CRITIQUE OF HEGEL'S PHILOSOPHY OF RIGHT, 1843

Translated by Henry James Stenning

This early manuscript was written in 1843, but remained unpublished during Marx's lifetime, except for the introduction that appeared in print in 1844. The text centres on fellow philosopher Georg Wilhelm Friedrich Hegel's 1820 book *Elements of the Philosophy of Right*, commenting paragraph by paragraph. One of Marx's major criticisms of Hegel is the fact that many of his dialectical arguments begin in abstraction. This work contains the formulations of Marx's particular alienation theory, which was informed by Ludwig Andreas Feuerbach's work. The narrative of the work develops around analysis of the relations between civil society and political society, including Marx's most famous commentaries on the function of religion in the introduction.

Portrait of Georg Wilhelm Friedrich Hegel by Jakob Schlesinger, 1831

Grundlinien

der

Philosophie des Rechts.

The first edition's title page of Hegel's landmark book

A CRITICISM OF THE HEGELIAN PHILOSOPHY OF RIGHT

As far as Germany is concerned the criticism of religion is practically completed, and the criticism of religion is the basis of all criticism.

The profane existence of error is threatened when its heavenly oratio pro aris et focis has been refuted.

He who has only found a reflexion of himself in the fantastic reality of heaven where he looked for a superman, will no longer be willing to find only the semblance of himself, only the sub-human, where he seeks and ought to find his own reality.

The foundation of the criticism of religion is: Man makes religion, religion does not make man. Religion indeed is man's self-consciousness and self-estimation while he has not found his feet in the universe. But Man is no abstract being, squatting outside the world. Man is the world of men, the State, society. This State, this society produces religion, which is an inverted world-consciousness, because they are an inverted world. Religion is the general theory of this world, its encyclopædic compendium, its logic in popular form, its spiritualistic Point d'honneur, its enthusiasm, its moral sanction, its solemn complement, its general basis of consolation and justification. It is the fantastic realization of the human being, inasmuch as the human being possesses no true reality. The struggle against religion is therefore indirectly the struggle against that world whose spiritual aroma is religion.

Religious misery is in one mouth the expression of real misery, and in another is a protestation against real misery. Religion is the moan of the oppressed creature, the sentiment of a heartless world, as it is the spirit of spiritless conditions. It is the opium of the people.

The abolition of religion, as the illusory happiness of the people, is the demand for their real happiness. The demand to abandon the illusions about their condition is a demand to abandon a condition which requires illusions. The criticism of religion therefore contains potentially the criticism of the Vale of Tears whose aureole is religion.

Criticism has plucked the imaginary flowers which adorned the chain, not that man should wear his fetters denuded of fanciful embellishment, but

that he should throw off the chain, and break the living flower.

The criticism of religion disillusiones man, so that he thinks, acts, shapes his reality like the disillusioned man come to his senses, so that he revolves around himself, and thus around his real sun. Religion is but the illusory sun which revolves around man, so long as he does not revolve around himself.

It is therefore the task of history, once the thither side of truth has vanished, to establish the truth of the hither side.

The immediate task of philosophy, when enlisted in the service of history, is to unmask human self-alienation in its unholy shape, now that it has been unmasked in its holy shape. Thus the criticism of heaven transforms itself into the criticism of earth, the criticism of religion into the criticism of right, and the criticism of theology into the criticism of politics.

The following essay — a contribution to this work — is in the first place joined not to the original, but to a copy, to the German philosophy of politics and of right, for no other reason than because it pertains to Germany.

If one should desire to strike a point of contact with the German status quo, albeit in the only appropriate way, which is negatively, the result would ever remain an anachronism. Even the denial of our political present is already a dust-covered fact in the historical lumber room of modern nations. If I deny the powdered wig, I still have to deal with unpowdered wigs. If I deny the German conditions of 1843, I stand, according to French chronology, scarcely in the year 1789, let alone in the focus of the present.

German history flatters itself that it has a movement which no people in the historical heaven have either executed before or will execute after it. We have in point of fact shared in the restoration epoch of modern nations without participating in their revolutions.

We were restored, in the first place, because other nations dared to make a revolution, and, in the second place, because other nations suffered a counter revolution: in the first place, because our masters were afraid, and, in the second place, because they regained their courage.

Led by our shepherds, we suddenly found ourselves in the society of freedom on the day of its interment.

As a school which legitimates the baseness of to-day by the baseness of yesterday, a school which explains every cry of the serf against the knout as rebellious, once the knout becomes a prescriptive, a derivative, a historical knout, a school to which history only shows itself a posteriori, like the God

of Israel to his servant Moses, the historical juridical school would have invented German history, were it not itself an invention of German history.

On the other hand, good-humoured enthusiasts, Teutomaniacs by upbringing and freethinkers by reflexion, seek for our history of freedom beyond our history in the Teutonic primeval woods. But in what respect is our freedom history distinguished from the freedom history of the boar, if it is only to be found in the woods? Moreover, as one shouts into the wood, so one's voice comes back in answer ("As the question, so the answer"). Therefore peace to the Teutonic primeval woods.

But war to German conditions, at all events! They lie below the level of history, they are liable to all criticism, but they remain a subject for criticism just as the criminal who is below the level of humanity remains a subject for the executioner.

Grappling with them, criticism is no passion of the head, it is the head of passion. It is no anatomical knife, it is a weapon. Its object is its enemy, which it will not refute but destroy. For the spirit of the conditions has been refuted. In and for themselves they are no memorable objects, but existences as contemptible as they are despised. Criticism has already settled all accounts with this subject. It no longer figures as an end in itself, but only as a means. Its essential pathos is indignation, its essential work is denunciation.

What we have to do is to describe a series of social spheres, all exercising a somewhat sluggish pressure upon each other, a general state of inactive dejection, a limitation which recognizes itself as much as it misunderstands itself, squeezed within the framework of a governmental system, which, living on the conservation of all meannesses, is itself nothing less than meanness in government.

What a spectacle! On the one hand, the infinitely ramified division of society into the most varied races, which confront each other with small antipathies, bad consciences, and brutal mediocrity, and precisely because of the ambiguous and suspicious positions which they occupy towards each other, such positions being devoid of all real distinctions although coupled with various formalities, are treated by their lords as existences on sufferance. And even more. The fact that they are ruled, governed, and owned they must acknowledge and confess as a favour of heaven! On the other hand, there are those rulers themselves whose greatness is in inverse proportion to their number.

The criticism which addresses itself to this object is criticism in hand-to-hand fighting, and in hand-to-hand fighting, it is not a question of whether the opponent is a noble opponent, of equal birth, or an interesting opponent; it is a question of meeting him. It is thus imperative that the Germans should have no opportunity for self-deception and resignation. The real pressure must be made more oppressive by making men conscious of the pressure, and the disgrace more disgraceful by publishing it.

Every sphere of German society must be described as the *partie honteuse* of German society, these petrified conditions must be made to dance by singing to them their own melody! The people must be taught to be startled at their own appearance, in order to implant courage into them.

And even for modern nations this struggle against the narrow-minded actuality of the German status quo cannot be without interest, for the German status quo represents the frank completion of the *ancien régime*, and the *ancien régime* is the concealed defect of the modern State. The struggle against the German political present is the struggle against the past of modern nations, which are still vexed by the recollections of this past. For them it is instructive to see the *ancien régime*, which enacted its tragedy with them, playing its comedy as the German revenant. Its history was tragic so long as it was the pre-existing power of the world, and freedom, on the other hand, a personal invasion, in a word, so long as it believed and was obliged to believe in its justification. So long as the *ancien régime* as the existing world order struggled with a nascent world, historical error was on its side, but not personal perversity. Its downfall was therefore tragic.

On the other hand, the present German *régime*, which is an anachronism, a flagrant contradiction of the generally recognized axiom of the obsolescence of the *ancien régime*, imagines that it believes in itself, and extorts from the world the same homage. If it believed in its own being, would it seek to hide it under the semblance of an alien being and look for its salvation in hypocrisy and sophistry? The modern *ancien régime* is merely the comedian of a world order whose real heroes are dead.

History is thorough, and passes through many phases when it bears an old figure to the grave. The last phase of a world historical figure is its comedy. The gods of Greece, once tragically wounded to death in the chained Prometheus of Æschylus, were fated to die a comic death in Lucian's dialogues. Why does history take this course? In order that mankind may break away in a jolly mood from its past.

In the light of this historical foresight, the political powers of Germany are vindicated. As soon then as the modern politico-social reality is itself subjected to criticism, as soon, therefore, as criticism raises itself to the height of truly human problems, it either finds itself outside the German status quo, or it would delve beneath the latter to find its object.

To take an example! The relation of industry, and of the world of wealth generally, to the political world is one of the chief problems of modern times. Under what form is this problem beginning to engage the attention of Germans? Under the form of protective tariffs, of the system of prohibition, of political economy. Teutomania has passed out of men and gone into matter, and thus one fine day we saw our cotton knights and iron heroes transformed into patriots. Thus in Germany we are beginning to recognize the sovereignty of monopoly at home, in order that it may be invested with sovereignty abroad. We are now beginning in Germany at the point where they are leaving off in France and England.

The old rotten condition, against which these countries are theoretically in revolt, and which they only tolerate as chains are borne, is greeted in Germany as the dawning of a splendid future, which as yet scarcely dares to translate itself from cunning theory into the most ruthless practice. Whereas the problem in France and England reads: Political economy or the rule of society over wealth, it reads in Germany: national economy or the rule of private property over nationality. Thus England and France are faced with the question of abolishing monopoly which has been carried to its highest point; in Germany the question is to carry monopoly to its highest point.

If, therefore, the total German development were not in advance of the political German development, a German could at the most take part in present-day problems only in the same way as a Russian can do so.

But if the individual is not bound by the ties of a nation, the entire nation is even less liberated by the emancipation of an individual. The Scythians made no advance towards Greek culture because Greece numbered a Scythian among her philosophers. Luckily we Germans are no Scythians.

As the old nations lived their previous history in imagination, in mythology, so we Germans live our history to come in thought, in philosophy. We are philosophical contemporaries of the present without being its historical contemporaries. German philosophy is the ideal prolongation of German history. If, therefore, we criticize the *œuvres posthumes* of our ideal history, philosophy, instead of the *œuvres*

incomplètes of our real history, our criticism occupies a position among the questions of which the present says: that is the question. That which represents the decaying elements of practical life among the progressive nations with modern State conditions first of all becomes critical decay in the philosophical reflexion of these conditions in Germany, where the conditions themselves do not yet exist.

German juridical and political philosophy is the sole element of German history which stands *al pari* with the official modern present.

The German people must therefore strike this their dream history against their existing conditions, and subject to criticism not only these conditions, but at the same time their abstract continuation.

Their future can neither be confined to the direct denial of their real nor to the direct enforcement of their ideal political and juridical conditions, for they possess the direct denial of their real conditions in their ideal conditions, and the direct enforcement of their ideal conditions they have almost outlived in the opinion of neighbouring nations. Consequently the practical political party in Germany properly demands the negation of philosophy. Its error consists not in the demand, but in sticking to the demand, which seriously it neither does nor can enforce. It believes it can accomplish this negation by turning its back on philosophy, the while its averted head utters a few irritable and banal phrases over it. Moreover, its horizon is so limited as to exclude philosophy from the realm of German actuality unless it imagines philosophy to be implied in German practice and in the theories subserving it. It urges the necessity for linking up with vital forces, but forgets that the real vital force of the German people has hitherto only pullulated under its skull.

In a word: you cannot abolish philosophy without putting it into practice. The same error, only with the factors reversed, is committed by the theoretical party, the political party which founds on philosophy.

The latter perceives in the present struggle only the critical struggle of philosophy with the German world; it does not suspect that all previous philosophy has itself been a part of this world, and is its complement, if an ideal one. While critical towards its opposing party, it behaves uncritically towards itself. It starts from the assumptions of philosophy, but either refuses to carry further the results yielded by philosophy, or claims as the direct outcome of philosophy results and demands which have been culled from another sphere.

We reserve to ourselves a more detailed examination of this party.

Its fundamental defect may be reduced to this: it believes it can enforce philosophy without abolishing it. The criticism of German juridical and political philosophy, which has received through Hegel its most consistent, most ample and most recent shape, is at once both the critical analysis of the modern State and of the actuality which is connected therewith, and in addition the decisive repudiation of the entire previous mode of the German political and juridical consciousness, whose principal and most universal expression, elevated to the level of a science, is speculative jurisprudence itself.

While, on the one hand, speculative jurisprudence, this abstract and exuberant thought-process of the modern State, is possible only in Germany, on the other hand, the German conception of the modern State, making abstraction of real men, was only possible because and in so far as the modern State itself makes abstraction of real men or only satisfies the whole of man in an imaginary manner.

Germans have thought in politics what other peoples have done. Germany was their theoretical conscience. The abstraction and arrogance of her thought always kept an even pace with the one-sidedness and stunted growth of her actuality. If, therefore, the status quo of the German civic community expresses the completion of the ancien régime, the completion of the pile driven into the flesh of the modern State, the status quo of German political science expresses the inadequacy of the modern State, the decay that is set up in its flesh.

As a decisive counterpart of the previous mode of German political consciousness, the criticism of speculative jurisprudence does not run back upon itself, but assumes the shape of problems for whose solution there is only one means: practice.

The question arises: can Germany attain to a practice à la hauteur de principes, that is, to a revolution which will not only raise her to the level of modern nations, but to the human level which will be the immediate future of these nations?

The weapon of criticism cannot in any case replace the criticism of weapons, material force must be overthrown by material force, but theory too becomes a material force as soon as it grasps weapons. Theory is capable of grasping weapons as soon as its argument becomes *ad hominem*, and its argument becomes *ad hominem* as soon as it becomes radical. To be

radical is to grasp the matter by its root. Now the root for mankind is man himself. The evident proof of the radicalism of German theory, and therefore of its practical energy, is its outcome from the decisive and positive abolition of religion.

The criticism of religion ends with the doctrine that man is the supreme being for mankind, and therefore with the categorical imperative to overthrow all conditions in which man is a degraded, servile, neglected, contemptible being, conditions which cannot be better described than by the exclamation of a Frenchman on the occasion of a projected dog tax: "Poor dogs; they want to treat you like men!"

Even historically, theoretical emancipation has a specifically practical significance for Germany. Germany's revolutionary past is particularly theoretical, it is the Reformation. Then it was the monk, and now it is the philosopher in whose brain the revolution begins.

Luther vanquished servility based upon devotion, because he replaced it by servility based upon conviction. He shattered faith in authority, because he restored the authority of faith. He transformed parsons into laymen, because he transformed laymen into parsons. He liberated men from outward religiosity, because he made religiosity an inward affair of the heart. He emancipated the body from chains, because he laid chains upon the heart.

But if Protestantism is not the true solution, it was the true formulation of the problem. The question was no longer a struggle between the layman and the parson external to him; it was a struggle with his own inner parson, his parsonic nature. And if the protestant transformation of German laymen into parsons emancipated the lay popes, the princes, together with their clergy, the privileged and the philistines, the philosophic transformation of the parsonic Germans into men will emancipate the people. But little as emancipation stops short of the princes, just as little will the secularization of property stop short of church robbery, which was chiefly set on foot by the hypocritical Prussians. Then the Peasants' War, the most radical fact of German history, came to grief on the reef of theology. To-day, when theology itself has come to grief, the most servile fact of German history, our status quo, will be shivered on the rock of philosophy.

The day before the Reformation, official Germany was the most abject vassal of Rome. The day before its revolution, it is the abject vassal of less than Rome, of Prussia and Austria, of country squires and philistines.

Meanwhile there seems to be an important obstacle to a radical German revolution.

Revolutions in fact require a passive element, a material foundation.

Theory becomes realized among a people only in so far as it represents the realization of that people's needs. Will the immense cleavage between the demands of the German intellect and the responses of German actuality now involve a similar cleavage of middle-class society from the State, and from itself? Will theoretical needs merge directly into practical needs? It is not enough that the ideas press towards realization; reality itself must stimulate to thinking.

But Germany did not pass through the middle stages of political emancipation simultaneously with the modern nations. Even the stages which she has overcome theoretically she has not reached practically.

How would she be able to clear with a salto mortale not only her own obstacles, but at the same time the obstacles of modern nations, obstacles which she must actually feel to mean a liberation to be striven for from her real obstacles? A radical revolution can only be the revolution of radical needs, whose preliminary conditions appear to be wholly lacking.

Although Germany has only accompanied the development of nations with the abstract activity of thought, without taking an active part in the real struggles incident to this development, she has, on the other hand, shared in the suffering incident to this development, without sharing in its enjoyments, or their partial satisfaction. Abstract activity on the one side corresponds to abstract suffering on the other side.

Consequently, one fine day Germany will find herself at the level of European decay, before she has ever stood at the level of European emancipation. The phenomenon may be likened to a fetish-worshipper, who succumbs to the diseases of Christianity.

Looking upon German governments, we find that, owing to contemporary conditions, the situation of Germany, the standpoint of German culture and finally their own lucky instincts, they are driven to combine the civilized shortcomings of the modern State world, whose advantages we do not possess, with the barbarous shortcomings of the ancien régime, which we enjoy in full measure, so that Germany is constantly obliged to participate, if not intelligently, at any rate unintelligently, in the State formations which lie beyond her status quo.

Is there for example a country in the world which shares so naïvely in all the illusions of the constitutional community, without sharing in its realities, as does so-called constitutional Germany? Was it necessary to combine German governmental interference, the tortures of the censorship, with the tortures of the French September laws which presupposed freedom of the press? Just as one found the gods of all nations in the Roman pantheon, so will one find the flaws of all State forms in the Holy Roman German Empire. That this eclecticism will reach a point hitherto unsuspected is guaranteed in particular by the politico-æsthetic gourmanderie of a German king, who thinks he can play all the parts of monarchy, both of the feudal and the bureaucratic, both of the absolute and the constitutional, of the autocratic as of the democratic, if not in the person of his people, then in his own person, if not for the people, then for himself. Germany as the embodiment of the defect of the political present, constituted in her own world, will not be able to overthrow the specifically German obstacles without overthrowing the general obstacles of the political present.

It is not the radical revolution which is a utopian dream for Germany, not the general human emancipation, but rather the partial, the merely political revolution, the revolution which leaves the pillars of the house standing. Upon what can a partial, a merely political revolution base itself? Upon the fact that a part of bourgeois society could emancipate itself and attain to general rulership, upon the fact that, by virtue of its special situation, a particular class could undertake the general emancipation of society. This class would liberate the whole of society, but only upon the assumption that the whole of society found itself in the situation of this class, and consequently possessed money and education, for instance, or could acquire them if it liked.

No class in bourgeois society can play this part without setting up a wave of enthusiasm in itself and among the masses, a wave of feeling wherein it would fraternize and commingle with society in general, and would feel and be recognized as society's general representative, a wave of enthusiasm wherein its claims and rights would be in truth the claims and rights of society itself, wherein it would really be the social head and the social heart. Only in the name of the general rights of society can a particular class vindicate for itself the general rulership.

Revolutionary energy and intellectual self-confidence are not sufficient by themselves to enable a class to attain to this emancipatory position, and

thereby exploit politically all social spheres in the interest of its own sphere. In order that the revolution of a people should coincide with the emancipation of a special class of bourgeois society, it is necessary for a class to stand out as a class representing the whole of society. Thus further involves, as its obverse side, the concentration of all the defects of society in another class, and this particular class must be the embodiment of the general social obstacles and impediments. A particular social sphere must be identical with the notorious crime of society as a whole, in such wise that the emancipation of this sphere would appear to be the general self-emancipation. In order that one class should be the class of emancipation par excellence, another class must contrariwise be the class of manifest subjugation. The negative-general significance of the French nobility and the French clergy was the condition of the positive-general significance of the class of the bourgeoisie, which was immediately encroaching upon and confronting the former.

But in Germany every class lacks not only the consistency, the keenness, the courage, the ruthlessness, which might stamp it as the negative representative of society. It lacks equally that breadth of soul which would identify it, if only momentarily, with the popular soul, that quality of genius which animates material power until it becomes political power, that revolutionary boldness which hurls at the opponent the defiant words: I am nothing, and I have to be everything. But the stock-in-trade of German morality and honour, not only as regards individuals but also as regards classes, constitutes rather that modest species of egoism which brings into prominence its own limitations.

The relation of the various spheres of German society is therefore not dramatic, but epic. Each of them begins to be self-conscious and to press its special claims upon the others not when it is itself oppressed, but when the conditions of the time, irrespective of its co-operation, create a sociable foundation from which it can on its part practise oppression. Even the moral self-esteem of the German middle class is only based on the consciousness of being the general representative of the philistine mediocrity of all the other classes.

Consequently it is not only the German kings who succeed to the throne *mal à propos*, but it is every sphere of bourgeois society which experiences its defeat before it celebrates its victory, develops its own handicaps before it overcomes the handicaps which confront it, asserts its own narrow-

mind nature before it can assert its generous nature, so that even the opportunity of playing a great part is always past before it actually existed, and each class, so soon as it embarks on a struggle with the class above it, becomes involved in a struggle with the class below it. Consequently, the princedom finds itself fighting the monarchy, the bureaucrat finds himself fighting the nobility, the bourgeois finds himself fighting them all, while the proletariat is already commencing to fight the bourgeois.

The middle class hardly dares to seize hold of the ideas of emancipation from its own standpoint before the development of social conditions and the progress of political theory declare this standpoint to be antiquated, or at least very problematical. In France partial emancipation is the basis of universal emancipation. In Germany universal emancipation is the condition sine qua non of every partial emancipation. In France it is the reality, in Germany it is the impossibility of gradual emancipation which must bring forth entire freedom. In France every popular class is tinged with political idealism, and does not feel primarily as a particular class, but as the representative of social needs generally. The rôle of emancipator, therefore, flits from one class to another of the French people in a dramatic movement, until it eventually reaches the class which will no longer realize social freedom upon the basis of certain conditions lying outside of mankind and yet created by human society, but will rather organize all the conditions of human existence upon the basis of social freedom. In Germany, on the other hand, where practical life is as unintellectual as intellectual life is unpractical, no class of bourgeois society either feels the need or possesses the capacity for emancipation, unless driven thereto by its immediate position, by material necessity, by its chains themselves.

Wherein, therefore, lies the positive possibility of German emancipation?

Answer: In the formation of a class in radical chains, a class which finds itself in bourgeois society, but which is not of it, an order which shall break up all orders, a sphere which possesses a universal character by virtue of its universal suffering, which lays claim to no special right, because no particular wrong but wrong in general is committed upon it, which can no longer invoke a historical title, but only a human title, which stands not in a one-sided antagonism to the consequences, but in a many-sided antagonism to the assumptions of the German community, a sphere finally which cannot emancipate itself without emancipating all the other spheres of society,

which represents in a word the complete loss of mankind, and can therefore only redeem itself through the complete redemption of mankind. The dissolution of society reduced to a special order is the proletariat.

The proletariat arises in Germany only with the beginning of the industrial movement; for it is not poverty resulting from natural circumstances but poverty artificially created, not the masses who are held down by the weight of the social system, but the multitude released by the acute break-up of society — especially of the middle class — which gives rise to the proletariat. When the proletariat proclaims the dissolution of the existing order of things it is merely announcing the secret of its own existence, for it is in itself the virtual dissolution of this order of things. When the proletariat desires the negation of private property, it is merely elevating to a general principle of society what it already involuntarily embodies in itself as the negative product of society.

With respect to the nascent world the proletariat finds itself in the same position as the German king occupies with respect to the departed world, when he calls the people his people, just as he calls a horse his horse. In declaring the people to be his private property, the king acknowledges that private property is king.

Just as philosophy finds in the proletariat its material weapons, so the proletariat finds in philosophy its intellectual weapons, and as soon as the lightning of thought has penetrated into the flaccid popular soil, the elevation of Germans into men will be accomplished.

Let us summarize the result at which we have arrived. The only liberation of Germany that is practical or possible is a liberation from the standpoint of the theory that declares man to be the supreme being of mankind. In Germany emancipation from the Middle Ages can only be effected by means of emancipation from the results of a partial freedom from the Middle Ages. In Germany no brand of serfdom can be extirpated without extirpating every kind of serfdom. Fundamental Germany cannot be revolutionized without a revolution in its basis. The emancipation of Germans is the emancipation of mankind. The head of this emancipation is philosophy; its heart is the proletariat. Philosophy cannot be realized without the abolition of the proletariat, the proletariat cannot abolish itself without realizing philosophy.

When all the inner conditions are fulfilled, the German day of resurrection will be announced by the crowing of the Gallic Cock.

ON THE JEWISH QUESTION, 1843

Translated by Henry James Stenning

Written in 1843 and first published in Paris in 1844 under the German title *Zur Judenfrage*, this essay was one of Marx's first attempts to deal with categories, which would later be called the materialist conception of history. The essay analyses two studies by Marx's fellow Young Hegelian Bruno Bauer on the attempt by Jews to achieve political emancipation in Prussia. Bauer argued that Jews could achieve political emancipation only by relinquishing their particular religious consciousness, since political emancipation requires a secular state, which he assumes does not leave any "space" for social identities such as religion. According to Bauer, such religious demands are incompatible with the idea of the "Rights of Man". True political emancipation, for Bauer, requires the abolition of religion.

Marx uses Bauer's essay to present his own analysis of liberal rights, arguing that Bauer is mistaken in his assumption that in a "secular state" religion will no longer play a prominent role in social life, and giving as an example the pervasiveness of religion in the United States, which, unlike Prussia, had no state religion. In Marx's analysis, the "secular state" is not opposed to religion, but rather actually presupposes it. The removal of religious or property qualifications for citizens does not mean the abolition of religion or property, but only introduces a way of regarding individuals in abstraction from them. From here Marx moves beyond the question of religious freedom to his real concern with Bauer's analysis of "political emancipation". He concludes that while individuals can be "spiritually" and "politically" free in a secular state, they can still be bound to material constraints on freedom by economic inequality, an assumption that would later form the basis of his critiques of capitalism.

Bruno Bauer : Die Judenfrage. Braunschweig 1843.

Die deutschen Juden begehren die Emancipation. Welche Emancipation begehren sie? Die staatsbürgerliche, die politische Emancipation.

Bruno Bauer antwortet ihnen : Niemand in Deutschland ist politisch-emancipiert. Wir selbst sind unfrei. Wie sollen wir auch befreien? Ihr Juden seid Egoisten, wenn ihr eine besondere Emancipation für euch als Juden verlangt. Ihr müsstet als Deutsche an der politischen Emancipation Deutschlands, als Menschen an der menschlichen Emancipation arbeiten und die besondere Art eures Drucks und eurer Schmach nicht als Ausnahme von der Regel, sondern vielmehr als Bestätigung der Regel empfinden.

Oder verlangen die Juden Gleichstellung mit den christlichen Unterthanen? So erkennen sie den christlichen Staat als berechtigt an, so erkennen sie das Regiment der allgemeinen Unterjochung an. Warum mißfällt ihnen ihr spezielles Joch, wenn ihnen das allgemeine Joch gefällt? Warum soll der Deutsche sich für die Befreiung des Juden interessieren, wenn der Jude sich nicht für die Befreiung des Deutschen interessiert?

Der christliche Staat kennt nur Privilegien. Der Jude besitzt in ihm das Privilegium, Jude zu sein. Er hat als Jude Rechte,

Bruno Bauer (1809-1882) was a German philosopher and historian. As a student of G. W. F. Hegel, Bauer was a radical Rationalist in philosophy, politics and Biblical criticism.

1. Bruno Bauer, Die Judenfrage, Brunswick 1843.

The German Jews crave for emancipation. What emancipation do they crave? Civic, political emancipation.

Bruno Bauer answers them: Nobody in Germany is politically emancipated. We ourselves are unfree. How shall we liberate you? You Jews are egoists, if you demand a special emancipation for yourselves as Jews. As Germans you ought to labour for the political emancipation of Germany, as men for human emancipation, and you ought to feel the special nature of your oppression and your disgrace not as an exception from the rule, but rather as its confirmation.

Or do Jews demand to be put on an equal footing with Christian subjects? Then they recognize the Christian State as justified, then they recognize the régime of general subjugation. Why are they displeased at their special yoke, when the general yoke pleases them? Why should Germans interest themselves in the emancipation of the Jews, if Jews do not interest themselves in the emancipation of Germans?

The Christian State knows only privileges. In that State the Jew possesses the privilege of being a Jew. As a Jew, he has rights which a Christian has not. Why does he crave the rights which he has not, and which Christians enjoy?

If the Jew wants to be emancipated from the Christian State, then he should demand that the Christian State abandon its religious prejudice. Will the Jew abandon his religious prejudice? Has he therefore the right to demand of another this abdication of religion?

By its very nature the Christian State cannot emancipate the Jews; but, adds Bauer, by his very nature the Jew cannot be emancipated.

So long as the State is Christian and the Jew is Jewish, both are equally incapable of granting and receiving emancipation.

The Christian State can only behave towards the Jew in the manner of a Christian State, that is in a privileged manner, by granting the separation of the Jew from the other subjects, but causing him to feel the pressure of the other separated spheres, and all the more onerously inasmuch as the Jew is

in religious antagonism to the dominant religion. But the Jew also can only conduct himself towards the State in a Jewish fashion, that is as a stranger, by opposing his chimerical nationality to the real nationality, his illusory law to the real law, by imagining that his separation from humanity is justified, by abstaining on principle from all participation in the historical movement, by waiting on a future which has nothing in common with the general future of mankind, by regarding himself as a member of the Jewish people and the Jewish people as the chosen people.

Upon what grounds therefore do you Jews crave emancipation? On account of your religion? It is the mortal enemy of the State religion. As citizens? There are no citizens in Germany. As men? You are as little men as He on whom you called.

After giving a criticism of the previous positions and solutions of the question, Bauer has freshly posited the question of Jewish emancipation. How, he asks, are they constituted, the Jew to be emancipated, and the Christian State which is to emancipate? He replies by a criticism of the Jewish religion, he analyses the religious antagonism between Judaism and Christianity, he explains the nature of the Christian State, and all this with boldness, acuteness, spirit, and thoroughness, in a style as precise as it is forcible and energetic.

How then does Bauer solve the Jewish question? What is the result? The formulation of a question is its solution. The criticism of the Jewish question is the answer to the Jewish question.

The summary is therefore as follows:

We must emancipate ourselves before we are able to emancipate others.

The most rigid form of the antagonism between the Jew and the Christian is the religious antagonism. How is this antagonism resolved? By making it impossible. How is a religious antagonism made impossible? By abolishing religion.

As soon as Jew and Christian recognize their respective religions as different stages in the development of the human mind, as different snake skins which history has cast off, and men as the snakes encased therein, they stand no longer in a religious relationship, but in a critical, a scientific, a human one. Science then constitutes their unity. Antagonisms in science, however, are resolved by science itself.

The German Jew is particularly affected by the lack of political emancipation in general and the pronounced Christianity of the State. In

Bauer's sense, however, the Jewish question has a general significance independent of the specific German conditions.

It is the question of the relation of religion to the State, of the contradiction between religious entanglement and political emancipation. Emancipation from religion is posited as a condition, both for the Jews, who desire to be politically emancipated, and for the State, which shall emancipate and itself be emancipated.

“Good, you say, and the Jew says so too, the Jew also is not to be emancipated as Jew, not because he is a Jew, not because he has such an excellent, general, human principle of morality; the Jew will rather retire behind the citizen and be a citizen, although he is a Jew and wants to remain one: that is, he is and remains a Jew, in spite of the fact that he is a citizen and lives in general human relationships: his Jewish and limited nature always and eventually triumphs over his human and political obligations. The prejudice remains in spite of the fact that it has been outstripped by general principles. If, however, it remains, it rather outstrips everything else.” “Only sophistically and to outward seeming would the Jew be able to remain a Jew in civic life; if he desired to remain a Jew, the mere semblance would therefore be the essential thing and would triumph, that is, his life in the State would be only a semblance or a passing exception to the rule and the nature of things” (“The Capacity of modern Jews and Christians to become free,”).

Let us see, on the other hand, how Bauer describes the task of the State: “France has recently (proceedings of the Chamber of Deputies, 26th December 1840) in connection with the Jewish question — as constantly in all other political questions — given us a glimpse of a life which is free, but revokes its freedom in law, and therefore asserts it to be a sham, and on the other hand contradicts its free law by its act.” “The Jewish Question,” .

“General freedom is not yet legal in France, the Jewish question is not yet solved, because legal freedom — that all citizens are equal — is limited in practice, which is still dominated by religious privileges, and this unfreedom in practice reacts on the law, compelling the latter to sanction the division of nominally free citizens into oppressed and oppressor,” .

When, therefore, would the Jewish problem be solved for France?

“The Jew, for instance, must cease to be a Jew if he will not allow himself to be hindered by his law from fulfilling his duties towards the State and his fellow-citizens, going, for example, to the Chamber of Deputies on

the Sabbath and taking part in the public sittings. Every religious privilege, and consequently the monopoly of a privileged Church, must be surrendered, and if few or many or even the great majority believe they ought still to perform religious duties, this performance must be left to themselves as a private matter,” . “When there is no longer a privileged religion, there will no longer be a religion. Take from religion its excommunicating power, and it exists no longer,” .

On the one hand, Bauer states that the Jew must abandon Judaism, and that man must abandon religion, in order to be emancipated as a citizen. On the other hand, he feels he is logical in interpreting the political abolition of religion to mean the abolition of religion altogether. The State, which presupposes religion, is as yet no true, no real State. “At any rate the religious idea gives the State guarantees. But what State? What kind of State?” .

At this point we are brought up against the one-sided conception of the Jewish question.

It was by no means sufficient to inquire: Who shall emancipate? Who shall be emancipated? Criticism had a third task to perform.

It had to ask: what kind of emancipation are we concerned with? Upon what conditions is the desired emancipation based? The criticism of political emancipation itself was only the eventual criticism of the Jewish question and its true solution, in the “general question of the time.”

Because Bauer does not raise the question to this level he falls into contradictions. He posits conditions which are not involved in the nature of political emancipation itself. He suggests questions which his problem does not imply, and he solves problems which leave his questions unsettled. Whereas Bauer says of the opponents of Jewish emancipation: “Their mistake was that they assumed the Christian State to be the only real State, and did not subject it to the same criticism that they applied to Judaism,” we find Bauer’s mistake to consist in the fact that it is only the Christian State, and not the “general State,” that he subjects to criticism, that he does not investigate the relation of political emancipation to human emancipation, and consequently lays down conditions which are only explicable from an uncritical confusion of political emancipation with general human emancipation.

When Bauer asks Jews: Have you the right from your standpoint to crave political emancipation? we would inquire on the contrary: Has the

standpoint of political emancipation the right to demand of Jews the abolition of Judaism, or from men generally the abolition of religion.

The complexion of the Jewish question changes according to the State in which Jews find themselves. In Germany, where no political State, no State as State exists, the Jewish question is a purely theological question. The Jew finds himself in religious antagonism to the State, which acknowledges Christianity as its basis. This State is theologian *ex professo*. Here criticism is criticism of theology, is two-edged criticism, criticism of Christian and criticism of Jewish theology. But however critical we may be, we cannot get out of the theological circle.

In France, in the constitutional State, the Jewish question is the question of constitutionalism, of the incompleteness of political emancipation. As the semblance of a State religion is there preserved, although in a meaningless and self-contradictory formula, in the formula of a religion of the majority, the relationship of Jews to the State retains the semblance of a religious and theological antagonism.

It is only in the North American Free States — at least in part of them — that the Jewish question loses its theological significance and becomes a really secular question. Only where the political State exists in its completeness can the relation of the Jew, of the religious man generally, to the political State, and therefore the relation of religion to the State, be studied in its special features and its purity. The criticism of this relationship ceases to be theological criticism when the State ceases to adopt a theological attitude towards religion, when its attitude towards religion becomes purely political. The criticism then becomes criticism of the political State. At this point, where the question ceases to be theological, Bauer's criticism ceases to be critical. In the United States there is neither a State religion nor a religion declared to be that of the majority, nor the predominance of one cult over another. The State is alien to all cults. (*Marie ou l'esclavage aux Etats-Unis*, etc., by G. Beaumont, Paris 1835, .) There are even North American States where "the constitution does not impose religious beliefs or the practice of a cult as a condition of political privileges" (l. c.). Yet "nobody in the United States believes that a man without religion might be an honest man" (l. c.). Yet North America is pre-eminently the country of religiosity, as Beaumont, Tocqueville and the Englishman Hamilton assure us with one voice. Meanwhile, the North American States only serve us as an example. The question is: What is the

attitude of completed political emancipation towards religion? If even in the country of completed political emancipation we find religion not only existing, but in a fresh and vital state, it proves that the existence of religion does not contradict the completeness of the State. But as the existence of religion indicates the presence of a defect, the source of this defect may only be looked for in the nature of the State. We are no longer concerned with religion as the basis, but only as the phenomenon of secular shortcomings. Consequently we explain the religious handicap of the free citizens from their secular handicap. We do not assert that they must remove their religious handicap as soon as they cast off their secular fetters. We do not transform secular questions into theological questions. We transform theological questions into secular questions.

After history has for so long been dissolved in superstition, we dissolve the superstition in history. The question of the relation of political emancipation becomes for us the question of the relation of political emancipation to human emancipation. We criticize the religious weakness of the political State by criticizing the political State in its secular construction, apart from the religious weaknesses. We transmute the contradiction of the State with a specific religion, like Judaism, into the contradiction of the State with specific secular elements, and the contradiction of the State with religion generally into the contradiction of the State with its general assumptions.

The political emancipation of the Jew, of the Christian, of the religious man in general, means the emancipation of the State from Judaism, from Christianity, from religion generally. In its form as State, in the manner peculiar to its nature, the State emancipates itself from religion by emancipating itself from the State religion, that is, by the State as State acknowledging no religion.

Political emancipation from religion is not a thorough-going and consistent emancipation from religion, because political emancipation is not effectual and consistent human emancipation.

The limit of political emancipation is immediately seen to consist in the fact that the State can cast off a fetter without men really becoming free from it, that the State can become a free State without men becoming free men. Bauer tacitly assents to this in laying down the following condition for political emancipation. "Every religious privilege, and therefore the monopoly of a privileged Church must be surrendered, and if few or many

or even the great majority believe they ought still to perform religious duties, this performance must be left to themselves as a private matter.” The State may therefore achieve emancipation from religion, although the great majority are still religious. And the great majority do not cease to be religious by being religious privately.

The political elevation of the individual above religion shares all the defects and all the advantages of political elevation generally. For example, the State as State annuls private property, the individual declares in a political manner that private property is abolished as soon as he abolishes the census for active and passive eligibility, which has been done in many North American States. Hamilton interprets this fact quite correctly from the political standpoint: “The great multitude has won the victory over the property owners and the monied men.” Is not private property ideally abolished when the have-nots become the legislators of the haves? The census is the last political form to recognize private property.

