and not practising a trade, is to be sent to the galleys. Of the same nature are the statute of Charles V. for the Netherlands (October, 1537), the first edict of the States and Towns of Holland (March 10, 1614), the "Plakaat" of the United Provinces (June 26, 1649), 8c.

Thus were the agricultural people, first forcibly expropriated from the soil, driven from their homes, turned into vagabonds, and then whipped, branded, tortured by laws grotesquely terrible, into the discipline necessary for the wage system.

It is not enough that the conditions of labour are concentrated in a mass, in the shape of capital, at the one pole of society, while at the other are grouped masses of men, who have nothing to sell but their labour-power. Neither is it enough that they are compelled to sell it voluntarily. The advance of capitalist production develops a working-class, which by education, tradition, habit, looks upon the conditions of that mode of production as self-evident laws of nature. The organization of the capitalist process of production, once fully developed, breaks down all resistance. The constant generation of a relative surplus-population keeps the law of supply and demand of labour, and therefore keeps wages, in a rut that corresponds with the wants of capital. The dull compulsion of economic relations completes the subjection of the labourer to the capitalist. Direct force, outside economic conditions, is of course still used, but only exceptionally. In the ordinary run of things, the labourer can be left to the "natural laws of production," i.e., to his dependence on capital, a dependence springing from, and guaranteed in perpetuity by, the conditions of production themselves. It is otherwise during the historic genesis of capitalist production. The bourgeoisie, at its rise, wants and uses the power of the state to "regulate" wages, i.e., to force them within the limits suitable for surplus-value making, to lengthen the working-day and to keep the labourer himself in the normal degree of dependence. This is an essential element of the so-called primitive accumulation.

The class of wage-labourers, which arose in the latter half of the 14th century, formed then and in the following century only a very small part of the population, well protected in its position by the independent peasant proprietary in the country and the guild-organization in the town. In country and town master and workman stood close together socially. The subordination of labour to capital was only formal — i.e., the mode of production itself had as yet no specific capitalistic character. Variable capital preponderated greatly over constant. The demand for wage-labour grew, therefore, rapidly with every accumulation of capital, whilst the supply of wage-labour followed but slowly. A large part of the national product, changed later into a fund of capitalist accumulation, then still entered into the consumption fund of the labourer.

Legislation on wage-labour, (from the first, aimed at the exploitation of the labourer and, as it advanced, always equally hostile to him), is started in England by the Statute of Labourers, of Edward III., 1349. The ordinance of 1350 in France, issued in the name of King John, corresponds with it. English and French legislation run parallel and are identical in purport. So far as the labour-statutes aim at compulsory extension of the working-day, I do not return to them, as this point was treated earlier (Chap. X., Section 5).

The Statute of Labourers was passed at the urgent instance of the House of Commons. A Tory says naively: “Formerly the poor demanded such high wages as to threaten industry and wealth. Next, their wages are so low as to threaten industry and wealth equally and perhaps more, but in another way.” A tariff of wages was fixed by law for town and country, for piece-work and day-work. The agricultural labourers were to hire themselves out by the year, the town ones “in open market.” It was forbidden, under pain of imprisonment, to pay higher wages than those fixed by the statute, but the taking of higher wages was more severely punished than the giving them. [So also in Sections 18 and 19 of the Statute of Apprentices of Elizabeth, ten days’ imprisonment is decreed for him that pays the higher wages, but twenty-one days for him that receives them.] A statute of 1360 increased the penalties and authorised the masters to extort labour at the legal rate of wages by corporal punishment. All combinations, contracts, oaths, &c., by which masons and carpenters reciprocally bound themselves, were declared null and void. Coalition of the labourers is treated as a heinous crime from the 14th century to 1825, the year of the repeal of the laws against Trades’ Unions. The spirit of the Statute of Labourers of 1349 and of its offshoots,

comes out clearly in the fact, that indeed a maximum of wages is dictated by the State, but on no account a minimum.

In the 16th century, the condition of the labourers had, as we know, become much worse. The money wage rose, but not in proportion to the depreciation of money and the corresponding rise in the prices of commodities. Wages, therefore, in reality fell. Nevertheless, the laws for keeping them down remained in force, together with the ear-clipping and branding of those “whom no one was willing to take into service.” By the Statute of Apprentices 5 Elizabeth, c. 3, the justices of the peace were empowered to fix certain wages and to modify them according to the time of the year and the price of commodities. James I. extended these regulations of labour also to weavers, spinners, and all possible categories of workers. George II. extended the laws against coalitions of labourers to manufactures. In the manufacturing period par excellence, the capitalist mode of production had become sufficiently strong to render legal regulation of wages as impracticable as it was unnecessary; but the ruling classes were unwilling in case of necessity to be without the weapons of the old arsenal. Still, 8 George II. forbade a higher day’s wage than 2s. 7½d. for journeymen tailors in and around London, except in cases of general mourning; still 13 George III., c. 68, gave the regulation of the wages of silk-weavers to the justices of the peace; still, in 1706, it required two judgments of the higher courts to decide, whether the mandates of justices of the peace as to wages held good also for non-agricultural labourers; still, in 1799, an act of Parliament ordered that the wages of the Scotch miners should continue to be regulated by a statute of Elizabeth and two Scotch acts of 1661 and 1671. How completely in the meantime circumstances had changed, is proved by an occurrence unheard-of before in the English Lower House. In that place, where for more than 400 years laws had been made for the maximum, beyond which wages absolutely must not rise, Whitbread in 1796 proposed a legal minimum wage for agricultural labourers. Pitt opposed this, but confessed that the “condition of the poor was cruel.” Finally, in 1813, the laws for the regulation of wages were repealed. They were an absurd anomaly, since the capitalist regulated his factory by his private legislation, and could by the poor-rates make up the wage of the agricultural labourer to the indispensable minimum. The provisions of the labour statutes as to contracts between master and workman, as to giving notice and the like, which only allows of a civil