Yet private property is not only not abolished with the political annulment of private property, but is even implied therein. The State abolishes in its fashion the distinctions of birth, status, education, and occupation when it declares birth, status, education, and occupation to be unpolitical distinctions, when, without taking account of these distinctions, it calls upon every member of the community to participate in the popular sovereignty on an equal footing, when it deals with all the elements of the real popular life from the State’s point of view. Nevertheless the State leaves private property, education, occupation operating in their own manner, that is, as education, as occupation, and developing their potentialities.

From abolishing these actual distinctions, it rather exists only upon their basis, and is conscious of being a political State and enforcing its communal principle only in opposition to these its elements. Consequently Hegel defines the relation of the political State to religion quite correctly when he says: “If the State is to have reality as the ethical, self-conscious realization of spirit, it must be distinguished from the form of authority and faith. But this distinction arises only in so far as the ecclesiastical side is in itself divided into several churches. Then only is the State seen to be superior to them, and wins and brings into existence the universality of thought as the principle of its form.” (“Philosophy of Right,” Eng. tr. .)

By its nature the completed political State is the generic life of man in contradistinction to his material life. All the assumptions of this egoistic life remain in existence outside the sphere of the State, in bourgeois society, but as the peculiarities of bourgeois society.

Where the political State has attained its true development, the individual leads not only in thought, in consciousness, but in reality, a double life, a heavenly and an earthly life, a life in the political community, wherein he counts as a member of the community, and a life in bourgeois society, wherein he is active as a private person, regarding other men as a means, degrading himself into a means and becoming a plaything of alien powers.

The political State is related to bourgeois society as spiritualistically as heaven is to earth. It occupies the same position of antagonism towards bourgeois society; it subdues the latter just as religion overcomes the limitations of the profane world, that is, by recognizing bourgeois society and allowing the latter to dominate it. Man in his outermost reality, in bourgeois society, is a profane being. Here, where he is a real individual for himself and others, he is an untrue phenomenon.

In the State, on the other hand, where the individual is a generic being, he is the imaginary member of an imagined sovereignty, he is robbed of his real individual life and filled with an unreal universality.

The conflict in which the individual as the professor of a particular religion is involved with his citizenship, with other individuals as members of the community, reduces itself to the secular cleavage between the political State and bourgeois society.

For the individual as a bourgeois, "life in the State is only a semblance, or a passing exception to the rule and the nature of things." In any case, the bourgeois, like the Jew, remains only sophistically in political life, just as the citizen remains a Jew or a bourgeois only sophistically; but this sophistry is not personal. It is the sophistry of the political State itself. The difference between the religious individual and the citizen is the difference between the merchant and the citizen, between the labourer and the citizen, between the landowner and the citizen, between the living individual and the citizen. The contradiction in which the religious individual is involved with the political individual is the same contradiction in which the bourgeois is involved with the citizen, in which the member of bourgeois society is involved with his political lionskin.

This secular conflict to which the Jewish question is finally reduced, the relation of the political State to its fundamental conditions, whether the latter be material elements, like private property, etc., or spiritual elements, like education or religion, the conflict between the general interest and the private interest, the cleavage between the political State and bourgeois society — these secular antagonisms are left unnoticed by Bauer, while he controverts their religious expression. “It is precisely its foundation, the need which assures to bourgeois society its existence and guarantees its necessity, which exposes its existence to constant dangers, maintains in it an uncertain element and converts the latter into a constantly changing mixture of poverty and wealth, distress and prosperity,” .

Bourgeois society in its antagonism to the political State is recognized as necessary, because the political State is recognized as necessary.

Political emancipation at least represents important progress; while not the last form of human emancipation generally, it is the last form of human emancipation within the existing world order. It is understood that we are speaking here of real, of practical emancipation.

The individual emancipates himself politically from religion by banishing it from public right into private right. It is no longer the spirit of the State, where the individual — although in a limited manner, under a particular form and in a special sphere — behaves as a generic being, in conjunction with other individuals; it has become the spirit of bourgeois society, of the sphere of egoism, of the *bellum omnium contra omnes*. It is no longer the essence of the community, but the essence of social distinctions.

It has become the expression of the separation of the individual from his community, from himself and from other individuals — what it was originally. It is only the abstract profession of special perversity, of private whim. The infinite splitting-up of religion in North America, for example, gives it outwardly the form of a purely individual concern. It has been added to the heap of private interests, and exiled from the community as community. But there is no misunderstanding about the limits of political emancipation. The division of the individual into a public and a private individual, the expulsion of religion from the State into bourgeois society, is not a step, it is the completion of political emancipation, which thus neither abolishes nor seeks to abolish the real religiosity of the individual.

The splitting-up of the individual into Jew and citizen, into Protestant and citizen, into a religious person and citizen, this decomposition does not belie citizenship; it is not a circumvention of political emancipation; it is political emancipation itself, it is the political manner of becoming emancipated from religion. Moreover, in times when the political State as a political State is forcibly born of bourgeois society, when human self-liberation strives to realize itself under the form of political self-liberation, the State is driven the whole length of abolishing, of destroying religion, but it also proceeds to the abolition of private property, to the law of maximum, to confiscation, to progressive taxation, just as it proceeds to the abolition of life, to the guillotine. In the moment of its heightened consciousness, the political life seeks to suppress its fundamental conditions, bourgeois society and its elements, and to constitute itself as the real and uncontradictory generic life of the individual. It is, however, only enabled to do this by a flagrant violation of its own conditions of life, by declaring the revolution to be permanent, and the political drama therefore ends as inevitably with the restoration of religion, of private property, and all the elements of bourgeois society, as war ends with peace.

Why not even the so-called Christian State, which acknowledges Christianity as its basis, as the State religion, and therefore adopts a proscriptive attitude towards other religions is the completed Christian State. The latter is rather the atheistic State, the democratic State, the State which consigns religion among the other elements of bourgeois society. The State which is still theological and which still officially prescribes belief in Christianity, has not yet succeeded in giving secular and human expression to those human foundations whose exaggerated expression is Christianity. The so-called Christian State is simply no State at all, because it is not Christianity as a religion, but only the human background of the Christian religion which can realize itself in actual human creations.

The so-called Christian State is the Christian denial of the State, although it is not by any means the political realization of Christianity. The State, which still professes Christianity in the form of religion, does not yet profess it in the form of the State, for its attitude towards religion is a religious attitude. It is not yet the actual realization of the human basis of religion, because it still operates upon the unreality, upon the imaginary shape of this human kernel. The so-called Christian State is the incomplete State, and the Christian religion is regarded by it as the complement and the

redemption of its imperfection. Consequently religion becomes its instrument, and it is the State of hypocrisy. The so-called Christian State needs the Christian religion in order to complete itself as a State. The democratic State, the real State, does not need religion for its political completion. It can rather do without religion, because it represents the realization of the human basis of religion in a secular manner. The so-called Christian State, on the other hand, adopts a political attitude towards religion and a religious attitude towards politics. If it degrades the State form to the level of a fiction, it equally degrades religion to a fiction.

In order to elucidate these antagonisms, let us consider Bauer's construction of the Christian State, a construction which has proceeded from contemplating the Christian-Germanic State.

Says Bauer: "In order to demonstrate the impossibility or the non-existence of a Christian State, we are frequently referred to that pronouncement in the Gospel which it not only does not follow, but cannot follow without dissolving itself completely as a State." "But the question is not settled so easily. What then does this Gospel text enjoin? Supernatural self-denial, subjection to the authority of revelation, the turning away from the State, the abolition of secular conditions. Now all this is enjoined and carried out by the Christian State. It has absorbed the spirit of the Gospel, and if it does not repeat it in the same words as the Gospel expresses it, the reason is only because it expresses this spirit in the State form, that is, in forms which are indeed derived from the State of this world, but which are degraded to a sham in the religious rebirth which they have to undergo."

Bauer goes on to show how the people of the Christian State are only a sham people, who no longer have any will of their own, but possess their real existence in the chief to whom they are subject, but from whom they were originally and naturally alien, as he was given to them by God; how the laws of this people are not their creation, but positive revelations; how their chief requires privileged mediators with his own people, with the masses; how these masses themselves are split up into a multitude of special circles, which are formed and determined by chance, which are distinguished by their interests, their particular passions and prejudices, and receive as a privilege permission to make mutual compacts .

The separation of the "spirit of the Gospel" from the "letter of the Gospel" is an irreligious act. The State, which makes the Gospel speak in the letter of politics, in other letters than those of the Holy Spirit, commits a

sacrilege if not in human eyes, at least in its own religious eyes. The State, which acknowledges Christianity as its supreme embodiment and the Bible as its charter, must be confronted with the words of Holy Writ, for the writings are sacred to the letter. The State lapses into a painful, and from the standpoint of the religious consciousness, irresolvable contradiction, when it is pinned down to that pronouncement of the Gospel, which it “not only does not follow, but cannot follow without completely dissolving itself as a State.” And why does it not want to completely dissolve itself? To this question it can find no answer, either for itself or for others. In its own consciousness the official Christian State is an Ought, which is impossible of realization. Only by lies can it persuade itself of the reality of its existence, and consequently it always remains for itself an object of doubt, an unreliable and ambiguous object. The critic is therefore quite justified in forcing the State, which appeals to the Bible, into a condition of mental derangement where it no longer knows whether it is a phantasm or a reality, where the infamy of its secular objects, for which religion serves as a mantle, falls into irresolvable conflict with the integrity of its religious consciousness, to which religion appears as the object of the world. This State can only redeem itself from its inner torment by becoming the hangman of the Catholic Church. As against the latter, which declares the secular power to be its serving body, the State is impotent. Impotent is the secular power which claimed to be the rule of the religious spirit.

In the so-called Christian State it is true that alienation counts, but not the individual. The only individual who counts, the king, is a being specially distinguished from other individuals, who is also religious and directly connected with heaven, with God. The relations which here prevail are still relations of faith. The religious spirit is therefore not yet really secularized.

Moreover, the religious spirit cannot be really secularized, for what in fact is it but the unworldly form of a stage in the development of the human mind? The religious spirit can only be realized in so far as the stage of development of the human mind, whose religious expression it is, emerges and constitutes itself in its secular form. This is what happens in the democratic State. It is not Christianity, but the human basis of Christianity which is the basis of this State. Religion remains the ideal, unworldly consciousness of its members, because it is the ideal form of the human stage of development which it represents.

The members of the political State are religious by virtue of the dualism between the individual life and the generic life, between the life of bourgeois society and the political life; they are religious inasmuch as the individual regards as his true life the political life beyond his real individuality, in so far as religion is here the spirit of bourgeois society, the expression of the separation and the alienation of man from man. The political democracy is Christian to the extent that it regards every individual as the sovereign, the supreme being, but it means the individual in his uncultivated, unsocial aspect, the individual in his fortuitous existence, the individual just as he is, the individual as he is destroyed, lost, and alienated through the whole organization of our society, as he is given under the dominance of inhuman conditions and elements, in a word, the individual who is not yet a real generic being.

The sovereignty of the individual, as an alien being distinguished from the real individual, which is the chimera, the dream, and the postulate of Christianity, is under democracy sensual reality, the present, and the secular maximum.

The religious and theological consciousness itself is heightened and accentuated under a completed democracy, because it is apparently without political significance, without earthly aims, an affair of misanthropic feeling, the expression of narrow-mindedness, the product of caprice, because it is a really other-worldly life. Here Christianity achieves the practical expression of its universal religious significance, in that the most various philosophies are marshalled in the form of Christianity, and, what is more, other members of society are not required to subscribe to Christianity, but to some kind of religion. The religious consciousness riots in the wealth of religious antagonism and of religious variety.

We have therefore shown: Political emancipation from religion leaves religion in existence, although not as a privileged religion. The contradiction in which the supporter of a particular religion finds himself involved with his citizenship, is only a part of the general secular contradiction between the political State and bourgeois society. The completion of the Christian State is the State which professes to be a State and abstracts from the religion of its members. The emancipation of the State from religion is not the emancipation of the real individual from religion.

We do not therefore tell the Jews with Bauer: You cannot be politically emancipated without radically emancipating yourselves from Judaism. We tell them rather: Because you could be emancipated politically without entirely breaking away from Judaism, political emancipation is not human emancipation. If you Jews desire to be politically emancipated without emancipating yourselves humanly, the incompleteness, the contradiction, lies not only in you, but it also resides in the essence and the category of political emancipation. If you remain enmeshed in this category, you share in a general disability.

But if the individual, although a Jew, can be politically emancipated and receive civic rights, can he claim and receive the so-called rights of man? Bauer denies it: "The question is whether the Jew as such, that is the Jew who admits that by his very nature he is compelled to live in everlasting separation from others, is capable of receiving and conceding to others the general rights of man."

"The idea of the rights of man was first discovered in the last century so far as the Christian world is concerned. It is not innate in the individual, it is rather conquered in the struggle with the historical traditions in which the individual has hitherto been brought up. Thus the rights of man are not a gift from Nature, not a legacy from past history, but the price of the struggle against the accident of birth and against the privileges which history has bequeathed from generation to generation up to now. They are the result of education, and can only be possessed by those who have acquired and earned them."

"Can they really be claimed by the Jew? So long as he is a Jew, the limiting quality which makes him a Jew must triumph over the human quality which binds him as a man to other men, and must separate him from gentiles. By this separation he proclaims that the special quality which makes him a Jew is his real supreme quality, to which the human quality must give place."

"In the same manner the Christian as Christian cannot grant the rights of man," p, 20.

According to Bauer, the individual must sacrifice the "privilege of faith" in order to be able to receive the general rights of man. Let us consider for a moment the so-called rights of man, in fact the rights of man in their authentic shape, in the shape which they possess among their discoverers, the North Americans and the French. In part these rights of man are

political rights, rights which are only exercised in the community with others. Participation in the affairs of the community, in fact of the political community, forms their substance. They come within the category of political freedom, of civil rights, which does not, as we have seen, by any means presuppose the unequivocal and positive abolition of religion, and therefore of Judaism. It remains to consider the other aspect of human rights, the *droits de l'homme* apart from the *droits du citoyen*.

Among them is to be found liberty of conscience, the right to practise any cult to one's liking. The privilege of belief is expressly recognized, either as a human right or as the consequence of a human right, of freedom.

Declaration of the rights of man and of citizenship, 1791, article 10: No penalty should attach to the holding of religious opinions. The right of every man to practise the religious cult to which he is attached is guaranteed by clause 1 of the Constitution of 1791.

The Declaration of the Rights of Man, etc., 1793, includes among human rights, article 7: The free practice of cults. With respect to the right to publish ideas and opinions and to assemble for the practice of a cult, it is even stated: The necessity for enunciating these rights presupposes either the presence or the recent memory of a despotism.

Constitution of Pennsylvania, article 9, paragraph 3: All men have received from Nature the imprescriptible right to worship the Almighty according to the dictates of their conscience, and nobody may legally be constrained to follow, to institute, or to support, against his will, any religious cult or ministry. In no case may any human authority interfere in questions of conscience and control the prerogatives of the soul.

Constitution of New Hampshire, articles 5 and 6: Among the number of natural rights, some are inalienable by their nature, because nothing can take their place. Such are the rights of conscience.

The incompatibility of religion with the rights of man is thus not implied by the conception of the rights of man, because the right to be religious, to be religious according to one's liking, to practise the cult of a particular religion, is expressly included among the rights of man. The privilege of faith is a general right of man.

The rights of man as such are distinguished from the rights of the citizen. What is man apart from the citizen? Nothing else than a member of bourgeois society. Why is the member of bourgeois society called "man," and why are his rights called the rights of man? How do we explain this

fact? From the relation of the political State to bourgeois society, from the meaning of political emancipation.

Above all we must record the fact that the so-called rights of man, as distinguished from the rights of the citizen, are nothing else than the rights of the member of bourgeois society, that is of the egoistic individual, of man separated from man and the community. The most radical constitution, the Constitution of 1793, may be cited:

Declaration of the rights of man and of the citizen. Article 2. These rights, etc. (natural and imprescriptible rights) are: equality, liberty, security, property.

Of what consists liberty? Article 6. Liberty is the power which belongs to man to do everything which does not injure the rights of others.

Freedom is therefore the right to do and perform that which injures none. The limits within which each may move without injuring others are fixed by the law, as the boundary between two fields is fixed by the fence. The freedom in question is the freedom of the individual as an isolated atom thrown back upon itself. Why, according to Bauer, is the Jew incapable of receiving the rights of man? "So long as he is a Jew, the limiting quality which makes him a Jew must triumph over the human quality which binds him as a man to other men, and must separate him from gentiles." But the right of man to freedom is not based upon the connection of man with man, but rather on the separation of man from man. It is the right to this separation, the right of the individual limited to himself.

The practical application of the right of man to freedom is the right of man to private property.

In what consists the right of man to private property?

Article 16 (Const. of 1793): The right to property is the right of every citizen to enjoy and dispose of as he likes his goods, his income, the fruit of his toil and of his industry.

The right of man to private property is therefore the right to enjoy and dispose of his property, at his will and pleasure, without regard for others, and independently of society: the right of self-interest. Each particular individual freedom exercised in this way forms the basis of bourgeois society. It leaves every man to find in other men not the realization, but rather the limits of his freedom. But it proclaims above all the right of man to enjoy and dispose of his property, his income, and the fruit of his toil and his industry according to his pleasure.

There still remain the other rights of man, equality and security.

Equality here in its non-political significance is nothing but the equality of the above described liberty, viz.: every individual is regarded as a uniform atom resting on its own bottom. Article 5 of the Constitution of 1793 states: Equality consists in the fact that the law is the same for all, whether it protects or whether it punishes.

And security? Article 8 of the Constitution of 1793: Security consists in the protection accorded by society to each of its members for the preservation of his person, his rights, and his property.

Security is the supreme social conception of bourgeois society, the conception of the police, the idea that society as a whole only exists to guarantee to each of its members the maintenance of his person, his rights, and his property.

By the conception of security bourgeois society does not raise itself above its egoism. Security is rather the confirmation of its egoism.

None of the so-called rights of man, therefore, goes beyond the egoistic individual, beyond the individual as a member of bourgeois society, withdrawn into his private interests and separated from the community. Far from regarding the individual as a generic being, the generic life, Society itself, rather appears as an external frame for the individual, as a limitation of his original independence. The sole bond which connects him with his fellows is natural necessity, material needs and private interest, the preservation of his property and his egoistic person.

It is strange that a people who were just beginning to free themselves, to break down all the barriers between the various members of the community, to establish a political community, that such a people should solemnly proclaim the justification of the egoistic individual, separated from his fellows and from the community, and should even repeat this declaration at a moment when the most heroic sacrifice could alone save the nation and was therefore urgently required, at a moment when the sacrifice of all interests of bourgeois society was imperative, and egoism should have been punished as a crime. This fact is even stranger when we behold the political liberators degrading citizenship and the political community to the level of a mere means for the maintenance of these so-called rights of man, proclaiming the citizen to be the servant of the egoistic man, degrading the sphere in which the individual behaves as a social being below the sphere in

which he behaves as a fractional being, and finally accepting as the true proper man not the individual as citizen, but the individual as bourgeois.

The aim of every political association is the preservation of the natural and imprescriptible rights of man. (Declaration of the rights, etc., of 1791, article 2.) The purpose of government is to assure to man the enjoyment of his natural and imprescriptible rights. (Declaration of 1793, art. 1.)

Thus even at the time when its enthusiasm was still fresh and kept at boiling point by the pressure of circumstances, the political life proclaimed itself to be a mere means whose end is the life of bourgeois society.

It is true that its revolutionary practice was in flagrant contradiction to its theory. While security, for example, was proclaimed to be a right of man, the violation of the secrecy of correspondence was publicly proposed.

While the indefinite liberty of the press (1793 Constitution, art. 122) was guaranteed as a consequence of the right of man to individual liberty, the freedom of the press was completely destroyed, for liberty of the press could not be permitted when it compromised public liberty. (Robespierre jeune, "Parliamentary History of the French Revolution." Buchez et Roux, .) This means that the right of man to liberty ceases to be a right as soon as it comes into conflict with the political life, whereas, according to theory, the political life is only the guarantee of the rights of man, and should therefore be surrendered as soon as its object contradicts these rights of man. But the practice is only the exception and the theory is the rule. If, however, we regard the revolutionary practice as the correct position of the relation, the riddle still remains to be solved, why the relationship was inverted in the consciousness of the political liberators, the end appearing as the means, and the means as the end. This optical illusion of their consciousness would still be the same riddle, although a psychological, a theoretical riddle.

The riddle admits of easy solution.

The political emancipation is at the same time the dissolution of the old society, upon which was based the civic society, or the rulership alienated from the people. The political revolution is the revolution of bourgeois society. What was the character of the old society? It can be described in one word. Feudality. The old civic society had a directly political character, that is, the elements of civic life, as for example property or the family, or the mode and kind of labour, were raised to the level of elements of the community in the form of landlordism, status, and corporation. In this form

they determined the relation of the individual to the community, that is his political relation, his relationship of separation and exclusion from the other constituent parts of society. For the latter organization of popular life did not raise property or labour to the level of social elements, but rather completed their separation from the political whole and constituted them as special societies within society. Thus the vital functions and vital conditions of society continued to be political, although political in the sense of feudality, which means that they excluded the individual from the political whole, and transformed the special relation of his corporation to the political whole into his own general relation to the popular life. As a consequence of this organization, the political unity necessarily appears as the consciousness, the will and the activity of the political unity, and likewise the general State power as the special concern of a ruler and his servants sundered from the people.

The political revolution, which overthrew this domination and raised political affairs to the rank of popular affairs, which constituted the political State as a general concern, that is as a real State, necessarily shattered all Estates, corporations, guilds, privileges, which were just so many expressions of the separation of the people from their community. The political revolution thereby abolished the political character of civic society.

It dissolved civic society into its elemental parts, on the one hand, into the individuals, on the other hand, into the material and spiritual elements, which formed the vital content, the civic situation of these individuals. It released the political spirit, which was imprisoned in fragments in the various blind alleys of the feudal society; it collected all these dispersed parts of it, liberated it from its entanglement with the civic life, and constituted it as the sphere of the community, of the general popular concerns in ideal independence from its particular elements of civic life. The specific life activity and the specific life situation settled into a merely general significance. They no longer formed the general relation of the individual to the political whole. The public business as such became rather the general business of every individual and the political function became his general function.

But the completion of the idealism of the State was at the same time the completion of the materialism of civic society.

The throwing off of the political yoke was at the same time the throwing off of the bond which had curbed the egoistic spirit of civic society. The

political emancipation was at the same time the emancipation of civic society from politics, from even the semblance of a general content.

Feudal society was resolved into its basic elements, its individual members. But into the individuals who really formed its basis, that is, the egoistic individual.

This individual, the member of civic society, is now the basis, the assumption of the political State. He is recognized as such in the rights of man.

The liberty of the egoistic individual and the recognition of this liberty are, however, tantamount to the recognition of the unbridled movement of the intellectual and material elements which inform him.

The individual was therefore not liberated from religion; he received religious freedom. He was not freed from property; he received freedom of property. He was not freed from the egoism of industry; he received industrial freedom.

The constitution of the political State and the dissolution of civic society into independent individuals — whose relation is right, as the relation of the members of Estates and of guilds was privilege — is accomplished in one and the same act. But the individual as a member of civic society, the unpolitical individual, necessarily appears as the natural individual. The rights of man appear as natural rights, for the self-conscious activity concentrates itself upon the political act. The egoistic individual is the sediment of the dissolved society, the object of immediate certitude, and therefore a natural object. The political revolution dissolves the civic society into its constituent parts without revolutionizing and subjecting to criticism those parts themselves. It regards bourgeois society, the world of needs, of labour, of private interests, as the foundation of its existence, as an assumption needing no proof, and therefore as its natural basis. Lastly, the individual as a member of bourgeois society counts as the proper individual, as the man in contradistinction to the citizen, because he is man in his sensual, individual, closest existence, whereas political man is only the abstract, artificial individual, the individual as an allegorical, moral person. The real man is only recognized in the shape of the egoistic individual, the true man is only recognized in the shape of the abstract citizen.

The abstraction of the political man was very well described by Rousseau: He who dares undertake to give instructions to a nation ought to feel himself capable as it were of changing human nature; of transforming

every individual who in himself is a complete and independent whole into part of a greater whole, from which he receives in some manner his life and his being; of altering man's constitution, in order to strengthen it; of substituting a social and moral existence for the independent and physical existence which we have all received from nature. In a word, it is necessary to deprive man of his native powers, in order to endow him with some which are alien to him, and of which he cannot make use without the aid of other people.

All emancipation leads back to the human world, to relationships, to men themselves.

Political emancipation is the reduction of man, on the one side, to the member of bourgeois society, to the egoistic, independent individual, on the other side, to the citizen, to the moral person.

Not until the real, individual man is identical with the citizen, and has become a generic being in his empirical life, in his individual work, in his individual relationships, not until man has recognized and organized his own capacities as social capacities, and consequently the social force is no longer divided by the political power, not until then will human emancipation be achieved.

2. The Capacity of Modern Jews and Christians to become Free, by Bruno Bauer.

Under this form Bauer deals with the relation of the Jewish and Christian religion, as well as with the relation of the same to criticism. Its relation to criticism is its relation “to the capacity to be free.”

It follows: “The Christian has only one stage to surmount, viz.: his religion, in order to abolish religion generally,” and therefore to become free. “The Jew, on the contrary, has to break not only with his Jewish essence, but also with the development of the completion of his religion, with a development that has remained alien to him” .

Bauer therefore transforms here the question of Jewish emancipation into a purely religious question. The theological scruple as to who stood the most chance of being saved, Jew or Christian, is here repeated in the enlightened form: which of the two is most capable of emancipation? It is no longer a question of whether Judaism or Christianity makes free? but rather on the contrary: which makes more for freedom, the negation of Judaism or the negation of Christianity?

“If they wish to be free, Jews should be converted, not to Christianity, but to Christianity in dissolution, to religion generally in dissolution, that is to enlightenment, criticism and its results, to free humanity,” .

It appears that Jews have still to be converted, but to Christianity in dissolution, instead of to Christianity.

Bauer requires Jews to break with the essence of the Christian religion, a requirement which, as he says himself, does not arise from the development of Jewish essentials.

As Bauer had interpreted Judaism merely as a crude-religious criticism of Christianity, and had therefore read “only” a religious meaning into it, it was to be foreseen that the emancipation of the Jews would be transformed into a philosophic-theological act.

Bauer conceives the ideal abstract being of the Jew, his religion as his whole being. Consequently he correctly infers: “The Jew gives mankind nothing, when he despises his narrow law, when he abolishes his whole Judaism,” .

The relation of Jews and Christians is therefore as follows: the sole interest of Christians in the emancipation of the Jews is a general human, a theoretical interest. Judaism is a detrimental fact in the religious eyes of Christians. As soon as their eyes cease to be religious, this fact ceases to be detrimental. The emancipation of Jews in itself is no work for Christians.

But in order to emancipate himself, the Jew has to undertake not only his own work, but at the same time the work of the Christian, the criticism of the synoptics, etc.

We will try to get rid of the theological conception of the question. The question of the capacity of the Jews for emancipation is from our standpoint transformed into the question, what particular social element has to be overcome in order to abolish Judaism? For the capacity for emancipation of the modern Jew is the relation of Judaism to the emancipation of the modern world. This relation is necessarily disclosed by the special position of Judaism in the modern subjugated world.

Let us consider the real worldly Jews, not the Sabbath Jews, as Bauer does, but the every-day Jews.

We will not look for the secret of the Jew in his religion, but we will look for the secret of religion in the real Jew.

What is the secular basis of Judaism? Practical needs, egoism.

What is the secular cult of the Jew? Huckstering. What is his secular God? Money.

Very well. Emancipation from huckstering and from money, and therefore from practical, real Judaism would be the self-emancipation of our epoch.

An organization of society, which would abolish the fundamental conditions of huckstering, and therefore the possibility of huckstering, would render the Jew impossible. His religious consciousness would dissolve like a mist in the real vital air of society. On the other hand: if the Jew recognizes as valueless this his practical essence, and labours for its abolition, he would work himself free of his previous development, and labour for human emancipation generally, turning against the supreme practical expression of human self-alienation.

We therefore perceive in Judaism a general pervading anti-social element, which has been carried to its highest point by the historical development, in which Jews in this bad relation have zealously co-operated, a point at which it must necessarily dissolve itself.

The emancipation of the Jews in its last significance is the emancipation of mankind from Judaism.

The Jew has already emancipated himself in Jewish fashion. "The Jew who in Vienna, for example, is only tolerated, determines by his financial power the fate of the whole Empire. The Jew who may be deprived of rights in the smallest German State, determines the fate of Europe."

"While the corporations and guilds excluded the Jew, the enterprise of industry laughs at the obstinacy of the medieval institution." (Bauer, "The Jewish Question," .)

This is no isolated fact. The Jew has emancipated himself in Jewish fashion, not only by taking to himself financial power, but by virtue of the fact that with and without his co-operation, money has become a world power, and the practical Jewish spirit has become the practical spirit of Christian nations. The Jews have emancipated themselves in so far as Christians have become Jews.

"The pious and politically free inhabitant of New England," relates Colonel Hamilton, "is a kind of Laokoon, who does not make even the slightest effort to free himself from the serpents which are throttling him. Mammon is his god, he prays to him, not merely with his lips, but with all the force of his body and mind.

"In his eyes, the world is nothing more than a Stock Exchange, and he is convinced that here below he has no other destiny than to become richer than his neighbours. When he travels, he carries his shop or his counter on his back, so to speak, and talks of nothing but interest and profit."

The practical domination of Judaism over the Christian world has reached such a point in North America that the preaching of the Gospel itself, the Christian ministry, has become an article of commerce, and the bankrupt merchant takes to the Gospel, while the minister grown rich goes into business.

"He whom you see at the head of a respectable congregation began as a merchant; his business failing, he became a minister. The other started his career in the ministry, but as soon as he had saved a sum of money, he abandoned the pulpit for the counter. In the eyes of a large number, the ministry is a commercial career." Beaumont.

According to Bauer, to withhold political rights from the Jew in theory, while in practice he wields enormous power, exercising wholesale the influence he is forbidden to distribute in retail, is an anomaly.

The contradiction between the practical, political power of the Jew and his political rights is the contradiction between politics and financial power generally. While the former is raised ideally above the latter, it has in reality become its bond slave.

Judaism has persisted alongside of Christianity not only as religious criticism of Christianity, not only as the embodiment of doubt in the religious parentage of Christianity, but equally because Judaism has maintained itself, and even received its supreme development, in Christian society. The Jew who exists as a peculiar member of bourgeois society, is only the particular expression of the Judaism of bourgeois society.

Judaism has survived not in spite of, but by virtue of history.

Out of its own entrails, bourgeois society continually creates Jews.

What was the foundation of the Jewish religion? Practical needs, egoism. Consequently the monotheism of the Jew is in reality the polytheism of many needs. Practical needs or egoism are the principle of bourgeois society, and they appear openly as such so soon as bourgeois society gives birth to the political state. The God of practical needs and egoism is money.

Money is the jealous God of Israel, by the side of which no other god may exist. Money degrades all the gods of man and converts them into commodities. Money is the general and self-constituted value of all things. Consequently it has robbed the whole world — the world of mankind as well as Nature — of its peculiar value. Money is the being of man's work and existence alienated from himself, and this alien being rules him, and he prays to it.

The God of the Jews has secularized himself and become the universal God. Exchange is the Jew's real God.

The conception of Nature which prevails under the rule of private property and of money is the practical degradation of Nature, which indeed exists in the Jewish religion, but only in imagination.

In this sense Thomas Münzer declared it to be intolerable "that all creatures have been turned into property, the fishes in the water, the birds in the air, the growths of the soil."

What remains as the abstract part of the Jewish religion, contempt for theory, for art, for history, for man as an end in himself, is the real conscious standpoint and virtue of the monied man. The generic relation itself — the relation of man to woman, etc., becomes an object of commerce. Woman is bartered.

The chimerical nationality of the Jew is the nationality of the merchant, of the monied man generally.

The baseless law of the Jew is only the religious caricature of the baseless morality and of right generally, of the merely formal ceremonies which pervade the world of egoism.

Here also the highest relation of man is the legal relation — the relation to laws which do not govern him because they are the laws of his own will and being, but because they are imposed on him from without. Any infraction thereof is punished.

Jewish Jesuitism, the same practical Jesuitism that Bauer infers from the Talmud, is the relation of the world of egoism to the laws which dominate it, and the cunning circumvention of which is the supreme art of this world.

The movement of this world within its laws is necessarily a continual abrogation of the law.

Judaism cannot develop any further as a religion, that is theoretically, because the philosophy of practical needs is limited by its nature and is exhausted in a few moves.

Judaism could create no new world; it could only draw the new world creations and world relations within the orbit of its activity, because the practical need whose rationale is egoism remains a passive state, which does not extend itself by spontaneous act, but only expands with the development of social conditions.

Judaism reaches its acme with the completion of bourgeois society, but bourgeois society first completes itself in the Christian world. Only under the reign of Christianity, which turns all national, natural, moral and theoretical relations into relations external to man, can bourgeois society separate itself entirely from the political life, dissever all the generic ties of the individual, set egoism in the place of these generic ties, and dissolve the human world into a world of atomized, mutually hostile individuals.

Christianity sprang out of Judaism. It has again withdrawn into Judaism.

The Christian from the outset was the theorizing Jew; the Jew is therefore the practical Christian, and the practical Christian has again become a Jew.

Christianity had only appeared to overcome Judaism. It was too noble, too spiritual to abolish the crudeness of practical needs except by elevation into the blue sky.

Christianity is the sublime idea of Judaism. Judaism is the common application of Christianity, but this application could only become general after Christianity had completed the alienation of man from himself, and theoretically from Nature. Not until then could Judaism attain to general domination and turn the alienated individual and alienated Nature into alienable and saleable objects.

Just as the individual while he remained in the toils of religion could only objectivize his being by turning it into a fantastic and alien being, so under the domination of egoistic needs he can only manifest himself in a practical way and only create practical objects by placing both his products and his activity under the domination of an alien being, and investing them with the significance of an alien being — of money.

The Christian selfishness of bliss is necessarily transmuted in its completed practice into the material selfishness of the Jew, heavenly needs become earthly needs, and subjectivity becomes egoism. We do not explain the Jew's tenacity from his religion, but rather from the human basis of his religion, that is, practical needs, egoism.

Because the real essence of the Jew has been generally realized and secularized in bourgeois society, the latter could not convince the Jew of the unreality of his religious essence, which is merely the ideal reflexion of his practical needs.

Consequently, it is not only in the Pentateuch or the Talmud, but also in present-day society that we find the essence of the modern Jew; not as an abstract, but as an extremely empirical being, not merely in the form of the Jew's limitations, but in that of the Jewish limitations of society.

As soon as society succeeds in abolishing the empirical essence of Judaism, the huckster, and the conditions which produce him, the Jew will become impossible, because his consciousness will no longer have a corresponding object, because the subjective basis of Judaism, viz.: practical needs, will have been humanized, because the conflict of the individual sensual existence with the generic existence of the individual will have been abolished.

The social emancipation of the Jew is the emancipation of society from Judaism.

THE HOLY FAMILY, 1845

Translated by Richard Dixon

Published in November 1844, this book was the first full collaboration between Marx and Friedrich Engels. It is a critique of the Young Hegelians and their trend of thought that was popular in academic circles at the time. The title was a suggestion by the publisher and is intended as an ironic reference to the Bauer Brothers and their supporters. The book created a controversy with much of the press and caused Bruno Bauer to attempt to refute it in an article published in Wigand's *Vierteljahrsschrift* in 1845. Bauer claimed that Marx and Engels misunderstood what he was trying to say. Marx later replied to his response with his own article that was published in the journal *Gesellschaftsspiegel* in January 1846.

During Engels' short stay in Paris in 1844, Marx suggested that they should write together a critique of the popular topic of their day, the Young Hegelians. While working on the project, their friendship blossomed. Agreeing to co-author the Foreword, they divided up the other sections. Engels finished his assigned chapters before leaving Paris. Marx had the larger share of work and he completed it by the end of November 1844. He drew from his *Economic and Philosophic Manuscripts*, on which he had been working the spring and summer of 1844.

The Holy Family caused considerable interest in the newspapers. One paper noted that it expressed socialist views, since it criticised the "inadequacy of any half-measures directed at eliminating the social ailments of our time." The conservative press immediately recognised the radical elements inherent in its many arguments. One paper wrote that, in *The Holy Family*, "every line preaches revolt... against the state, the church, the family, legality, religion and property."

Engels, 1877

Foreword

Real humanism has no more dangerous enemy in Germany than *spiritualism* or *speculative idealism*, which substitutes “*self-consciousness*” or the “*spirit*” for the *real individual man* and with the evangelist teaches: “It is the spirit that quickeneth; the flesh profiteth nothing.” Needless to say, this incorporeal spirit is spiritual only in its imagination. What we are combating in *Bauer’s* criticism is precisely *speculation* reproducing itself as a *caricature*. We see in it the most complete expression of the *Christian-Germanic* principle, which makes its last effort by transforming “*criticism*” itself into a transcendent power.

Our exposition deals first and foremost with *Bruno Bauer’s Allgemeine Literatur-Zeitung* — the first eight numbers are here before us — because in it *Bauer’s* criticism, and with it the nonsense of *German speculation in general*, has reached its peak. The more completely Critical Criticism (the criticism of the *Literatur-Zeitung*) distorts reality into an obvious comedy through philosophy, the more instructive it is. — For examples see *Faucher* and *Szeliga*. — The *Literatur-Zeitung* offers material by which even the broad public can be enlightened on the illusions of speculative philosophy. That is the aim of our book.

Our exposition is naturally determined by its *subject*. Critical Criticism is in all respects *below* the level already attained by German theoretical development. The nature of our subject therefore justifies our refraining *here* from further *discussion* of that development itself.

Critical Criticism makes it necessary rather to assert, in contrast to it, the already achieved results *as such*.

We therefore give this polemic as a preliminary to the independent works in which we — each of us for himself, of course — shall present our positive view and thereby our positive attitude to the more recent philosophical anti social doctrines.

Paris, September 1844

Engels, Marx

Chapter I. “Critical Criticism in the Form of a Master-Bookbinder”, Or Critical Criticism As Herr Reichardt

Critical Criticism, however superior to the mass it deems itself, nevertheless has boundless pity for the mass. And therefore Criticism has so loved the mass that it sent its only begotten son, that all who believe in him may not be lost, but may have Critical life. Criticism was made mass and dwells amongst us and we behold its glory, the glory of the only begotten son of the father. In other words, Criticism becomes socialistic and speaks of “works on pauperism.” It considers it not a crime to be equal to God but empties itself and takes the form of a bookbinder and humbles itself even to nonsense, yea, even to Critical nonsense in foreign languages. It, whose heavenly virginal purity shrinks from contact with the sinful leprous mass, overcomes itself to the extent of taking notice of “*Boz*” and “*all original writers on pauperism*” and “has for years been following this evil of the present time step by step”; it scorns writing for experts, it writes for the general public, banning all outlandish expressions, all “Latin intricacies, all professional jargon”. It bans all that from the works of *others*, for it would be too much to expect Criticism itself to submit to “this administrative regulation”. And yet it does do so partly, renouncing with admirable ease, if not the words themselves, at least their content. And who will reproach it for using “the huge heap of unintelligible foreign words” when it repeatedly proves that it does not understand those words itself? Here are a few samples:

“That is why the *institutions of mendicancy* inspire them with horror.”

“A doctrine of responsibility in which every motion *of human thought becomes an image of Lot’s wife*.”

“On the keystone of this really *profound edifice of art*.”

“This is the main content of Stein’s political testament, which the great statesman handed in even before retiring from the active service of the government and from all its transactions.”

“This people had *not yet any dimensions* at that time for such extensive freedom.”

“By *palavering* with fair assurance at the end of his publicistic work that only confidence was still lacking.”

“To the manly state-elevating understanding, rising above routine and pusillanimous fear, reared on history and nurtured with a live perception of foreign public state system.”

“The education of general national welfare.”

“Freedom lay dead in the *breast of the Prussian national mission* under the control of the authorities.”

“*Popular-organic* publicism.”

“The people to whom even Herr Brüggemann delivers the *baptismal certificate of its adulthood*.”

“A rather glaring contradiction to the other *certitudes* which are expressed in the work on the professional capacities of the people.”

“Wretched self-interest quickly dispels all the *chimeras of the national will*.”

“Passion for great gains, etc., was the spirit that pervaded the whole of the Restoration period and which, with a *fair quantity of indifference*, adhered to the new age.”

“The vague idea of political significance to be found in the *Prussian countrymanship nationality rests on the memory of a great history*.”

“The antipathy disappeared and turned into a completely exalted condition.”

“In this wonderful transition each one in his own way still *put forward in prospect* his own special *wish*.”

“A catechism with unctuous Solomon-like language the words of which rise gently like a dove — chirp! chirp! — to the regions of pathos and *thunder-like aspects*.”

“All the *dilettantism of thirty-five years of neglect*.”

“The *too sharp thundering* at the citizens by one of their former town authorities could have been suffered with the calmness of mind characteristic of our representatives if Benda’s view of the Town Charter of 1808 had not laboured under a *Mussulman conceptual affliction* with regard to the essence and the application of the Town Charter.”

In Herr Reichardt, the audacity of style always corresponds to the audacity of the thought. He makes transitions like the following:

“Herr Brüggemann ... 1843 ... state theory ... every upright man ... the great modesty of our Socialists ... natural marvels ... demands to be made on Germany ... supernatural marvels ... Abraham ... Philadelphia ... manna ... baker ... but *since* we are speaking of *marvels*, *Napoleon* brought,” etc.

After these samples it is no wonder that Critical Criticism gives us a further “explanation” of a sentence which it itself describes as expressed in “popular language”, for it “arms its eyes with organic power to penetrate chaos”. And here it must be said that then even “popular language” cannot remain unintelligible to Critical Criticism. It is aware that the way of the writer must necessarily be a crooked one if the individual who sets out on it is not strong enough to make it straight; and therefore it naturally ascribes “mathematical operations” to the author.

It is self-evident — and history, which proves everything which is self-evident, also proves this — that Criticism does not become mass in order to remain mass, but in order to redeem the mass from its mass-like mass nature, that is, to raise the popular language of the mass to the critical language of Critical Criticism. It is the lowest grade of degradation for Criticism to learn the popular language of the mass and transfigure that vulgar jargon into the high-flown intricacy of the dialectics of Critical Criticism.

Chapter II. “Critical Criticism” As a ‘Mill-Owner’, Or Critical Criticism As Herr Jules Faucher

After rendering most substantial services to self-consciousness by humiliating itself to the extent of nonsense in foreign languages, and thereby at the same time freeing the world from pauperism, Criticism still further humiliates itself to the extent of *nonsense* in *practice* and *history*. It masters “*English questions of the day*” and gives us a genuinely *critical outline of the history of English industry*.

Criticism, which is self-sufficient, and complete and perfect in itself, naturally cannot recognise history as it really took place, for that would mean recognising the base mass in all its mass-like mass nature, whereas the problem is precisely to redeem the mass from its mass nature. History is therefore freed from its mass nature, and Criticism, which has a free attitude to its object, calls to history: “*You ought to have happened in such and such a way!*” All the laws of Criticism have *retrospective* force: *prior to* the decrees of Criticism, history behaved quite differently from how it did *after* them. Hence mass-type history, so-called *real* history, deviates considerably from Critical history, as it takes place in Heft VII of the *Literatur-Zeitung* from page 4 onwards.

In mass-type history there were *no factory towns* before there were *factories*; but in Critical history, in which, as already in *Hegel*, the son begets his father, *Manchester*, *Bolton* and *Preston* were flourishing factory towns before factories were even thought of. In real history the *cotton industry* was founded mainly on *Hargreaves’ jenny* and *Arkwright’s throstle*, *Crompton’s mule* being only an improvement of the spinning jenny according to the new principle discovered by Arkwright. But Critical history knows how to make distinctions: it scorns the one-sidedness of the jenny and the throstle, and gives the crown to the mule as the speculative identity of the extremes. In reality, the invention of the throstle and the mule immediately made possible the *application of water-power* to those machines, but Critical Criticism sorts out the principles lumped together by crude history and makes this application come only later, as something

quite special. In reality the invention of the steam-engine *preceded* all the above-mentioned inventions; according to Criticism it is the crown of them all and the *last*.

In reality the *business* ties between Liverpool and Manchester in their present scope were the result of the export of English goods; according to Criticism they are the *cause* of the export and both are the result of the proximity of the two towns. In reality nearly all goods from Manchester go to the Continent via *Hull*, according to Criticism via *Liverpool*.

In reality all *grades of wages* exist in English factories, from 1s 6d to 40s and more; but according to Criticism only one rate is paid — 11s. In reality the *machine* replaces *manual labour*; according to Criticism it replaces *thought*. In reality the association of workers for wage rises is allowed in *England*, but according to Criticism it is prohibited, for when the Mass wants to allow itself anything it must first ask Criticism. In reality *factory labour* is extremely *tiring* and gives rise to specific diseases — there are even special medical works on them; according to Criticism “excessive exertion cannot be a hindrance to work, for the power is provided by the machine”. In reality the machine is a machine; according to Criticism it has a will, for as it does not rest, neither can the worker, and he is subordinated to an alien will.

But that is still nothing at all. Criticism cannot be content with the *mass-type parties* in England; it creates new ones, including a “*factory party*”, for which history may be thankful to it. On the other hand, it lumps together the factory-owners and the factory workers in one massive heap — why bother about such trifles! — and decrees that the factory workers refused to contribute to the Anti-Corn-Law Leagues not out of ill-will or because of Chartism, as the stupid factory-owners maintain, but merely because they were poor. It further decrees that with the repeal of the English Corn Laws agricultural labourers will have to put up with a lowering of wages, in regard to which, however, we must most submissively remark that that destitute class cannot be deprived of another penny without being reduced to absolute starvation. It decrees that the working day in English factories is sixteen hours, although a silly un-Critical English law has fixed a maximum of twelve hours. It decrees that England is to become a huge workshop for the world, although the un-Critical mass of Americans, Germans and Belgians are ruining one market after another for the English by their competition. Lastly, it decrees that neither the propertied nor the non-

propertied classes in England are aware of the *centralisation of property* and its consequences for the working classes, although the stupid Chartists think they are well aware of them; the Socialists maintain that they expounded those consequences in detail long ago, and even Tories and Whigs like *Carlyle, Alison and Gaskell* have proved their knowledge of them in their works.

Criticism decrees that Lord *Ashley's Ten Hour Bill* is a half-hearted *juste-milieu* measure and Lord Ashley himself “a true illustration of constitutional action”, while the factory-owners, the Chartists, the landowners — in short, all that makes up the mass nature of England — have so far considered this measure as an expression, the mildest possible one admittedly, of a downright radical principle, since it would lay the axe at the root of foreign trade and thereby at the root of the factory system — nay, not merely lay the axe to it, but cut deeply into it. Critical Criticism knows better. It knows that the ten hour question was discussed before a “commission” of the Lower House, although the un-Critical newspapers try to make us believe that this “commission” was the *House itself*, “a *Committee of the Whole House*” ; but Criticism must needs do away with that eccentricity of the English Constitution.

Critical Criticism, which itself *begets* its *opposite*, the *stupidity of the Mass*, also produces the stupidity of Sir James Graham: by a Critical understanding of the English language it puts things in his mouth which the un-Critical Home Secretary never said, just to allow Critical wisdom to shine brighter in comparison with his stupidity. Graham, according to Criticism, says that the machines in the factories wear out in about twelve years whether they work ten hours a day or twelve, and that therefore a Ten Hour Bill would make it impossible for the capitalists to reproduce in twelve years through the work of their machines the capital laid out on them. Criticism proves that it has thus put a false conclusion in the mouth of Sir James Graham, for a machine that works one-sixth of the time less every day will naturally remain usable longer.

However correct this observation of Critical Criticism against its own false conclusion, it must, on the other hand, be conceded that Sir James Graham said that under a Ten Hour Bill the machine would have to work quicker in the proportion that its working time was reduced (Criticism itself quotes this in VIII, page 32) and that in that case the time when it would be worn out would be the same — twelve years. This must all the more be

acknowledged as the acknowledgment contributes to the glory and exaltation of "*Criticism*"; for only Criticism both made the false conclusion and then refuted it. Criticism is just as magnanimous towards Lord *John Russell*, to whom it imputes the wish to change the political form of the state and the electoral system. From this we must conclude either that Criticism's urge to produce stupidities is uncommonly powerful or that Lord John Russell must have become a Critical Critic within the past week.

But Criticism only becomes truly magnificent in its fabrication of stupidities when it discovers that the English workers — who in April and May held meeting after meeting, drew up petition after petition, and all for the Ten Hour Bill, and displayed more agitation throughout the factory districts than at any time during the past two years — that those workers take only a "*partial* interest" in this question, although it is evident that "legislation limiting the working day has also occupied their attention" Criticism is truly magnificent when it finally makes the great, the glorious, the unheard-of discovery that

"the apparently more immediate help from the repeal of the Corn Laws absorbs most of the wishes of the workers and will do so until no longer doubtful realisation of those wishes practically proves the futility of the repeal" —

proves it to workers who drag Anti-Corn-Law agitators down from the platform at every public meeting, who have seen to it that the Anti-Corn-Law League no longer dares to hold a public meeting in any English industrial town, who consider the League to be their only enemy and who, during the debate of the Ten Hour Bill — as nearly always before in similar matters — had the support of the Tories. Criticism is superb, too, when it discovers that "the workers still let themselves be lured by the sweeping promises of the *Chartist movement*", which is nothing but the political expression of public opinion among the workers. Criticism is superb, too, when it realises, in the depths of its Absolute Spirit, that

"the two party groupings, the political one and that of the landowners and mill-owners, *no longer* wish to merge or coincide".

It was so far not known that the party grouping of the landowners and the mill-owners, because of the numerical smallness of either class of owners and the equal political rights of each (with the exception of the few peers), was so comprehensive that it was completely identical with the political party groupings, and not their most consistent expression, their

peak. Criticism is splendid when it suggests that the Anti-Corn-Law Leaguers do not know that, *ceteris paribus*, a drop in the price of bread must be followed by a drop in wages, so that all would remain as it was; whereas these people expect that, granted there is a drop in wages and a consequent lowering of production costs, the result will be an expansion of the market. This, they expect, would lead to a reduction of competition among the workers, and consequently wages would still be kept a little higher in comparison with the price of bread than they are now.

Freely creating its opposite — nonsense — and moving in artistic rapture, Criticism, which only two years ago exclaimed “Criticism speaks German, theology speaks Latin!”, has now learnt *English* and calls the estate-owners “*Landeigner*” (landowners), the factoryowners “*Mühleigner*” (mill-owners) — in English a mill means any factory with machinery driven by steam or water-power — and the workers “*Hände*” (hands). Instead of “*Einmischung*” it says *Interferenz* (interference); and in its infinite mercy for the English language, the sinful mass nature of which is abundantly evident, it condescends to improve it by doing away with the pedantry with which the English place the title “Sir” before the *Christian* name of knights and baronets. Where the Mass says “Sir James Graham”, it says “Sir Graham”.

That Criticism reforms *English* history and the *English* language out of *principle* and not out of levity will presently be provided by the *thoroughness* with which it treats the *history of Herr Nauwerck*.

Chapter III. “The Thoroughness of Critical Criticism”, Or Critical Criticism As Herr J. (Jungnitz?)

Criticism cannot ignore Herr *Nauwerck*’s infinitely important dispute with the Berlin Faculty of Philosophy. It has indeed had a similar experience and it must take Herr Nauwerck’s fate as a background in order to put its own *dismissal from Bonn* in sharper relief. Criticism, being accustomed to considering the Bonn affair as the event of the century, and having already written the “philosophy of the deposition of criticism”, could be expected to give a similar detailed philosophical construction of the Berlin “collision”. Criticism proves *a priori* that everything had to happen in such a way and no other. It proves:

- 1) Why the Faculty of Philosophy was bound to come into “collision” not with a logician or metaphysician, but with a philosopher of the state;
- 2) Why that collision could not be so sharp and decisive as Criticism’s conflict with theology in Bonn;
- 3) Why that collision was, properly speaking, a stupid business, since Criticism had already concentrated all principles and all content in its Bonn collision, so that world history could only become a plagiarist of Criticism;
- 4) Why the Faculty of Philosophy considered attacks on the works of Herr Nauwerck as attacks on itself;
- 5) Why no other course remained for Herr N, but to retire of his own accord;
- 6) Why the Faculty had to defend Herr N. if it did not want to disavow itself;
- 7) Why the “inner split in the Faculty had necessarily to manifest itself in such a way” that the Faculty declared both N. and the Government right and wrong at the same time;
- 8) Why the Faculty finds in N.’s works no reason for dismissing him;
- 9) What determined the lack of clarity of the whole verdict;
- 10) Why the Faculty “deems itself (!) entitled (!) as a scientific authority (!) to examine the essence of the matter”, and finally;

11) Why, nevertheless, the Faculty does not want to write in the same way as Herr N.

Criticism disposes of these important questions with rare thoroughness in four pages, proving by means of Hegel's logic why everything had to happen as it did and why no god could have prevented it. In another place Criticism says that there has not yet been full knowledge of a single epoch in history; modesty prevents it from saying that it has full knowledge of at least its own collision and Nauwerck's, which, although they are not epochs, appear to Criticism to be epoch-making.

Having "abolished" in itself the "element" of *thoroughness*, Critical Criticism becomes "*the tranquillity of knowledge*".

Chapter IV. “Critical Criticism” As the Tranquillity of Knowledge, Or “Critical Criticism” As Herr Edgar

1) *Flora Tristan's* “Union Ouvrière

The French Socialists maintain that the worker makes everything, produces everything and yet has no rights, no possessions, in short, nothing at all. Criticism answers in the words of Herr *Edgar*, the personification of the *tranquillity of Knowledge*:

“To be able to create everything, a stronger consciousness is needed than that of the worker. Only the opposite of the above proposition would be true: the worker makes nothing, therefore he has nothing; but the reason why he makes nothing is that his work is always individual, having as its object his most personal needs, and is everyday work.”

Here Criticism achieves a height of abstraction in which it regards only the creations of its own thought and generalities which contradict all reality as “something”, indeed as “*everything*”, The worker creates nothing because he creates only “individual”, that is, perceptible, palpable, spiritless and un-Critical objects, which are an abomination in the eyes of pure Criticism. Everything that is real and living is un-Critical, of a mass nature, and therefore “nothing”; only the ideal, fantastic creatures of Critical Criticism are “*everything*”.

The worker creates nothing, because his work remains individual, having only his individual needs as its object, that is, because in the present world system the individual interconnected branches of labour are separated from, and even opposed to, one another; in short, because labour is not *organized*. Criticism's own proposition, if taken in the only reasonable sense it can possibly have, demands the organization of labour. Flora Tristan, in an assessment of whose work this great proposition appears, puts forward the same demand and is treated *en canaille* for her insolence in anticipating Critical Criticism. Anyhow, the proposition that the worker creates nothing is absolutely crazy except in the sense that the *individual* worker produces nothing *whole*, which is tautology. Critical Criticism creates nothing, the

worker creates everything; and so much so that even his intellectual creations put the whole of Criticism to shame; the English and the French workers provide proof of this. The worker creates even *man*; the critic will never be anything but sub-human though on the other hand, of course, he has the satisfaction of being a Critical critic.

“Flora Tristan is an example of the feminine dogmatism which must have a formula and constructs it out of the categories of what exists.”

Criticism does nothing but “construct formulae out of the categories of what exists”, namely, out of the existing *Hegelian* philosophy and the existing social aspirations. Formulae, nothing but formulae. And despite all its invectives against dogmatism, it condemns itself to dogmatism and even to *feminine* dogmatism. It is and remains an old woman — faded, widowed *Hegelian* philosophy which paints and adorns its body, shrivelled into the most repulsive abstraction, and ogles all over Germany in search of a wooer.

2) Béraud on Prostitutes

Herr Edger, taking pity on social questions, meddles also in “*conditions of prostitutes*” (Heft V,).

He criticizes Paris Police Commissioner Béraud’s book on prostitution because he is concerned with the “*point of view*” from which “Béraud considers the attitude of prostitutes to society” The “tranquillity of knowledge” is surprised to see that a policeman adopts the point of view of the police, and it gives the mass to understand that that point of view is quite wrong. But it does not reveal its own point of view. Of course not! When Criticism takes up with prostitutes it cannot be expected to do so in public.

3) Love

In order to complete its transformation into the “tranquillity of knowledge”, Critical Criticism must first seek to dispose of *love*. Love is a passion, and nothing is more dangerous for the tranquillity of knowledge than passion. That is why, speaking of Madame von Paalzow’s novels, which, he assures us, he has “thoroughly *studied*”. Herr Edgar is amazed at “*a childish thing*”

like so-called love". It is a horror and abomination and excites the wrath of Critical Criticism, makes it almost as bitter as gall, indeed, insane.

"Love ... is a cruel goddess, and like every deity she wishes to possess the whole of man and is not satisfied until he has surrendered to her not merely his soul, but his physical self. The worship of love is suffering, the peak of this worship is self-immolation, suicide."

In order to change love into "Moloch", the devil incarnate, Herr Edgar first changes it into a goddess. When love has become a goddess, i.e., a theological object, it is of course submitted to *theological criticism*; moreover, it is known that god and the devil are not far apart. Herr Edgar changes love into a "goddess", a, "cruel goddess" at that, by changing *man who loves*, the love of *man*, into a man of *love*; by making "*love*" a being apart, separate from man and as such independent. By this simple process, by changing the predicate into the subject, all the attributes and manifestations of human nature can be Critically transformed into their *negation* and into *alienations* of human nature." Thus, for example, Critical Criticism makes criticism, as a predicate and activity of man, into a subject apart, criticism which relates itself to itself and is therefore Critical Criticism: a "Moloch", the worship of which consists in the self-immolation, the suicide of man, and in particular of his *ability to think*.

"Object," exclaims, the tranquillity of knowledge, "object is the right expression, for the beloved is important to the lover (there is no feminine) only as this external object of the emotion of his soul, as the object in which he wishes to see his selfish feeling satisfied."

Object! Horrible! There is nothing more damnable, more profane, more mass-like than an *object* — *abase*; *bas* the object! How could absolute subjectivity, the *actus puris*, "*pure*" Criticism, not see in love its *bête noire*, that Satan incarnate, in love, which first really teaches man to believe in the objective world outside himself, which not only makes man into an object, but even the object into a man!

Love, continues the tranquillity of knowledge, beside itself, is not even content with turning man into the *category of "object"* for another man, it even makes him into a definite, real object, into *this* bad-individual (see Hegel's *Phänomenologie* on the categories "This" and "That", where there is also a polemic against the bad "*This*"), *external* object, which does not remain internal, hidden in the brain, but is sensuously manifest.

Love

Lives not only in the brain immured.

No, the beloved is a *sensuous object*, and if Critical Criticism is to condescend to recognition of an object, it demands at the very least a *senseless* object. But love is an *un-Critical, un-Christian materialist*.

Finally, love even makes one human being “*this external object of the emotion of the soul*” of another, the object in which the *selfish* feeling of the other finds its satisfaction, a selfish feeling because it *looks for its own essence* in the other, and that must not be. Critical Criticism is so *free* from all *selfishness* that for it the whole range of human essence is exhausted *by its own self*.

Herr Edgar, of course, does not tell us in what way the beloved differs from the other “external objects of the emotion of the soul in which the selfish feelings of men find their satisfaction”. The spiritually profound, meaningful, highly expressive object of love means nothing to the tranquillity of knowledge but the abstract formula: “this external object of the emotion of the soul”, much as the comet means nothing to the speculative natural philosopher but “negativity”. By making man the external object of the emotion of his soul, man does in fact attach “importance” to him, Critical Criticism itself admits, but only *objective importance*, so to speak, while the importance which Criticism attaches to objects is none other than that which it attaches to itself. Hence this importance lies not in “*bad external being*”, but in the “*Nothing*” of the Critically important object.

If the tranquillity of knowledge has no *object* in real man, it has, on the other hand, a *cause in humanity*. Critical love “*is careful* above all not to forget the *cause* behind the personality, for that cause is none other than the cause of humanity”. Un-Critical love does not separate humanity from the personal, individual man.

Love itself, as an abstract passion, which comes we know not whence and goes we know not whither, is incapable of having an interest in internal development.”

In the eyes of the tranquillity of knowledge, love is an abstract passion according to the *speculative* terminology in which the concrete is called abstract and the abstract concrete.

The maid was not born in that valley,
But where she came from, no one knew.

And soon all trace of her did vanish
Once she had bidden them adieu.

For abstraction, love is “the maid from a foreign land” who has no dialectical passport and is therefore expelled from the country by the Critical police.

The passion of love is incapable of having an interest in *internal* development because it cannot be construed *a priori*, because its development is a real one which takes place in the world of the senses and between real individuals. But the main interest of speculative construction is the “Whence” and the “Whither”. The “Whence” is the “*necessity* of a concept, its proof and deduction” (Hegel). The “Whither” is the determination “by which each individual link of the speculative circular course, as the animated content of the method, is at the same time the beginning of a new link” (Hegel). Hence, only if its “Whence” and its “Whither” could be construed *a priori* would love deserve the “interest” of speculative Criticism.

What Critical Criticism combats here is not merely love but everything living, everything which is immediate, every sensuous experience, any and every *real* experience, the “Whence” and the “Whither” of which one never *knows* beforehand.

By overcoming love, Herr Edgar has completely *asserted* himself as the “tranquillity of knowledge”, and now by his treatment of *Proudhon*, he can show great virtuosity in knowledge, the “*object*” of which is no longer “*this external object*”, and a still greater *lack of love* for the French language.

4) *Proudhon*

It was not *Proudhon* himself, but “Proudhon’s *point of view*”, Critical Criticism informs us, that wrote *Qu’est-ce que la propriété?*

“I begin my exposition of Proudhon’s point of view by characterizing it” (the point of view’s) “work, “*Qu’est-ce que la propriété?*”

As only the works of the Critical point of view possess a character of their own, the Critical characterization necessarily begins by giving a character to Proudhon’s work. Herr Edgar gives this work a character by *translating* it. He naturally gives it a *bad* character, for he turns it into an *object* of “Criticism”

Proudhon's work, therefore, is subjected to a double attack by Herr Edgar — an *unspoken* one in his characterising translation and an *outspoken* one in his Critical comments. We shall see that Herr Edgar is more devastating when he translates than when he comments.

Characterizing Translation No. 1

“I do not wish” (says the Critically translated Proudhon) “to give any system of the new; I wish for nothing but the abolition of privilege, the abolition of slavery.... Justice, nothing but justice, that is what I mean.”

The characterized Proudhon confines himself to will and opinion, because “good will” and unscientific “opinion” are characteristic attributes of the un-Critical Mass. The characterized Proudhon behaves with the humility that is fitting for the mass and subordinates what he wishes to what he does *not* wish. He does not presume to wish to give a system of the new, he wishes less, he even wishes for *nothing* but the abolition of privilege, etc. Besides this Critical subordination of the will he has to the will he has not, his very first word is marked by a characteristic lack of logic. A writer who begins his book by saying that he does not wish to give any system of the new, should then tell us what he does wish to give: whether it is a systematised old or an unsystematised new. But does the characterized Proudhon, who does not wish to give any system of the new, wish to give the abolition of privilege? No. He just *wishes* it.

The real Proudhon says: “*Je ne fais pas de système; je demande la fin du privilège,*” etc. I make no system, I demand, etc., that is to say, the real Proudhon declares that he does not pursue any abstract scientific aims, but makes immediately practical demands on society. And the demand he makes is not an arbitrary one. It is motivated and justified by his whole argument and is the summary of that argument for, he says, “*justice, rien que justice; tel est le résumé de mon discours.*” With his “Justice, nothing but justice, that is what I mean”, the characterized Proudhon gets himself into a position which is all the more embarrassing as he means much more. According to Herr Edgar, for example, he “*means*” that philosophy has not been practical enough, he “*means*” to refute Charles Comte, and so forth.

The Critical Proudhon asks: “Ought *man* then always to be unhappy?” In other words, he asks whether unhappiness is man's moral destiny. The real Proudhon is a light-minded Frenchman and he asks whether unhappiness is

a material necessity, a must. (*L'homme doit-il être éternellement malheureux?*)

The mass-type Proudhon says: “Et, sans m’arrêter aux explications à toute fin des entrepreneurs de réformes, accusant de la détresse générale, ceux-ci la lâcheté et l’impéritie du pouvoir, ceux-là les conspirateurs et les émeutes, d’autres l’ignorance et la corruption générale”, etc.

The expression “à toute fin” being a bad mass-type expression that is not in the mass-type German dictionaries, the Critical Proudhon naturally omits this more exact definition of the “explanations”. This term is taken from mass-type French jurisprudence, and “explications ... toute fin” means explanations which preclude any objection. The Critical Proudhon censures the “*Reformists*”, a French Socialist Party; the massy Proudhon censures the initiators of reforms. The mass-type Proudhon distinguishes various classes of “entrepreneurs de réformes”. These (ceux-ci) say *one thing*, those (ceux-là) say *another*, others (d’autres) a third. The Critical Proudhon, on the other hand, makes *the same reformists* “accuse now one, then another, then a third”, which in any case is proof of their inconstancy. The real Proudhon, who follows mass-type French practice, speaks of “les conspirateurs et les émeutes”, i.e., first of the conspirators and then of their activity, revolts. The Critical Proudhon, on the other hand, who has lumped together the various classes of reformists, classifies the rebels and hence says: the conspirators and the rebels. The mass-type Proudhon speaks of *ignorance* and “*general corruption*”. The Critical Proudhon changes ignorance into stupidity, “corruption” into “depravity, and finally, as a Critical critic, makes the stupidity *general*. He himself gives an immediate example of it by putting “générale” in the singular instead of the plural. He writes: “l’ignorance et la corruption générale” for general stupidity and depravity. According to un-Critical French grammar this should be: “l’ignorance et la corruption générales.

The characterized Proudhon, who speaks and thinks otherwise than the mass-type one, necessarily went through quite a different *course of education*. He “questioned the masters of science, read hundreds of volumes of philosophy and law, etc., and *at last*” he “realised that we have never yet grasped the meaning of the words Justice, Equity, Freedom”. The real Proudhon thought he had realised *at first* (*je crus d’abord reconnaître*) what the Critical Proudhon realised only “at last”. The Critical alteration of *d’abord* into *enfin* is necessary because the mass may not think it realises

anything “at first”. The mass-type Proudhon tells explicitly how he was staggered by the unexpected result of his studies and distrusted it. Hence he decided to carry out a “*countertest*” and asked himself: “Is it possible that mankind has so long and so universally been mistaken over the principles of the application of morals? How and why was it mistaken?” etc. He made the correctness of his observations dependent on the solution of these questions. He found that in morals, as in all other branches of knowledge, errors “*are stages of science*”. The Critical Proudhon, on the other hand, immediately trusted the first impression that his studies of political economy, law and the like made upon him. Needless to say, the mass cannot proceed in any *thorough* way; it is bound to raise the first results of its investigations to the level of indisputable truths. It has “reached the end before it has started, before it has measured itself with its opposite”. Hence, “it is seen” later “that it is not yet at the beginning when it thinks it has reached the end”.

The Critical Proudhon therefore continues his reasoning in the most untenable and incoherent way.

“Our knowledge of moral laws is not complete from the beginning; thus it can for some time suffice for social progress, but in the long run it will lead us on a false path.”

The Critical Proudhon does not give any reason why incomplete knowledge of moral laws can suffice for social progress even for a single day. The real Proudhon, having asked himself whether and why mankind could universally and so long have been mistaken and having found as the solution that all errors are stages of science and that our most imperfect judgments contain a sum of truths sufficient for a certain number of inductions and for a certain area of practical life, beyond which number and which area they lead theoretically to the absurd and practically to decay, is in a position to say that even imperfect knowledge of moral laws can suffice for social progress for a time.

The Critical Proudhon says:

“But if new knowledge has become necessary, a bitter struggle arises between the old prejudices and the new idea.”

How can a struggle arise against an opponent who does *not yet* exist? Admitted, the Critical Proudhon has told us that a new idea has become necessary but he has not said that it has already *come into existence*.

The mass-type Proudhon says:

“Once higher knowledge has become indispensable it is *never lacking*”, it is therefore ready at hand. “*It is then* that the struggle begins.”

The Critical Proudhon asserts: “It is man’s destiny to learn step by step”, as if man did not have a quite different destiny, namely, that of being man, and as if that learning “step by step” necessarily brought him a step farther. I can go step by step and arrive at the very point from which I set out. The un-Critical Proudhon speaks, not of “destiny”, but of the *condition (condition)* for man to learn not *step by step (pas à pas)*, but *by degrees (par degrés)*. The Critical Proudhon says to himself:

“Among the principles upon which society rests there is one which society does not understand, which is spoilt by society’s ignorance and is the cause of all evil. Nevertheless, man honours *this principle*” and “wills it, for otherwise it would have no influence. Now this principle which is true in its *essence*; but is false in the way we conceive it ... what is it?”

In the first sentence the Critical Proudhon says that the principle is spoilt, misunderstood by society, hence that it is correct in itself. In the second sentence he admits superfluously that it is true in its essence; nevertheless he reproaches society with willing and honouring “this principle”. The mass-type Proudhon, on the other hand, reproaches society with willing and honouring not this principle, but this principle *as falsified* by our ignorance (“*Ce principe ... tel que notre ignorance l’a fait, est honoré*”). The Critical Proudhon finds the *essence* of the principle in its untrue form *true*. The mass-type Proudhon finds that the essence of the falsified principle is our incorrect conception, but that it is true in its *object (objet)*, just as the essence of alchemy and astrology is our imagination, but their objects — the movement of the heavenly bodies and the chemical properties of substances — are true.

The Critical Proudhon continues his monologue:

The object of our investigation is the law, the definition of the social principle. Now the politicians, i.e., the men of social science, are a prey to complete lack of clarity...; but as there is a reality at the basis of every error, in their books we shall find the truth, which they have brought into the world without knowing it.”

The Critical Proudhon has a most fantastic way of reasoning. From the fact that the politicians are ignorant and unclear, he goes on in the most arbitrary fashion to say that a reality lies *at the basis* of every error, which can all the less he doubted as there is a reality at the basis of every error —

in the person of the one who errs. From the fact that a reality lies at the basis of every error he goes on to conclude that truth is to be found *in the books* of politicians. And finally he even makes out that the politicians have brought this truth into the *world*. Had they brought it into the *world* we should not need to look for it in their *books*.

The mass-type Proudhon says:

“The politicians do not understand one another (*ne s’entendent pas*); their error is therefore a subjective one, having its origin in them (*donc c’est en eux qu’est l’erreur*).” Their mutual misunderstanding proves their one-sidedness. They confuse “their private opinion with common sense”, and “as”, according to the previous deduction, “every error has a true reality as its object, their books must contain the truth, which they unconsciously have put there” — i.e., in their books— “but have not brought into the world” (*dans leurs livres doit se trouver la vérité qu’ à leur insu ils y auront mise*).

The Critical Proudhon asks himself: “What is justice, what is its essence, its character, its meaning?” As if it had some meaning apart from its essence and character. The un-Critical Proudhon asks: What is its principle, its character and its formula (*formule*)? The formula is the principle as a principle of scientific reasoning. In the mass-type French language there is an essential difference between *formule* and *signification*. In the Critical French language there is none.

After his highly irrelevant disquisitions, the Critical Proudhon pulls himself together and exclaims:

“Let us try to get somewhat closer to our object.”

The un-Critical Proudhon, on the other hand, who arrived at his object long ago, tries to attain more precise and more positive definitions of his object (*d’arriver à quelque chose de plus précis et de plus positif*).

For the Critical Proudhon “the law” is a “*definition* of what is right”, for the un-Critical Proudhon it is a “*statement*” (*déclaration*) of it. The un-Critical Proudhon disputes the view that right is made by law. But a “definition of the law” can mean that the law is defined just as it can mean that it defines. Previously, the Critical Proudhon himself spoke about the definition of the social principle in this latter sense. To be sure, it is unseemly of the mass-type Proudhon to make such nice distinctions.

Considering these differences between the Critically characterised Proudhon and the real Proudhon, it is no wonder that Proudhon No. 1 seeks to *prove* quite different things than Proudhon No. 2.

The Critical Proudhon

“*seeks to prove by the experience of history*” that “if the idea that we have of what is just and right is false, *evidently*” (he tries to prove it in spite of its evidence) “all its applications in law must be bad, all our institutions must be defective”.

The mass-type Proudhon is far from wishing to prove what is evident. He says instead:

“If the idea that we have of what is just and right were badly defined, if it were incomplete or even false, it is *evident* that all our legislative applications would be bad”, etc.

What, then, does the un-Critical Proudhon wish to prove?

“This hypothesis,” he continues, “of the perversion of justice in our understanding, and as a necessary consequence in our actions, would be an established fact if the opinions of men concerning the concept of justice and its applications had not remained constantly the same, if at different times they had undergone modifications; in a word, if there had been progress in ideas.”

And precisely that inconstancy, that change, that progress “is what *history* proves by the most striking testimonies”. And the un-Critical Proudhon quotes these striking testimonies of history. His Critical double, who proves a completely different proposition by the experience of history, also presents that experience itself in a different way.

According to the real Proudhon, “the wise” (*les sages*), according to the Critical Proudhon, “the philosophers”, foresaw the fall of the Roman Empire. The Critical Proudhon can of course consider only philosophers to be wise men. According to the real Proudhon, Roman “rights were consecrated by ten centuries of law practice” or “administration of justice” (*ces droits consacrés par une justice dix: fois séculaire*); according to the Critical Proudhon, Rome had “rights consecrated by ten centuries of *justice*”.

According to the same Proudhon No. 1, the Romans reasoned as follows:

“Rome ... was victorious through its policy and its gods; any reform in worship or public spirit would be stupidity and profanation” (according to the Critical Proudhon, *sacrilège* means not the profanation or desecration of

a holy thing, as in the mass-type French language, but just profanation). “Had it wished to free the peoples, it would thereby have renounced its right.” “Rome had thus fact and right in its favour,” Proudhon No. 1 adds.

According to the un-Critical Proudhon, the Romans reasoned more logically. The *fact* was set out in detail:

“The slaves are the most fertile source of its wealth; the freeing of the peoples would therefore be the *ruin of its finance*.”

And the mass-type Proudhon adds, referring to law: “Rome’s claims were justified by the law of nations (*droit des gens*).” This way of proving the right of subjugation was completely in keeping with the Roman view on law. See the mass-type pandects: “*jure gentium servitus invasit*” (Fr. 4. D.I.I).”

According to the Critical Proudhon, “idolatry, slavery and softness” were “the basis of Roman institutions”, of all its institutions without exception. The real Proudhon says: “Idolatry in religion, slavery in the state and Epicureanism in private life” (*épicurisme* in the ordinary French language is not synonymous with *mollesse*, softness) “were the basis of the institutions.” Within that Roman situation there “appeared”, says the mystic Proudhon, “the Word of God”, whereas according to the real, rationalistic Proudhon, it was “a man who *called* himself the Word of God”. In the real Proudhon this man calls the priests “vipers” (*vipères*); in the Critical Proudhon he speaks more courteously with them and calls them “serpents”. In the former he speaks in the Roman way of “advocates” , in the latter in the German way of “lawyers” .

The Critical Proudhon calls the spirit of the French Revolution a spirit of contradiction, and adds:

“That is enough to realised that the new which replaced the old had on itself nothing methodical and considered.”

He cannot refrain from repeating mechanically the favourite categories of Critical Criticism, the “old” and the “new”. He cannot refrain from the senseless demand that the “new” should have on itself something methodical and considered, just as one might have a stain on oneself . The real Proudhon says:

“That is enough to prove that the new order of things which was substituted for the old was in itself without method or reflection.”

Carried away by the memory of the French Revolution, the Critical Proudhon *revolutionises* the French language so much that he translates un

fait physique by “a fact of physics”, and *un fait intellectuel* by “a fact of the intellect”. By this revolution in the French language the Critical Proudhon manages to put physics in possession of all the facts to be found in nature. Raising natural science unduly on one side, he debases it just as much on the other by depriving it of intellect and distinguishing between a fact of physics and a fact of the intellect. To the same extent he makes all further psychological and logical investigation unnecessary by raising the intellectual fact directly to the level of a fact of the intellect.

Since the Critical Proudhon, Proudhon No. 1, has not the slightest idea what the real Proudhon, Proudhon No. 2, wishes to prove by his historical deduction, neither does the real content of that deduction exist for him, namely, the proof of the change in the views on law and of the continuous *implementation* of justice by the *negation* of historical actual right.

“La société fut sauvée par la *négarion* de ses principes ... et la violation des droits les plus sacrés.”

Thus the real Proudhon proves how the negation of Roman law led to the widening of right in the Christian *conception*, the negation of the right of conquest to the right of the communes and the negation of the whole feudal law by the French Revolution to the present more comprehensive system of law.

Critical Criticism could not possibly leave Proudhon the glory of having discovered the law of the implementation of a principle by its negation. In this conscious formulation, this idea was a real revelation for the French.