action against the contract-breaking master, but on the contrary permit a criminal action against the contract-breaking workman, are to this hour (1873) in full force. The barbarous laws against Trades' Unions fell in 1825 before the threatening bearing of the proletariat. Despite this, they fell only in part. Certain beautiful fragments of the old statute vanished only in 1859. Finally, the act of Parliament of June 29, 1871, made a pretence of removing the last traces of this class of legislation by legal recognition of Trades Unions. But an act of Parliament of the same date (an act to amend the criminal law relating to violence, threats, and molestation), re-established, in point of fact, the former state of things in a new shape. By this Parliamentary escamotage the means which the labourers could use in a strike or lock-out were withdrawn from the laws common to all citizens, and placed under exceptional penal legislation, the interpretation of which fell to the masters themselves in their capacity as justices of the peace. Two years earlier, the same House of Commons and the same Mr. Gladstone in the well-known straightforward fashion brought in a bill for the abolition of all exceptional penal legislation against the working-class. But this was never allowed to go beyond the second reading, and the matter was thus protracted until at last the "great Liberal party," by an alliance with the Tories, found courage to turn against the very proletariat that had carried it into power. Not content with this treachery, the "great Liberal party" allowed the English judges, ever complaisant in the service of the ruling classes, to dig up again the earlier laws against "conspiracy," and to apply them to coalitions of labourers. We see that only against its will and under the pressure of the masses did the English Parliament give up the laws against Strikes and Trades' Unions, after it had itself, for 500 years, held, with shameless egoism, the position of a permanent Trades' Union of the capitalists against the labourers.

During the very first storms of the revolution, the French bourgeoisie dared to take away from the workers the right of association but just acquired. By a decree of June 14, 1791, they declared all coalition of the workers as "an attempt against liberty and the declaration of the rights of man," punishable by a fine of 500 livres, together with deprivation of the rights of an active citizen for one year. This law which, by means of State compulsion, confined the struggle between capital and labour within limits comfortable for capital, has outlived revolutions and changes of dynasties. Even the Reign of Terror left it untouched. It was but quite recently struck

out of the Penal Code. Nothing is more characteristic than the pretext for this bourgeois coup d'état. "Granting," says Chapelier, the reporter of the Select Committee on this law, "that wages ought to be a little higher than they are,...that they ought to be high enough for him that receives them, to be free from that state of absolute dependence due to the want of the necessities of life, and which is almost that of slavery," yet the workers must not be allowed to come to any understanding about their own interests, nor to act in common and thereby lessen their "absolute dependence, which is almost that of slavery;" because, forsooth, in doing this they injure "the freedom of their cidevant masters, the present entrepreneurs," and because a coalition against the despotism of the quondam masters of the corporations is — guess what! — is a restoration of the corporations abolished by the French constitution.

CHAPTER XXIX. GENESIS OF THE CAPITALIST FARMER.

NOW that we have considered the forcible creation of a class of outlawed proletarians, the bloody discipline that turned them into wage-labourers, the disgraceful action of the state which employed the police to accelerate the accumulation of capital by increasing the degree of exploitation of labour, the question remains: whence came the capitalists originally? For the expropriation of the agricultural population creates, directly, none by great landed proprietors. As far, however, as concerns the genesis of the farmer, we can, so to say, put our hand on it, because it is a slow process evolving through many centuries. The serfs, as well as the free small proprietors, held land under very different tenures, and were therefore emancipated under very different economic conditions. In England the first form of the farmer is the bailiff, himself a serf. His position is similar to that of the old Roman villicus, only in a more limited sphere of action. During the second half of the 14th century he is replaced by a farmer, whom the landlord provides with seed, cattle and implements. His condition is not very different from that of the peasant. Only he exploits more wage-labour. Soon he becomes a métayer, a half-farmer. He advances one part of the agricultural stock, the landlord the other. The two divide the total product in proportions determined by contract. This form quickly disappears in England, to give place to the farmer proper, who makes his own capital breed by employing wage-labourers, and pays a part of the surplus product, in money or in kind, to the landlord as rent. So long, during the 15th century, as the independent peasant and the farm-labourer working for himself as well as for wages, enriched themselves by their own labour, the circumstances of the farmer, and his field of production, were equally mediocre. The agricultural revolution which commenced in the last third of the 15th century, and continued during almost the whole of the 16th (excepting, however, its last decade), enriched him just as speedily as it impoverished the mass of the agricultural people.

The usurpation of the common lands allowed him to augment greatly his stock of cattle, almost without cost, whilst they yielded him a richer supply of manure for the tillage of the soil. To this, was added in the 16th century, a

very important element. At that time the contracts for farms ran for a long time, often for 99 years. The progressive fall in the value of the precious metals, and therefore of money, brought the farmers golden fruit. Apart from all the other circumstances discussed above, it lowered wages. A portion of the latter was now added to the profits of the farm. The continuous rise in the price of corn, wool, meat, in a word of all agricultural produce, swelled the money capital of the farmer without any action on his part, whilst the rent he paid, (being calculated on the old value of money) diminished in reality. Thus they grew rich at the expense both of their labourers and their landlords. No wonder therefore, that England, at the end of the 16th century, had a class of capitalist farmers, rich, considering the circumstances of the time.

CHAPTER XXX. REACTION OF THE AGRICULTURAL REVOLUTION ON INDUSTRY. CREATION OF THE HOME MARKET FOR INDUSTRIAL CAPITAL.