Critical Comment No. 1

As the first criticism of any science is necessarily influenced by the premises of the science it is fighting against, so Proudhon's treatise *Qu'est-ce que la propriété?* is the criticism of *political economy* from the standpoint of political economy. — We need not go more deeply into the juridical part of the book, which criticizes law from the standpoint of law, for our main interest is the criticism of political economy. — Proudhon's treatise will therefore be scientifically superseded by a criticism of *political economy*, including Proudhon's conception of political economy. This work became possible only owing to the work of Proudhon himself, just as Proudhon's criticism has as its premise the criticism of the mercantile system by the Physiocrats, Adam Smith's criticism of the Physiocrats,

Ricardo's criticism of Adam Smith, and the works of Fourier and Saint-Simon.

All treatises on political economy take *private property* for granted. This basic premise is for them an incontestable fact to which they devote no further investigation, indeed a fact which is spoken about only "*accidentellement*", as Say naively admits. But Proudhon makes a critical investigation — the first resolute, ruthless, and at the same time scientific investigation — of the basis of political economy, *private property*. This is the great scientific advance he made, an advance which revolutionizes political economy and for the first time makes a real science of political economy possible. Proudhon's treatise *Qu'est-ce que la propriété?* is as important for modern political economy as Sieyès' work *Qu'est-ce que le tiers état?* for modern politics.

Proudhon does not consider the further creations of private property, e.g., wages, trade, value, price, money, etc., as forms of private property in themselves, as they are considered, for example, in the *Deutsch-Französische Jahrbücher* (see *Outlines of a Critique of Political Economy* by F. Engels), but uses these economic premises in arguing against the political economists; this is fully in keeping with his historically justified standpoint to which we referred above.

Accepting the relationships of private property as human and rational, political economy operates in permanent contradiction to its basic premise, private property, a contradiction analogous to that of the theologian who continually gives a human interpretation to religious conceptions, and by that very fact comes into constant conflict with his basic premise, the superhuman character of religion. Thus in political economy wages appear at the beginning as the proportional share of the product due to labour. Wages and profit on capital stand in the most friendly, mutually stimulating, apparently most human relationship to each other. Afterwards it turns out that they stand in the most hostile relationship, in *inverse* proportion to each other. Value is determined at the beginning in an apparently rational way, by the cost of production of an object and by its social usefulness. Later it turns out that value is determined quite fortuitously and that it does not need to bear any relation to either the cost of production or social usefulness. The size of wages is determined at the beginning by *free* agreement between the free worker and the free capitalist. Later it turns out that the worker is compelled to allow the capitalist to determine it, just as the capitalist is

compelled to fix it as low as possible. *Freedom* of the contracting parties has been supplanted by *compulsion*. The same holds good of trade and all other economic relationships. The economists themselves occasionally feel these contradictions, the development of which is the main content of the conflict between them. When, however, the economists become conscious of these contradictions, *they themselves* attack *private property* in one or other *particular* form as the falsifier of what is in itself (i.e., in their imagination) rational wages, in itself rational value, in itself rational trade. Adam Smith, for instance, occasionally polemises against the capitalists, Destutt de Tracy against the money-changers, Simonde de Sismondi against the factory system, Ricardo against landed property, and nearly all modern economists against the *non-industrial* capitalists, among whom property appears as a mere *consumer*.

Thus, as an exception — when they attack some special abuse — the economists occasionally stress the semblance of humanity in economic relations, but sometimes, and as a rule, they take these relations precisely in their clearly pronounced *difference* from the human, in their strictly economic sense. They stagger about within this contradiction completely unaware of it.

Now *Proudhon* has put an end to this unconsciousness once for all. He takes the *human semblance* of the economic relations seriously and sharply opposes it to their *inhuman reality*. He forces them to be in reality what they imagine themselves to be, or rather to give up their own idea of themselves and confess their real inhumanity. He therefore consistently depicts as the falsifier of economic relations not this or that particular kind of private property, as other economists do, but private property as such and in its entirety. He has done all that criticism of political economy from the standpoint of political economy can do.

Herr Edgar, who wishes to *characterise* the *standpoint* of the treatise *Qu'est-ce que la propriété?*, naturally does not say a word either of political economy or of the distinctive character of this book, which is precisely that it has made the *essence of private property* the vital question of political economy and jurisprudence. This is all self-evident for Critical Criticism. Proudhon, it says, has done nothing new by his negation of private property. He has only let out a secret which Critical Criticism did not want to divulge.

“Proudhon,” Herr Edgar continues immediately after his characterising translation, “therefore finds something absolute, an eternal foundation in

history, a god that guides mankind — justice.”

Proudhon’s book, written in France in 1840, does not adopt the standpoint of German development in 1844. It is Proudhon’s standpoint, a standpoint which is shared by countless diametrically opposed French writers, which therefore gives Critical Criticism the advantage of having characterized the most contradictory standpoints with a single stroke of the pen. Incidentally, to be relieved from this Absolute in history as well one has only to apply consistently the law formulated by Proudhon himself, that of the implementation of justice by its negation. If Proudhon does not carry consistency as far as that, it is only because he had the misfortune of being born a Frenchman, not a German.

For Herr Edgar, Proudhon has become a *theological* object by his Absolute in history, his belief in justice, and Critical Criticism, which is *ex professo* a criticism of theology, can now set to work on him in order to expatiate on “religious conceptions”

“It is a characteristic of every religious conception that it sets up as a dogma a situation in which at the end one of the opposites comes out victorious as the only truth.”

We shall see how religious Critical Criticism sets up as a dogma a situation in which at the end one of the opposites, “*Criticism*”, comes out victorious over the other, the “Mass”, as the only truth. By seeing in mass-type justice an Absolute, a god of history, Proudhon committed an injustice that is all the greater because just Criticism has *explicitly* reserved for itself the role of that Absolute, that god in history.

Critical Comment No. 2

“The fact of misery, of poverty, makes Proudhon one-sided in his considerations; he sees in it a *contradiction* to equality and justice; it provides him with a weapon. Hence this fact becomes for him absolute and justified, whereas the fact of property becomes unjustified.”

The tranquillity of knowledge tells us that Proudhon sees in the fact of poverty a contradiction to justice, that is to say, finds it unjustified; yet in the same breath it assures us that this fact becomes for him absolute and justified.

Hitherto political economy proceeded from *wealth*, which the movement of private property supposedly creates for the *nations*, to its considerations

which are an apology for private property. Proudhon proceeds from the opposite side, which political economy sophistically conceals, from the poverty bred by the movement of private property to his considerations which negate private property. The first criticism of private property proceeds, of course, from the fact in which its contradictory essence appears in the form that is most perceptible and most glaring and most directly arouses man's indignation — from the fact of poverty, of misery.

“Criticism, on the other hand, joins the two facts, poverty and property, in a single unity, grasps the inner link between them and makes them a single whole, which it investigates as such to find the preconditions for its existence.”

Criticism, which has hitherto understood nothing of the facts of property and of poverty, uses, “on the other hand”, the deed which it has accomplished in its imagination as an argument against Proudhon's real deed. It unites the *two* facts in a *single* one, and having made *one* out of *two*, grasps the inner link between the two. Criticism cannot deny that Proudhon, too, is aware of an inner link between the facts of poverty and of property, since because of that very link he abolishes property in order to abolish poverty. Proudhon did even more. He proved in detail *how* the movement of capital produces poverty. But Critical Criticism does not bother with such trifles. It recognizes that poverty and private property are *opposites* — a rather widespread recognition. It makes poverty and wealth *a single whole*, which it “investigates *as such* to find the preconditions for its existence” an investigation which is all the more superfluous since it has just *made* “the whole as such” and therefore its *making* is in itself the precondition for the existence of this whole.

By investigating “the whole as such” to find the preconditions for its existence, Critical Criticism is searching in the genuine theological manner *outside* the “whole” for the preconditions for its existence. Critical speculation operates outside the object which it pretends to deal with. Whereas the *whole antithesis* is nothing but the *movement of both its sides*, and the precondition for the existence of the whole lies in the very nature of the two sides. But Critical Criticism dispenses with the study of this real movement which forms the whole in order to be able to declare that it, Critical Criticism as the tranquillity of knowledge, is above both extremes of the antithesis, and that its activity, which has made “the whole as such”, is now alone in a position to abolish the abstraction of which it is the maker.

Proletariat and wealth are opposites; as such they form a single whole. They are both creations of the world of private property. The question is exactly what place each occupies in the antithesis. It is not sufficient to declare them two sides of a single whole.

Private property as private property, as wealth, is compelled to maintain *itself*, and thereby its opposite, the proletariat, in *existence*. That is the *positive* side of the antithesis, self-satisfied private property.

The proletariat, on the contrary, is compelled as proletariat to abolish itself and thereby its opposite, private property, which determines its existence, and which makes it proletariat. It is the *negative* side of the antithesis, its restlessness within its very self, dissolved and self-dissolving private property.

The propertied class and the class of the proletariat present the same human self-estrangement. But the former class feels at ease and strengthened in this self-estrangement, it recognizes estrangement as *its own power* and has in it the *semblance* of a human existence. The class of the proletariat feels annihilated in estrangement; it sees in it its own powerlessness and the reality of an inhuman existence. It is, to use an expression of Hegel, in its abasement the indignation at that abasement, an *indignation* to which it is necessarily driven by the contradiction between its human *nature* and its condition of life, which is the outright, resolute and comprehensive negation of that nature.

Within this antithesis the private property-owner is therefore the *conservative* side, the proletarian the *destructive* side. From the former arises the action of preserving the antithesis, from the latter the action of annihilating it.

Indeed private property drives itself in its economic movement towards its own dissolution, but only through a development which does not depend on it, which is unconscious and which takes place against the will of private property by the very nature of things, only inasmuch as it produces the proletariat as proletariat, poverty which is conscious of its spiritual and physical poverty, dehumanization which is conscious of its dehumanization, and therefore self-abolishing. The proletariat executes the sentence that private property pronounces on itself by producing the proletariat, just as it executes the sentence that wage-labour pronounces on itself by producing wealth for others and poverty for itself. When the proletariat is victorious, it by no means becomes the absolute side of society, for it is victorious only

by abolishing itself and its opposite. Then the proletariat disappears as well as the opposite which determines it, private property.

When socialist writers ascribe this world-historic role to the proletariat, it is not at all, as Critical Criticism pretends to believe, because they regard the proletarians as *gods*. Rather the contrary. Since in the fully-formed proletariat the abstraction of all humanity, even of the *semblance* of humanity, is practically complete; since the conditions of life of the proletariat sum up all the conditions of life of society today in their most inhuman form; since man has lost himself in the proletariat, yet at the same time has not only gained theoretical consciousness of that loss, but through urgent, no longer removable, no longer disguisable, absolutely imperative *need* — the practical expression of *necessity* — is driven directly to revolt against this inhumanity, it follows that the proletariat can and must emancipate itself. But it cannot emancipate itself without abolishing the conditions of its own life. It cannot abolish the conditions of its own life without abolishing all the inhuman conditions of life of society today which are summed up in its own situation. Not in vain does it go through the stern but steeling school of *labour*. It is not a question of what this or that proletarian, or even the whole proletariat, at the moment *regards* as its aim. It is a question of *what the proletariat is*, and what, in accordance with this *being*, it will historically be compelled to do. Its aim and historical action is visibly and irrevocably foreshadowed in its own life situation as well as in the whole organization of bourgeois society today. There is no need to explain here that a large part of the English and French proletariat is already *conscious* of its historic task and is constantly working to develop that consciousness into complete clarity.

“Critical Criticism” can all the less admit this since it has proclaimed itself the exclusive creative element in history. To it belong the historical antitheses, to it belongs the task of abolishing them. That is why it issues the following *notification* through its incarnation, Edgar:

“Education and lack of education, property and absence of property, these antitheses, if they are not to be desecrated, must be wholly and entirely the concern of Criticism.”

Property and absence of property have received metaphysical consecration as Critical speculative antitheses. That is why only the hand of Critical Criticism can touch them without committing a sacrilege. Capitalists and workers must not interfere in their mutual relationship.

Far from having any idea that his Critical conception of antitheses could be touched, that this holy thing could be desecrated, Herr Edgar lets his opponent make an objection that he alone could make to himself.

“Is it then possible,” the imaginary opponent of Critical Criticism asks, “to use other concepts than those already existing — liberty, equality, etc.? I answer” (note Herr Edgar’s answer) “that Greek and Latin perished as soon as the range of thoughts that they served to express was exhausted.”

It is now clear why Critical Criticism does not give a single thought in *German*. The language of its thoughts has not yet come into being in spite of all that Herr Reichardt by his Critical handling of foreign words, Herr Faucher by his handling of English, and Herr Edgar by his handling of French, have done to prepare the *new Critical* language.

Characterizing Translation No. 2

The Critical Proudhon says:

“The husbandmen divided the land among themselves; equality consecrated only possession; on this occasion it consecrated property.”

The Critical Proudhon makes landed property arise simultaneously with the division of land. He effects the transition from possession to property by the expression “on this occasion”.

The real Proudhon says:

“Husbandry was the basis of possession of the land.... It was not enough to ensure for the tiller the fruit of his labour without ensuring for him at the same time the instruments of production. To guard the weaker against the encroachments of the stronger ... it was felt necessary to establish permanent demarcation lines between owners.”

On this occasion, therefore, it is *possession* that equality consecrated in the first place.

“Every year saw the population increase and the greed of the settlers grow; it was thought ambition should be checked by new insuperable barriers. Thus the land became property owing to the need for equality ... doubtless the division was never geographically equal ... but the principle nevertheless remained the same; equality had consecrated possession, equality consecrated property.”

According to the Critical Proudhon

“the ancient founders of property, absorbed with concern for their needs, overlooked the fact that to the right of property corresponded at the same time the right to alienate, to sell, to give away, to acquire and to lose, which destroyed the equality from which they started out.”

According to the real Proudhon it was not that the founders of property overlooked this course of its development in their concern for their needs. It was rather that they did not foresee it; but even if they had been able to foresee it, their actual need would have gained the upper hand. Besides, the real Proudhon is too mass-minded to counterpose the right to alienate, sell, etc., to the “*right of property*”, i.e., to counterpose the varieties to the species. He contrasts the “right to *keep* one’s heritage” to the “right to *alienate* it, etc.”, which constitutes a real opposition and a real step forward.

Critical Comment No. 3

“On what then does Proudhon base his proof of the impossibility of property? Difficult as it is to believe it — on the same principle of equality!”

A short consideration would have sufficed to arouse the belief of Herr Edgar. He must be aware that Herr Bruno Bauer based all his arguments on “*infinite* self-consciousness” and that he also saw in this principle the creative principle of the gospels which, by their infinite unconsciousness, appear to be in direct contradiction to infinite self-consciousness. In the same way Proudhon conceives equality as the creative principle of private property, which is in direct contradiction to equality. If Herr Edgar compares French *equality* with German “self-consciousness” for an instant, he will see that the latter principle expresses in *German*, i.e., in abstract thought, what the former says in *French*, that is, in the language of politics and of thoughtful observation. Self-consciousness is man’s equality with himself in pure thought. Equality is man’s consciousness of himself in the element of practice, i.e., man’s consciousness of other men as his equals and man’s attitude to other men as his equals. Equality is the French expression for the unity of human essence, for man’s consciousness of his species and his attitude towards his species, for the practical identity of man with man, i.e., for the social or human relation of man to man. Hence, just as destructive criticism in Germany, before it had progressed in *Feuerbach* to the consideration of *real man*, tried to resolve everything definite and

existing by the principle of *self-consciousness*, destructive criticism in France tried to do the same by the principle of equality.

“Proudhon is angry with philosophy, for which, in itself, we cannot blame him. But why is he angry? Philosophy, he maintains, has not yet been practical enough; it has mounted the high horse of speculation and from up there human beings have seemed much too small. I think that philosophy is over practical, i.e., it has so far been nothing but the abstract expression of the existing state of things; it has always been captive to the premises of the existing state of things, which it has accepted as absolute.”

The opinion that philosophy is the abstract expression of the existing state of things does not belong originally to Herr Edgar. It belongs to *Feuerbach*, who was the first to describe philosophy as speculative and mystical empiricism and to prove it. But Herr Edgar manages to give this opinion an original, Critical twist. While Feuerbach concludes that philosophy must come down from the heaven of speculation to the depth of human misery, Herr Edgar, on the contrary, informs us that philosophy is over-practical. However, it seems rather that philosophy, precisely because it was only the transcendent, abstract expression of the actual state of things, by reason of its transcendentalism and abstraction, by reason of its *imaginary difference* from the world, must have imagined it had left the actual state of things and real human beings far below itself. On the other hand, it seems that because philosophy was not really different from the world it could not pronounce any *real judgment* on it, it could not bring any real differentiating force to bear on it and could therefore not interfere *practically*, but had to be satisfied at most with a practice *in abstracto*. Philosophy was over-practical only in the sense that it soared above practice. Critical Criticism, by lumping humanity together in a spiritless mass, gives the most striking proof how infinitely small real human beings seem to speculation. In this the old speculation agrees with Critical Criticism, as the following sentence out of Hegel’s *Rechtsphilosophie* shows:

“From the standpoint of needs, it is the concrete object of the idea that is called man; therefore what we are concerned with here, and properly speaking only here, is man in this sense.”

In other cases in which speculation speaks of man it does not mean the *concrete*, but the *abstract*, *the idea*, *the spirit*, etc. The way in which philosophy expresses the actual state of things is strikingly exemplified by

Herr Faucher in connection with the actual English situation and by Herr Edgar in connection with the actual situation of the French language.

“Thus Proudhon also is practical because, finding that the concept of equality is the basis of the proofs in favour of property, he argues from the same concept against property.”

Proudhon here does exactly the same thing as the German critics who,, finding that the proofs of the existence of God are based on the idea of man, argue from that idea against the existence of God.

“If the consequences of the principle of equality are more powerful than equality itself, how does Proudhon intend to help that principle to acquire its sudden power?”

Self-consciousness, according to Herr Bruno Bauer, lies at the basis of all religious ideas. It is, he says, the creative principle of the gospels. Why, then, were the consequences of the principle of self-consciousness more powerful than self-consciousness itself? Because, the answer comes after the German fashion, self-consciousness is indeed the creative principle of religious ideas, but only as self-consciousness outside itself, in contradiction to itself, alienated and estranged. Self-consciousness that has come to itself, that understands itself, that apprehends its essence, therefore governs the creations of its self-alienation. Proudhon finds himself in exactly the same case, with the difference, of course, that he speaks French whereas we speak German, and he therefore expresses in a French way what we express in a German way.

Proudhon asks himself why equality, although as the creative principle of reason it underlies the institution of property and as the ultimate rational foundation is the basis of all arguments in favour of property, nevertheless does not exist, while its negation, private property, does. He accordingly considers the fact of property in itself. He proves “that, in truth, property, as an institution and a principle, is *impossible*” , i.e., that *it contradicts itself* and abolishes itself in all points; that, to put it in the German way, it is the existence of alienated, self-contradicting, self-estranged equality. The real state of things in France, like the recognition of this estrangement, suggests correctly to Proudhon the necessity of the real abolition of this estrangement.

While negating private property, Proudhon feels the need to justify the existence of private property historically. His argument, like all first arguments of this kind, is pragmatic, i.e., he assumes that earlier generations

wished consciously and with reflection to realised in their institutions that equality which for him represents the human essence.

“We always come back to the same thing.... Proudhon writes in the interest of the proletarians.”

He does not write in the interest of self-sufficient Criticism or out of any abstract, self-made interest, but out of a mass-type, real, historic interest, an interest that goes beyond criticism, that will go as far as a crisis. Not only does Proudhon write in the interest of the proletarians, he is himself a proletarian, an *ouvrier*. His work is a scientific manifesto of the French proletariat and therefore has quite a different historical significance from that of the literary botch-work of any Critical Critic.

“Proudhon writes in the interest of those who have nothing; to have and not to have are for him absolute categories. To have is for him the highest, because at the same time not to have is for him the highest object of thought. Every man ought to have, but no more or less than another, Proudhon thinks. But one should bear in mind that of all I have, only what I have exclusively, or what I have more of than other people have, is interesting for me. With equality, both to have and equality itself will be a matter of indifference to me.

According to Herr Edgar, *having and not having* are for Proudhon absolute categories. Critical Criticism sees nothing but categories everywhere. Thus, according to Herr Edgar, having and not having, wages, salary, want and need, and work to satisfy that need, are nothing but categories.

If society had to free itself only from the *categories* of having and not having, how easy would the “overcoming” and “abolition” of those categories be made for it by any dialectician, even if he were weaker than Herr Edgar! Indeed, Herr Edgar considers this such a trifle that he does not think it worth the trouble to give even an *explanation* of the categories of having and not having as an argument against Proudhon. But not having is not a mere category, it is a most dismal reality; today the man who has nothing is nothing, for he is cut off from existence in general, and still more from a human existence, for the condition of not having is the condition of the complete separation of man from his objectivity. Therefore not having seems quite justified in being the highest object of thought for Proudhon; all the more since so little thought had been given to this subject prior to him and the socialist writers in general. Not having is the most despairing

spiritualism, a complete unreality of the human being, a complete reality of the dehumanized being, a very positive having, a having of hunger, of cold, of disease, of crime, of debasement, of hebetude, of all inhumanity and abnormality. But every object which for the first time is made the object of thought with full consciousness of its importance is the *highest object of thought*.

Proudhon's wish to abolish not having and the old way of having is quite identical with his wish to abolish the practically estranged relation of man to his *objective essence* and the *economic* expression of human self-estrangement. But since his criticism of political economy is still captive to the premises of political economy, the re-appropriation of the objective world itself is still conceived in the economic form of *possession*.

Proudhon does not oppose having to not having, as Critical Criticism makes him do; he opposes *possession* to the old way of having, to *private property*. He proclaims possession to be a "*social function*". What is "interesting" in a function, however, is not to "exclude" the other person, but to affirm and to realised the forces of my own being.

Proudhon did not succeed in giving this thought appropriate development. The idea of "*equal possession*" is the economic and therefore itself still estranged expression for the fact that the *object as being for man*, as the *objective being of man*, is at the same time the *existence of man for other men*, his human relation to other men, the *social behaviour of man to man*. Proudhon abolishes economic estrangement *within* economic estrangement.

Characterising Translation No. 3

The Critical Proudhon has a *Critical property-owner*, too, according to whose

"own admission those who had to work for him lost what he appropriated."

The mass-type Proudhon says to the mass-type property-owner:

"You have worked! Ought you never to have let others work for you! How, then, have they lost while working for you, what you were able to acquire while not working for them!"

By "*richesse naturelle*"," the Critical Proudhon makes Say understand "*natural possessions*" although Say, to preclude any error, states explicitly

in the *Épitom;é* to his *Traité d'économie politique* that by *richesse* he understands neither property nor possession, but a “sum of values”. Of course, the Critical Proudhon reforms Say just as he himself is reformed by Herr Edgar. He makes Say “infer immediately a right to take a field as property” because land is easier to appropriate than air or water. But Say, far from inferring from the greater possibility of appropriating land a property right to it, says instead quite explicitly:

“Les droits des proprietaires de terres — remontent une *spoliation*.”
(*Traité d'conomie politique*, edition III. t. I., , Nota.)

That is why, in Say's opinion, there must be “*concours de la législation*” and “*droit positif*” to provide a basis for the *right* to landed property. The real Proudhon does not make Say “immediately” *infer* the right of landed property from the easier appropriation of land. He reproaches him with basing himself on possibility *instead* of right and *confusing* the question of possibility with the question of right:

“Say prend la possibilité *pour* le droit. On ne demande pas pourquoi la terre a été plutt appropriée que la mer et les airs; on veut savoir, en vertu de quel droit l'homme s'est approprié cette richesse.

The Critical Proudhon continues:

“The only remark to be made on this is that with the appropriation of a piece of land the other elements — air, water and fire — are also appropriated: *terra, aqua, aëre et igne interdicti sumus*.”

Far from making “*only*” this remark, the real Proudhon says, on the contrary, that he draws “attention”, to the appropriation of air and water incidentally (*en passant*). The Critical Proudhon makes an unaccountable use of the Roman formula of banishment. He forgets to say who the “we” are who have been banished. The real Proudhon addresses the non-property-owners :

“Proletarians... property *excommunicates* us: *terra, etc. interdicti sumus*.”

The Critical Proudhon polemises against Charles Comte as follows:

“Charles Comte thinks that, in order to live, man needs air, food and clothing. Some of these things, like air and water, are inexhaustible and therefore always remain common property; but others are available in smaller quantities and become private property. Charles Comte therefore bases his proof on the concepts of limitedness and unlimitedness; he would

perhaps have come to a different conclusion had he made the concepts of dispensability and indispensability his main categories.”

How childish the Critical Proudhon’s polemic is! He expects Charles Comte to give up the categories he uses for his proof and to jump over to others so as to come, not to his own conclusions, but “*perhaps*” to those of the Critical Proudhon.

The real Proudhon does not make any such demands on Charles Comte; he does not dispose of him with a “perhaps”, but defeats him with his own categories.

Charles Comte, Proudhon says, proceeds from the indispensability of air, food, and, in certain climates, clothing, not in order to live, but in order not to stop living. Hence (according to Charles Comte) in order to maintain himself, man constantly needs to appropriate things of various kinds. These things do not all exist in the same proportion.

“The light of the heavenly bodies, air and water exist in such quantities that man can neither increase nor decrease them appreciably; hence everyone can appropriate as much of them as his needs require, *without prejudice to the enjoyment of others*”.

Proudhon proceeds from Comte’s own definitions. First of all he proves to him that land is also an object of primary necessity, the usufruct of which must therefore remain free to everyone, within the limits of Comte’s clause, namely: “*without prejudice to the enjoyment of others.*” Why then has land become private property? Charles Comte answers: because it is *not unlimited*. He should have concluded, on the contrary, that because land is *limited* it may not be appropriated. The appropriation of air and water causes no prejudice to anybody because, as they are unlimited, there is always enough left. The arbitrary appropriation of land, on the other hand, prejudices the enjoyment of others precisely because the land is *limited*. The use of the land must therefore be regulated in the interests of *all*. Charles Comte’s method of proving refutes his own thesis.

“Charles Comte, so Proudhon” (the Critical one, of course) “reasons, proceeds from the view that a nation can be the owner of a land; yet if property involves the right to use and misuse — *jus utendi et abutendi re sua* — even a nation cannot be adjudged the right to use and misuse a land.”

The real Proudhon does not speak of *jus utendi et abutendi* that the right of property “*involves*”. He is too mass-minded to speak of a right of property that the right of property involves. *Jus utendi et abutendi re sua* is,

in fact, the right of property itself. Hence Proudhon directly refuses a people the right of property over its territory. To those who find that exaggerated, he replies that in all epochs the imagined right of national property gave rise to suzerainty, tribute, royal prerogatives, *corvée*, etc.

The real Proudhon reasons against Charles Comte as follows: Comte wishes to expound how property arises and he begins with the hypothesis of a nation as owner. He thus falls into a *petitio principii*. He makes the state sell lands, he lets industrialists buy those estates, that is to say, he presupposes the *property* relations that he wishes to prove.

The Critical Proudhon scraps the French *decimal system*. He keeps the *franc* but replaces the *centime* by the “*Dreier*”.

“If I cede a piece of land, Proudhon” (the Critical one) “continues, I not only rob myself of one harvest; I deprive my children and children’s children of a lasting good. Land has value not only today, it has also the value of its capacity and its future.”

The real Proudhon does not speak of the fact that land has value not only today but also tomorrow: he contrasts the full present value to the value of its capacity and its future, which depends on my skill in exploiting the land. He says:

“Destroy the land, or, what comes to the same thing for you, sell it; you not only deprive yourself of one, two or more harvests; you annihilate all the produce you could have obtained from it, you, your children and your children’s children.”

For Proudhon the question is not one of stressing the contrast between one harvest and the lasting good — the money I get for the field can, as capital, also become a “lasting good” — but the contrast between the present value and the value the land can acquire through continuous cultivation.

“The new value, Charles Comte says, that I give to a thing by my work is my property. Proudhon” (the Critical one) “thinks he can refute him in the following way: *Then* a man must cease to be a property-owner as soon as he ceases to work. Ownership of the product can by no means involve ownership of the material from which the product was made.”

The real Proudhon says:

“Let the worker appropriate the products of his work, but I do not understand how ownership of the products involves ownership of the matter. Does the fisherman who manages to catch more fish than the others

on the same bank become by this skill the owner of the place where he fishes! Was the skill of a hunter ever considered a title to ownership of the game in a canton! The same applies to agriculture. In order to transform *possession* into *property*, *another condition* is necessary besides work, or a man would cease to be a property-owner as soon as he ceased to be a worker.”

Cessante causa cessat effectus. When the owner is owner only as a worker, he ceases to be an owner as soon as he ceases to be a worker.

“According to *law*, it is *prescription* which creates ownership; *work* is only the perceptible sign, the material act by which occupation is *manifested*.”

“The system of appropriation through work,” Proudhon goes on, “is therefore *contrary* to law; and when the supporters of that system put it forward as an explanation of the laws they are *contradicting themselves*.”

To say further, according to this opinion, that the cultivation of the land, for example, “creates full ownership of the same” is a *petitio principii*. It is a fact that a new productive capacity of the matter has been created. But what has to be proved is that ownership of the matter itself has thereby been created. Man has not created the matter itself. And he cannot even create any productive capacity if the matter does not exist beforehand.

The Critical Proudhon makes *Gracchus Babeuf* a partisan of *freedom*, but for the mass-minded Proudhon he is a partisan of *equality* (*partisan de l'égalité*).

The *Critical Proudhon*, who wanted to estimate *Homer's* fee for the *Iliad*, says:

“The fee which I pay *Homer* should be equal to what he gives me. But how is the value of what he gives to be determined!”

The Critical Proudhon is too superior to the trifles of political economy to know that the *value* of an object and what that object gives somebody else are two different things. The real Proudhon says:

“The fee of the poet should be equal to his product: what then is the value of that product?”

The real Proudhon supposes that the *Iliad* has an infinite *price* (or exchange value, *prix*), while the Critical Proudhon supposes that it has an infinite *value*. The real Proudhon counterposes the value of the *Iliad*, its *value* in the *economic* sense (*valeur intrinsèque*), to its exchange value

(*valeur changeable*); the Critical Proudhon counterposes its “value for exchange” to its “intrinsic value”, i.e., its value as a poem.

The real Proudhon says:

“Between material reward and talent there is no common measure. In this respect the situation of all producers is the same. Consequently any comparison between them, any classification according to fortune is impossible.” (“Entre une récompense matérielle et le talent il n’existe pas de commune mesure; sous ce rapport la condition de tous les producteurs est égale; conséquemment toute comparaison entre eux et toute distinction de fortunes est impossible.”)

The Critical Proudhon says:

“*Relatively*, the position of all producers is the same. Talent cannot be weighed materially Any comparison of the producers among themselves, any *external distinction* is impossible.”

In the Critical Proudhon we read that

“the man of science must feel himself equal in society, because his talent and his insight are only a product of the insight of society”.

The real Proudhon does not speak anywhere about the feelings of talent. He says that talent must lower itself to the level of society. Nor does he at all assert that the man of talent is only a product of society. On the contrary, he says:

“The man of talent has contributed to produce in himself a useful instrument There exist in him a free worker and an accumulated social capital.”

The Critical Proudhon goes on to say:

“Besides, he must be thankful to society for releasing him from other work so that he can apply himself to science.”

The real Proudhon nowhere resorts to the gratitude of the man of talent. He says:

“The artist, the scientist, the poet, receive their just reward by the mere fact that society allows them to apply themselves exclusively to science and art.”

Finally, the Critical Proudhon achieves the miracle of making a society of 150 workers able to maintain a “*marshal*” and, therefore, probably, an army. In the real Proudhon the marshal is a “*farrier*” (*maréchal*).

“If he” (Proudhon) “retains the concept of wages, if he sees in society an institution that gives us work and pays us for it, he has all the less right to recognize time as the measure for payment as he but shortly before, agreeing with Hugo Grotius, professed that time has no bearing on the validity of an object.”

This is the only point on which Critical Criticism attempts to solve its problem and to prove to Proudhon that from the standpoint of political economy he is arguing wrongly against political economy. Here Criticism *disgraces* itself in truly Critical fashion.

Proudhon agrees with Hugo Grotius in arguing that *prescription* is no title to change *possession into property* or a “*legal principle*” into another principle, any more than time can change the truth that the three angles of a triangle are together equal to two right angles into the truth that they are equal to three right angles.

“Never,” exclaims Proudhon, “will you succeed in making length of time, which of itself creates nothing, changes nothing, modifies nothing, able to change the user into a proprietor.”

Herr Edgar’s conclusion is: since Proudhon said that mere time cannot *change* one legal principle into another, that by itself it cannot change or modify anything, he is inconsistent when he makes *labour time* the measure of the economic value of the product of labour. Herr Edgar achieves this Critically Critical remark by translating “*valeur*” by “*Geltung*” so that he can use the word for validity of a legal principle in the same sense as for the commercial value of a product of labour. He achieves it by identifying empty length of time with time filled with labour. Had Proudhon said that time cannot change a fly into an elephant, Critical Criticism could have said with the same justification: he has therefore no right to make labour time the measure of wages.

Even Critical Criticism must be capable of grasping that the *labour time expended* on the production of an object is included in the *cost of production* of that object, that the *cost of production* of an object is what it *costs*, and therefore what it can be sold for, abstraction being made of the influence of *competition*. Besides the labour time and the material of labour, economists include in the cost of production the rent paid to the owner of the land, interest and the profit of the capitalist. The latter are excluded by Proudhon because he excludes private property. Hence there remain only the labour time and the expenses. By making labour time, the immediate

existence of human activity as activity, the measure of wages and the determinant of the value of the product, Proudhon makes the human side the decisive factor. In old political economy, on the other hand, the decisive factor was the material power of capital and of landed property. In other words, Proudhon reinstates man in his rights, but still in an economic and therefore contradictory way. How right he is from the standpoint of political economy can be seen from the fact that *Adam Smith*, the founder of modern political economy, in the very first pages of his book, *An Inquiry into the Nature and Causes of the Wealth of Nations*, develops the idea that before the invention of private property, that is to say, presupposing the *non-existence of private property*, *labour time* was the measure of *wages* and of the *value of the product of labour*, which was not yet distinguished from wages.

But even let Critical Criticism suppose for an instant that Proudhon did not proceed from the premise of wages. Does it believe that the time which the production of an object requires will ever not be an essential factor in the “*validity*” of the object! Does it believe that time will lose its *costliness*?

As far as immediate material production is concerned, the decision whether an object is to be produced or not, i.e., the decision on the *value* of the object, will depend essentially on the labour time required for its production. For it depends on time whether society has time to develop in a human way.

And even as far as *intellectual* production is concerned, must I not, if I proceed reasonably in other respects, consider the time necessary for the production of an intellectual work when I determine its scope, its character and its plan? Otherwise I risk at least that the object that is in my idea will never become an object in reality, and can therefore acquire only the value of an imaginary object, i.e., an *imaginary value*.

The criticism of political economy from the standpoint of political economy recognizes all the essential determinants of human activity, but only in an estranged, alienated form. Here, for example, it converts the importance of time for *human labour* into its importance for *wages*, for wage-labour.

Herr Edgar continues:

“In order to force talent to accept that measure, Proudhon misuses the concept of free contract and asserts that society and its individual members have the right to reject the products of talent.”

Among the *followers of Fourier and Saint-Simon*, talent puts forward exaggerated *fee claims* on an economic basis and makes its imagined notion of its infinite value the measure of the *exchange value* of its products. Proudhon answers it in exactly the same way as political economy answers any claim for a price much higher than the so-called natural price, that is, higher than the cost of production of the object offered. He answers by freedom of contract. But Proudhon does not *misuse* this relation in the sense of political economy; on the contrary, he assumes that to be real which the economists consider to be only nominal and illusory—the *freedom* of the contracting parties.

Characterizing Translation No. 4

The Critical Proudhon finally reforms *French society* by as deep a transformation of the French proletarians as of the French bourgeoisie.

He denies the French proletarians “*strength*” because the real Proudhon reproaches them with a lack of *virtue (vertu)*. He makes their *skill* in work problematic— “you are *perhaps* skilled in work” — because the real Proudhon unconditionally recognizes it (“*prompts au travail vous êtes*”, etc.). He converts the French bourgeoisie into dull burghers whereas the real Proudhon counterposes the ignoble bourgeois (*bourgeois ignobles*) to the blemished nobles (*nobles flétris*). He converts the bourgeois from happy-medium burghers (*bourgeois juste-milieu*) into “our good burghers”, for which the French bourgeoisie can be grateful. Hence, where the real Proudhon says the “ill will” of the French bourgeoisie (*la malveillance de nos bourgeois*) is growing, the Critical Proudhon consistently makes the “*carefreeness* of our burghers” grow. The real Proudhon’s bourgeois is so far from being carefree that he calls out to himself: “*N’ayons pas peur! N’ayons pas peur!*” Those are the words of a man who wishes to reason himself out of fear and worry.

By creating the Critical Proudhon through its translation of the real Proudhon, Critical Criticism has revealed to the Mass what a Critically perfect translation is. It has given directions for “translation as it ought to be”. It is therefore rightly against bad, mass-type translations.

“The German public wants the booksellers’ wares ridiculously cheap, so the publisher needs a cheap translation; the translator does not want to starve at his work, he cannot even perform it with mature reflection” (with

all the tranquillity of knowledge) “because the publisher must anticipate rivals by quick delivery of translations; even the translator has to fear competition, has to fear that someone else will produce the ware cheaper and quicker; he therefore dictates his manuscript offhand to some poor scribe — as quickly as he can in order not to pay the scribe his hourly wage for nothing. He is more than happy when he can next day adequately satisfy the harassing type-setter. For the rest, the translations with which we are flooded are but a manifestation of the present-day impotence of German literature”, etc. (*Allgemeine Literatur-Zeitung*, Heft VIII, p.54.)

Critical Comment No. 5

“The proof of the impossibility of property that Proudhon draws from the fact that mankind ruins itself particularly by the interest and profit system and by the disproportion between consumption and production lacks its counterpart, namely, the proof that private property is historically possible.”

Critical Criticism has the fortunate instinct not to go into Proudhon’s reasoning on the interest and profit system, etc., i.e., into the most important part of his argument. The reason is that on this point not even a semblance of criticism of Proudhon can be offered without absolutely positive knowledge of the movement of private property. Critical Criticism tries to make up for its impotence by observing that Proudhon has not proved the historical possibility of property. Why does Criticism, which has nothing but words to give, expect others to give it *everything*?

“Proudhon proves the impossibility of property by the fact that the worker cannot buy back the product of his work out of his wage. Proudhon does not give an exhaustive proof of this by expounding the essence of capital. The worker cannot buy back his product because it is always a joint product, whereas he is never anything but an individual paid man.”