THE expropriation and expulsion of the agricultural population, intermittent but renewed again and again, supplied, as we saw, the town industries with a mass of proletarians, entirely unconnected with the corporate guilds and unfettered by them; a fortunate circumstance that makes old A. Anderson (not to be confounded with James Anderson) in his "History of Commerce," believe in the direct intervention of Providence. We must still pause a moment on this element of primitive accumulation. The thinning-out of the independent, self-supporting peasants not only brought about the crowding together of the industrial proletariat, in the way that Geoffroy Saint Hilaire explained the condensation of cosmical matter at one place, by its rarefaction at another. In spite of the smaller numbers of its cultivators, the soil brought forth as much or more produce, after as before, because the revolution in the conditions of landed property was accompanied by improved methods of culture, greater co-operation, concentration of the means of production, &c., and because not only were the agricultural wage-labourers put on the strain more intensely, but the field of production on which they worked for themselves, became more and more contracted. With the setting free of a part of the agricultural population, therefore, their former means of nourishment were also set free. They were now transformed into material elements of variable capital. The peasant, expropriated and cast adrift, must buy their value in the form of wages, from his new master, the industrial capitalist. That which holds good of the means of subsistence holds with the raw materials of industry dependent upon home agriculture. They were transformed into an element of constant capital. Suppose, e.g., a part of the West-phalian peasants, who, at the time of Frederic II., all spun flax, forcibly expropriated and hunted from the soil; and the other part that remained, turned into day-labourers of large farmers. At the same time arise large establishments for flax-spinning and weaving, in which the men "set free" now work for wages. The flax looks exactly as

before. Not a fibre of it is changed, but a new social soul has popped into its body. It forms now a part of the constant capital of the master manufacturer. Formerly divided among a number of small producers, who cultivated it themselves and with their families spun it in retail fashion, it is now concentrated in the hand of one capitalist, who sets others to spin and weave it for him. The extra labour expended in flax-spinning realised itself formerly in extra income to numerous peasant families, or maybe, in Frederic II.'s time, in taxes pour le roi de Prusse. It realises itself now in profit for a few capitalists. The spindles and looms, formerly scattered over the face of the country, are now crowded together in a few great labour-barracks, together with the labourers and the raw material. And spindles, looms, raw material, are now transformed, from means of independent existence for the spinners and weavers, into means for commanding them and sucking out of them unpaid labour. One does not perceive, when looking at the large manufactories and the large farms, that they have originated from the throwing into one of many small centres of production, and have been built up by the expropriation of many small independent producers. Nevertheless, the popular intuition was not at fault. In the time of Mirabeau, the lion of the Revolution, the great manufactories were still called manufactures réunies, workshops thrown into one, as we speak of fields thrown into one. Says Mirabeau: "We are only paying attention to the grand manufactories, in which hundreds of men work under a director and which are commonly called manufactures réunies. Those where a very large number of labourers work, each separately and on his own account, are hardly considered; they are placed at an infinite distance from the others. This is a great error, as the latter alone make a really important object of national prosperity...The large workshop (manufacture réunie) will enrich prodigiously one or two entrepreneurs, but the labourers will only be journeymen, paid more or less, and will not have any share in the success of the undertaking. In the discrete workshop (manufacture séparée,) on the contrary, no one will become rich, but many labourers will be comfortable; the saving and the industrious will be able to amass a little capital, to put by a little for a birth of a child, for an illness, for themselves or their belongings. The number of saving and industrious labourers will increase, because they will see in good conduct, in activity, a means of essentially bettering their condition, and not of obtaining a small rise of wages that can never be of any importance for the future, and whose sole result is to place

men in the position to live a little better, but only from day to day...The large workshops, undertakings of certain private persons who pay labourers from day to day to work for their gain, may be able to put these private individuals at their ease, but they will never be an object worth the attention of governments. Discrete workshops, for the most part combined with cultivation of small holdings, are the only free ones." The expropriation and eviction of a part of the agricultural population not only set free for industrial capital, the labourers, their means of subsistence, and material for labour; it also created the home market.

In fact, the events that transformed the small peasants into wage-labourers, and their means of subsistence and of labour into material elements of capital, created, at the same time, a home-market for the latter. Formerly, the peasant family produced the means of subsistence and the raw materials, which they themselves, for the most part, consumed. These raw materials and means of subsistence have now become commodities; the large farmer sells them, he finds his market in manufactures. Yarn, linen, coarse woollen stuffs — things whose raw materials had been within the reach of every peasant family, had been spun and woven by it for its own use — were now transformed into articles of manufacture, to which the country districts at once served for markets. The many scattered customers, whom stray artisans until now had found in the numerous small producers working on their own account, concentrate themselves now into one great market provided for by industrial capital. Thus, hand in hand with the expropriation of the self-supporting peasants, with their separation from their means of production, goes the destruction of rural domestic industry, the process of separation between manufacture and agriculture. And only the destruction of rural domestic industry can give the internal market of a country that extension and consistence which the capitalist mode of production requires. Still the manufacturing period, properly so-called, does not succeed in carrying out this transformation radically and completely. It will be remembered that manufacture, properly so-called, conquers but partially the domain of national production, and always rests on the handicrafts of the town and the domestic industry of the rural districts as its ultimate basis. If it destroys these in one form, in particular branches, at certain points, it calls them up again elsewhere, because it needs them for the preparation of raw material up to a certain point. It produces, therefore, a new class of small villagers who, while following the cultivation of the

soil as an accessory calling, find their chief occupation in industrial labour, the products of which they sell to the manufacturers directly, or through the medium of merchants. This is one, though not the chief, cause of a phenomenon which, at first, puzzles the student of English history. From the last third of the 15th century he finds continually complaints, only interrupted at certain intervals, about the encroachment of capitalist farming in the country districts, and the progressive destruction of the peasantry. On the other hand, he always finds this peasantry turning up again, although in diminished number, and always under worse conditions. The chief reason is: England is at one time chiefly a cultivator of corn, at another chiefly a breeder of cattle, in alternate periods, and with these the extent of peasant cultivation fluctuates. Modern Industry alone, and finally, supplies, in machinery, the lasting basis of capitalistic agriculture, expropriates radically the enormous majority of the agricultural population, and completes the separation between agriculture and rural domestic industry, whose roots — spinning and weaving — it tears up. It therefore also, for the first time, conquers for industrial capital the entire home market.

CHAPTER XXXI. GENESIS OF THE INDUSTRIAL CAPITALIST.

THE genesis of the industrial capitalist did not proceed in such a gradual way as that of the farmer. Doubtless many small guild-masters, and yet more independent small artisans, or even wage-labourers, transformed themselves into small capitalists, and (by gradually extending exploitation of wage-labour and corresponding accumulation) into full-blown capitalists. In the infancy of capitalist production, things often happened as in the infancy of mediæval towns, where the question, which of the escaped serfs should be master and which servant, was in great part decided by the earlier or later date of their flight. The snail's-pace of this method corresponded in no wise with the commercial requirements of the new world-market that the great discoveries of the end of the 15th century created. But the middle age had handed down two distinct forms of capital, which mature in the most different economic social formations, and which, before the era of the capitalist mode of production, are considered as capital *quand même* — usurer's capital and merchant's capital.

“At present, all the wealth of society goes first into the possession of the capitalist...he pays the landowner his rent, the labourer his wages, the tax and tithe gatherer their claims, and keeps a large, indeed the largest, and a continually augmenting share, of the annual produce of labour for himself. The capitalist may now be said to be the first owner of all the wealth of the community, though no law has conferred on him the right to this property...this change has been effected by the taking of interest on capital...and it is not a little curious that all the lawgivers of Europe endeavoured to prevent this by statutes, viz., statutes against usury.... The power of the capitalist over all the wealth of the country is a complete change in the right of property, and by what law, or series of laws, was it effected?” The author should have remembered that revolutions are not made by laws.

The money capital formed by means of usury and commerce was prevented from turning into industrial capital, in the country by the feudal constitution, in the towns by the guild organization. These fetters vanished with the dissolution of feudal society, with the expropriation and partial

eviction of the country population. The new manufacturers were established at sea-ports, or in inland points beyond the control of the old municipalities and their guilds. Hence in England an embittered struggle of the corporate towns against these new industrial nurseries.

The discovery of gold and silver in America, the extirpation, enslavement and entombment in mines of the aboriginal population, the beginning of the conquest and looting of the East Indies, the turning of Africa into a warren for the commercial hunting of black-skins, signalled the rosy dawn of the era of capitalist production. These idyllic proceedings are the chief momenta of primitive accumulation. On their heels treads the commercial war of the European nations, with the globe for a theatre. It begins with the revolt of the Netherlands from Spain, assumes giant dimensions in England's anti-jacobin war, and is still going on in the opium wars against China, 8c.

The different momenta of primitive accumulation distribute themselves now, more or less in chronological order, particularly over Spain, Portugal, Holland, France, and England. In England at the end of the 17th century, they arrive at a systematical combination, embracing the colonies, the national debt, the modern mode of taxation, and the protectionist system. These methods depend in part on brute force, e.g., the colonial system. But they all employ the power of the State, the concentrated and organised force of society, to hasten, hothouse fashion, the process of transformation of the feudal mode of production into the capitalist mode, and to shorten the transition. Force is the midwife of every old society pregnant with a new one. It is itself an economic power.

Of the Christian colonial system, W. Howitt, a man who makes a specialty of Christianity, says: "The barbarities and desperate outrages of the so-called Christian race, throughout every region of the world, and upon every people they have been able to subdue, are not to be paralleled by those of any other race, however fierce, however untaught, and however reckless of mercy and of shame, in any age of the earth." The history of the colonial administration of Holland — and Holland was the head capitalistic nation of the 17th century — "is one of the most extraordinary relations of treachery, bribery, massacre, and meanness." Nothing is more characteristic than their system of stealing men, to get slaves for Java. The men stealers were trained for this purpose. The thief, the interpreter, and the seller, were the chief agents in this trade, native princes the chief sellers. The young

people stolen, were thrown into the secret dungeons of Celebes, until they were ready for sending to the slave-ships. An official report says: "This one town of Macassar, e.g., is full of secret prisons, one more horrible than the other, crammed with unfortunates, victims of greed and tyranny fettered in chains, forcibly torn from their families." To secure Malacca, the Dutch corrupted the Portuguese governor. He let them into the town in 1641. They hurried at once to his house and assassinated him, to "abstain" from the payment of £21,875, the price of his treason. Wherever they set foot, devastation and depopulation followed. Banjuwangi, a province of Java, in 1750 numbered over 80,000 inhabitants, in 1811 only 18,000. Sweet commerce!

The English East India Company, as is well known, obtained, besides the political rule in India, the exclusive monopoly of the tea-trade, as well as of the Chinese trade in general, and of the transport of goods to and from Europe. But the coasting trade of India and between the islands, as well as the internal trade of India, were the monopoly of the higher employés of the company. The monopolies of salt, opium, betel and other commodities, were inexhaustible mines of wealth. The employés themselves fixed the price and plundered at will the unhappy Hindus. The Governor-General took part in this private traffic. His favourites received contracts under conditions whereby they, cleverer than the alchemists, made gold out of nothing. Great fortunes sprang up like mushrooms in a day; primitive accumulation went on without the advance of a shilling. The trial of Warren Hastings swarms with such cases. Here is an instance. A contract for opium was given to a certain Sullivan at the moment of his departure on an official mission to a part of India far removed from the opium district. Sullivan sold his contract to one Binn for £40,000; Binn sold it the same day for £60,000, and the ultimate purchaser who carried out the contract declared that after all he realised an enormous gain. According to one of the lists laid before Parliament, the Company and its employés from 1757-1766 got £6,000,000 from the Indians as gifts. Between 1769 and 1770, the English manufactured a famine by buying up all the rice and refusing to sell it again, except at fabulous prices.

The treatment of the aborigines was, naturally, most frightful in plantation-colonies destined for export trade only, such as the West Indies, and in rich and well-populated countries, such as Mexico and India, that

were given over to plunder. But even in the colonies properly so-called, the Christian character of primitive accumulation did not belie itself. Those sober virtuosi of Protestantism, the Puritans of New England, in 1703, by decrees of their assembly set a premium of £40 on every Indian scalp and every captured red-skin: in 1720 a premium of £100 on every scalp; in 1744, after Massachusetts-Bay had proclaimed a certain tribe as rebels, the following prices: for a male scalp of 12 years and upwards £100 (new currency), for a male prisoner £105, for women and children prisoners £50, for scalps of women and children £50. Some decades later, the colonial system took its revenge on the descendants of the pious pilgrim fathers, who had grown seditious in the meantime. At English instigation and for English pay they were tomahawked by red-skins. The British Parliament, proclaimed blood-hounds and scalping as “means that God and Nature had given into its hand.”