Herr Edgar, in contrast to Proudhon’s deduction, could have expressed himself still more exhaustively to the effect that the worker cannot buy back his product because in general he must *buy it back*. The definition of buying already implies that he regards his product as an object that is no longer his, an estranged object. Among other things, Herr Edgar’s exhaustive argument does not exhaust the question why the capitalist, who himself is *nothing* but an *individual* man, and what is more, a man *paid* by profit and interest, can buy back not only the product of labour, but still more than this product. To

explain this Herr Edgar would have to explain the relationship between labour and capital, that is, to expound the essence of capital.

The above quotation from Criticism shows most palpably how Critical Criticism immediately makes use of what it has learnt from a writer to pass it off as wisdom it has itself discovered and use it with a Critical twist against the same writer. For it is from Proudhon himself that Critical Criticism drew the argument that it says Proudhon did not give and that Herr Edgar did. Proudhon says:

“Divide et impera ... separate the workers from one another, and it is quite possible that the daily wage paid to each one may exceed the value of each individual product; but that is not the point at issue.... Although you have paid for all the individual powers you have still not paid for the collective power.”

Proudhon was the first to draw attention to the fact that the sum of the wages of the individual workers, even if each individual labour be paid for completely, does not pay for the collective power objectified in its product, that therefore the worker is not paid as a part of the *collective labour power*. Herr Edgar twists this into the assertion that the worker is nothing but an individual paid man. Critical Criticism thus opposes a *general* thought of Proudhon's to the further *concrete* development that Proudhon himself gives to the same thought. It takes possession of this thought after the fashion of Criticism and expresses the secret of *Critical socialism* in the following sentence:

“The modern worker thinks only of himself, i.e., he allows himself to be paid only for his own person. It is he himself who fails to take into account the enormous, the immeasurable power which arises from his co-operation with other powers.”

According to Critical Criticism, the whole evil lies only in the workers' “*thinking*”. It is true that the English and French workers have formed associations in which they exchange opinions not only on their immediate needs as *workers*, but on their needs as human beings. In their associations, moreover, they show a very thorough and comprehensive consciousness of the “enormous” and “immeasurable” power which arises from their co-operation. But these *mass-minded*, communist workers, employed, for instance, in the Manchester or Lyons workshops, do not believe that by “*pure thinking*” they will be able to argue away their industrial masters and their own practical debasement. They are most painfully aware of the

difference between being and thinking, between consciousness and life. They know that property, capital, money, wage-labour and the like are no ideal figments of the brain but very practical, very objective products of their self-estrangement and that therefore they must be abolished in a practical, objective way for man to become man not only in *thinking*, in *consciousness*, but in mass *being*, in life. Critical Criticism, on the contrary, teaches them that they cease in reality to be wage-workers if in thinking they abolish the thought of wage-labour; if in thinking they cease to regard themselves as wage-workers and, in accordance with that extravagant notion, no longer let themselves be paid for their person. As absolute idealists, as ethereal beings, they will then naturally be able to live on the ether of pure thought. Critical Criticism teaches them that they abolish real capital by overcoming in *thinking* the category Capital, that they *really* change and transform themselves into real human beings by changing their “*abstract ego*” in consciousness and scorning as an un-Critical operation all real change of their real existence, of the real conditions of their existence, that is to say, of their *real ego*. The “*spirit*”, which sees in reality only categories, naturally reduces all human activity and practice to the dialectical process of thought of Critical Criticism. That is what distinguishes its socialism from *mass-type* socialism and communism.

After his great argumentation, Herr Edgar must, of course, declare Proudhon’s criticism “devoid of consciousness”.

“Proudhon, however, wishes to be practical too.” “He thinks he has grasped.” “And nevertheless,” cries the tranquillity of knowledge triumphantly, “we cannot even now credit him with the tranquillity of knowledge.” “We quote a few passages to show how little he has thought out his attitude to society.”

Later we shall also quote a few passages from the works of Critical Criticism (see the *Bank for the Poor* and the *Model Farm*) to show that it has not yet become acquainted with the most elementary economic relationships, let alone thought them out, and hence with its characteristic Critical tact has felt itself called upon to pass judgment on Proudhon.

Now that Critical Criticism as the tranquillity of knowledge has “*made*” *all the mass-type “antitheses its concern”*, has mastered all reality in the form of categories and dissolved all human activity into speculative dialectics, we shall see it produce the world again out of speculative dialectics. It goes without saying that if the miracles of the Critically

speculative creation of the world are not to be “desecrated”, they can be presented to the profane mass only in the form of *mysteries*. Critical Criticism therefore appears in the incarnation of Vishnu-Szeliga as a *mystery-monger*.

Chapter V. “Critical Criticism” As a Mystery-Monger, Or “Critical Criticism” As Herr Szeliga

“Critical Criticism” in its *Szeliga-Vishnu* incarnation provides an apotheosis of the *Mystères de Paris*. Eugène Sue is proclaimed a “Critical Critic”. Hearing this, he may exclaim like Molière’s *Bourgeois gentilhomme*:

“*Par ma foi, il y a plus de quarante ans que je dis de la prose, sans que j’en susse rien: et je vous suis le plus obligé du monde de m’avoir appris cela.*”

Herr Szeliga prefaces his criticism with an *aesthetic* prologue. “The aesthetic prologue” gives the following explanation of the general meaning of the “Critical” epic and in particular of the *Mystères de Paris*:

“The epic gives rise to the thought that the present in itself is nothing, and not only” (nothing and not only!) “the eternal boundary between past and future, but” (nothing, and not only, but) “but the gap that separates immortality from transience and must continually be filled.... Such is the *general meaning of the Mystères de Paris.*”

The “aesthetic prologue” further asserts that “if the Critic wished he could also be a *poet*”.

The whole of Herr Szeliga’s criticism will prove that assertion. It is “*poetic fiction*” in every respect.

It is also a product of “free art” according to the definition of the latter given in the “aesthetic prologue” — it “*invents something quite new, something that absolutely never existed before*”.

Finally, it is even a *Critical epic*, for it is “the gap that separates immortality” — Herr Szeliga’s Critical Criticism — from “transience” — Eugène Sue’s novel — and “must continually be filled”.

- 1) “The Mystery of Degeneracy in Civilisation” and “The Mystery of Rightlessness in the State”

Feuerbach, we know, conceived the Christian ideas of the Incarnation, the Trinity, Immortality, etc., as the mystery of the Incarnation, the mystery of

the Trinity, the mystery of Immortality. Herr Szeliga conceives all present world conditions as mysteries. But whereas *Feuerbach* disclosed *real mysteries*, Herr *Szeliga* makes *mysteries* out of real *trivialities*. His art is not that of disclosing what is hidden, but of hiding what is disclosed.

Thus he proclaims as *mysteries* degeneracy (criminals) within civilisation and rightlessness and inequality in the state. This means that socialist literature, which has revealed these mysteries, is still a mystery to Herr Szeliga, or that he wants to convert the best-known findings of that literature into a private mystery of “Critical Criticism.”

We therefore need not go more deeply into Herr Szeliga’s discourse on these mysteries; we shall merely draw attention to a few of the most brilliant points.

“Before the law and the judge everything is *equal*, the high and the low, the rich and the poor. This proposition stands at the head of the credo of *the state*.”

Of the state? The credo of most states starts, on the contrary, by making the high and the low, the rich and the poor *unequal* before the *law*.

“The gem-cutter Morel in his naive probity most clearly expresses the mystery” (the mystery of the antithesis of poor and rich) “when he says: If only the rich knew! If only the rich knew! The misfortune is that they do not know what poverty is.”

Herr Szeliga does not know that Eugène Sue commits an *anachronism* out of courtesy to the French bourgeoisie when he puts the motto of the burghers of Louis XIV’s time “*Ah! si le roi le savait!*” in a modified form: “*Ah! si le riche le savait!*” into the mouth of the working man Morel who lived at the time of the *Charte vérité*” In England and France, at least, this *naive* relation between rich and poor has ceased to exist. There the scientific representatives of wealth, the economists, have spread a very detailed understanding of the physical and moral misery of poverty. They have made up for that by proving that misery must remain because the present state of things must remain. In their solicitude they have even calculated the *proportions* in which the poor must be reduced in number by deaths for the good of the rich and for their own welfare.

If Eugene Sue depicts the taverns, hide-outs and language of *criminals*, Herr Szeliga discloses the “*mystery*” that what the “author” wanted was not to depict that language or those hide-outs, but

“to teach us the mystery of the mainsprings of evil, etc.” “It is precisely in the most crowded places ... that criminals feel at *home*.”

What would a natural scientist say if one were to prove to him that the bee’s cell does not interest him as a bee’s cell, that it has no mystery for one who has not studied it, because the bee “feels at home precisely” in the open air and on the flower? The hide-outs of the criminals and their language reflect the character of the criminal, they are part of his existence, their description is part of his description just as the description of the *petite maison* is part of the description of the *femme galante*.

For Parisians in general and even for the Paris police the hide-outs of criminals are such a “mystery” that at this very moment broad light streets are being laid out in the *Cité* to give the police access to them.

Finally, Eugène Sue himself states that in the descriptions mentioned above he was counting “*sur la curiosité, craintive*” of his readers. M. Eugène Sue has counted on the timid curiosity of his readers in all his novels. It is sufficient to recall *Atar Gull*, *Salamandre*, *Plick and Plock*, etc.

2) The Mystery of Speculative Construction

The mystery of the Critical presentation of the *Mystères de Paris* is the mystery of *speculative*, of *Hegelian construction*. Once Herr Szeliga has proclaimed that “degeneracy within civilisation” and rightlessness in the state are “mysteries”, i.e., has dissolved them in the category “*mystery*”, he lets “*mystery*” begin its *speculative career*. A few words will suffice to characterise speculative construction *in general*. Herr Szeliga’s treatment of the *Mystères de Paris* will give the application in *detail*.

If from real apples, pears, strawberries and almonds I form the general idea “*Fruit*”, if I go further and *imagine* that my abstract idea “*Fruit*”, derived from real fruit, is an entity existing outside me, is indeed the true essence of the pear, the apple, etc., then in the *language of speculative philosophy* — I am declaring that “*Fruit*” is the “*Substance*” of the pear, the apple, the almond, etc. I am saying, therefore, that to be a pear is not essential to the pear, that to be an apple is not essential to the apple; that what is essential to these things is not their real existence, perceptible to the senses, but the essence that I have abstracted from them and then foisted on them, the essence of my idea — “*Fruit*”. I therefore declare apples, pears, almonds, etc., to be mere forms of existence, *modi*, of “*Fruit*” My finite

understanding supported by my senses does of course *distinguish* an apple from a pear and a pear from an almond, but my speculative reason declares these sensuous differences inessential and irrelevant. It sees in the apple *the same* as in the pear, and in the pear the same as in the almond, namely “*Fruit*”. Particular real fruits are no more than semblances whose true essence is “*the substance*”— “*Fruit*”.

By this method one attains no particular *wealth of definition*. The mineralogist whose whole science was limited to the statement that all minerals are really “*the Mineral*” would be a mineralogist only in *his imagination*. For every mineral the speculative mineralogist Says “the Mineral”, and his science is reduced to repeating this word as many times as there are real minerals.

Having reduced the different real fruits to the *one* “fruit” of abstraction — “*the Fruit*”, speculation must, in order to attain some semblance of real content, try somehow to find its way back from “*the Fruit*”, from the *Substance* to the *diverse*, ordinary real fruits, the pear, the apple, the almond, etc. It is as hard to produce real fruits from the abstract idea “*the Fruit*” as it is easy to produce this abstract idea from real fruits. Indeed, it is impossible to arrive at the opposite of an abstraction without relinquishing the abstraction.

The speculative philosopher therefore relinquishes the abstraction “*the Fruit*”, but in a *speculative, mystical* fashion — with the appearance of *not* relinquishing it. Thus it is really only in appearance that he rises above his abstraction. He argues somewhat as follows:

If apples, pears, almonds and strawberries are really nothing but “*the Substance*”, “*the Fruit*”, the question arises: Why does “*the Fruit*” manifest itself to me sometimes as an apple, sometimes as a pear, sometimes as an almond? Why this *semblance of diversity* which so obviously contradicts my speculative conception of *Unity*, “*the Substance*”, “*the Fruit*”?

This, answers the speculative philosopher, is because “*the Fruit*” is not dead, undifferentiated, motionless, but a living, self-differentiating, moving essence. The diversity of the ordinary fruits is significant not only for my sensuous understanding, but also for “*the Fruit*” itself and for speculative reason. The different ordinary fruits are different manifestations of the life of the “one Fruit”; they are crystallisations of “*the Fruit*” itself. Thus in the apple “*the Fruit*” gives itself an apple-like existence, in the pear a pear-like

existence. We must therefore no longer say, as one might from the standpoint of the Substance: a pear is “*the Fruit*”, an apple is “*the Fruit*”, an almond is “*the Fruit*”, but rather “*the Fruit*” presents itself as a pear, “*the Fruit*” presents itself as an apple, “*the Fruit*” presents itself as an almond; and the differences which distinguish apples, pears and almonds from one another are the self-differentiations of “*the Fruit*” and, make the particular fruits different members of the life-process of “*the Fruit*”. Thus “*the Fruit*” is no longer an empty undifferentiated unity; it is oneness as *allness*, as “*totality*” of fruits, which constitute an “*organically linked series of members*”. In every member of that series “*the Fruit*” gives itself a more developed, more explicit existence, until finally, as the “*summary*” of all fruits, it is at the same time the living *unity* which contains all those fruits dissolved in itself just as it produces them from within itself, just as, for instance, all the limbs of the body are constantly dissolved in and constantly produced out of the blood.

We see that if the Christian religion knows only *one* Incarnation of God, speculative philosophy has as many incarnations as there are things, just as it has here in every fruit an incarnation of the Substance, of the Absolute Fruit. The main interest for the speculative philosopher is therefore to produce the *existence* of the real ordinary fruits and to say in some mysterious way that there are apples, pears, almonds and raisins. But the apples, pears, almonds and raisins that we rediscover in the speculative world are nothing but *semblances* of apples, *semblances* of pears, *semblances* of almonds and *semblances* of raisins, for they are moments in the life of “*the Fruit*”, this abstract creation of the mind, and therefore themselves abstract *creations of the mind*. Hence what is delightful in this speculation is to rediscover all the real fruits there, but as fruits which have a higher mystical significance, which have grown out of the ether of your brain and not out of the material earth, which are incarnations of “*the Fruit*”, of the *Absolute Subject*. When you return from the abstraction, the *supernatural* creation of the mind, “*the Fruit*”, to real *natural* fruits, you give on the contrary the natural fruits a supernatural significance and transform them into sheer abstractions. Your main interest is then to point out the *unity* of “*the Fruit*” in all the manifestations of its life — the apple, the pear, the almond — that is, to show the *mystical interconnection* between these fruits, how in each one of them “*the Fruit*” realises itself by

degrees and *necessarily* progresses, for instance, from its existence as a raisin to its existence as an almond. Hence the value of the ordinary fruits *no longer* consists in their *natural* qualities, *but* in their *speculative* quality, which gives each of them a definite place in the life-process of “*the Absolute Fruit*”

The ordinary man does not think he is saying anything extraordinary when he states that there are apples and pears. But when the philosopher expresses their existence in the speculative way he says something *extraordinary*. He performs a *miracle* by producing the real *natural objects*, the apple, the pear, etc., out of the unreal *creation of the mind* “*the Fruit*”, i.e., by *creating* those fruits out of his *own abstract reason*, which he considers as an Absolute Subject outside himself, represented here as “*the Fruit*”. And in regard to every object the existence of which he expresses, he accomplishes an act of creation.

It goes without saying that the speculative philosopher accomplishes this continuous creation only by presenting universally known qualities of the apple, the pear, etc., which exist in reality, as determining features *invented* by him, by giving the *names* of the real things to what abstract reason alone can create, to abstract formulas of reason, finally, by declaring his *own* activity, by which *he passes* from the idea of an apple to the idea of a pear, to be the *self-activity* of the Absolute Subject, “*the Fruit*”

In the speculative way of speaking, this operation is called comprehending *Substance as Subject*, as an *inner process*, as an *Absolute Person*, and this comprehension constitutes the essential character of *Hegel's* method.

These preliminary remarks were necessary to make Herr Szeliga intelligible. Only now, after dissolving real relations, e.g., law and civilisation, in the category of mystery and thereby making “*Mystery*”(das Geheimnis) into Substance, does he rise to the true speculative, *Hegelian* height and transforms “*Mystery*” into a self-existing Subject *incarnating* itself in real situations and persons so that the manifestations of its life are countesses, marquises, grisettes, porters, notaries, charlatans, and love intrigues, balls, wooden doors, etc. Having produced the category “*Mystery*” out of the real world, he produces the real world out of this category.

The mysteries of *speculative construction* in Herr Szeliga's presentation will be all the *more visibly* disclosed as he has an indisputable *double* advantage over *Hegel*. On the one hand, Hegel with masterly sophistry is able to present as a process of the imagined creation of the mind itself, of the Absolute Subject, the process by which the philosopher through sensory perception and imagination passes from one subject to another. On the other hand, however, Hegel very often gives a *real* presentation, embracing the *thing* itself, within the *speculative* presentation. This real development *within* the speculative development misleads the reader into considering the speculative development as real and the real as speculative.

With Herr Szeliga both these difficulties vanish. His dialectics have no hypocrisy or dissimulation. He performs his tricks with the most laudable honesty and the most ingenuous straightforwardness. But then he *nowhere* develops any *real content*, so that his speculative construction is free from all disturbing accessories, from all ambiguous disguises, and appeals to the eye in its naked beauty. In Herr Szeliga we also see a brilliant illustration of how speculation on the one hand apparently freely creates its object *a priori* out of itself and, on the other hand, precisely because it wishes to get rid by sophistry of the rational and natural dependence on the *object*, falls into the most irrational and unnatural *bondage* to the object, whose most accidental and most individual attributes it is obliged to construe as absolutely necessary and general.

3) "The Mystery of Educated Society"

After leading us through the lowest strata of society, for example through the criminals' taverns, Eugene Sue transports us to "*haute volée*," to a *ball* in the Quartier Saint-Germain.

This *transition* Herr Szeliga construes as follows:

"*Mystery* tries to evade examination by a ... twist: so far it appeared as the absolutely enigmatic, elusive and negative, in contrast to the true, real and positive; now it withdraws into the latter as its *invisible* content. But by doing so it gives up the unconditional possibility of becoming known."

"*Mystery*" which has so far appeared in contrast to the "true", the "real", the "positive", that is, to law and education, "now withdraws into the latter", that is, into the realm of education. It is certainly a *mystère* for Paris, if not of Paris, that "*haute volée*" is the exclusive realm of education. Herr

Szeliga does not pass from the mysteries of the criminal world to those of aristocratic society; instead, “*Mystery*” becomes the “invisible content” of educated society, its *real essence*. It is “*not a new twist*” of Herr Szeliga’s designed to enable him to proceed to further examination; “*Mystery*” itself takes this “new twist” in order to escape examination.

Before really following Eugene Sue where his heart leads him - to an aristocratic ball, Herr Szeliga resorts to the *hypocritical* twists of speculation which makes *a priori* constructions.

“One can *naturally foresee* what a solid shell ‘*Mystery*’ will *choose* to hide in; *it seems, in fact*, that it is of *insuperable impenetrability* ... that ... *hence it may be expected* that in *general* ... *nevertheless* a new attempt to pick out the kernel is *here indispensable*.”

Enough. Herr Szeliga has gone so far that the

“*metaphysical* subject, *Mystery*, now steps forward, light, self-confident and jaunty”.

In order now to change aristocratic society into a “mystery”, Herr Szeliga gives us a few considerations on “*education*”. He presumes aristocratic society to have all sorts of qualities that no man would look for in it, in order later to find the “mystery” that it does not possess those qualities. Then he presents this discovery as the “mystery” of educated society. Herr Szeliga wonders, for example, whether “*general* reason” (does he mean speculative logic?) constitutes the content of its “*drawing-room talk*”, whether “the *rhythm* and *measure* of love *alone* makes” it a “harmonious whole”, whether “what we call *general education* is the form of the *general, the eternal, the ideal*”, i.e., whether what we call education is a metaphysical illusion. It is not difficult for Herr Szeliga to prophesy *a priori* in answer to his questions:

“It is to be *expected, however* ... that the answer will be in the negative.”

In Eugene Sue’s novel, the transition from the low world to the aristocratic world is a normal transition for a novel. The *disguises* of Rudolph, Prince of Geroldstein, give him entry into the lower strata of society as his title gives him access to the highest circles. On his way to the aristocratic ball he is by no means engrossed in the contrasts of contemporary life; it is the contrasts of his own disguises that he finds *piquant*. He informs his obedient companions how extraordinarily interesting he finds himself in the various situations.

“Je trouve,” he says, “assez de piquant dans ces contrastes: un jour peintre en éventails, m’établant dans un bouge de la rue aux Fèves; ce matin commis marchand offrant un verre de cassis à Madame Pipelet, et ce soir ... un des privilégiés par la grâce de dieu, qui règnent sur ce monde.”

When Critical Criticism is ushered into the ball-room, it sings:

Sense and reason forsake me near,
In the midst of the potentates here!

It pours forth in *dithyrambs* as follows:

“Here magic brings the brilliance of the sun at night, the verdure of spring and the splendour of summer in winter. We immediately feel in a mood to believe in the miracle of the divine presence in the breast of man, especially when beauty and grace uphold the conviction that we are in the immediate proximity of ideals.” (!!!)

Inexperienced, credulous *Critical country parson*! Only your Critical ingenuousness can be raised by an elegant Parisian ball-room “to a mood” in which you believe in “the miracle of the divine presence in the breast of man”, and see in Parisian lionesses “immediate ideals” and angels corporeal!

In his *unctuous* naivety the Critical parson listens to the two “most beautiful among the beautiful”, Clemence d’Harville and Countess Sarah MacGregor. One can guess what he wishes to “*hear*” from them:

“In what way we can be the *blessing* of beloved children and the ‘*fullness* of happiness of a husband’!... “We hark ... we wonder ... we do not trust our ears.”

We secretly feel a malicious pleasure when the listening parson is disappointed. The ladies converse neither about “blessing”, nor “fullness”, nor “general reason”, but about “an infidelity of Madame d’Harville to her husband”.

We get the following naive revelation about one of the ladies, Countess MacGregor:

She was “*enterprising enough* to become *mother to a child as the result* of a secret marriage”.

Unpleasantly affected by the
of the Countess, Herr Szeliga has sharp words for her:

“We find that all the strivings of the Countess are for her personal, selfish advantage.”

Indeed, he expects nothing good from the attainment of her purpose - marriage to the Prince of Geroldstein:

“concerning which we can *by no means* expect that she will avail herself of it for the *happiness* of the Prince of Geroldstein’s *subjects*.”

The puritan ends his admonitory sermon with “profound earnestness”:

“Sarah” (the *enterprising* lady), “*incidentally, is hardly* an exception in this brilliant circle, *although* she is one of its *summits*.”

Incidentally, hardly! Although! And is not the “summit” of a circle an exception?

Here is what we learn about the character of two other ideals, the Marquise d’Harville and the Duchess of Lucenay:

They “‘lack satisfaction of the heart’. They have not found in marriage the object of love, so they seek it outside marriage. In marriage, love has remained a *mystery* for them, and the imperative urge of the heart drives them to unravel this mystery. So they give themselves up to *secret love*. These ‘victims’ of ‘loveless marriage’ are ‘driven against their will to debase love to something external, to a so-called affair, and take the romantic, the *secrecy*, for the internal, the vivifying, the essential element of love’”.

The merit of this dialectical reasoning is to be assessed all the higher as it is of more general application.

He, for example, who is not allowed to *drink* at home and yet feels the need to drink looks for the “object” of drinking “*outside*” the house, and “so” takes to *secret drinking*. Indeed, he will be driven to consider secrecy an essential ingredient of drinking, although he will not debase drink to a mere “external” indifferent thing, any more than those ladies did with love. For, according to Herr Szeliga himself, it is not love, but marriage without love, that they debase to what it really is, to something external, to a so-called affair.

Herr Szeliga goes on to ask: “What is the ‘*mystery*’ of love?”

We have just had the speculative construction that “mystery” is the “*essence*” of this kind of love. How is it that we now come to be looking for the mystery of the mystery, the essence of the essence?

“Not the shady paths in the thickets,” declaims the parson, “not the *natural* semi-obscurity of moonlight night nor the artificial semi-obscurity

of costly curtains and draperies; not the soft and enrapturing notes of the harps and the organs, not the attraction of what is forbidden....”

Curtains and draperies! Soft and enrapturing notes! Even the *organ*! Let the reverend parson stop thinking of *church*! Who would bring an organ to a love tryst?

“All this” (curtains, draperies and organs) “is only the mysterious.”

And is not the mysterious the “mystery” of mysterious love? By no means:

“The mysterious in it is what excites, what intoxicates, what enraptures, the *power of sensuality*.”

In the “soft and *enrapturing*” notes, the parson already had what enraptures. Had he brought turtle soup and champagne to his love tryst instead of curtains and organs, the “*exciting and intoxicating*” would have been present too.

“It is true we do not like to admit,” the reverend gentleman argues, “the power of sensuality; but it has such tremendous power over us only because we cast it out of us and will not recognise it as our own nature, which we should then be in a position to dominate if it tried to assert itself at the expense of reason, of true love and of will-power.”

The parson advises us, after the fashion of speculative theology, to *recognise* sensuality as our *own* nature, in order afterwards to be able to *dominate* it, i.e., to retract recognition of it. True, he wishes to dominate it only when it tries to assert itself at the expense of *Reason* - will-power and love as *opposed* to sensuality are only the will-power and love of *Reason*. The unspeculative Christian also recognises *sensuality* as long as it does not assert itself at the expense of true reason, i.e., of faith, of true love, i.e., of love of God, of true will-power, i.e., of will in Christ.

The parson immediately betrays his real meaning when he continues:

“If then love ceases to be the essential element of marriage and of morality in general, *sensuality* becomes the mystery of love, of morality, of educated society - sensuality both in its *narrow* meaning, in which it is a *trembling in the nerves* and a *burning stream* in the veins, and in the broader meaning, in which it is elevated to a *semblance* of spiritual power, to lust for power, ambition, craving for glory.... Countess MacGregor represents” the latter meaning “of sensuality as the mystery of educated society.”

The parson hits the nail on the head. To overcome *sensuality* he must first of all overcome the *nerve currents* and the quick *circulation of the blood*.- Herr Szeliga believes in the “narrow” meaning that greater warmth in the body comes from the heat of the blood in the veins; he does not know that *warm-blooded animals* are so called because the temperature of their blood, apart from slight modifications, always remains at a constant level.- As soon as there is no more nerve current and the blood in the veins is no longer hot, the *sinful body*, this seat of sensual lust, becomes a *corpse* and the souls can converse unhindered about “general reason”, “true love”, and “pure morals”. The parson debases sensuality to such an extent that he abolishes the very elements of sensual love which inspire it - the rapid circulation of the blood, which proves that man does not love by insensitive phlegm; the nerve currents which connect the organ that is the main seat of sensuality with the brain. He reduces true sensual love to the *mechanical secretio seminis* and lisps with a notorious German theologian:

“Not for the sake of sensual love, not for the lust of the flesh, but because the Lord said: Increase and multiply.”

Let us now compare the speculative construction with Eugene Sue’s novel. It is not *sensuality* which is presented as the secret of love, but mysteries, adventures, obstacles, fears, dangers, and especially the attraction of what is forbidden.

“Pourquoi,” says Eugene Sue, “beaucoup de femmes prennent-elles pourtant des hommes qui ne valent pas leurs maris? Parce que le plus grand charme de l’amour est l’attrait affriandant du fruit défendu ... avancez que, en retranchant de cet amour les craintes, les angoisses, les difficultés, les mystères, les dangers, il ne reste rien ou peu de chose, c’est-à-dire, l’amant ... dans sa simplicité première ... en un mot, ce serait toujours plus ou moins l’aventure de cet homme à qui l’on disait: ‘Pourquoi n’épousez-vous donc pas cette veuve, votre maîtresse?’ - ‘Hélas, j’y ai bien pensé’ - répondit-il’ - ‘mais alors je ne saurais plus où aller passer mes soirées.’”

Whereas Herr Szeliga says explicitly that the mystery of love is not in the *attraction of what is forbidden*, Eugene Sue says just as explicitly that it is the “greatest charm of love” and the reason for all love adventures *extra muros*.

“Prohibition and smuggling are as inseparable in love as in trade.”

Eugene Sue similarly maintains, contrary to his speculative commentator, that

“the propensity to pretence and craft, the liking for mysteries and intrigues, is an essential quality, a natural propensity and an imperative instinct of woman’s nature”.

The only thing which embarrasses Eugene Sue is that this propensity and this liking are directed against *marriage*. He would like to give the instincts of woman’s nature a more harmless, more useful application.

Herr Szeliga makes Countess MacGregor a representative of the kind of *sensuality* which “is elevated to a semblance of spiritual power”, but in Eugene Sue she is a *person of abstract reason*. Her “ambition” and her “pride”, far from being forms of sensuality, are born of an abstract reason which is completely independent of sensuality. That is why Eugene Sue explicitly notes that

“the fiery impulses of love could never make her icy breast heave; no surprise of the heart or the senses could upset the pitiless calculations of this crafty, selfish, ambitious woman”.

This woman’s essential character lies in the egoism of abstract reason that never suffers from the sympathetic senses and on which the blood has no influence. Her soul is therefore described as “dry and hard”, her mind as “artfully wicked”, her character as “treacherous” and - what is very typical of a person of abstract reason - as “absolute”, her dissimulation as “profound”.- It is to be noted incidentally that Eugene Sue motivates the career of the Countess just as stupidly as that of most of his characters. An old nurse gives her the idea that she must become a “crowned head”. Convinced of this, she undertakes journeys to capture a crown through marriage. Finally she commits the inconsistency of considering a petty German “*Serenissimus*” as a “crowned head”.

After his outpourings against *sensuality*, our Critical saint deems it necessary to show why Eugene Sue introduces us to *haute volee* at a ball, a method which is used by nearly all French novelists, whereas the *English* do so more often at the chase or in a country mansion.

“For this” (i.e., Herr Szeliga’s) “conception it cannot be indifferent there” (in Herr Szeliga’s construction) “and merely accidental that Eugene Sue introduces us to high society at a ball.”

Now the horse has been given a free rein and it trots briskly towards the necessary end through a series of conclusions reminding one of the late Wolff.

“*Dancing* is the most common manifestation of *sensuality as a mystery*. The immediate *contact*, the embracing of the two sexes” (?) “necessary to form a couple are allowed in dancing because, in spite of appearances, and the really” (really, Mr. Parson?) “perceptible pleasant sensation, it is not considered as *sensual* contact and embracing” (but probably as connected with universal reason?).

And then comes a closing sentence which at best staggers rather than dances:

“For if it were in actual fact considered as such it would be impossible to understand why society is so lenient only as regards dancing while it, on the contrary, so severely condemns that which, if exhibited with similar freedom elsewhere, incurs branding and merciless casting out as a most unpardonable offence against morals and modesty.”

The reverend parson speaks here neither of the *cancan* nor of the *polka*, but of *dancing* in general, of the *category* Dancing, which is not performed anywhere except in his Critical cranium. Let him see a dance at the Chaumiere in Paris, and his Christian-German soul would be outraged by the boldness, the frankness, the graceful petulance and the music of that most sensual movement. His own “really perceptible pleasant sensation” would make it “perceptible” to him that “in actual fact it would be impossible to understand why the dancers themselves, while on the contrary they” give the spectator the uplifting impression of frank human sensuality - “which, if exhibited in the same way elsewhere” - namely in Germany - “would be severely condemned as an unpardonable offence”, etc., etc.- why those dancers, at least so to speak in their own eyes, not only should not and may not, but of necessity cannot and must not be frankly sensual human beings!!

The Critic introduces us to the *ball* for the sake of the *essence of dancing*. He encounters a great difficulty. True, there is dancing at this ball, but only in imagination. The fact is that Eugene Sue does not say a word describing the dancing. He does not mix among the throng of dancers. He makes use of the ball only as an opportunity for bringing together his characters from the upper aristocracy. In despair, “Criticism” comes to help out and *supplement* the author, and its own “fancy” easily provides a description of ball incidents, etc. If, as prescribed by Criticism, Eugene Sue was not directly interested in the criminals’ hide-outs and language when he

described them, the dance, on the other hand, which *not he* but his “fanciful” Critic describes, necessarily interests him infinitely.

Let us continue.

“*Actually*, the secret of sociable tone and tact - the secret of that extremely unnatural thing - is the longing to return to nature. That is why the appearance of a person like *Cecily* in educated society has such an electrifying effect and is crowned with such extraordinary success. She grew up a slave among slaves, without any education, and the only source of life she has to rely upon is her -nature. Suddenly transported to a court and subjected to its constraint and customs, she soon learns to see through the secret of the latter.... In this sphere, which she can undoubtedly hold in sway because her power, the power of her nature, has an enigmatic magic, *Cecily* must necessarily stray into losing all sense of measure, whereas formerly, when she was still a slave, the same nature taught her to resist any unworthy demand of the powerful master and to remain true to her love. *Cecily is the mystery of educated society disclosed*. The scorned senses finally break down the barriers and surge forth completely uncurbed”, etc.

Those of Herr Szeliga’s readers who have not read Sue’s novel will certainly think that *Cecily* is the lioness of the ball that is described. In the novel she is in a German gaol while the dancing goes on in Paris.

Cecily, as a slave, remains true to the Negro doctor David because she loves him “passionately” and because her owner, Mr. Willis, is “*brutal*” in courting her. The reason for her change to a dissolute life is a very simple one. Transported into the “European world”, she “blushes” at being “married to a Negro”. On arriving in Germany she is “*at once*” seduced by a wicked man and her “Indian blood” comes into its own. This the hypocritical M. Sue, for the sake of *douce morale* and *doux commerce*, is bound to describe as “*perversité naturelle*”.

The secret of *Cecily* is that she is a *half-breed*. The secret of her sensuality is the *heat of the tropics*. Parny sang praises of the half-breed in his beautiful lines to Eleonore. Over a hundred sea-faring tales tell us how dangerous she is to sailors.

“*Cecily* était le type incarné de la sensualité brûlante, qui ne s’allume qu’au feu des tropiques.... Tout le monde a entendu parler de ces filles de couleur, pour ainsi dire mortelles aux Européens, de ces vampires enchanteurs, qui, enivrant leurs victimes de séductions terribles ... ne lui

laissent, selon l'énergique expression du pays, que ses larmes à boire, que son coeur à ronger."

Cecily was far from producing such a magical effect precisely on people aristocratically educated, blasé...

"les femmes de l'espèce de Cecily exercent une action soudaine, une omnipotence magique sur les hommes de sensualité brutale tels que Jacques Ferrand".

Since when have men like Jacques Ferrand been representative of fine society? But Critical Criticism must speculatively make *Cecily* a factor in the life-process of Absolute Mystery.

4) "The Mystery of Probité and Piety"

"*Mystery, as that* of educated society, withdraws, *it is true*, from the *antithesis* into the *inner* sphere. Nevertheless, high society *once again* has exclusively *its own* circles in which it preserves the holy. It is, *as it were*, the chapel for this holy of holies. But for people in the forecourt, the chapel itself is the *mystery*. Education, *therefore*, in its exclusive position is the same thing for the people ... as vulgarity is for the educated."

It is true, nevertheless, once again, as it arere, but, therefore - those are the magic hooks which hold together the links of the chain of *speculative reasoning*. Herr Szeliga has made *Mystery* withdraw from the world of criminals into high society. Now he has to construct the mystery that high society has its *exclusive* circles and that the mysteries of those circles are mysteries for the people. Besides the magic hooks already mentioned, this construction requires the transformation of a *circle* into a *chapel* and the transformation of non-aristocratic society into a *forecourt* of that chapel. Again it is a mystery *for* Paris that all the spheres of bourgeois society are only a forecourt of the chapel of high society.

Herr Szeliga pursues two aims. Firstly, *Mystery* which has become incarnate in the exclusive circle of high society must be declared "*common property of the world*". Secondly, the *notary Jacques Ferrand* must be construed as a link in the life of Mystery. Here is the way Herr Szeliga reasons:

"Education as yet is unable and unwilling to bring all estates and distinctions into its circle. Only *Christianity and morality* are able to found universal kingdoms on earth."

Herr Szeliga identifies education, civilisation, with *aristocratic* education. That is why he cannot see that *industry and trade* found universal kingdoms quite different from Christianity and morality, domestic happiness and civic welfare. But how do we come to the *notary Jacques Ferrand*? Quite simply!

Herr Szeliga transforms *Christianity* into an *individual* quality, “*piety*”, and *morality* into another *individual* quality, “*probity*”. He combines these two qualities in one individual whom he christens *Jacques Ferrand*, because Jacques Ferrand does not possess these two qualities but only pretends to. Thus Jacques Ferrand becomes the “mystery of probity and piety”. His “testament”, on the other hand, is “the mystery of *seeming* piety and probity”, and therefore no longer of piety and probity themselves. If Critical Criticism had wanted speculatively to construe this testament as a mystery, it should have declared the seeming probity and piety to be the mystery of this testament, and not the other way round, this testament as the mystery of the seeming probity.

Whereas the Paris college of notaries considered Jacques Ferrand as a malicious libel against itself and through the theatrical censorship had this character removed from the stage performance of the *Mysteres de Paris*, Critical Criticism, at the very time when it “*polemises against the airy kingdom of conceptions*”, sees in a Paris notary not a Paris notary but religion and morality, probity and piety. The trial of the notary *Lehon* ought to have taught it better. The position held by the *notary* in Eugene Sue’s novel is closely connected with his official position.

“Les notaires sont au temporel ce qu’au spirituel sont les curés; ils sont les dépositaires de nos secrets” (Monteil, *Hist des frangais des div états*,” etc. t. ix,).

The notary is the secular confessor. He is a puritan by profession, and “honesty”, Shakespeare says, is “no Puritan”. He is at the same time the go-between for all possible purposes, the manager of all civil intrigues and plots.

With the notary Ferrand, whose whole mystery consists in his hypocrisy and his profession, we do not seem to have made a single step forward yet. But listen:

“If for the notary hypocrisy is a matter of the most complete consciousness, and for Madame Roland it is, *as it were*, instinct, then

between them there is the great mass of those who cannot get to the bottom of the mystery and yet involuntarily feel a desire to do so. It is therefore not superstition that leads the high and the low to the sombre dwelling of the charlatan Bradamanti (Abbe Polidori); no, it is the search for *Mystery*, to justify themselves to the world.”

“The high and the low” flock to Polidori not to find out a definite mystery which is justified to the whole world, but to look for *Mystery* in general, Mystery as the Absolute Subject, *in order to* justify themselves to the world; as if to chop wood one looked, not for an axe, but for the Instrument *in abstracto*.