The colonial system ripened, like a hot-house, trade and navigation. The “societies Monopolia” of Luther were powerful levers for concentration of capital. The colonies secured a market for the budding manufactures, and, through the monopoly of the market, an increased accumulation. The treasures captured outside Europe by undisguised looting, enslavement, and murder, floated back to the mother-country and were there turned into capital. Holland, which first fully developed the colonial system, in 1648 stood already in the acme of its commercial greatness. It was “in almost exclusive possession of the East Indian trade and the commerce between the south-east and north-west of Europe. Its fisheries, marine, manufactures, surpassed those of any other country. The total capital of the Republic was probably more important than that of all the rest of Europe put together.” Gülich forgets to add that by 1648, the people of Holland were more overworked, poorer and more brutally oppressed than those of all the rest of Europe put together.

To-day industrial supremacy implies commercial supremacy, In the period of manufacture properly so-called, it is, on the other hand, the commercial supremacy that gives industrial predominance. Hence the preponderant rôle that the colonial system plays at that time. It was “the strange God” who perched himself on the altar cheek by jowl with the old Gods of Europe, and one fine day with a shove and a kick chucked them all of a heap. It proclaimed surplus-value making as the sole end and aim of humanity.

The system of public credit, i.e. of national debts, whose origin we discover in Genoa and Venice as early as the middle ages, took possession of Europe generally during the manufacturing period. The colonial system with its maritime trade and commercial wars served as a forcing-house for it. Thus it first took root in Holland. National debts, i.e., the alienation of the state — whether despotic, constitutional or republican — marked with its stamp the capitalistic era. The only part of the so-called national wealth that actually enters into the collective possessions of modern peoples is — their national debt. Hence, as a necessary consequence, the modern doctrine that a nation becomes the richer the more deeply it is in debt. Public credit becomes the credo of capital. And with the rise of national debt-making, want of faith in the national debt takes the place of the blasphemy against the Holy Ghost, which may not be forgiven.

The public debt becomes one of the most powerful levers of primitive accumulation. As with the stroke of an enchanter's wand, it endows barren money with the power of breeding and thus turns it into capital, without the necessity of its exposing itself to the troubles and risks inseparable from its employment in industry or even in usury. The state-creditors actually give nothing away, for the sum lent is transformed into public bonds, easily negotiable, which go on functioning in their hands just as so much hard cash would. But further, apart from the class of lazy annuitants thus created, and from the improvised wealth of the financiers, middlemen between the government and the nation — as also apart from the taxfarmers, merchants, private manufacturers, to whom a good part of every national loan renders the service of a capital fallen from heaven — the national debt has given rise to joint-stock companies, to dealings in negotiable effects of all kinds, and to agiotage, in a word to stock-exchange gambling and the modern bankocracy.

At their birth the great banks, decorated with national titles, were only associations of private speculators, who placed themselves by the side of governments, and, thanks to the privileges they received, were in a position to advance money to the state. Hence the accumulation of the national debt has no more infallible measure than the successive rise in the stock of these banks, whose full development dates from the founding of the Bank of England in 1694. The Bank of England began with lending its money to the Government at 8%; at the same time it was empowered by Parliament to

coin money out of the same capital, by lending it again to the public in the form of bank-notes. It was allowed to use these notes for discounting bills, making advances on commodities, and for buying the precious metals. It was not long ere this credit-money, made by the bank itself, became the coin in which the Bank of England made its loans to the state, and paid, on account of the state, the interest on the public debt. It was not enough that the bank gave with one hand and took back more with the other; it remained, even whilst receiving, the eternal creditor of the nation down to the last shilling advanced. Gradually it became inevitably the receptacle of the metallic hoard of the country, and the centre of gravity of all commercial credit. What effect was produced on their contemporaries by the sudden uprising of this brood of bankocrats, financiers, rentiers, brokers, stock-jobbers, &c., is proved by the writings of that time, e.g., by Bolingbroke's.

With the national debt arose an international credit system, which often conceals one of the sources of primitive accumulation in this or that people. Thus the villanies of the Venetian thieving system formed one of the secret bases of the capital-wealth of Holland to whom Venice in her decadence lent large sums of money. So also was it with Holland and England. By the beginning of the 18th century the Dutch manufactures were far outstripped. Holland had ceased to be the nation preponderant in commerce and industry. One of its main lines of business, therefore, from 1701-1776, is the lending out of enormous amounts of capital, especially to its great rival England. The same thing is going on to-day between England and the United States. A great deal of capital, which appears to-day in the United States without any certificate of birth, was yesterday, in England, the capitalised blood of children.

As the national debt finds its support in the public revenue, which must cover the yearly payments for interest, &c., the modern system of taxation was the necessary complement of the system of national loans. The loans enable the government to meet extraordinary expenses, without the taxpayers feeling it immediately, but they necessitate, as a consequence, increased taxes. On the other hand, the raising of taxation caused by the accumulation of debts contracted one after another, compels the government always to have recourse to new loans for new extraordinary expenses. Modern fiscality, whose pivot is formed by taxes on the most necessary means of subsistence (thereby increasing their price), thus contains within

itself the germ of automatic progression. Over-taxation is not an incident, but rather a principle. In Holland, therefore, where this system was first inaugurated, the great patriot, De Witt, has in his "Maxims" extolled it as the best system for making the wage-labourer submissive, frugal, industrious, and overburdened with labour. The destructive influence that it exercises on the condition of the wage-labourer concerns us less however, here, than the forcible expropriation, resulting from it, of peasants, artisans, and in a word, all elements of the lower middle-class. On this there are not two opinions, even among the bourgeois economists. Its expropriating efficacy is still further heightened by the system of protection, which forms one of its integral parts.