All the mysteries that Polidori possesses are limited to a means for abortion and a poison for murder.- In a speculative frenzy Herr Szeliga makes the “murderer” resort to Polidori’s poison “because he wants to be not a murderer, but respected, loved and honoured”. As if in an act of murder it was a question of respect, love or honour and not of one’s *neck*! But the Critical murderer does not bother about his neck, but only about “*Mystery*”.- As not everyone commits murder or becomes pregnant illegitimately, how is Polidori to put *everyone* in the desired possession of Mystery? Herr Szeliga probably confuses the charlatan Polidori with the scholar *Polydore Virgil* who lived in the sixteenth century and who, although he did not discover any mysteries, tried to make the history of those who did, the *inventors*, the “common property of the world” (see *Polidori Virgilii liber de rerum inventoribus*, Lugduni MDCCVI).

Mystery, Absolute Mystery, as it has finally established itself as the “common property of the world”, consists therefore in the mystery of abortion and poisoning. *Mystery* could not make itself “the common property of the world” more skilfully than by turning itself into mysteries which are mysteries to no one.

5) “Mystery, a Mockery”

“Mystery has now become common property, the mystery of the whole world and of every individual. Either it is my art or my instinct, or I can buy it as a purchasable commodity.”

What mystery has now become the common property of the world? Is it the mystery of rightlessness in the state, or the mystery of educated society, or the mystery of adulterating wares, or the mystery of making eau-de-

cologne, or the mystery of “Critical Criticism”? None of all these, but *Mystery in abstracto*, the category Mystery!

Herr Szeliga intends to depict the servants and the *porter Pipelet and his wife* as the incarnation of Absolute Mystery. He wants speculatively to construct the *servant* and the *porter* of “Mystery”. How does he manage to make the headlong descent from *pure category* down to the “*servant*” who “*spies at a locked door*”, from *Mystery as the Absolute Subject*, which is enthroned above the *roof* in the cloudy heavens of abstraction, down to the ground floor where the *porter’s lodge* is situated?

First he subjects the category Mystery to a speculative process. When by the aid of means for abortion and poisoning Mystery has become the common property of the world, it is

“*therefore by no means any longer concealment and inaccessibility itself, but it conceals itself, or better still*” (always better!) “*I conceal it, I make it inaccessible*”.

With this transformation of Absolute Mystery from *essence* into *concept*, from the *objective* stage, in which it is concealment itself, into the *subjective* stage, in which it conceals itself, or better still, in which I conceal it, we have not made a single step forward. On the contrary, the difficulty seems to grow, for a mystery in man’s head or breast is more inaccessible and concealed than at the bottom of the sea. That is why Herr Szeliga comes to the aid of his *speculative* progress *directly* by means of an *empirical* progress.

“It is *behind locked doors*” - hark! hark! - “that *henceforth*” - henceforth! - “Mystery, is hatched, brewed and perpetrated.”

Herr Szeliga has “*henceforth*” changed the speculative *ego* of Mystery into a very empirical, very *wooden* reality - a *door*.

“*But with that*” - i.e., with the locked door, not with the transition from the closed essence to the concept - “there exists *also the possibility* of my overhearing, eavesdropping, and spying on it.”

It is not *Herr Szeliga* who discovered the “mystery” that one can eavesdrop at locked doors. The mass-type proverb even says that walls have ears. On the other hand it is a quite Critical speculative mystery that only “*henceforth*”, after the descent into the hell of the criminals’ hide-outs and the ascent into the heaven of educated society, and after Polidori’s miracles, mysteries can be brewed behind locked doors and overheard *through* closed

doors. It is just as great a Critical mystery that locked doors are a categorical necessity for hatching, brewing and perpetrating mysteries - how many mysteries are hatched, brewed, and perpetrated behind bushes! - as well as for spying them out.

After this brilliant dialectical feat of arms, Herr Szeliga naturally goes on from *spying* itself to the *reasons for spying*. Here he reveals the mystery that *malicious gloating* is the reason for it. From malicious gloating he goes on to the *reason for malicious gloating*.

“Everyone wishes to be better than the others,” he says, “because he keeps secret the mainsprings not only of his good actions, but of his bad ones too, which he tries to hide in impenetrable darkness.”

The sentence should be the other way round: Everyone not only keeps the mainsprings of his good actions secret, but tries to conceal his bad ones in impenetrable darkness because he wishes to be better than the others.

Thus it seems we have gone from *Mystery that conceals itself* to the *ego* that conceals it, from the *ego* to the *locked door*, from the *locked door* to *spying*, from *spying* to the *reason for spying*, malicious gloating; from *malicious gloating* to the *reason for malicious gloating*, the *desire to be better than the others*. We shall soon have the pleasure of seeing the *servant* standing at the locked door. For the general desire to be better than the others leads us directly to this: that “everyone is inclined to find out the mysteries of another”, and this is followed easily by the witty remark:

“In this respect *servants* have the *best opportunity*.”

Had Herr Szeliga read the records from the Paris police archives, Vidocq’s memoirs, the *Livre noir* and the like, he would know that in this respect the *police* has still greater opportunity than the “best opportunity” that servants have; that it uses servants only for crude jobs, that it does not stop at the door or where the masters are in *neglige*, but creeps under their sheets next to their naked body in the shape of a femme galante or even of a legitimate wife. In Sue’s novel the police spy “*Bras rouge*” plays a leading part in the story.

What “henceforth” annoys Herr Szeliga in servants is that they are not “*disinterested*” enough. This Critical misgiving leads him to the *porter Pipelet and his wife*.

“The porter’s position, on the other hand, gives him relative independence so that he can pour out free, disinterested, although vulgar

and injurious, mockery on the mysteries of the house.”

At first this speculative construction of the porter is put into a great difficulty because in many Paris houses the servant and the porter are one and the same person for some of the tenants.

The following facts will enable the reader to form an opinion of the Critical fantasy concerning the relatively independent, disinterested position of the porter. The porter in Paris is the representative and spy of the landlord. He is generally paid not by the landlord but by the tenants. Because of that precarious position he often combines the functions of commission agent with his official duties. During the Terror, the Empire and the Restoration, the porter was one of the main agents of the secret police. General Foy, for instance, was watched by his porter, who took all the letters addressed to the general to be read by a police agent not far away (see Froment, *La police dévoilée*). As a result “*portier*” and “*épiciier*” are considered insulting names and the porter prefers to be called “*concierge*”.

Far from being depicted as “disinterested” and harmless, Eugene Sue’s Madame Pipelet immediately cheats Rudolph when giving him his change; she recommends to him the dishonest money-lender living in the house and describes Rigolette to him as an acquaintance who may be pleasant to him. She teases the major because he pays her badly and haggles with her - in her vexation she calls him a “*commandant de deux liards*” - “*ca t’apprendra à ne donner que douze francs par mois pour ton ménage.*” - and because he has the “*petitesse*” as to keep a check on his firewood, etc. She herself gives the reason for her “independent” behaviour: the major only pays her twelve francs a month.

According to Herr Szeliga, “Anastasia Pipelet has, *to some extent*, to declare a small war on *Mystery*”.

According to Eugene Sue, Anastasia Pipelet is a typical *Paris Portière*. He wants “to dramatise the *Portière*, whom Henri Monier portrayed with such mastery”. But Herr Szeliga feels bound to transform one of Madame Pipelet’s qualities - “*médisance*” - into a separate being and then to make her a representative of that being.

“The husband,” Herr Szeliga continues, “the porter Alfred Pipelet, helps her, but with less luck.”

To console him for this bad luck, Herr Szeliga makes him also into an *allegory*. He represents the “*objective*” side of *Mystery*, “*Mystery as Mockery*”.

“The mystery which defeats him is a mockery, a joke, that is played on him.”

Indeed, in its infinite pity divine dialectic makes the “unhappy, old, childish man” a “*strong man*” in the *metaphysical sense*, by making him represent a very worthy, very happy and very decisive factor in the life-process of Absolute Mystery. The victory over Pipelet is

“*Mystery’s most decisive defeat.*” “A cleverer, courageous man would not let himself be duped by a *joke.*”

6) Turtle-Dove (Rigolette)

“There is still one step left. Through *its own consistent development*, Mystery, as we saw in Pipelet and Cabrion, is driven to debase itself to mere clowning. The *one* thing necessary now is that the individual should no longer agree to play that silly comedy. *Turtle-dove* takes that step in the most nonchalant way in the world.”

Anyone in two minutes can see through the mystery of this speculative clowning and learn to practise it himself. We will give brief directions in this respect.

Problem. You must give me the speculative construction showing how man becomes master over animals.

Speculative solution. Given are half a dozen animals, such as the lion, the shark, the snake, the bull, the horse and the pug. From these six animals abstract the category: *the* “Animal”. Imagine *the* “Animal” to be an independent being. Regard the lion, the shark, the snake, etc., as disguises, incarnations, of *the* “Animal”. Just as you made your imagination, the “Animal” of your abstraction, into a real being, now make the real animals into beings of abstraction, of your imagination. You see that the “Animal”, which in the *lion* tears man to pieces, in the *shark* swallows him up, in the *snake* stings him with venom, in the *bull* tosses him with its horns and in the *horse* kicks him, only barks at him when it presents itself as a *pug*, and converts the fight against man into the mere *semblance of a fight*. Through *its own consistent development*, the “Animal” is driven, as we have seen in the *pug*, to debase itself to a *mere clown*. When a child or a childish man runs away from a pug, the only thing is for the individual no longer to agree to play the silly comedy. The individual X takes this step in the most nonchalant way in the world by using his bamboo cane on the pug. You see

how “Man”, through the agency of the individual X and the pug, has become master over the “Animal”, and consequently over animals, and in the *Animal as a pug* has defeated the *lion as an animal*.

Similarly Herr Szeliga’s “turtle-dove” defeats the mysteries of the present state of the world through the intermediary of Pipelet and Cabrion. More than that! She is herself a manifestation of the category “*Mystery*”.

“She herself is not yet conscious of her high moral value, therefore she is still a mystery to herself.”

The mystery of *non-speculative* Rigolette is revealed in Eugene Sue’s book by Murph. She is “*une fort jolie grisette*”. Eugene Sue described in her the lovely human character of the Paris *grisette*. Only owing to his devotion to the bourgeoisie and his own tendency to high-flown exaggeration, he had to idealise the *grisette morally*. He had to gloss over the essential point of her situation in life and her character, to be precise, her disregard for the form of marriage, her naive attachment to the Etudiant or the Ouvrier. It is precisely in that attachment that she constitutes a really human contrast to the hypocritical, narrow-hearted, self-seeking wife of the bourgeois, to the whole circle of the bourgeoisie, that is, to the official circle.

7) The World System of the Mysteries of Paris

“This world of mysteries is now the general world system, in which the individual action of the *Mysteries of Paris* is set.”

Before, “however”, Herr Szeliga “passes on to the *philosophical reproduction* of the epic event”, he must “assemble in a general picture the sketches previously jotted down separately”.

It must be considered as a real confession, a revelation of Herr Szeliga’s Critical Mystery, when he says that he wishes to pass on to the “philosophical reproduction” of the epic event. He has so far been “philosophically reproducing” the world system.

Herr Szeliga continues his confession:

“From our presentation it appears that the individual mysteries dealt with have not their value in themselves, each separate from the others, and are in no way magnificent novelties for gossip, but that their value consists in their constituting an *organically linked sequence*, the *totality* of which is “*Mystery*”.

In his mood of sincerity, Herr Szeliga goes still further. He admits that the “*speculative sequence*” is not the *real* sequence of the *Mysteres de Paris*.

“Granted, the mysteries do not appear in our epic in the relationship of this *self-knowing sequence*” (to cost prices?). “But we are not dealing with the *logical*, obvious, *free organism* of criticism, but with a *mysterious vegetable existence*.”

We shall pass over Herr Szeliga’s summary and go on immediately to the point that constitutes the “transition”. In Pipelet we saw the “self-mockery of Mystery”.

“In self-mockery, Mystery passes judgment on itself. *Thereby* the mysteries, annihilating themselves in their final consequence, challenge every strong character to independent examination.”

Rudolph, Prince of Geroldstein, the *man of “pure Criticism”*, is destined to carry out this examination and the “*disclosure of the mysteries*.”

If we deal with Rudolph and his deeds only later, after diverting our attention from Herr Szeliga for some time, it can already be foreseen, and to a certain degree the reader can sense, indeed even surmise without presumption, that instead of treating him as a “*mysterious vegetable existence*”, which he is in the *Critical Literatur-Zeitung*, we shall make him a “*logical*, obvious, *free link*” in the “organism of Critical Criticism.”

Chapter VI. Absolute Critical Criticism, Or Critical Criticism As Herr Bruno

1) Absolute Criticism's First Campaign

a) "Spirit" and "Mass"

So far Critical Criticism has seemed to deal more or less with the Critical treatment of various mass-type objects. We now find it dealing with the absolutely Critical object, *with itself*. So far it has derived its relative glory from Critical debasement, rejection and transformation of *definite* mass-type objects and persons. It now derives its *absolute* glory from the Critical debasement, rejection and transformation of the Mass in general. Relative Criticism was faced with relative limits. Absolute Criticism is faced with an absolute limit, the limit of the Mass, the Mass as limit. Relative Criticism in its opposition to definite limits was itself necessarily a *limited* individual. Absolute Criticism, in its opposition to the *general* limit, to limit in general, is necessarily an *absolute* individual. As the various mass-type objects and persons have merged in the *impure* pulp of the "Mass", so has still seemingly objective and personal Criticism changed into "*pure Criticism*". So far Criticism has appeared to be more or less a quality of the Critical individuals: Reichardt, Edgar, Faucher, etc. Now it is the *Subject* and Herr Bruno is its incarnation.

So far *mass character* has seemed to be more or less the quality of the objects and persons criticised; now objects and persons have become the "Mass", and the "Mass" has become object and person. All previous Critical attitudes have been dissolved in the attitude of absolute Critical wisdom to absolute mass-type stupidity. This *basic attitude* appears as the *meaning*, the *tendency* and the *keyword* of Criticism's previous deeds and struggles.

In accordance with its absolute character, "pure" Criticism, as soon as it appears, will pronounce the differentiating "*cue*"; nevertheless, as Absolute Spirit it must go through a dialectical process. Only at the end of its heavenly motion will its original concept be truly realised (see Hegel, *Enzyklopädie*).

“But a few months ago,” Absolute Criticism announces, “the Mass believed itself to be of gigantic strength and destined to world mastery within a time that it could count on its fingers.”

It was Herr *Bruno Bauer*, in *Die gute Sache der Freiheit* (his “own” cause, of course), in *Die Judenfrage*, etc., who counted on his fingers the time until the approaching world mastery, although he admitted he could not give the exact date. To the record of the sins of the Mass he adds the mass of his own sins.

“The Mass thought itself in possession of so many truths which seemed obvious to it.” “But one *possesses a truth* completely only ... when one follows it through *its* proofs.”

For Herr Bauer, as for Hegel, truth is an *automaton* that proves itself. Man must *follow* it. As in Hegel, the result of real development is nothing but the *truth proven*, — i.e., brought to *consciousness*. Absolute Criticism may therefore ask with the most’ narrow-minded theologian:

“*What* would be the purpose of *history* if it; task were not precisely to *prove* these simplest of all truths (such as the movement of the earth round the sun)?”

Just as, according to the earlier teleologists, plants exist to be eaten by animals, and animals to be eaten by men, history exists in order to serve as the act of consumption of theoretical eating — *proving*. Man exists so that history may exist, and history exists so that the *proof of truths* exists. In this *Critically* trivialised form is repeated the speculative wisdom that man exists, and history exists, so that *truth* may arrive at *self-consciousness*.

That is why *history*, like *truth*, becomes a person apart, a metaphysical subject of which the real human individuals are merely the bearers. That is why Absolute Criticism uses phrases like these:

“*History* does not allow itself to be mocked at ... *History* has exerted *its* greatest efforts to ... *History* has been engaged ... what would be the purpose of *History*?... *History* provides the explicit proof ... *History* puts forward truths,” etc.

If, as Absolute Criticism asserts, history has so far been occupied with only a *few* such truths — the simplest of all — which in the end are self-evident, this inadequacy to which Absolute Criticism reduces previous human experiences proves first of all only its own inadequacy. From the un-Critical standpoint the result of history is, on the contrary, that the most

complicated truth, the quintessence of all truth, man, is self-evident in the end.

“But truths,” Absolute Criticism continues to argue, “which *seem* to the mass to be so crystal-clear that they are self-evident *from the start* ... and that the mass regards proof of them as superfluous, are not worth history supplying explicit proof of them; they are in general no part of the problem which history is engaged in solving.”

In its holy zeal against the mass, Absolute Criticism pays it the finest compliment. If a truth is *crystal-clear* because it *seems* crystal-clear to the mass; if history’s *attitude* to truths *depends* on the *opinion* of the mass, then the verdict of the mass is absolute, infallible, the *law* of history, and history proves only what does not seem crystal-clear to the mass, and therefore needs proof. It is the mass, then, that prescribes history’s “task” and “occupation”.

Absolute Criticism speaks of “truths which are self-evident *from the start*. In its Critical naivety it invents an absolute “*from the start*” and an abstract, immutable “*mass*”. There is just as little difference, in the eyes of Absolute Criticism, between the “from the start” of the sixteenth-century mass and the “from the start” of the nineteenth-century mass as there is between those masses themselves. It is precisely the characteristic feature of a truth which has become true and obvious and is self-evident that it is “self-evident *from the start*”. Absolute Criticism’s polemic against truths which are self-evident from the start is a polemic against truths which are “self-evident” in general.

A truth which is self-evident has lost its savour, its meaning, its value for Absolute Criticism as it has for divine *dialectic*. It has become flat, like stale water. On the one hand, therefore, Absolute Criticism proves everything which is self-evident and, in addition, many things which have the luck to be incomprehensible and therefore will never be self-evident. On the other hand, it considers as self-evident everything which needs some elaboration. Why? Because it is *self-evident* that *real problems* are not self-evident.

Since, *the* “Truth”, like history, is an ethereal subject separate from the material mass, it addresses itself not to the empirical man but to the “*innermost depths of the soul*”; in order to be “*truly apprehended*” it does not act on his *vulgar body*, which may live deep down in an English cellar

or at the top of a French block of flats; it “stretches” “from end to end” through his idealistic intestines. Absolute Criticism does certify that “the mass” has so far in its own way, i.e., superficially, been affected by the truths that history has been so gracious as to “put forward”; but at the same time it prophesies that

“the *attitude* of the *mass* to *historical progress* will “*completely change*”.

It will not be long before the mysterious meaning of this Critical prophecy becomes “crystal-clear” to us.

“All great actions of previous history,” we are told, “were failures *from the start* and had no effective success because the mass became *interested* in and *enthusiastic* over them — or, they were bound to come to a pitiful end because the idea underlying them was such that it had to be content with a superficial comprehension and therefore to rely on the approval of the mass.”

It seems that the comprehension which suffices for, and therefore corresponds to, an idea ceases to be superficial. It is only for appearance’s *sake* that Herr Bruno brings out a *relation* between an *idea* and its *comprehension*, just as it is only for *appearance’s sake* that he brings out a *relation* between unsuccessful historical action and the *mass*. If, therefore, Absolute Criticism condemns something as “superficial”, it is simply previous history, the actions and ideas of which were those of the “masses”. It rejects *mass-type* — history to replace it by *Critical* history (see Herr Jules Faucher on English problems of the day). According to previous *un-Critical* history, i.e., history not conceived in the sense of Absolute Criticism, it must further be precisely distinguished to what extent the *mass* was “*interested*” in aims and to what extent it was “*enthusiastic*” over them.. The “*idea*” always disgraced itself insofar as it differed from the “*interest*”. On the other hand, it is easy to understand that every mass-type “*interest*” that asserts itself historically goes far beyond its real limits in the “*idea*” or “*imagination*” when it-first comes on the scene and is confused with *human* interest in general. This *illusion* constitutes what *Fourier* calls the *tone* of each historical epoch. The *interest* of the bourgeoisie in the 1789 Revolution, far from having been a “*failure*”, “*won*” everything and had “*most effective success*”, however much its “*pathos*” has evaporated and the “*enthusiastic*” flowers with which that Interest adorned its cradle have faded. That interest was so powerful that it was victorious over the pen of

Marat, the guillotine of the Terror and the sword of Napoleon as well as the crucifix and the blue blood of the Bourbons. The Revolution was a “failure” only for the mass which did not have in the *political* “idea” the idea of its real “*interest*”, i.e., whose true life-principle did not coincide with the life-principle of the Revolution, the mass whose real conditions for emancipation were essentially different from the conditions within which the bourgeoisie could emancipate itself and society. If the Revolution, which can exemplify all great historical “actions”, was a failure, it was so because the mass within whose living conditions it essentially came to a stop, was an *exclusive, limited* mass, not an all-embracing one. If the Revolution was a failure it was not because the mass was “*enthusiastic*” over it and “*interested*” in it, but because the most numerous part of the mass, the part distinct from the bourgeoisie, did not have its *real* interest in the principle of the Revolution, did not have a revolutionary principle of its own, but *only* an “*idea*”, and hence only an object of momentary enthusiasm and only seeming *uplift*.

Together with the thoroughness of the historical action, the size of the mass whose action it is will therefore increase. In Critical history, according to which in historical actions it is not a matter of the acting masses, of empirical action, or of the empirical interest of this action, but instead is only “a matter of an *idea in them*”, things must naturally take a different course.

“*In the mass,*” Criticism teaches us, “*not somewhere else, as its former liberal spokesmen believed, is the enemy of the spirit to be found.*”

The enemies of progress *outside* the mass are precisely those *products* of *self-debasement, self-rejection* and *self-alienation* of the *mass* which have been endowed with independent being and a life of their *own*. The mass therefore turns against its *own* deficiency when it turns against the independently existing *products* of its *self-debasement*, just as man, turning against the existence of God, turns against his *own religiosity*. But as those *practical* self-alienations of the mass exist in the real world in an outward way, the mass must fight them in an *outward* way. It must by no means hold these products of its self-alienation for mere *ideal* fantasies, mere *alienations of self-consciousness*, and must not wish to abolish material estrangement by purely *inward spiritual* action. As early as 1789 Loustalot’s journal bore the motto:

*The great appear great in our eyes
Only because we kneel
Let us rise!*

But to rise it is not enough to do so in *thought* and to leave hanging over one's *real sensuously perceptible* head the *real sensuously perceptible* yoke that cannot be subtilised away with ideas. Yet *Absolute Criticism* has learnt from Hegel's *Phänomenologie* at least *the* art of converting *real objective* chains that exist *outside me* into *merely ideal*, *merely subjective* chains, existing *merely in me* and thus of converting all external sensuously perceptible struggles into pure struggles of thought.

This Critical transformation is the basis of the *pre-established harmony* between *Critical Criticism* and the *censorship*. From the Critical point of view, the writer's fight against the censor is not a fight of "man against man". The censor is nothing but *my own tact personified* for me by the solicitous police, my own tact struggling against my tactlessness and un-Criticalness. The struggle of the writer with the censor is only seemingly, only in the eyes of wicked sensuousness, anything else than the *inner* struggle of the writer *with himself*. *Insofar* as the censor is *really individually different* from myself, a *police executioner* who mishandles the product of my mind by applying an external standard alien to the matter in question, he is a mere *mass-type* fantasy, an *un-Critical figment of the brain*. When Feuerbach's *Thesen zur Reform der Philosophie* were prohibited by the censorship, it was not the official barbarity of the censorship that was to blame but the uncultured character of Feuerbach's *Thesen*. "Pure" Criticism, unsullied by mass or matter, too, has in the censor a purely "ethereal" form, divorced from all mass-type reality.

Absolute Criticism has declared the "*Mass*" to be the *true enemy of the Spirit*. It develops this in more detail as follows:

"The Spirit now knows where to *look* for *its* only *adversary* — in the self-deception and the pithlessness of the Mass."

Absolute Criticism proceeds from the *dogma* of the absolute competency of the "*Spirit*". Furthermore, it proceeds from the *dogma* of the *extramundane* existence of the Spirit, i.e., of its existence outside the mass

of humanity. Finally, it transforms “*the Spirit*”, “*Progress*”, on the one hand, and “*the Mass*”, on the other, into *fixed* entities, into concepts, and then relates them to one another as such given rigid extremes. It does not occur to Absolute Criticism to investigate *the “Spirit”* itself, to find out whether it is not in its spiritualistic nature, in its airy pretensions, that the “Phrase”, “self-deception” and “pithlessness” are rooted. No, the Spirit is *absolute*, but unfortunately at the same time it continually turns into *spiritlessness*; it continually reckons without its host. Hence it must necessarily have an *adversary* that intrigues against it. That adversary is the Mass.

The position is the same with “*Progress*”. In spite of the pretensions of “*Progress*”, continual *retrogressions* and *circular movements* occur. Far from suspecting that the category “*Progress*” is completely empty and abstract, Absolute Criticism is so profound as to recognise “*Progress*” as being absolute, so as to explain retrogression by assuming a “*personal adversary*” of Progress, *the Mass*. As “*the Mass*” is nothing but the “*opposite of the Spirit*”, of Progress, of “*Criticism*”, it can accordingly be defined only by this imaginary opposition; apart from that opposition all that Criticism can say about the meaning and the existence of the Mass is only something *meaningless*, because completely undefined:

“The Mass, in *that sense* in which the ‘word’ also embraces the *so-called* educated world.”

“Also” and “so-called” suffice for a Critical definition. The “Mass” is therefore distinct from the *real* masses and exists as *the “Mass”* only for “*Criticism*”.

All communist and socialist writers proceeded from the observation that, on the one hand, even the most favourably brilliant deeds seemed to remain without brilliant results, to end in trivialities, and, on the other, *all progress of the Spirit* had so far been *progress against the mass of mankind*, driving it into an ever more *dehumanised* situation. They therefore declared “*progress*” (see *Fourier*) to be an inadequate, abstract phrase; they assumed (see *Owen* among others) a fundamental flaw in the civilised world; that is why they subjected the *real* foundations of contemporary society to incisive *criticism*. This communist criticism had practically at once as its counterpart the movement of the great mass, in opposition to which history had been developing so far. One must know the studiousness, the craving for knowledge, the moral energy and ‘the unceasing urge for development

of the French and English workers to be able to form an idea of the human nobility of this movement.

How infinitely *profound* then is “Absolute Criticism”, which, in face of these intellectual and practical facts, sees in a one-sided way only *one* aspect of the relationship, the continual foundering of the Spirit, and, vexed at this, seeks in addition an *adversary* of the “Spirit”, which it finds in *the* “Mass”! In the end this great Critical *discovery* amounts to a *tautology*. According to Criticism, *the* Spirit has so far had a limit, an obstacle, in other words, an *adversary*, *because* it has had an *adversary*. Who, then, is the adversary of the *Spirit*? *Spiritlessness*. For the Mass is defined only as the “opposite” of the Spirit, as *spiritlessness* or, to take the more precise definitions of spiritlessness, as “indolence”, “superficiality”, “self-complacency”. What a fundamental superiority over the communist writers it is not to have traced spiritlessness, indolence, superficiality and self-complacency to their places of origin, but to have denounced them *morally* and *exposed* them as the opposite of the Spirit, of Progress! If these qualities are proclaimed qualities of *the* Mass, as of a *subject* still distinct from them, that distinction is nothing but a “Critical” *semblance* of distinction. Only in *appearance* has Absolute Criticism a *definite* concrete subject besides the abstract qualities of spiritlessness, indolence, etc., for “*the* Mass” in the Critical conception is *nothing* but those abstract qualities, another *word* for them, a *fantastic personification* of them. . The relation between “Spirit and Mass” has, however, also a *hidden* meaning which will be completely revealed in the course of the reasoning. We only indicate it here. That relation *discovered* by Herr Bruno is, in fact, nothing but a *Critically caricatured consummation of Hegel’s conception of history*, which, in turn, is nothing but the *speculative* expression of the *Christian-Germanic* dogma of the antithesis between *Spirit* and *Matter*, between God and the world-. This antithesis finds expression in history, in the human world itself in such a way that a few chosen *individuals* as the *active Spirit* are counterposed to the rest of mankind, as the *spiritless Mass*, as *Matter*.

Hegel’s conception of history presupposes an *Abstract* or *Absolute Spirit* which develops in such a way that mankind is a mere *mass* that bears the Spirit with a varying degree of consciousness or. unconsciousness. Within *empirical*, exoteric history, therefor e, Hegel makes a speculative, esoteric

history, develop. The history of mankind becomes the history of the *Abstract Spirit* of mankind, hence a *spirit far removed* from the real man.

Parallel with this doctrine of Hegel's there developed in France the theory of the *Soctrinairians* proclaiming the *sovereignty of reason* in opposition to the *sovereignty of the people*, in order to exclude the masses and rule *alone*. This was quite consistent. If the activity of *real* mankind is nothing but the activity of a mass of human individuals, then abstract *generality*, *Reason*, the Spirit, on the contrary, must have an abstract expression restricted to a few individuals. It then depends on the situation and imaginative power of each individual whether he will claim to be this representative of "the Spirit".

Already in *Hegel* the *Absolute Spirit* of history has its material in the *Mass* and finds its appropriate expression only in *philosophy*. The philosopher, however, is only the organ through which the maker of history, the Absolute Spirit, arrives at self-consciousness *retrospectively* after the movement has ended. The participation of the philosopher in history is reduced to this retrospective consciousness, for the real movement is accomplished by the Absolute Spirit *unconsciously*. Hence the philosopher appears on the scene *post festum*.

Hegel is guilty of being doubly half-hearted: firstly in that, while declaring that philosophy is the mode of existence of the Absolute Spirit, he refuses to recognise the *actual philosophical individual* as the *Absolute Spirit*; secondly, in that he lets the Absolute Spirit as Absolute Spirit make history only in *appearance*. For since the Absolute Spirit becomes *conscious* of itself as the creative World Spirit only *post festum* in the philosopher, its making of history exists only in the consciousness, in the opinion and conception of the philosopher, i.e., only in the speculative imagination. Herr Bruno Bauer overcomes Hegel's half-heartedness.

Firstly, he proclaims *Criticism* to be the Absolute Spirit and *himself* to be *Criticism*. Just as the element of Criticism is banished from the Mass, so the element of the Mass is banished from Criticism. Therefore *Criticism* sees itself incarnate not in a *mass*, but exclusively in a *handful* of chosen men, in Herr Bauer and his disciples.

Herr Bauer furthermore overcomes Hegel's other half-heartedness. No longer, like the Hegelian Spirit, does he make history *post festum* and in imagination. He *consciously* plays the part of the *World Spirit* in opposition

to the mass of the rest of mankind; he enters into a contemporary *dramatic* relation with that mass; he invents and executes history with a purpose and after mature reflection.

On the one side is the Mass as the passive, spiritless, unhistorical, *material* element of history. On the other is *the Spirit, Criticism*, Herr Bruno and Co. as the active element from which all *historical* action proceeds. The act of transforming society is reduced to the *cerebral activity* of Critical Criticism.

Indeed, the relation of Criticism, and hence of Criticism incarnate, Herr Bruno and Co., to the Mass is in truth the only historical relation of the present time. The whole of present-day history is reduced to the movement of these two sides against each other. All antitheses have been dissolved in this *Critical* antithesis.

Critical Criticism, which becomes *objective* to itself only in relation to its antithesis, to the Mass, to *stupidity*, is consequently obliged continually *to produce* this antithesis for itself, and Herren Faucher, Edgar and Szeliga have supplied sufficient proof of their Virtuosity in their speciality, the *mass stupefaction* of persons and things.

Let us now accompany Absolute Criticism in its *campaigns* against the *Mass*.

b) The Jewish Question No. 1.

The Setting of the Questions

The “Spirit”, contrary to the Mass, behaves from the outset in a *Critical way* by considering its own narrow-minded work, Bruno Bauer’s *Die Judenfrage*, as absolute, and only the opponents of that work as sinners. In Reply No. 1 to attacks on that treatise, he does not show any inkling of its defects; on the contrary, he declares he has set forth the “true”, “*general*” (!) significance of the Jewish question. In later replies we shall see him obliged to admit his “*oversights*”.

“The reception my book has had is the *beginning* of the proof that the very ones who so far have advocated freedom, and still advocate it, must rise against the Spirit more than any others; the defence of my book which I am now going to undertake will supply further pond how thoughtless the *spokesmen of the Mass* are; they have God knows what a great opinion of

themselves for supporting emancipation and the dogma of the ‘*rights of man*’.”

On the occasion of a treatise by Absolute Criticism, the “Mass” must necessarily have *begun* to prove its antithesis to the Spirit; for it is its antithesis to Absolute Criticism that *determines* and *proves* its very *existence*.

The polemic of a few liberal and rationalist Jews against Herr Bruno’s *Die Judenfrage* has naturally a Critical meaning quite different from that of the mass-type polemic of the liberals against philosophy and of the rationalists against Strauss. Incidentally, the originality of the above-quoted remark can be judged by the following passage from *Hegel*:

“We can here note the particular form of bad conscience manifest in the kind of eloquence with which that shallowness” (of the liberals) “plumes itself, and first of all in the fact that it speaks most of *Spirit* where its speech has the *least spirit*, and uses the word *life*”, etc., “where it is most dead and withered.”

As for the “*rights of man*”, it has been proved to Herr Bruno (“On the Jewish Question”, *Deutsch-Französische Jahrbücher*) that it is “*he himself*”, not the *spokesmen of the Mass*, who has misunderstood and dogmatically mishandled the essence of those rights. Compared to his discovery that the rights of man are not “*inborn*” — a discovery which has been made innumerable times in England during the last 40-odd years — Fourier’s assertion that the right to fish, to hunt, etc., are inborn rights of men is one of genius.

We give only a few examples of Herr Bruno’s fight against *Philippson*, *Hirsch* and others. Even such poor opponents as these are not disposed of by Absolute Criticism. It is by no means preposterous of Herr *Philippson*, as Absolute Criticism maintains, to say:

“Bauer conceives a peculiar kind of state ... a *philosophical ideal* of a *state*.”

Herr Bruno, who confuses the state with humanity, the rights of man with man and political emancipation with human emancipation, was bound, if not to conceive, at least to imagine a peculiar kind of state, a philosophical ideal of a state.

“Instead of writing his laboured statement, the rhetorician” (Herr Hirsch) “would have done better to refute my proof that the *Christian state*, having

as its vital principle a definite religion, cannot allow adherents of another particular religion ... complete equality with its own social estates.”

Had the rhetorician *Hirsch* really refuted Herr Bruno’s proof and shown, as is done in the *Deutsch-Französische Jahrbücher*, that the state of social estates and of exclusive Christianity is not only an incomplete state but an incomplete *Christian* state, Herr Bruno would have answered as he does to that refutation:

“Objections in this matter are meaningless.”

Herr Hirsch is quite correct when in answer to Herr Bruno’s statement:

“By pressure against the mainsprings of history the Jews provided counterpressure”,

he recalls:

“Then they must have counted for something in the making of history, and if Bauer himself asserts this, he has no right to assert, on the other hand, that they did not contribute anything to the making of modern times.”

Herr Bruno answers:

“An eyesore is something too — does that mean it contributes to develop my eyesight?”

Something which has been an eyesore to me from birth, as the Jews have been to the Christian world, and which persists and develops with the eye is not an ordinary sore, but a wonderful one, one that really belongs to my eye and must even contribute to a highly original development of my eyesight. The Critical “*eyesore*” does not therefore hurt the rhetorician “*Hirsch*”. Incidentally, the criticism quoted above revealed to Herr Bruno the significance of Jewry in “the *making* of modern times”.

The theological mind of Absolute Criticism feels so offended by a *deputy of the Rhenish Landtag* stating that “the Jews are *queer* in their own Jewish way, not in our so-called Christian way”, that it is still “calling him *to order* for using that argument”.

Concerning the assertion of another deputy that “civil equality of the Jews can be implemented only where Jewry no longer exists”, Herr Bruno comments:

“Correct! That is correct if Criticism’s other proposition, which I put forward in my treatise, is not omitted”, namely the proposition that Christianity also must have ceased to exist.

We see that in its Reply No. 1 to the attacks upon *Die Judenfrage*, Absolute Criticism still regards the abolition of religion . atheism, as the

condition for civil equality. In its first stage it has therefore not yet acquired any deeper insight into the essence of the state than into the “oversights” of its “work”.

Absolute Criticism feels offended when one of its *intended* “latest” scientific discoveries is betrayed as something already generally recognised. A Rhenish deputy remarks:

“No one has yet maintained that France and Belgium were distinguished by particular clarity in recognising principles in the organisation of their political affairs.”

Absolute Criticism could have objected that that assertion transferred the present into the past by representing as traditional the now trivial view of the inadequacy of French political principles. Such a relevant objection ‘would not be profitable for Absolute Criticism. On the contrary, it must assert the obsolete view to be that at present prevailing, and proclaim the now prevailing view a Critical mystery which its investigation still has to reveal to the Mass. Hence it must say:

“It” (the antiquated prejudice) “has been asserted *by very many*” (of the Mass): “*but a thorough investigation of history will provide the proof that even after the great work done by France to comprehend the principles, much still remains to be achieved.*”

That means that a thorough investigation of history will not itself “achieve” the comprehension of the principles. It will only *prove* in its thoroughness that “*much still remains to be achieved*”. A great achievement, especially after the works of the Socialists! Nevertheless Herr Bruno *already* achieves *much* for the comprehension of the present social state of things by his remark:

“The *certainty* prevailing at present is *uncertainty*.”

If Hegel says that the prevailing Chinese certainty is “Being”, that the prevailing *Indian* certainty is “Nothing”, etc., Absolute Criticism joins him in the “pure” way when it resolves the character of the present time in the logical category “*Uncertainty*”, and all the purer since “*Uncertainty*”, like “Being” and “Nothing”, belongs to the first chapter of speculative logic, the chapter on “*Quality*”.

We cannot leave No. 1 of *Die Judenfrage* without a general remark.

One of the chief pursuits of Absolute Criticism consists in first bringing all questions of the day into their *right setting*. For it does not answer the

real questions — it substitutes *quite different* ones. As it makes everything, it must also first make the “questions of the day”, make them *its own* questions, questions of Critical Criticism. If it were a question of the Code Napoléon, it would prove that it is *properly* a question of the *Pentateuch*. Its *setting* of “questions of the day” is Critical *distortion* and *misrepresentation* of them. It thus distorted the “Jewish question”, too, in such a way that it did not need to investigate *political emancipation*, which is the subject-matter of that question, but could instead confine itself to a criticism of the Jewish religion and a description of the Christian-Germanic state.

This method, too, like all Absolute Criticism’s originalities, is the repetition of a *speculative* verbal trick. *Speculative* philosophy, namely, *Hegel’s* philosophy, had to transpose all questions from the form of common sense to the form of speculative reason and convert the real question into a *speculative* one to be able to answer it. Having distorted *my* question on my lips and, like the catechism, put *its own* question into my mouth, it could, of course, like the catechism, have its ready answer to all my questions.

c) Hinrichs No. 1.

Mysterious Hints on Politics, Socialism and Philosophy

“*Political!*” Absolute Criticism is literally horrified at the presence of this word in Professor *Hinrichs’* lectures.

“Whoever has followed the development of modern times and knows history will also know that the political movements at present taking place have a significance *quite different*” (!) “from a *political* one: at their base” (at their base! ... now for basic wisdom) “they have a *social*” (!) “significance, which, as we know” (!) “is such” (!) “that *all* political interests appear *insignificant*” (!) “in comparison with it.”

A few months before the Critical *Literatur-Zeitung* began to be published, there appeared, *as we know* (!), Herr Bruno’s fantastic political treatise: *Staat, Religion und Parthei!*

If *political* movements have *social significance*, how can political interests appear “*insignificant*” in comparison with their own social significance?

“Herr Hinrichs does not know his way about either in his own house or anywhere else in the world.... He could not be at home anywhere *because ... because* Criticism, which in the last four years has begun and carried on its *by no means ‘political’* but *‘social’*” (!) “work, has remained *completely*” (!) “unknown to him.”

Criticism, which according to the opinion of the Mass carried on “by no means *political*” but “in *all* respects *theological*” work, is still content with the word “*social*”, even now when it has uttered this word for the first time, not just in the last four years, but since its literary birth.

Since socialist writings spread in Germany the recognition that all human aspirations and actions without exception have *social* significance, Herr Bruno can call his theological works social too. But what a *Critical* demand it is that Professor Hinrichs should have derived socialism from an *acquaintance* with *Bauer’s* works, considering that all Bruno Bauer’s works published up to the appearance of Hinrichs’ lectures, when they do draw practical conclusions, draw *political* ones! It was impossible, un-Critically speaking, for Professor Hinrichs to supplement Herr Bruno’s published works with his as yet unpublished ones. From the Critical point of view, the Mass is, of course, obliged to interpret all Absolute Criticism’s mass-type “movements”, as well as “political” ones, from the angle of the future and of Absolute Progress! But in order that Herr Hinrichs, after becoming acquainted with the *Literatur-Zeitung*, may never again forget the word “*social*” or fail to recognise the “*social*” character of *Criticism*, *Criticism* prohibits the word “political” for the third time before the whole world and solemnly repeats the word “*social*” for the third time.

“If the *true* tendency of modern history is considered it is *no longer a question of political*, but — but of *social* significance”, etc.

Just as Professor Hinrichs is the scapegoat for the former political” movements, so is he also for the “*Hegelian*” movements and expressions which Absolute Criticism used intentionally up to the publication of the *Literatur-Zeitung*, and continues to use unintentionally in it.

Once “*real Hegelian*” and twice “*Hegelian philosopher*” are thrown in Hinrichs’ face as catchwords. Herr Bruno even “*hopes*” that the “banal expressions so tiresomely circulated in all the books of the *Hegelian* school” (in particular in his own books) will, *in view of* their great “*exhaustion*” as seen in Professor Hinrichs’ lectures, soon reach the end of

their journey. From the “*exhaustion*” of *Professor Hinrichs*, Herr Bruno hopes for the dissolution of *Hegel’s philosophy* and thereby *his own redemption* from it.

Thus in its *first campaign* Absolute Criticism overthrows its own long-worshipped gods, “*Politics*” and “*Philosophy*”, declaring them idols of Professor Hinrichs.

Glorious first campaign!

2) Absolute Criticism’s Second Campaign

a) Hinrichs No. 2. “Criticism” and “Feuerbach”.

Condemnation of Philosophy

As the result of its first campaign, *Absolute Criticism* can regard “*philosophy*” as having been dealt with and term it outright an ally of the “*Mass*”.

“*Philosophy* were predestined to fulfil the heart’s desires of the ‘*Mass*’”. For “the *Mass wants* simple concepts, in order to have nothing to do with the thing itself, shibboleths, so as to have finished with everything from the start, phrases by which Criticism can be done away with”

And “philosophy” fulfils this longing of the “*Mass*”!

Dizzy after its victories, Absolute Criticism breaks out in *Pythian* frenzy against philosophy. *Feuerbach’s Philosophie der Zukunft* is the concealed cauldron whose fumes inspire the frenzy of Absolute Criticism’s victory-intoxicated head. It read Feuerbach’s work in March. The fruit of that reading, and at the same time the criterion of the earnestness with which it was undertaken, is Article No. 2 against Professor Hinrichs.

In this article Absolute Criticism, which has never freed itself from the cage of the Hegelian way of viewing things, storms at the iron bars and walls of its prison. The “simple concept”, the terminology, the whole mode of thought of philosophy, indeed, the whole of philosophy, is rejected with disgust. In its place we suddenly find the “*real wealth of human relations*”, the “*immense content of history*”, the “*significance of man*”, etc. “*The mystery of the system*” is declared “*revealed*”.

But who, then, revealed the mystery of the “system”? *Feuerbach*. Who annihilated the dialectics of concepts, the war of the gods that was known to the philosophers alone? *Feuerbach*. Who substituted for the old lumber and for “infinite self-consciousness” if not, indeed, “*the significance of man*” — as though man had another significance than that of being man! — at any rate “*Man*”? *Feuerbach*, and only *Feuerbach*. And he did more. Long ago he did away with the very categories with which “*Criticism*” now operates — the “real wealth of human relations, the immense content of history, the struggle of history, the fight of the Mass against the Spirit”, etc., etc.

Once man is recognised as the essence, the basis of all human activity and situations, only “*Criticism*” can invent *new categories* and transform *man* himself into a category and into the principle of a whole series of categories, as it is doing now. It is true that in so doing it takes the only road to salvation that has remained for frightened and persecuted *theological* inhumanity. *History* does *nothing*, it “possesses *no* immense wealth”, it “wages *no* battles”. It is *man*, real, living man who does all that, who possesses and fights; “history” is not, as it were, a person apart, using man as a means to achieve *its own* aims; history is *nothing but* the activity of man pursuing his aims. If *Absolute Criticism*, after *Feuerbach’s* brilliant expositions, still dares to reproduce all the old trash in a new form, at the same time abusing it as “*mass-type*” trash — which it has all the less right to do as it never stirred a finger to dissolve philosophy — that fact alone is sufficient to bring the “*mystery*” of *Criticism* to light and to assess the *Critical* naivety with which it says the following to Professor Hinrichs, whose “*exhaustion*” once did it such a great service:

“The *damage* is to those who have not gone through any development and therefore *could not alter themselves even if they wished to*, and at most to the *new* principle — but no! The new *cannot* be made *into a phrase, separate turn of speech cannot be borrowed from it.*”

Absolute Criticism prides itself that, in contrast to Professor Hinrichs, it has solved “*the mystery of the faculty sciences*”. Has it then solved the “mystery” of philosophy, jurisprudence, politics, medicine, political economy and so forth? Not at all! It has — be it noted! — shown in *Die gute Sache der Freiheit* that science as a source of livelihood and free science, freedom of teaching and faculty statutes, contradict each other.

If “Absolute Criticism” were honest it would have admitted where its pretended illumination on the “Mystery of Philosophy” Comes from. It is a good thing all the same that it does not put into *Feuerbach’s* mouth such nonsense as the misunderstood and distorted propositions that it borrowed from him, as it has done with other people. By the way, it is characteristic of “Absolute Criticism’s” *theological* viewpoint that, whereas the German philistines are now beginning to understand *Feuerbach* and to adopt his conclusions, it is unable to grasp a single sentence of his correctly or to use it properly.

Criticism achieves a real advance over its feats of the first campaign when it “defines” the struggle of “*the Mass*” against the “Spirit” as “*the aim*” of all previous history, when it declares that “*the Mass*” is the “*pure nothing*” of “misery”; when it calls the Mass purely and simply “*Matter*” and contrasts “*the Spirit*” as truth to “*Matter*”. Is not Absolute Criticism therefore *genuinely Christian-Germanic*? After the old antithesis between spiritualism and materialism has been fought out on all sides and overcome once for all by *Feuerbach*, “*Criticism*” again makes a basic dogma of it in its most loathsome form and gives the victory to the “*Christian-Germanic spirit*”.

Finally, it must be considered as a development of Criticism’s mystery concealed in its first campaign when it now identifies the antithesis between *Spirit* and *Mass* with the antithesis between “*Criticism*” and the Mass. Later it will go on to identify *itself* with “*Criticism*” and therefore to represent itself as “*the Spirit*”, the Absolute and Infinite, and the Mass, on the other hand, as finite, coarse, brutal, dead and inorganic — for that is what “*Criticism*” understands by matter.

How immense is the wealth of history that is exhausted in the relationship of humanity to *Herr Bauer*!

b) The Jewish Question No. 2

Critical Discoveries on Socialism, Jurisprudence and Politics (Nationality)

To the material, mass-type Jews is preached the *Christian* doctrine of *freedom of the Spirit, freedom in theory*, that *spiritualistic* freedom which *imagines* itself to be free even in chains, and whose soul is satisfied with “*the idea*” and only embarrassed by any mass-type existence.

“The Jews are *emancipated* to the extent they have now reached in *theory*, they are *free* to the extent that they *wish to be free*.”

From this proposition one can immediately measure the Critical gap which separates *mass-type*, profane communism and socialism from *absolute* socialism. The first proposition of profane socialism rejects emancipation *in mere theory* as an illusion and for *real* freedom it demands besides the idealistic “*will*” very tangible, very material conditions. How low “*the Mass*” is in comparison with holy Criticism, the Mass which considers material, practical Upheavals necessary even to win the time and means required merely to occupy itself with “*theory*”!

Let us leave purely spiritual socialism an instant for *politics*!

Herr *Riesser* maintains against Bruno Bauer that his state (i.e., the *Critical* state) must exclude “Jews” and “Christians”. Herr *Riesser* is right. Since Herr Bauer confuses *political* emancipation with *human* emancipation, since the state can react to antagonistic elements — and Christianity and Judaism are described as treasonable elements in *Die Judenfrage* — only by forcible exclusion of the persons representing them (as the Terror, for instance, wished to do away with hoarding by guillotining the hoarders), Herr Bauer must have both Jews and Christians hanged in his “Critical state”. Having confused political emancipation with human emancipation, he had to be consistent and confuse the *political means* of emancipation with the *human means*. But as soon as Absolute Criticism is told the *definite* meaning of its deductions, it gives the answer that *Schelling* once gave to all his opponents who substituted *real* thoughts for his phrases:

“*Criticism’s* opponents are its opponents because they not only measure it with their *dogmatic* yardstick but regard Criticism itself as *dogmatic*; they oppose Criticism because it does not recognise their dogmatic distinctions, definitions and evasions.”

It is, of course, to adopt a dogmatic attitude to Absolute Criticism, as also to Herr *Schelling*, if one assumes it to have *definite*, real meaning, thoughts and views. In order to be accommodating and to prove to Herr *Riesser* its humanity, “*Criticism*”, however, decides to resort to dogmatic distinctions, definitions and especially to “*evasions*”.

Thus we read:

“Had I in that work” (*Die Judenfrage*) “had the *will* or the *right* to go *beyond*, criticism, I *ought*’ (!) .’to *have spoken*” (!) “not of the *state*, but of

‘*society*’, which excludes no one but from which only those exclude themselves who do not wish to take part in its development.”

Here Absolute Criticism makes a *dogmatic distinction* between what it ought to have done, if it had not done the contrary, and what it actually did. It explains the narrowness of its work *Die Judenfrage* by the “*dogmatic evasions*” of having the *will* and the *right* which prohibited it from going “*beyond criticism*”. What? “*Criticism*” should go *beyond* “*criticism*”? This quite *mass-type* notion occurs to Absolute Criticism because of the dogmatic necessity for, on the one hand, asserting its conception of the Jewish question as absolute, as “*Criticism*”, and on the other hand, admitting the possibility of a more comprehensive conception.

The *mystery* of its “*not having the will*” and “*not having the right*” will later be revealed as the Critical *dogma* according to which all apparent limitations of “*Criticism*” are nothing but necessary *adaptations* to the powers of comprehension of the Mass.

It had not the *will*! It *had* not the *right* to go beyond its narrow conception of the Jewish question! But what would it have done *had it had* the *will* or the *right*? — It would have given a *dogmatic definition*. It would have spoken of “*society*” instead of the “*state*”, that is to say, it would not have studied the *real* relation of Jewry to *present-day civil* society! It would have given a *dogmatic definition* of “*society*” as distinct from the “*state*”, in the sense that if the *state* excludes, on the other hand *they exclude* themselves from society who do not wish to take part in its development!

Society behaves just as exclusively as the state, only in a more polite form: it does not throw you out, but it makes it so uncomfortable for you that you go out of your own will.

Basically, the state does not behave otherwise, for it does not exclude anybody who complies with all *its* demands and orders and its development. In its *perfection* it even closes its eyes and declares *real* contradictions to be *non-political* contradictions which do not disturb it. Besides, Absolute Criticism itself has argued that the state excludes Jew.. because and in so far as the Jews exclude the state and hence exclude *themselves* from the state. If this reciprocal relationship has a more polite, a more hypocritical, a more insidious form in *Critical* “*society*”, this only proves that “*Critical*” “*society*” is more hypocritical and less developed.

Let us follow Absolute Criticism deeper in its “dogmatic distinctions” and “definitions”, and, in particular, in its “*evasions*”.

Herr Riesser, for example, demands of the critic “that he *distinguish* what belongs to the domain of law” from “what is beyond its sphere”.

The Critic is indignant at the impertinence of this *juridical* demand.

“So far, *however*,” he retorts, “both feeling and conscience have interfered in law, always supplemented it, and because of its character, based on its *dogmatic form*” (not, therefore, on its dogmatic *essence*?), “have always had to supplement it.”

The Critic forgets only that *law*, on the other hand, *distinguishes itself* quite explicitly from “feeling and conscience”, that this distinction is based on the one-sided *essence* of *law* as well as on its dogmatic *form*, and is even one of the *main dogmas* of law; that, finally, the practical implementation of that distinction is just as much the peak of the *development of law* as the separation of religion from all profane content makes it *abstract, absolute* religion. The fact that “feeling and conscience” interfere in law is sufficient reason for the “Critic” to speak of feeling and conscience when it is a matter of *law*, and of *theological* dogmatism when it is a matter of *juridical* dogmatism.

The “definitions and distinctions of Absolute Criticism” have prepared us sufficiently to hear its latest “*discoveries*” on “*society*” and “*law*”.

“The world form that *Criticism* is preparing, and the *thought* of which it is *even only* just preparing, is not a *merely legal* form but” (collect yourself, reader) “a *social* one, about which *at least* this much” (this little?) “*can* he said: whoever has not made his contribution to its development and does not live with his conscience and feeling in it. cannot feel at home in it or take part in its history.”

The world form that “*Criticism*” is preparing is defined as *not merely* legal, *but* social. This definition can be interpreted in two ways. The sentence quoted may be taken as “*not legal but social*” or as “not merely legal, but *also* social”. Let us consider its content according to both readings, beginning with the first. Earlier, Absolute Criticism defined the new “world form” distinct from the “*state*” as “*society*”. Now it defines the noun “*society*” by the adjective “*social*”. If Herr Hinrichs was three times given the word “*social*” in contrast to his “*political*”, Herr Riesser is now given *social society* in contrast to his “*legal*” society. If the *Critical*

explanations for Herr Hinrichs reduced themselves to the formula “social” + “social” + “social” = 3a, Absolute Criticism in its second campaign passes from *addition* to *multiplication* and Herr Riesser is referred to society multiplied by itself, society to the *second* power, Social society = a². In order to complete its deductions on society, all that now remains for Absolute Criticism to do is to go On to fractions, to extract the *square root* of society, and so forth.

If, on the other hand, we take the second reading: the “*not merely* legal, *but also* social” world form, this hybrid world form is nothing but the *world form* existing *today*, the world form of *present-day society*. It is a great, a meritorious *Critical miracle* that “*Criticism*” in its pre-world thinking is only just *preparing* the *future* existence of the world form which *exists today*. But however matters stand with “not merely legal but social society”, *Criticism* can for the time being say no more about it than “*fabula docet*”, the *moral* application. Those who do not live in that society with their feeling and their conscience will “*not feel* at home” in it. In the end, no one will live in that society except “pure feeling” and “pure conscience”, that is, “the Spirit”, “*Criticism*” and its *supporters*. The *Mass* will be excluded from it in one way or another so that “mass-type society” will exist outside “social society”.

In a word, this society is nothing but the *Critical heaven* from which the real world is excluded as being the *un-Critical hell*. In its pure thinking, Absolute Criticism is preparing this transfigured *world form* of the contradiction between “*Mass*” and “*Spirit*”.

Of the same *Critical* depth as these explanations on “*society*” are the explanations Herr Riesser is given on the destiny of *nations*.

The Jews’ desire for emancipation and the desire of the Christian states to “classify” the Jews in “their government scheme” — as though the Jews had not long ago been classified in the Christian government scheme! — lead Absolute Criticism to prophecies on the *decay of nationalities*. See by what a complicated detour Absolute Criticism arrives at the present historical movement — namely, by the *detour of theology*. The following illuminating oracle shows us what great results Criticism achieves in this way:

“The *future* of all nationalities — *is* — *very* — *obscure!*”

But let the future of nationalities be as obscure as it may be, for Criticism's sake. The one essential thing is *clear*: the *future* is the *work of Criticism*.

"*Destiny*," it exclaims, "may decide as it will: we now know that it is *our work*."

As God leaves *his creation*, man, his *own will*, so *Criticism* leaves destiny, which is *its creation*, its *own will*. *Criticism*, of which destiny is the work, is, like God, *almighty*. Even the "resistance" which it "*finds*" outside itself is its own work. "*Criticism makes its adversaries*." The "*mass indignation*" against it is therefore "dangerous" only for "the Mass" itself.

But if Criticism, like God, is *almighty*, it is also, like God, *all-wise* and is capable of combining its almightiness with the *freedom*, the will and the *natural determination* of human individuals.

"It would not be the *epoch-making* force if it did not have the effect of *making each one* what he *wills* to be and showing each one irrevocably the standpoint *corresponding to his nature* and *his will*."

Leibniz could not have given a happier presentation of the re-established harmony between the almightiness of God and the freedom and natural determination of man.

If "*Criticism*" seems to clash with psychology by *not distinguishing* between the *will* to be something and the *ability* to be something, it must be borne in mind that it has decisive grounds to declare this "*distinction*" "*dogmatic*".

Let us steel ourselves for the third campaign! Let us recall once more that "*Criticism makes its adversary*"! But how could it make its adversary, *the*. "*phrase*", if it were not a phrase-monger?

3) Absolute Criticism's Third Campaign

a) Absolute Criticism's Self-Apology.

Its "Political" Past

Absolute Criticism begins its third campaign against the "*Mass*" with the question:

"*What is now the object of criticism?*"

In the same number of the *Literatur-Zeitung* we find the information:
“*Criticism* wishes *nothing* but to know *things*.”

According to this, all things are the *object* of Criticism. It would be senseless to inquire about some particular, definite object peculiar to Criticism. The contradiction is easily resolved when one remembers that all things “merge” into Critical things and all Critical things into *the Mass*, as the “Object” of “*Absolute Criticism*”.

First of all, Herr Bruno describes his *infinite pity* for the “*Mass*.” He makes “*the gap* that separates him from the *crowd*” an object of “*persevering study*.” He wants “*to find out the significance of that gap for the future*” (this is what above was called knowing “*all*” things) and at the same time “*to abolish it*”. In truth he therefore already knows the *significance* of that gap. It consists in being *abolished* by him.

As each man’s self is nearest to him, “*Criticism*” first sets about abolishing its *own mass nature*, like the Christian ascetics who begin the campaign of the spirit against the flesh with the mortification of their own flesh. The “*flesh*” of Absolute Criticism is its *really* massive literary *past*, amounting to 20-30 volumes. Herr Bauer must therefore free the literary biography of “*Criticism*” — which coincides exactly with his own literary biography — from its *mass-like appearance*; he must retrospectively *improve* and *explain* it and by this *apologetic* commentary “*place its earlier works in safety*”.

He begins by explaining by a double cause the error of the *Mass*, which until the end of the *Deutsche Jahrbücher* and the *Rheinische Zeitung* regarded Herr Bauer as one of its supporters. Firstly the mistake was made of regarding the literary movement as *not* “*purely literary*”. At the same time the opposite mistake was made, that of regarding the literary movement as “*a merely*” or *purely* “*literary*” movement. There is no doubt that the “*Mass*” was mistaken in any case, if only because it made two mutually incompatible errors at *the same time*.

Absolute Criticism takes this opportunity of exclaiming to those who ridiculed the “German nation” as a “*blue stocking*”:

“Name even a single historical epoch which was not authoritatively *outlined beforehand by the ‘pen’* and had not to allow itself to be shattered by a stroke of the pen.”

In his Critical naivety Herr Bruno separates “*the pen*” from the *subject who writes*, and the subject who writes as “*abstract writer*” from the living *historical man* who wrote. This allows him to go into ecstasy over the wonder-working power of the “*pen*”. He might just as well have demanded to be told of a historical movement which was not outlined beforehand by “poultry” or the “goose girl”.

Later we shall be told by the same Herr Bruno that so far not one historical epoch, not a single one, has become known. How could the “*pen*”, which so far has been unable to *outline “any single”* historical epoch *after* the event, have been able to *outline them all beforehand*?

Nevertheless, Herr Bruno proves the correctness of his view by *deeds*, by himself “*outlining beforehand*” his own “past” with *apologetic “strokes of the pen”*.

Criticism, which was involved on all sides not only in the *general* limitation of the world and of the epoch, but in quite particular and personal limitations, and which nevertheless assures us that it has been “*absolute, perfect and pure*” *Criticism* in all its works for as long as man can think, has only *accommodated* itself to the *prejudices* and *power of comprehension* of the Mass, as God is wont to do in his revelations to man.

“It was bound to come,” Absolute *Criticism* informs us, “to a breach of *Theory* with its *seeming ally*.”

But because *Criticism*, here called *Theory* for a change, comes to *nothing*, but everything, on the contrary, comes from it; because it develops not inside but *outside* the world, and has predestined everything in its divine immutable consciousness, the *breach* with its former ally was a “*new turn*” only in *appearance*, only for others, not in itself and not for *Criticism* itself.

“But this rum ‘*properly speaking*’ was not even new. *Theory* had continually worked on *criticism of itself*’ (we know how much effort has been expended on it to force it to criticise itself); “it had never flattered the Mass” (but itself an the more); lit had always *taken care* not to get itself ensnared in the premises of its opponent.”

“The Christian theologian must tread *cautiously*.” (Bruno Bauer, *Das entdeckte Christenthum*, .) How did it happen that “cautious” *Criticism* nevertheless did get ensnared and did not already at that time express its “proper” meaning clearly and audibly? Why did it not speak out bluntly? Why did it let the illusion of its brotherhood with the Mass persist?

“‘Why hast thou done this to me?’ said Pharaoh to Abraham as he restored to him Sarah his wife. ‘Why didst thou say she was thy sister?’” (*Das entdeckte Christenthum* by Bruno Bauer, .)

“‘Away with reason and language!’ says the theologian, ‘for otherwise Abraham would be a liar. It would be a mortal insult to Revelation!’” (*loc. cit.*)

“‘Away with reason and language!’ says the Critic. For had Herr Bauer *really* and not just apparently been ensnared with the Mass, Absolute Criticism would not be absolute in its revelations, it would be mortally insulted.

“It is *only*,” Absolute Criticism continues, “that its” (Absolute Criticism’s) efforts *had not been noticed*, and *there was moreover* a stage of Criticism when it was *forced sincerely* to consider its opponent’s premises and to take them seriously for an instant; a stage, in short, when it was *not yet fully* capable of taking away from the Mass the latter’s conviction that it had the same cause and the same interest as Criticism.”

“*Criticism’s* efforts had just not been noticed; therefore the Mass was to blame. On the other hand, Criticism admits that its efforts *could* not be noticed because it itself was not yet “*capable*” of making them *noticeable*. Criticism *therefore appears* to be to blame.

God help us! Criticism was “forced” — violence was used against it— “sincerely to consider its opponent’s premises and to take them seriously for an instant”. A fine sincerity, a truly theological sincerity, which does not really take a thing seriously but only “*takes it seriously for an instant*”; which has always, therefore every instant, been careful not to get itself ensnared in its opponent’s premises, and nevertheless, “for *an instant*” “sincerely” takes these very premises into consideration. Its “sincerity” is still greater in the closing part of the sentence. It was in the same instant when Criticism “sincerely took into consideration the premises of the Mass” that it “was not yet fully *capable*” of destroying the illusion about the unity of *its* cause and the cause of the *Mass*. It was *not yet capable*, but it already had the *will* and the *thought* of it. It *could* not yet *outwardly* break with the Mass but the break was already *complete inside it*, in its *mind* — complete in the same instant when it *sincerely* sympathised with the Mass!

In its involvement with the prejudices of the Mass, Criticism was not *really* involved in *them*; on the contrary, it was, *properly speaking*, free

from its own limitation and was only “*not yet completely* capable” of informing the Mass of this. Hence all the limitation of “Criticism” was pure *appearance*; an appearance which without the limitation of the Mass would have been superfluous and would therefore not have existed at all. It is therefore again the Mass that is to blame.

Insofar as this *appearance*, however, was supported by “the inability”, “the impotence” of Criticism to express its thought, Criticism itself was *imperfect*. This it admits in its own way, which is as sincere as it is apologetic.

“In spite of having subjected liberalism itself to devastating criticism, it” (Criticism) “could *still* be regarded as a peculiar kind of liberalism, *perhaps* as its extreme form; *in spite of* its true and decisive arguments having gone beyond politics, it *nevertheless* was *still* bound to give an *appearance* of *engaging in politics*, and this *incomplete appearance* won it most of the friends mentioned above.”

Criticism won its friends through its *incomplete appearance* of engaging in politics. Had it *completely appeared* to engage in politics, it would inevitably have lost its *political* friends. In its *apologetic anxiety* to wash itself free of all sin, it accuses the *false appearance* of having been an *incomplete false appearance*, not a *complete false one*. By substituting one appearance for the other, “Criticism” can console itself with the thought that if it had the “complete appearance” of wishing to engage in politics, it does not have, on the other hand, even the “incomplete appearance” of anywhere or at any time having dissolved politics.

Not completely satisfied with the “incomplete appearance”, Absolute Criticism again asks itself:

“How did it happen that *Criticism* at that time became involved in ‘mass-linked, political’ interests, that it — *even*” (!)— “*was obliged*” (!)— “*to engage in politics*”

Bauer the *theologian* takes it as a matter of course that *Criticism* had to indulge endlessly in *speculative theology* for he, “Criticism”, is indeed a theologian *ex professo*. But to *engage in politics*? That must be motivated by very special, political, personal circumstances!

Why, then, had “*Criticism*” to *engage* even in *politics*? “It was accused — *that is the answer to the question.*” At least the “mystery” of “*Bauer’s politics*” is thereby disclosed; at least the *appearance*, which in Bruno

Bauer's *Die gute Sache der Freiheit und meine eigene Sache* links its "own cause" to the *mass-linked* "cause of freedom" by means of an "*and*", cannot be called *non-political*. But if Criticism pursued not its "own cause" in the *interest of politics*, but *politics* in the *interest of its own cause*, it must be admitted that not Criticism was taken in by politics, but politics by Criticism.

So Bruno Bauer was to be dismissed from his chair of theology: he was *accused*; "*Criticism*" had to engage in politics, that is to say, to *conduct* "*its*", i.e., Bruno Bauer's, suit. Herr Bauer did not conduct Criticism's suit, "*Criticism*" conducted Herr Bauer's suit. Why did "*Criticism*" *have* to conduct its suit?

"In order to justify itself!" *It may well be*; only "*Criticism*" is far from limiting itself to such a personal, vulgar reason. It may well be; but *not solely* for that reason, "*but mainly* in order to bring out the contradictions of its opponents", and, Criticism could add, in order to have bound together in a single *book* old essays against various theologians — see among other things the wordy bickering with *Planck*, that family affair between "Bauer-theology" and Strauss-theology.

Having got a load off its heart by admitting the real interest of its "*politics*", Absolute Criticism remembers its "*suit*" and again chews the old *Hegelian* cud (see the struggle between Enlightenment and faith in the *Phänomenologie*, see *the whole of the Phänomenologie*) that "the old which resists the new is no longer really the old", the cud which it has already chewed over at length in *Die gute Sache der Freiheit*. Critical Criticism is a ruminant animal. It keeps on warming up a few crumbs dropped by Hegel, like the above-quoted proposition about the "old" and the "new", or again that about the "development of the extreme out of its opposite extreme", and the like, without ever feeling the need to deal with "*speculative dialectic*" in any other way than by the exhaustion of Professor Hinrichs. Hegel, on the contrary, it continually transcends "Critically" by repeating him. For example:

"Criticism, by appearing and giving the investigation a new form, i.e., giving it the form which is *no longer* susceptible of being transformed into an external limitation," etc.

When I *transform* something I make it something essentially different. Since every form is also an "*external limitation*", *no* form is "susceptible"

of being *transformed* into an “external limitation” any more than an apple of being “transformed” into an apple. Admittedly, the form which “Criticism” gives to the investigation is not susceptible of being transformed into any “external limitation” for quite *another* reason. Beyond every “external limitation” it is blurred into an ash-grey, dark-blue vapour of nonsense.

“It” (the struggle between the old and the new) “would, *however, be quit. impossible even then*” (namely at the moment when Criticism “gives” the investigation “the new form”) “if the old were to deal with the question of compatibility or incompatibility ... *theoretically*.”

But why does not the old deal with this question theoretically? Because “this, *however, is least of all possible for it in the beginning, since at the moment of surprise*” (i.e., in the beginning) it “knows neither itself nor the new”, i.e., it deals *theoretically* neither with itself nor with the new. It would be quite impossible if “impossibility”, unfortunately, were not impossible!

When *the* “Critic” from the theological faculty further “admits that he erred *intentionally*, that he committed the mistake deliberately and after mature reflection” (all that Criticism has experienced, learnt, and done *is transformed* for it into a free, pure and intentional product of its reflection) this confession of the Critic has only an “incomplete appearance” of truth. Since the *Kritik der Synoptiker* has a completely *theological* foundation, since it is through and through *theological* criticism, Herr Bauer, university lecturer in theology, could write and teach it “without mistake or error”. The mistake and error were rather on the part of the theological faculties, which did not realise how strictly Herr Bauer had kept his promise, the promise he gave in *Kritik der Synoptiker*, Bd. 1, Foreword, p. xxiii.

“If the *negation* may appear still too sharp and far-reaching in this first volume too, we must remember that the truly positive can be born only if the negation has been serious and general.... *In the end* it will be seen that only the most devastating criticism of the world can teach us the creative *power of Jesus* and of his *principle*.”

Herr Bauer intentionally separates the Lord “Jesus” and his “principle” in order to free the *positive* meaning of his promise from all semblance of ambiguity. And Herr Bauer has really made the “*creative*” power of the Lord Jesus and of his principle so evident that his “*infinite self-consciousness*” and the “*Spirit*” are nothing but *creations* of Christianity.

If Critical Criticism's dispute with the Bonn theological faculty explained so well its "politics" at that time, why did Critical Criticism continue to engage in politics after the dispute had been settled? Listen to this:

"At this point 'Criticism' *should have* either *come to a halt* or immediately *proceeded further* to examine the essence of politics and depict it as its adversary; — if only it had been possible for it to be able to come to a halt in the struggle at that time and if, on the *other* hand, there had not been a far too strict historical law that when a principle measures itself for the first time with its opposite it must let itself be repressed by it ..."

What a delightful apologetic phrase! "Criticism *should have* come to a halt" if only it had been possible ... "to be able to come to a halt"! Who "*should*" come to a halt? And who should have done what "it would not have been possible ... to be able to do"? On the other hand! Criticism should have proceeded "if *only*, on the other hand, there had *not* been a far *too* strict historical law," etc. Historical laws are also "*far too strict*" with Absolute Criticism! If only they did not stand on the *opposite* side to Critical Criticism, how brilliantly the latter would proceed! But *à la guerre comme à la guerre*! In history, Critical Criticism must allow itself to be made a sorry "story" of!

"If Criticism" (still Herr Bauer) "had to ... it will *at the same time* be admitted that it always felt *uncertain* when it gave in to demands of this" (political) "kind, and that as a result of these demands it came into contradiction with its *true elements*, a contradiction that had *already* found its *solution* in those *elements*."

Criticism was forced into political weaknesses by the all too strict laws of history, but — it entreats — *it will at the same time be admitted* that it was above those weaknesses, if not in reality, at least *in itself*. Firstly, it had overcome them, "*in feeling*", for "it always felt uncertain in its demands"; it felt *ill at ease* in politics, it could not make out what was the matter with it. More- than that! It came into contradiction with its *true elements*. And finally the greatest thing of ally The contradiction with its *true elements* into which it came found its solution not in the course of Criticism's *development*, but "*had*", on the contrary, "*already*" found its solution in Criticism's *true elements* existing independently of the contradiction! These Critical elements can claim with pride: before Abraham was, we were.

Before the opposite to us was produced by development, it lay yet unborn in our chaotic womb, dissolved, dead, ruined. But since Criticism's contradiction with its true elements "had already found its solution" in the true elements of Criticism, and since a *solved* contradiction is *not* a contradiction, it found itself, to be precise, in no contradiction with its true elements, in *no* contradiction with itself, and — the general aim of self-apology seems attained.

Absolute Criticism's self-apology has a whole *apologetical* dictionary at its disposal:

"not even properly speaking", "only not noticed", "there was besides", "not yet complete", "although — nevertheless", "not only — but mainly", "just as much, properly speaking, only", "Criticism should have if only it had been possible and if on the other hand", "if ... it will *at the same time* be admitted", "was it not 1. natural, was it not inevitable", "neither ..." etc.

Not so very long ago Absolute Criticism said the following about apologetic phrases of this kind:

"'Although' and 'nevertheless', 'indeed' and 'but', a heavenly 'Nay', and an earthly 'Yea', are the main pillars of modern theology, the stilts on which it strides along, the artifice to which its whole wisdom is reduced, the phrase which recurs in all its phrases, its alpha and omega" (*Das entdeckte Christenthum*,).

b) The Jewish Question No. 3

"Absolute Criticism" does not stop at proving by its autobiography its own singular almightiness which "*properly speaking, first creates the old*, just as much as the *new*". It does not stop at writing in *person* the apology of its past. It now sets third persons, the rest of the secular world, the Absolute "Task", the "task which is *much more* important *now*", the *apologia* for Bauer's deeds and "works".

The *Deutsch-Französische Jahrbücher* published a criticism of Herr Bauer's *Die Judenfrage* . His basic error, the confusion of "*political*" with "*human* emancipation", was revealed. True, the old Jewish question was not first brought into its "*correct setting*"; the "Jewish question" was rather dealt with and solved in the setting which recent developments have given

to *old questions of the day*, and as a result of which the latter have become “questions” of the present instead of “questions” of the past.

Absolute Criticism’s *third* campaign, it seems, is intended to reply to the *Deutsch-Französische Jahrbücher*. First of all, Absolute Criticism *admits*:

“In *Die Judenfrage* the same ‘oversight’ was made — that of identifying the *human* with the *political* essence.”

Criticism remarks:

“it would be too late to *reproach* criticism for the stand which it still maintained partially *two* years ago.” “*The question is rather to explain why criticism ... even had to engage in politics.*”

“Two years ago?” We must reckon according to the *absolute* chronology, from the birth of the Critical Redeemer of the world, Bauer’s *Literatur-Zeitung*! The Critical world redeemer was born anno 1843. In the same year the second, enlarged edition of *Die Judenfrage* was published. The “Critical” treatment of the ‘Jewish question’ in *Einundzwanzig Bogen aus der Schweiz* appeared later in the same year, 1843 old style. *After the end* of the *Deutsche Jahrbücher* and the *Rheinische Zeitung*, in the same momentous year 1843 old style, or anno 1 of the Critical era, appeared Herr Bauer’s fantastic-political work *Staat, Religion und Parthei*, which exactly repeated his old errors on the “*political* essence”. The apologist is forced to falsify *chronology*.

The “*explanation*” why Herr Bauer “*even had to*” engage in politics is a matter of general interest only under certain conditions. If the infallibility, purity and absoluteness of Critical Criticism are assumed as *basic dogma*, then, of course, the facts contradicting that dogma turn into riddles which are just as difficult, profound and mysterious as the apparently ungodly deeds of God are for theologians.

If, on the other hand, “*the Critic*” is considered as a finite individual, if he is not separated from the *limitations* of his time, one does not have to answer the question *why he* had to develop *even* within the world, because the *question* itself does not exist.

If, however, Absolute Criticism insists on its demand, one can offer to provide a little scholastic treatise dealing with the following “*questions of the times*”:

“Why had the Virgin Mary’s conception by the Holy Ghost to be proved by no other than Herr Bruno Bauer?” “Why had Herr Bauer to prove that

the angel that appeared to Abraham was a *real* emanation of God, an emanation which, nevertheless, lacked the consistency necessary to *digest food*?” “Why had Herr Bauer to provide an apologia for the Prussian royal house and to raise the Prussian state to the rank of *absolute* state?” “Why had Herr Bauer, in his *Kritik der Synoptiker*, to substitute ‘*infinite self-consciousness*’ for man?” “Why had Herr Bauer in his *Das entdeckte Christenthum* to repeat the *Christian theory of creation* in a *Hegelian* form?” “Why had Herr Bauer to demand of himself and others an ‘*explanation*’ of the miracle that he was bound to be mistaken?”

While waiting for proofs of these necessities, which are just as “Critical” as they are “Absolute”, let us listen once more to “*Criticism*’s” apologetic evasions.

“The Jewish question ... had ... first to be brought into its *correct* setting, as a *religious* and *theological* and as a *political* question.” “As to the treatment and solution of both these questions, *Criticism* is *neither religious nor political*.”

The point is that the *Deutsch-Französische-Jahrbücher* declares Bauer’s treatment of the “Jewish question” to be *really* theological and *fantastic-political*.

First, “*Criticism*” replies to the “reproach” of *theological* limitation.

“The Jewish question is a *religious* question. The *Enlightenment* claimed to solve it by describing the *religious contradiction* as *insignificant* or even by denying it. *Criticism*, on the contrary, had to present it in its purity.”

When we come to the *political* part of the Jewish question we shall see that in politics, too, Herr Bauer the theologian is not concerned with politics but with theology.

But when the *Deutsch-Französische-Jahrbücher* attacked his treatment of the Jewish question as “*purely religious*”, it was concerned especially with his article in *Einundzwanzig Bogen*, the title of which was:

“*Die Fähigkeit der hewigen Juden und Christen, frei zu werden*”.

“The Ability of Present-Day Jews and Christians to obtain Freedom.”