The great part that the public debt, and the fiscal system corresponding with it, has played in the capitalisation of wealth and the expropriation of the masses, has led many writers, like Cobbett, Doubleday and others, to seek in this, incorrectly, the fundamental cause of the misery of the modern peoples.

The system of protection was an artificial means of manufacturing manufacturers, of expropriating independent labourers, of capitalising the national means of production and subsistence, of forcibly abbreviating the transition from the mediæval to the modern mode of production. The European states tore one another to pieces about the patent of this invention, and, once entered into the service of the surplus-value makers, did not merely lay under contribution in the pursuit of this purpose their own people, indirectly through protective duties, directly through export premiums. They also forcibly rooted out, in their dependent countries, all industry, as, e.g., England did with the Irish woollen manufacture. On the continent of Europe, after Colbert's example, the process was much simplified. The primitive industrial capital, here, came in part directly out of the state treasury. "Why," cries Mirabeau, "why go so far to seek the cause of the manufacturing glory of Saxony before the war? 180,000,000 of debts contracted by the sovereigns!"

Colonial system, public debts, heavy taxes, protection, commercial wars, &c., these children of the true manufacturing period, increase gigantically during the infancy of Modern Industry. The birth of the latter is heralded by a great slaughter of the innocents. Like the royal navy, the factories were recruited by means of the press-gang. Blasé as Sir F. M. Eden is as to the

horrors of the expropriation of the agricultural population from the soil, from the last third of the 15th century to his own time; with all the self-satisfaction with which he rejoices in this process, “essential” for establishing capitalistic agriculture and “the due proportion between arable and pasture land” — he does not show, however, the same economic insight in respect to the necessity of child-stealing and child-slavery for the transformation of manufacturing exploitation into factory exploitation, and the establishment of the “true relation” between capital and labour-power. He says: “It may, perhaps, be worthy the attention of the public to consider, whether any manufacture, which, in order to be carried on successfully, requires that cottages and workhouses should be ransacked for poor children; that they should be employed by turns during the greater part of the night and robbed of that rest which, though indispensable to all, is most required by the young; and that numbers of both sexes, of different ages and dispositions, should be collected together in such a manner that the contagion of example cannot but lead to profligacy and debauchery; will add to the sum of individual or national felicity?”

“In the counties of Derbyshire, Nottinghamshire, and more particularly in Lancashire,” says Fielden, “the newly-invented machinery was used in large factories built on the sides of streams capable of turning the water-wheel. Thousands of hands were suddenly required in these places, remote from towns; and Lancashire, in particular, being, till then, comparatively thinly populated and barren, a population was all that she now wanted. The small and nimble fingers of little children being by very far the most in request, the custom instantly sprang up of procuring apprentices from the different parish workhouses of London, Birmingham, and elsewhere. Many, many thousands of these little, hapless creatures were sent down into the north, being from the age of 7 to the age of 13 or 14 years old. The custom was for the master to clothe his apprentices and to feed and lodge them in an “apprentice house” near the factory; overseers were appointed to see to the works, whose interest it was to work the children to the utmost, because their pay was in proportion to the quantity of work that they could exact. Cruelty was, of course, the consequence...In many of the manufacturing districts, but particularly, I am afraid, in the guilty county to which I belong [Lancashire], cruelties the most heart-rending were practised upon the unoffending and friendless creatures who were thus consigned to the charge of master manufacturers; they were harassed to the brink of death by excess

of labour...were flogged, fettered and tortured in the most exquisite refinement of cruelty;...they were in many cases starved to the bone while flogged to their work and...even in some instances...were driven to commit suicide...The beautiful and romantic valleys of Derbyshire, Nottinghamshire and Lancashire, secluded from the public eye, became the dismal solitudes of torture, and of many a murder. The profits of manufactures were enormous; but this only whetted the appetite that it should have satisfied, and therefore the manufacturers had recourse to an expedient that seemed to secure to them those profits without any possibility of limit; they began the practice of what is termed “night-working,” that is, having tired one set of hands, by working them throughout the day, they had another set ready to go on working throughout the night; the day-set getting into the beds that the night-set had just quitted, and in their turn again, the night-set getting into the beds that the day-set quitted in the morning. It is a common tradition in Lancashire, that the beds never get cold.”

With the development of capitalist production during the manufacturing period, the public opinion of Europe had lost the last remnant of shame and conscience. The nations bragged cynically of every infamy that served them as a means to capitalistic accumulation. Read, e.g., the naïve *Annals of Commerce* of the worthy A. Anderson. Here it is trumpeted forth as a triumph of English statecraft that at the Peace of Utrecht, England extorted from the Spaniards by the Asiento Treaty the privilege of being allowed to ply the negro-trade, until then only carried on between Africa and the English West Indies, between Africa and Spanish America as well. England thereby acquired the right of supplying Spanish America until 1743 with 4800 negroes yearly. This threw, at the same time, an official cloak over British smuggling. Liverpool waxed fat on the slave-trade. This was its method of primitive accumulation. And, even to the present day, Liverpool “respectability” is the Pindar of the slave-trade which — compare the work of Aikin already quoted— “has coincided with that spirit of bold adventure which has characterised the trade of Liverpool and rapidly carried it to its present state of prosperity; has occasioned vast employment for shipping and sailors, and greatly augmented the demand for the manufactures of the country” . Liverpool employed in the slave trade, in 1730, 15 ships; in 1751, 53; in 1760, 74; in 1770, 96; and in 1792, 132.

Whilst the cotton industry introduced child-slavery in England, it gave in the United States a stimulus to the transformation of the earlier, more or less patriarchal slavery, into a system of commercial exploitation. In fact, the veiled slavery of the wage-earners in Europe needed, for its pedestal, slavery pure and simple in the new world.

Tantæ molis erat, to establish the “eternal laws of Nature” of the capitalist mode of production, to complete the process of separation between labourers and conditions of labour, to transform, at one pole, the social means of production and subsistence into capital, at the opposite pole, the mass of the population into wage-labourers, into “free labouring poor,” that artificial product of modern society. If money, according to Augier, “comes into the world wide a congenital blood-stain on one cheek,” capital comes dripping from head to foot, from every pore, with blood and dirt.

CHAPTER XXXII. HISTORICAL TENDENCY OF CAPITALIST ACCUMULATION.

WHAT does the primitive accumulation of capital, i.e., its historical genesis, resolve itself into? In so far as it is not immediate transformation of slaves and serfs into wage-labourers, and therefore a mere change of form, it only means the expropriation of the immediate producers, i.e., the dissolution of private property based on the labour of its owner. Private property, as the antithesis to social, collective property, exists only where the means of labour and the external conditions of labour belong to private individuals. But according as these private individuals are labourers or not labourers, private property has a different character. The numberless shades, that it at first sight presents, correspond to the intermediate stages lying between these two extremes. The private property of the labourer in his means of production is the foundation of petty industry, whether agricultural, manufacturing or both; petty industry, again, is an essential condition for the development of social production and of the free individuality of the labourer himself. Of course, this petty mode of production exists also under slavery, serfdom, and other states of dependence. But it flourishes, it lets loose its whole energy, it attains its adequate classical form, only where the labourer is the private owner of his own means of labour set in action by himself: the peasant of the land which he cultivates, the artisan of the tool which he handles as a virtuoso. This mode of production pre-supposes parcelling of the soil, and scattering of the other means of production. As it excludes the concentration of these means of production, so also it excludes co-operation, division of labour within each separate process of production, the control over, and the productive application of the forces of Nature by society, and the free development of the social productive powers. It is compatible only with a system of production, and a society, moving within narrow and more or less primitive bounds. To perpetuate it would be, as Pecqueur rightly says, “to decree universal mediocrity.” At a certain stage of development it brings forth the material agencies for its own dissolution. From that moment new forces and new passions spring up in the bosom of society; but the old social organization fetters them and keeps them down. It must be annihilated; it is

annihilated. Its annihilation, the transformation of the individualised and scattered means of production into socially concentrated ones, of the pigmy property of the many into the huge property of the few, the expropriation of the great mass of the people from the soil, from the means of subsistence, and from the means of labour, this fearful and painful expropriation of the mass of the people forms the prelude to the history of capital. It comprises a series of forcible methods, of which we have passed in review only those that have been epoch-making as methods of the primitive accumulation of capital. The expropriation of the immediate producers was accomplished with merciless Vandalism, and under the stimulus of passions the most infamous, the most sordid, the pettiest, the most meanly odious. Self-earned private property, that is based, so to say, on the fusing together of the isolated, independent labouring-individual with the conditions of his labour, is supplanted by capitalistic private property, which rests on exploitation of the nominally free labour of others, i.e., on wages-labour.

As soon as this process of transformation has sufficiently decomposed the old society from top to bottom, as soon as the labourers are turned into proletarians, their means of labour into capital, as soon as the capitalist mode of production stands on its own feet, then the further socialisation of labour and further transformation of the land and other means of production into socially exploited and, therefore, common means of production, as well as the further expropriation of private proprietors, takes a new form. That which is now to be expropriated is no longer the labourer working for himself, but the capitalist exploiting many labourers. This expropriation is accomplished by the action of the immanent laws of capitalistic production itself, by the centralisation of capital. One capitalist always kills many. Hand in hand with this centralisation, or this expropriation of many capitalists by few, develop, on an ever extending scale, the co-operative form of the labour-process, the conscious technical application of science, the methodical cultivation of the soil, the transformation of the instruments of labour into instruments of labour only usable in common, the economising of all means of production by their use as the means of production of combined, socialised labour, the entanglement of all peoples in the net of the world-market, and this, the international character of the capitalistic régime. Along with the constantly diminishing number of the magnates of capital, who usurp and monopolise all advantages of this process of transformation, grows the mass of misery, oppression, slavery,

degradation, exploitation; but with this too grows the revolt of the working-class, a class always increasing in numbers, and disciplined, united, organised by the very mechanism of the process of capitalist production itself. The monopoly of capital becomes a fetter upon the mode of production, which has sprung up and flourished along with, and under it. Centralisation of the means of production and socialisation of labour at last reach a point where they become incompatible with their capitalist integument. This integument is burst asunder. The knell of capitalist private property sounds. The expropriators are expropriated.

The capitalist mode of appropriation, the result of the capitalist mode of production, produces capitalist private property. This is the first negation of individual private property, as founded on the labour of the proprietor. But capitalist production begets, with the inexorability of a law of Nature, its own negation. It is the negation of negation. This does not re-establish private property for the producer, but gives him individual property based on the acquisitions of the capitalist era: i.e., on co-operation and the possession in common of the land and of the means of production.

The transformation of scattered private property, arising from individual labour, into capitalist private property is, naturally, a process, incomparably more protracted, violent, and difficult, than the transformation of capitalistic private property, already practically resting on socialised production, into socialised property. In the former case, we had the expropriation of the mass of the people by a few usurpers; in the latter, we have the expropriation of a few usurpers by the mass of the people.

CHAPTER XXXIII. THE MODERN THEORY OF COLONISATION.

POLITICAL economy confuses on principle two very different kinds of private property, of which one rests on the producers' own labour, the other on the employment of the labour of others. It forgets that the latter not only is the direct antithesis of the former, but absolutely grows on its tomb only. In Western Europe, the home of political economy, the process of primitive accumulation is more or less accomplished. Here the capitalist régime has either directly conquered the whole domain of national production, or, where economic conditions are less developed, it, as least, indirectly controls those strata of society which, though belonging to the antiquated mode of production, continue to exist side by side with it in gradual decay. To this ready-made world of capital, the political economist applies the notions of law and of property inherited from a pre-capitalistic world with all the more anxious zeal and all the greater unction, the more loudly the facts cry out in the face of his ideology. It is otherwise in the colonies. There the capitalist régime everywhere comes into collision with the resistance of the producer, who, as owner of his own conditions of labour, employs that labour to enrich himself, instead of the capitalist. The contradiction of these two diametrically opposed economic systems, manifests itself here practically in a struggle between them. Where the capitalist has at his back the power of the mother-country, he tries to clear out of his way by force, the modes of production and appropriation, based on his independent labour of the producer. The same interest which compels the sycophant of capital, the political economist, in the mother-country, to proclaim the theoretical identity of the capitalist mode of production with its contrary, that same interest compels him in the colonies to make a clean breast of it, and to proclaim aloud the antagonism of the two modes of production. To this end he proves how the development of the social productive power of labour, co-operation, division of labour, use of machinery on a large scale, &c., are impossible without the expropriation of the labourers, and the corresponding transformation of their means of production into capital. In the interest of the so-called national wealth, he seeks for artificial means to ensure the poverty of the people. Here his

apologetic armour crumbles off, bit by bit, like rotten touchwood. It is the great merit of E.g. Wakefield to have discovered, not anything new about the Colonies, but to have discovered in the Colonies the truth as to the conditions of capitalist production in the mother-country. As the system of protection at its origin attempted to manufacture capitalists artificially in the mother-country. so Wakefield's colonisation theory, which England tried for a time to enforce by Acts of Parliament, attempted to effect the manufacture of wage-workers in the Colonies. This he calls "systematic colonisation."

First of all, Wakefield discovered that in the Colonies property in money, means of subsistence, machines and other means of production, does not as yet stamp a man as a capitalist if there be wanting the correlative — the wage-worker, the other man who is compelled to sell himself of his own free-will. He discovered that capital is not a thing, but a social relation between persons, established by the instrumentality of things. Mr. Peel, he moans, took with him from England to Swan River, West Australia, means of subsistence and of production to the amount of £50,000. Mr. Peel had the foresight to bring with him, besides, 3000 persons of the working-class, men, women, and children. Once arrived at his destination, "Mr. Peel was left without a servant to make his bed or fetch him water from the river." Unhappy Mr. Peel who provided for everything except the export of English modes of production to Swan River!

For the understanding of the following discoveries of Wakefield, two preliminary remarks: We know that the means of production and subsistence, while they remain the property of the immediate producer, are not capital. They become capital, only under circumstances in which they serve at the same time as means of exploitation and subjection of the labourer. But this capitalist soul of theirs is so intimately wedded, in the head of the political economist, to their material substance, that he christens them capital under all circumstances, even when they are its exact opposite. Thus is it with Wakefield. Further: the splitting up of the means of production into the individual property of many independent labourers, working on their own account, he calls equal division of capital. It is with the political economist as with the feudal jurist. The latter stuck on to pure monetary relations the labels supplied by feudal law.

"If," says Wakefield, "all the members of the society are supposed to possess equal portions of capital...no man would have a motive for accumulating more capital than he could use with his own hands. This is to

some extent the case in new American settlements, where a passion for owning land prevents the existence of a class of labourers for hire.” So long, therefore, as the labourer can accumulate for himself — and this he can do so long as he remains possessor of his means of production — capitalist accumulation and the capitalistic mode of production are impossible. The class of wage-labourers, essential to these, is wanting. How, then, in old Europe, was the expropriation of the labourer from his conditions of labour, i.e., the co-existence of capital and wage-labour, brought about? By a social contract of a quite original kind. “Mankind have adopted a...simple contrivance for promoting the accumulation of capital,” which, of course, since the time of Adam, floated in their imagination as the sole and final end of their existence: “they have divided themselves into owners of capital and owners of labour.... This division was the result of concert and combination.” In one word: the mass of mankind expropriated itself in honour of the “accumulation of capital.” Now, one would think, that this instinct of self-denying fanaticism would give itself full fling especially in the Colonies, where alone exist the men and conditions that could turn a social contract from a dream to a reality. But why, then, should “systematic colonisation” be called in to replace its opposite, spontaneous, unregulated colonisation? But — but— “In the Northern States of the American Union, it may be doubted whether so many as a tenth of the people would fall under the description of hired labourers.... In England...the labouring class compose the bulk of the people.” Nay, the impulse to self-expropriation, on the part of labouring humanity, for the glory of capital, exists so little, that slavery, according to Wakefield himself, is the sole natural basis of Colonial wealth. His systematic colonisation is a mere pis aller, since he unfortunately has to do with free men, not with slaves. “The first Spanish settlers in Saint Domingo did not obtain labourers from Spain. But, without labourers, their capital must have perished, or, at least, must soon have been diminished to that small amount which each individual could employ with his own hands. This has actually occurred in the last Colony founded by Englishmen — the Swan River Settlement — where a great mass of capital, of seeds, implements, and cattle, has perished for want of labourers to use it, and where no settler has preserved much more capital than he can employ with his own hands.”

We have seen that the expropriation of the mass of the people from the soil forms the basis of the capitalist mode of production. The essence of a free colony, on the contrary, consists in this — that the bulk of the soil is still public property, and every settler on it therefore can turn part of it into his private property and individual means of production, without hindering the later settlers in the same operation. This is the secret both of the prosperity of the colonies and of their inveterate vice — opposition to the establishment of capital. “Where land is very cheap and all men are free, where one who so pleases can easily obtain a piece of land for himself, not only is labour very dear, as respects the labourer’s share of the produce, but the difficulty is to obtain combined labour at any price.”

As in the colonies the separation of the labourer from the conditions of labour and their root, the soil, does not yet exist, or only sporadically, or on too limited a scale, so neither does the separation of agriculture from industry exist, nor the destruction of the household industry of the peasantry. Whence then is to come the internal market for capital? “No part of the population of America is exclusively agricultural, excepting slaves and their employers who combine capital and labour in particular works. Free Americans, who cultivate the soil, follow many other occupations. Some portion of the furniture and tools which they use is commonly made by themselves. They frequently build their own houses, and carry to market, at whatever distance, the produce of their own industry. They are spinners and weavers; they make soap and candles, as well as, in many cases, shoes and clothes for their own use. In America the cultivation of land is often the secondary pursuit of a blacksmith, a miller or a shopkeeper.” With such queer people as these, where is the “field of abstinence” for the capitalists?