This article has nothing to do with the old “Enlightenment” . It contains Herr Bauer’s *positive* view on the ability of the present-day Jews to be emancipated, that is, on the possibility of their emancipation.

“Criticism” says:

“The Jewish question is a *religious* question.”

The question is: *What is a religious question?* and, in particular, *what is a religious question today?*

The *theologian* will judge by *appearances* and see a *religious* question in a religious question. But “Criticism” must remember the explanation it gave Professor *Hinrichs* that the *political* interests of the present time have *social* significance, that it is “*no longer a question*” of *political interests*.

The *Deutsch-Französische Jahrbücher* with equal right said to Criticism: *Religious* questions of the day have at the present time a *social* significance. It is no longer a question of *religious* interests as *such*. Only the *theologian* can believe it is a question of religion as religion. Granted, the *Jahrbücher* committed the *error* of not stopping at the word “*social*”. It characterised the real position of the Jews in civil society today. Once Jewry was stripped bare of the *religious* shell and its empirical, worldly, practical kernel was revealed, the practical, *really social* way in which this kernel is to be abolished could be indicated. Herr Bauer was content with a “religious question” being a “religious question”.

It was by no means denied, as Herr Bauer *makes out*, that the Jewish question is also a *religious* question. On the contrary, it was shown that Herr Bauer grasps *only the religious* essence of Jewry, but not the *secular, real basis* of that religious essence. He combats *religious consciousness* as if it were something independent. Herr Bauer therefore explains the *real* Jews by the *Jewish religion*, instead of explaining the mystery of the Jewish religion by the *real Jews*. Herr Bauer therefore understands the Jew only insofar as he is an immediate object of *theology* or a *theologian*.

Consequently Herr Bauer has no inkling that real *secular* Jewry, and hence *religious* Jewry too, is being continually produced by the *present-day civil life* and finds its final development in the *money system*. He could not have any inkling of this because he did not know Jewry as a part of the real world but only as a part of his world, *theology*; because he, a pious, godly man, considers not the active *everyday Jew* but the hypocritical *Jew of the Sabbath* to be the *real Jew*. For Herr Bauer, as a theologian of the *Christian faith*, the *world-historic* significance of Jewry had to cease the *moment* Christianity was *born*. Hence he had to repeat the old orthodox view that it has maintained itself *in spite* of history; and the old theological superstition

that Jewry exists only as a *confirmation* of the divine curse, as a *tangible proof* of the Christian revelation had to recur with him in the *Critical-theological* form that it exists and has existed only as *crude religious doubt* about the supernatural origin of Christianity, i.e., as a *tangible proof* against Christian revelation.

On the other hand, it was proved that Jewry has maintained. itself and developed *through* history, *in* and *with* history, and that this development is to be perceived not by the eye of the theologian, but only by the eye of the man of the world, because it is to be found, not in *religious theory*, but only in *commercial* and *industrial practice*. It was explained why practical Jewry attains its full development only in the fully developed Christian world, *why* indeed it is the fully developed *practice* of the *Christian world itself*. The existence of the *present-day* Jew was not explained by his religion — as though this religion were something apart, independently existing — but the tenacious survival of the Jewish religion was explained by practical features of civil society which are *fantastically* reflected in that religion. The emancipation of the Jews into human beings, or the human emancipation of Jewry, was therefore not conceived, as by Herr Bauer, as the special task of the Jews, but as a general practical task of the present-day world, which is *Jewish* to the core. It was proved that the task of abolishing the essence of Jewry is actually the task of abolishing the *Jewish character of civil society*, abolishing the inhumanity of the present-day practice of life, the most extreme expression of which is the *money system*.

Herr Bauer, as a *genuine*, although *Critical*, *theologian* or *theological* Critic, could not get beyond the *religious contradiction*. In the attitude of the Jews to the Christian world he could see only the attitude of the *Jewish religion* to the *Christian religion*. He even had to restore the religious contradiction in a *Critical* way — in the *antithesis* between the attitudes of the Jew and the Christian to *Critical* religion — *atheism*, the last stage of *theism*, the *negative* recognition of God. Finally, in his *theological fanaticism* he had to *restrict* the ability of the “present-day Jews and Christians”, i.e., of the present-day world, “to obtain freedom” to their ability to grasp “the Criticism” of theology and apply it themselves. For the orthodox theologian the whole world is dissolved in “religion and theology”. (He could just as well dissolve it in politics, political economy, etc., and call *theology* heavenly *political economy*, for example, since it is

the theory of the production, distribution, exchange and consumption of “*spiritual wealth*” and of the treasures of heaven!) Similarly, for the radical, Critical theologian, the *ability* of the world to achieve freedom, is dissolved in the *single* abstract ability to criticise “religion and theology” as “religion and theology”. The only struggle he knows is the struggle against the *religious* limitations of self-consciousness, whose Critical “*purity*” and “*infinity*” is just as much a theological limitation.

Herr Bauer, therefore, dealt with the *religious* and *theological* question in the *religious* and *theological* way, if only because he saw in the “religious” question of the time a “*purely religious*” question. His “*correct setting* of the question” set the question “correctly” only in respect of his “*own ability*” — to answer!

Let us now go on to the political part of the *Jewish question*.

The *Jews* (like the Christians) *are* fully *politically emancipated* in various states. Both Jews and Christians are far from being *humanly* emancipated. Hence there must be a *difference* between *political* and *human* emancipation. The essence of political emancipation, i.e., of the developed, modern state, must therefore be studied. On the other hand, states which cannot yet *politically* emancipate the Jews must be rated by comparison with the perfected political state and shown to be under-developed states.

That is the point of view from which the “*political* emancipation” of the Jews should have been dealt with and is dealt with in the *Deutsch-Französische Jahrbücher*.

Herr Bauer offers the following defence of “Criticism’s” *Die Judenfrage*.

“The Jews were shown that they laboured under an illusion about *the system* from which they demanded freedom.”

Herr Bauer did show that the illusion of *the German Jews* was to demand the right to partake in the political community life in a land where there was no political community and to demand *political rights* where only political privileges existed. On the other hand, Herr Bauer was shown that he himself, no less than the Jews, laboured under “illusions” about the “German political system”. For he explained the position of the Jews in the German states as being due to the inability of “*the Christian state*” to emancipate the Jews politically. Flying in the face of the facts, he depicted the state of *privilege*, the *Christian-Germanic* state, as the Absolute Christian state. It was proved to him, on the contrary, that the politically

perfected, modern state that knows no religious privileges is also the fully developed *Christian* state, and that therefore the fully developed Christian state, not only can emancipate the Jews but has emancipated them and by its very nature must emancipate them.

.’the Jews are shown ... that they are under the greatest illusion about themselves when they think they are demanding *freedom* and the recognition of *free humanity*, whereas for them it is, and can be, only a question of a special *privilege*.”

Freedom! Recognition of free humanity! Special privilege! Edifying words by which to by-pass certain questions apologetically!

Freedom? it was a question of political freedom. Herr Bauer was shown that when the Jew demands freedom and nevertheless refuses to renounce his religion, he “*is engaging in politics*” and sets no condition that is contrary to *political* freedom. Herr Bauer was shown that it is by no means contrary to political emancipation to *divide* man into the non-religious citizen and the religious *private individual*. He was shown that just as the state emancipates itself from religion by emancipating itself from *state religion* and leaving religion to itself within civil society, so the individual emancipates himself *politically* from religion by regarding it no longer as a *public* matter but as a *private matter*. Finally, it was shown that the *terroristic* attitude of the French Revolution to *religion*, far from refuting this conception, bears it out.

Instead of studying the real attitude of the *modern* state to religion, Herr Bauer thought it necessary to imagine a *Critical* state, a state which is nothing but the *Critic of theology inflated into a state* in Herr Bauer’s imagination. If Herr Bauer is caught up in *politics* he continually makes politics a prisoner of his faith, *Critical* faith. Insofar as he deals with the state he always makes out of it an *argument* against “*the adversary*”, *un-Critical* religion and theology. The state acts as executor of *Critical-theological* cherished desires.

When Herr Bauer had first freed himself from *orthodox*, un-Critical *theology*, *political authority* took for him the place of *religious authority*. His faith in Jehovah changed into faith in the Prussian state. In Bruno Bauer’s work *Die evangelische Landeskirche*, not only the Prussian state, but, quite consistently, the Prussian royal house too, was made into an *absolute*. In reality Herr Bauer had no *political* interest in that state; its

merit, in the eyes of “Criticism”, was rather that it abolished dogmas by means of the *Unified Church* and suppressed the dissenting sects with the help of the police.

The political movement that began in the year 1840 redeemed Herr Bauer from *his conservative politics* and raised him for a moment to *liberal politics*. But here again politics was in reality only a *pretext* for theology. In his work *Die gute Sache der Freiheit und meine eigene Angelegenheit*, the free state is the Critic of the theological faculty in Bonn and an argument against religion. In *Die Judenfrage* the contradiction between state and religion is the main interest, so that the criticism of political emancipation changes into a criticism of the Jewish religion. In his latest political work, *Staat, Religion und Parthei*, the most secret cherished desire of the Critic inflated into a state is at last expressed. *Religion is sacrificed to the state* or rather the state is only the *means* by which the opponent of “Criticism”, un-Critical religion and theology, is done to death. Finally, after *Criticism* has been redeemed, if only apparently, from all politics by the socialist ideas, which have been spreading in Germany from 1843 onwards, in the same way as it was redeemed from its conservative politics by the political movement after 1840, it is finally able to proclaim its writings against *un-Critical* theology to be social and to indulge unhindered in its own *Critical* theology, the contrasting of Spirit and Mass, as the annunciation of the Critical Saviour and Redeemer of the world.

Let us return to our subject!

Recognition of free humanity? “Free humanity”, recognition of which the Jews did not merely think they wanted, but really did want, is. the same “free humanity” which found *classic* recognition in the so-called universal *rights of man*. Herr Bauer himself explicitly treated the Jews’ efforts for recognition of their free humanity as their efforts to obtain the universal *rights of man*.

In the *Deutsch-Französische Jahrbücher* it was demonstrated to Herr Bauer that this “free humanity” and the “recognition” of it are nothing but the recognition of the *egoistic civil individual* and of the *unrestrained* movement of the spiritual and material elements which are the content of his life situation, the content of *present-day* civil life; that the *rights of man* do not, therefore, free man from religion, but give him freedom of religion; that they do not free him from property, but procure for him *freedom of*

property; that they do not free him from the filth of gain, but rather give him *freedom of gainful occupation*.

It was shown that the *recognition of the rights of man* by the *modern state* has no other meaning than the *recognition of slavery* by the *state of antiquity* had. In other words, just as the ancient state had slavery as its *natural basis*, the *modern state* has as its *natural basis* civil society and the *man* of civil society, i.e., the independent man linked with other men ‘only by the ties of private interest and *unconscious* natural necessity, the *slave* of labour for gain and of his own as well as other men’s *selfish* need. The modern state has recognised this its natural basis as such in the *universal rights of man*. It did not create it. As it was the product of civil society driven beyond the old political bonds by its own development, the modern state, for its part, now recognised the womb from which it sprang and its basis by the *declaration* of the *rights of man*. Hence, the political emancipation of the Jews and the granting to them of the “*rights of man*” is an act the two sides of which are mutually dependent. Herr *Riesser* correctly expresses the meaning of the Jews’ desire for recognition of their free humanity when he demands, among other things, the freedom of movement, sojourn, travel, earning one’s living, etc. These manifestations of “*free humanity*” are explicitly recognised as such in the French Declaration of the Rights of Man. The Jew has all the more right to the recognition of his “free humanity” as “free civil society” is of a thoroughly commercial and Jewish nature, and the Jew is a necessary member of it. The *Deutsch-Französische Jahrbücher* further demonstrated why the member of civil society is called, *par excellence*, “Man” and why the rights of man are called “inborn rights”.

The only Critical thing Criticism could say about the rights of man was that they are not inborn but arose in the course of history. That much *Hegel* had already told us. Finally, to its assertion that both Jews and Christians, in order to grant or receive the universal rights of man, *must sacrifice the privilege of faith* — the Critical theologian supposes his *one* fixed idea at the basis of all things — there was specially counterposed the fact contained in all un-Critical declarations of the rights of man that the *right* to believe what one wishes, the right to practise any religion, is explicitly recognised as a *universal right of man*. Besides, “*Criticism*” should have known that Hébert’s party in particular was defeated on the pretext that it attacked the

rights of man by attacking *freedom of religion*, and that similarly the rights of man were invoked later when freedom of worship was restored.

“As far as *political* essence is concerned, *Criticism* followed its contradictions to the point where the *contradiction between theory and practice* had been most thoroughly elaborated during the past fifty years — to the *French representative system*, in which the freedom of theory is disavowed by practice and the freedom of practical life seeks in vain its expression in theory.

“Now that the basic illusion has been done away with, *the contradiction* proved in the *debates in the French Chamber*, the contradiction between *free theory* and the *practical validity of privileges*, between the legal validity of privileges and a *public system* in which the *egoism of the pure individual* tries to dominate the *exclusivity of the privileged*, should be conceived as a *general contradiction* in this sphere.”

The contradiction that Criticism proved in the debates in the French Chamber was nothing but a contradiction of *constitutionalism*. Had Criticism grasped it as a *general* contradiction it would have grasped the general contradiction of constitutionalism. Had it gone still further than in its opinion it “should have” gone, had it, to be precise, gone as far as the *abolition* of this general contradiction, it would have proceeded correctly from constitutional *monarchy* to arrive at the *democratic representative state*, the perfected modern state. Far from having criticised the essence of political emancipation and proved its definite relation to the essence of man, it would have arrived only at the *fact* of political emancipation, at the fully developed modern state, that is to say, only at the point where the existence of the modern state conforms to its essence and where, therefore, not only the relative, but the absolute *imperfections*, those which constitute its very essence, can be observed and described.

The above-quoted “Critical” passage is all the more valuable as it proves beyond any doubt that at the very moment when *Criticism* sees the “*political essence*” far below itself, it is, on the contrary, far below the political essence; it still needs to find in the latter the solution of its own contradictions and it still persists in not giving a thought to the *modern principle of the state*.

To “*free theory*” Criticism contrasts the “*practical validity of privileges*”; to the “*legal validity of privileges*” it contrasts the “*public system*”.

In order not to misinterpret the opinion of *Criticism*, let us recall the contradiction it proved in the debates in the French Chamber, the very contradiction which “should have been conceived” as a *general* one. One of the questions dealt with was the fixing of a day in the week on which children would be freed from work. *Sunday* was suggested. One deputy moved to leave out mention of Sunday in the law as being unconstitutional. The Minister Martin (du Nord) saw in this motion an attempt to proclaim that Christianity had ceased to exist. Monsieur Crémieux declared on behalf of the French Jews that the Jews, out of respect for the religion of the great majority of Frenchmen, did not object to Sunday being mentioned. Now, according to free theory, Jews and Christians are equal, but according to this practice Christians have a privilege over Jews; for otherwise how could the Sunday of the Christians have a place in a law made for all Frenchmen? Should not the Jewish Sabbath have the same right, etc.? Or in the practical life of the French too, the Jew is not really oppressed by Christian privileges; but the law does not dare to express this practical equality. All the contradictions in the political essence expounded by Herr Bauer in *Die Judenfrage* are of this kind — contradictions of *constitutionalism*, which is, in general, the contradiction between the modern representative state and the old state of privileges.

Herr Bauer is committing a very serious oversight when he thinks he is rising from the *political* to the *human* essence by conceiving and criticising this contradiction as a “general” one. He would thus only rise from partial political emancipation to full Political emancipation, from the constitutional state to the democratic representative state.

Herr Bauer thinks that by the abolition of *privilege* the *object* of privilege is also abolished. Concerning the statement of Monsieur Martin (du Nord), he says:

“*There is no longer any religion when there is no longer any privileged religion. Take from religion its exclusive power and it will no longer exist.*”

Just as *industrial* activity is not abolished when the *privileges of the trades*, guilds and corporations are abolished, but, on the contrary, real *industry* begins only after the abolition of these privileges; just as *ownership of the land* is not abolished when *privileged* land-ownership is abolished, but, on the contrary, begins its universal movement only with the abolition of privileges and with the free division and free sale of land; just

as *trade* is not abolished by the abolition of *trade privileges*, but finds its true realisation in free trade; so religion develops in its *practical* universality only where there is no *privileged* religion (cf. the North American States).

The modern “*public system*”, the developed modern state, is not based, as *Criticism* thinks, on a society of privileges, but on a society in which *privileges have been abolished and dissolved*, on developed *civil society* in which the vital elements which were still politically bound under the privilege system have been set free. Here no “*privileged exclusivity*,” stands opposed either to any other exclusivity or to the public system. Free industry and free trade abolish privileged exclusivity and thereby the struggle between the privileged exclusivities. They replace exclusivity with man freed from privilege — which isolates from the general totality but at the same time unites in a smaller exclusive totality — man no longer bound to other men even by the *semblance* of a common bond. Thus they produce the universal struggle of man against man, individual against individual. In the same way *civil society* as a whole is this war against one another of all individuals, who are no longer isolated from one another by anything but their *individuality*, and the universal unrestrained movement of the elementary forces of life freed from the fetters of privilege. ‘the contradiction between the *democratic representative state* and *civil society* is the completion of the *classic* contradiction between public *commonweal* and *slavery*. In the modern world each person is *at the same time* a member of slave society and of the public commonweal. Precisely the *slavery of civil society is in appearance* the greatest *freedom* because it is in appearance the fully developed independence of the individual, who considers as his *own* freedom the uncurbed movement, no longer bound by a common bond or by man, of the estranged elements of his life, such as property, industry, religion, etc., whereas actually this is his fully developed slavery and inhumanity. *Law* has here taken the place of *privilege*.

It is therefore only here, where we find no contradiction between free theory and the practical validity of privilege, but, on the contrary, the practical abolition of privilege, *free* industry, *free* trade, etc., conform to “free theory”, where the public system is not opposed by any privileged exclusivity, where the contradiction expounded by *Criticism* is *abolished* — only here is the *fully developed modern state to be found*.

Here also reigns the *reverse* of the law which Herr Bauer, on the occasion of the debates in the French Chamber, formulated in perfect agreement with Monsieur Martin (du Nord):

“Just as M. Martin (du Nord) saw the proposal to omit mention of *Sunday* in the *law* as a motion to declare that Christianity has ceased to exist, with equal reason (*and this reason is very well founded*) — the declaration that the *law of the Sabbath* is no longer binding on the Jews would be a *proclamation abolishing Judaism*.”

It is just *the opposite* in the developed modern state. The state declares that religion, like the other elements of civil life, only *begins* to exist in its full scope when the state declares it to be *non-political* and therefore leaves it to itself. To the dissolution of the *political* existence of these elements, as for example, the: dissolution of *property* by the abolition of the *property qualification for electors*, the dissolution of *religion* by the abolition of the *state church*, to this proclamation of their civil death corresponds their most vigorous life, which henceforth obeys its own laws undisturbed and develops to its full scope.

Anarchy is the law of civil society emancipated from divisive privileges, and the *anarchy of civil society* is the basis of the modern *public system*, just as the public system in its turn is the guarantee of that anarchy. To the same great extent that the two are opposed to each other they also determine each other.

It is clear how capable *Criticism* is of assimilating the “new”. But if we remain within the bounds of “pure Criticism”, the question arises: Why did Criticism not conceive as a *universal* contradiction the contradiction which it disclosed in connection with the debates in the French Chamber, although in its own opinion that is what it “*should have*” been done?

“That step *was*, however, then *impossible* — not only because ... not only because ... *but also* because without that *last remnant* of inner involvement with its opposite Criticism *was impossible* and *could not have come to the point* from which only *one step* remained to be taken.”

It was impossible ... because ... it was impossible! *Criticism* assures us, moreover, that the fateful “*one step*” necessary „to come to the point from which only one step remained to be taken” was impossible. Who will dispute that? In order to be able to come to a point from which only “*one step*” remains to be taken, it is absolutely impossible to take that “*one step*”

more which leads over the point beyond which still “*one step*” remains to be taken.

All’s well that ends well! At the end of the encounter with the *Mass*, which is hostile to *Criticism’s Die Judenfrage*, “*Criticism*” admits that its conception of the “*rights of man*”, its

“appraisal of religion in the French Revolution”, the “free political essence it pointed to occasionally *at the conclusion of its* considerations”, in short, the whole ‘.period of the French Revolution, was for *Criticism* neither more nor less than a symbol — that is to say, not the period of the revolutionary efforts of the French in the exact and prosaic sense — a symbol and therefore only a fantastic expression of the shapes which it saw at the end”.

We shall not deprive *Criticism* of the consolation that when it sinned politically it did so only at the “conclusion” and at the “end” of its works. A notorious drunkard used to console himself with the thought that he was never drunk before midnight.

In the sphere of the “Jewish question”, *Criticism* has indisputably been winning more and more ground from *the Enemy*. In No. 1 of the “Jewish question”, the treatise of “*Criticism*” defended by Herr Bauer was still absolute and revealed the “*true*” and “*general*” significance of the “Jewish question”. In No. 2 *Criticism* had neither the “*will*” nor the “*right*” to go beyond *Criticism*. In No. 3 it had still to take “*one step*”, but that step was “impossible” — because it was— “impossible”. It was not its “will or right” but its involvement in its “opposite” that prevented it from taking that *one step*”. It would very much have liked to clear the last obstacle, but unfortunately a *last remnant of Mass* stuck to its Critical seven-league boots.

c) Critical Battle Against the French Revolution

The *narrow-mindedness of the Mass* forced the “Spirit”, *Criticism*, Herr Bauer, to consider the *French Revolution* not as the time of the revolutionary efforts of the French in the “*prosaic sense*” but “*only*” as the “*symbol and fantastic expression*” of the Critical figments of his own brain. *Criticism* does *penance* for its “*oversight*” by submitting the *Revolution* to a *fresh examination*. At the same time it punishes the seducer of its innocence

— “the Mass” — by communicating to it the results of this “fresh examination”.

“The *French Revolution* was an experiment which still belonged entirely to the eighteenth century.”

The chronological truth that an experiment of the eighteenth century like the French Revolution is still entirely an experiment of the eighteenth century, and not, for example, an experiment of the nineteenth, seems “still entirely” to be one of those truths which “are self-evident from the start”. But in the terminology of criticism, which is very prejudiced against “crystal-clear” truths, a truth like that is called an “*examination*” and therefore naturally has its place in a “fresh examination of the Revolution”.

“The ideas to which the French Revolution gave rise did not, however, lead beyond the *order of things* that it wanted to abolish by force.”

Ideas can never lead beyond an old world order but only beyond the ideas of the old world order. Ideas *cannot carry out anything* at all. In order to carry out ideas men are needed who can exert practical force. In its literal *sense* the Critical sentence is therefore another truth that is self-evident, and therefore another “*examination*”.

Undeterred by this examination, the French Revolution gave rise to ideas which led beyond the *ideas* of the entire old world order. The revolutionary movement which began in 1789 in the *Cercle Social*, which in the middle of its course had as its chief representatives *Leclerc* and *Roux*, and which finally with *Babeuf's* conspiracy was temporarily defeated, gave rise to the communist idea which *Babeuf's* friend *Buonarroti* re-introduced in France after the Revolution of 1830. This idea, consistently developed, is the *idea* of the *new world order*.

“After the Revolution had therefore” (!) “abolished the feudal barriers in the life of the people, it was compelled to satisfy and even to inflame the pure egoism of the nation and, on the other hand, to curb it by its necessary complement, the recognition of a supreme being, by this higher confirmation of the general state System, which has to hold together the individual self-seeking atoms.”

The egoism of the nation is the natural egoism of the general state system, as opposed to the egoism of the feudal classes. The supreme being is the higher confirmation of the general state system, and hence also of the nation. Nevertheless, the supreme being is supposed to curb the egoism of

the nation, that is, of the general state system! A really Critical task, to *curb* egoism by means of its confirmation and even of its *religious* confirmation, i.e., by recognising that it is of a superhuman nature and therefore free of human restraint! The creators of the supreme being were not aware of this, their Critical intention.

Monsieur *Buchez*, who bases national fanaticism on religious fanaticism, understands his hero *Robespierre* better.

Nationalism led to the downfall of Rome and Greece. *Criticism* therefore says nothing specific about the French Revolution when it maintains that nationalism caused its downfall, and it says just as little about the nation when it defines its egoism as *pure*. This pure egoism appears rather to be a very dark, spontaneous egoism, combined with flesh and blood, when compared, for example, with the pure egoism of *Fichte's* "ego". But if, in contrast to the egoism of the feudal classes, its purity is only relative, no "fresh examination of the revolution" was needed to see that the egoism which has a nation as its content is more general or purer than that which has as its content a particular social class or a particular corporation.

Criticism's explanations about the general state system are no less instructive. They are confined to saying that the general state system must hold together the individual self-seeking atoms.

Speaking exactly and in the prosaic sense, the members of civil society are not *atoms*. The *specific property* of the atom is that it has no properties and is therefore not connected with beings outside it by any relationship determined by its own *natural necessity*. The atom *has no needs*, it is *self-sufficient*., the world outside it is an absolute *vacuum*, i.e., is contentless, senseless, meaningless, just because the atom has *all fullness* in itself. The egoistic individual in civil society may in his non-sensuous imagination and lifeless abstraction inflate himself into an *atom*, i.e., into an unrelated, self-sufficient, wantless, *absolutely full*, blessed being. Unblessed *sensuous reality* does not bother about his imagination, each of his senses compels him to believe in the existence of the world and of individuals outside him, and even his *profane* stomach reminds him every day that the world *outside* him is not *empty*, but is what really *fills*. Every activity and property of his being, every one of his vital urges, becomes a *need*, a *necessity*, which his *self-seeking* transforms into seeking for other things and human beings

outside him. But since the need of one individual has no self-evident meaning for another egoistic individual capable of satisfying that need, and therefore no direct connection with its satisfaction, each individual has to create this connection; it thus becomes the intermediary between the need of another and the objects of this need. Therefore, it is *natural necessity*, the *essential human properties* however estranged they may seem to be, and *interest* that hold the members of civil society together; *civil*, not *political* life is their *real* tie. It is therefore not the *state* that holds the *atoms* of civil society together, but the fact that they are *atoms* only in *imagination* in the *heaven* of their fancy, but in *reality* beings tremendously different from atoms, in other words, not *divine egoists*, but *egoistic human beings*. Only political superstition still imagines today that civil life must be held together by the state, whereas in reality, on the contrary, the state is held together by civil life.

“Robespierre’s and Saint-Just’s tremendous idea of making a ‘free people’ which would live only according to the rules of justice and *virtue* — see, for example, Saint-Just’s report on Danton’s crimes and his other report on the general police — could be maintained for a certain time only by terror and was a *contradiction against which* the vulgar, self-seeking elements of *the popular community* reacted in the cowardly and insidious way that was only to be expected from them..,

This phrase of *Absolute Criticism*, which describes a “free people” as a “*contradiction*” against which the elements of the “*popular community*” are bound to react, is absolutely hollow, for according to Robespierre and Saint-just *liberty, justice* and *virtue* could, on the contrary, be only manifestations of the life of the “*people*” and only properties of the “popular community”. Robespierre and Saint-just spoke explicitly of “liberty, justice and virtue” of *ancient times*, belonging only to the “*popular community*”. *Spartans, Athenians* and *Romans* at the time of their greatness were “free, just and virtuous peoples”.

“What,” asks Robespierre in his speech on the principles of public morals (sitting of the Convention on February 5, 1794), “is the *fundamental principle* of democratic or popular government? It is *virtue*, I mean *public* virtue, which worked such miracles in *Greece* and *Rome* and which will work still greater ones in Republican France; virtue which is nothing but love of one’s country and its laws.” >

Robespierre then explicitly calls the *Athenians* and *Spartans* “*peuples libres*”. He continually recalls the ancient *popular commune* and quotes its heroes as well as its corrupters — Lycurgus, Demosthenes, Miltiades, Aristides, Brutus and Catilina, Caesar, Clodius and Piso.

In his report on Danton’s arrest (referred to by Criticism) *Saint-Just* says explicitly:

“The world has been empty since the *Romans*, and only their memory fills it and still prophesies liberty.”

His accusation is composed in the ancient style and directed against *Danton* as against *Catilina*.

In *Saint-Just*’s other report, the one on the general police, the *republican* is described exactly in the *ancient* sense, as *inflexible, modest, simple* and so on. The *police* should be an institution of the same nature as the Roman *censorship*. — He does not fail to mention Codrus, Lycurgus, Caesar, Cato, Catilina, Brutus, Antonius, and Cassius. Finally, *Saint-Just* describes the “*liberty, justice and virtue*” that he demands in a *single word* when he says:

“Que les hommes révolutionnaires soient des *Romains*.”

Robespierre, Saint-just and their party fell because they confused the ancient, *realistic-democratic commonweal* based on *real slavery* with the *modern spiritualistic-democratic representative state*, which is based on *emancipated slavery, bourgeois society*. What a terrible illusion it is to have to recognise and sanction in the *rights of man* modern bourgeois society, the society of industry, of universal competition, of private interest freely pursuing its aims, of anarchy, of self-estranged natural and spiritual individuality, and at the same time to want afterwards to annul the *manifestations of the life* of this society in particular individuals and simultaneously to want to model the *political head* of that society in the manner of antiquity!

The illusion appears tragic when Saint-Just, on the day of his execution, pointed to the large table of the *Rights of Man* hanging in the hall of the *Conciergerie* and said with proud dignity: “*C’est pourtant moi qui ai fait cela*” It was just this table that proclaimed the *right* of a *man* who cannot

be the man of the ancient commonwealth any more than his *economic* and *industrial* conditions are those of *ancient* times.

This is not the place to vindicate the illusion of the *Terrorists* historically.

“After the fall of Robespierre the *political enlightenment* and *movement* hastened to the point where they became the prey of *Napoleon* who, shortly after 18 Brumaire, could say: ‘With my prefects, gendarmes and priests I can do what I like with France.’”

Profane history, on the other hand, reports: After the fall of Robespierre, the *political* enlightenment, which formerly had been *overreaching* itself and had been *extravagant*, began for the first time to develop *prosaically*. Under the government of the *Directory*, *bourgeois society*, freed by the Revolution itself from the trammels of feudalism and officially recognised in spite of the *Terror's* wish to sacrifice it to an ancient form of political life, broke out in powerful streams of life. A storm and stress of commercial enterprise, a passion for enrichment, the exuberance of the new bourgeois life, whose first self-enjoyment is pert, light-hearted, frivolous and intoxicating; a *real* enlightenment of the *land* of France, the feudal structure of which had been smashed by the hammer of the Revolution and which, by the first feverish efforts of the numerous new owners, had become the object of all-round cultivation; the first moves of industry that had now become free — these were some of the signs of life of the newly emerged bourgeois society. *Bourgeois society* is *positively* represented by the *bourgeoisie*. The bourgeoisie, therefore, *begins* its rule. The *rights of man* cease to exist *merely* in *theory*.

It was not the revolutionary movement as a whole that became the prey of Napoleon on 18 Brumaire, as *Criticism* in its faith in a Herr von Rotteck or Welcker believes; it was the *liberal bourgeoisie*. One only needs to read the speeches of the legislators of the time to be convinced of this. One has the impression of coming from the National Convention into a modern Chamber of Deputies.

Napoleon represented the last battle of *revolutionary terror* against the *bourgeois society* which had been proclaimed by this same Revolution, and against its policy. Napoleon, of course, already discerned the essence of the *modern state*; he understood that it is based on the unhampered development of bourgeois society, on the free movement of private interest, etc. He decided to recognise and protect this basis. He was no terrorist with

his head in the clouds. Yet at the same time he still regarded the *state* as an *end in itself* and civil life only as a treasurer and his *subordinate* which must have no *will of its own*. He *perfected* the *Terror* by *substituting permanent war* for *permanent revolution*. He fed the egoism of the French nation to complete satiety but demanded also the sacrifice of bourgeois business, enjoyments, wealth, etc., whenever this was required by the political aim of conquest. If he despotically suppressed the liberalism of bourgeois society — the political idealism of its daily practice — he showed no more consideration for its essential *material* interests, trade and industry, whenever they conflicted with his political interests. His scorn of industrial *hommes d'affaires* was the complement to his scorn of *ideologists*. In his home policy, too, he combated bourgeois society as the opponent of the state which in his own person he still held to be an absolute aim in itself. Thus he declared in the State Council that he would not suffer the owner of extensive estates to cultivate them or not as he pleased. Thus, too, he conceived the plan of subordinating trade to the state by appropriation of *roulage*. French businessmen took steps to anticipate the event that first shook Napoleon's power. Paris exchange-brokers forced him by means of an artificially created famine to delay the opening of the Russian campaign by nearly two months and thus to launch it too late in the year.

Just as the liberal bourgeoisie was opposed once more by revolutionary terror in the person of Napoleon, so it was opposed once more by counter-revolution in the Restoration in the person of the Bourbons. Finally, in 1830 the bourgeoisie put into effect its wishes of the year 1789, with the only difference that its *political enlightenment* was now *completed*, that it no longer considered the constitutional representative state as a means for achieving the ideal of the state, the welfare of the world and universal human aims but, on the contrary, had acknowledged it as the *official* expression of its own *exclusive* power and the *political* recognition of its own *special* interests.

The history of the French Revolution, which dates from 1789, did not come to an end in 1830 with the victory of one of its components enriched by the consciousness of its own *social* importance.

d) Critical Battle Against French Materialism

“*Spinozism* dominated the eighteenth century both in its later French variety, which made matter into substance, and in deism, which conferred on matter a more spiritual name.... *Spinoza's French school* and the supporters of deism were but two sects disputing over the true meaning of *his system*.... The simple fate of this Enlightenment was its decline in *romanticism* after being obliged to surrender to the reaction which began after the French movement.”

That is what *Criticism* says.

To the Critical history of French materialism we shall oppose a brief outline of its ordinary, mass-type history. We shall acknowledge with due respect the abyss between history as it really happened and history as it takes place according to the decree of “*Absolute Criticism*”, the creator equally of the old and of the new. And finally, obeying the prescriptions of *Criticism*, we shall make the “Why?”, “Whence?” and “Whither?” of Critical history the “object of a persevering study”.

“Speaking *exactly* and in the *prosaic sense*”, the French Enlightenment of the eighteenth century, and in particular *French materialism*, was not only a struggle against the existing political institutions and the existing religion and theology; it was just as much an *open, clearly expressed* struggle against the *metaphysics of the seventeenth century*, and against all *metaphysics*, in particular that of *Descartes, Malebranche, Spinoza and Leibniz*. Philosophy was counterposed to *metaphysics*, just as *Feuerbach*, in his first resolute attack on *Hegel*, counterposed *sober philosophy* to *wild speculation*. Seventeenth century *metaphysics*, driven from the field by the *French Enlightenment*, notably, by French materialism of the eighteenth century, experienced a *victorious and substantial restoration* in *German philosophy*, particularly in the *speculative German philosophy* of the nineteenth century. After *Hegel* linked it in a masterly fashion with all subsequent metaphysics and with German idealism and founded a metaphysical universal kingdom, the attack on theology again corresponded, as in the eighteenth century, to an attack on *speculative metaphysics* and *metaphysics in general*. It will be defeated for ever by *materialism*, which has now been perfected by the work of *speculation* itself and coincides with *humanism*. But just as *Feuerbach* is the representative of *materialism* coinciding with *humanism* in the *theoretical*

domain, French and English *socialism* and *communism* represent materialism coinciding with *humanism* in the *practical* domain.

“Speaking *exactly* and in the *prosaic sense*”, there are *two trends* in *French materialism*; one traces its origin to *Descartes*, the other to *Locke*. The latter is *mainly* a *French* development and leads directly to *socialism*. The former, *mechanical* materialism, merges with French *natural science* proper. The two trends intersect in the course of development. We have no need here to go more deeply into the French materialism that derives directly from *Descartes*, any more than into the French school of *Newton* and the development of French natural science in general.

We shall therefore merely say the following:

Descartes in his *physics* endowed *matter* with self-creative power and conceived *mechanical* motion as the manifestation of its life. He completely separated his *physics* from his *metaphysics*. Within his *physics*, *matter* is the sole *substance*, the sole basis of being and of knowledge.

Mechanical French materialism adopted *Descartes’ physics* in opposition to his *metaphysics*. His followers were by profession *anti-metaphysicians*, i.e., *physicists*.

This school begins with the *physician* *Le Roy*, reaches its zenith with the physician *Cabanis*, and the physician *La Mettrie* is its centre. *Descartes* was still living when *Le Roy*, like *La Mettrie* in the eighteenth century, transposed the Cartesian structure of the animal to the human soul and declared that the soul is a *modus of the body* and *ideas* are *mechanical motions*. *Le Roy* even thought *Descartes* had kept his real opinion secret. *Descartes* protested. At the end of the eighteenth century *Cabanis* perfected Cartesian materialism in his treatise: *Rapport du physique et du moral de l’homme*.

Cartesian materialism still exists today in France. It has achieved great successes in *mechanical natural science* which, “speaking *exactly* and in the *prosaic sense*”, will be least of all reproached with *romanticism*.

The *metaphysics* of the seventeenth century, represented in France by *Descartes*, had *materialism* as its *antagonist* from its very birth. The latter’s opposition to *Descartes* was personified by *Gassendi*, the restorer of *Epicurean* materialism. French and English materialism was always closely related to *Democritus* and *Epicurus*. Cartesian metaphysics had another opponent in the *English* materialist *Hobbes*. *Gassendi* and *Hobbes*

triumphed over their opponent long after their death at the very time when metaphysics was already officially dominant in all French schools.

Voltaire pointed out that the indifference of the French of the eighteenth century to the disputes between the Jesuits and the Jansenists was due less to philosophy than to *Law's* financial speculations. So the downfall of seventeenth-century metaphysics can be explained by the materialistic theory of the eighteenth century only in so far as this theoretical movement itself is explained by the practical nature of French life at that time. This life was turned to the immediate present, to worldly enjoyment and worldly interests, to the *earthly* world. Its anti-theological, anti-metaphysical, materialistic practice demanded corresponding anti-theological, anti-metaphysical, materialistic theories. Metaphysics had *in practice* lost all credit. Here we have only to indicate briefly the *theoretical* course of events.

In the seventeenth century metaphysics (cf. Descartes, Leibniz, and others) still contained a *positive*, secular element. It made discoveries in mathematics, physics and other exact sciences which seemed to come within its scope. This semblance was done away with as early as the beginning of the eighteenth century. The positive sciences broke away from metaphysics and marked out their independent fields. The whole wealth of metaphysics now consisted only of beings of thought and heavenly things, at the very time when real beings and earthly things began to be the centre of all interest. Metaphysics had become insipid. In the very year in which Malebranche and Arnauld, the last great French metaphysicians of the seventeenth century, died, *Helvétius* and *Condillac* were born.

The man who deprived seventeenth-century metaphysics and metaphysics in general of all *credit* in the domain of *theory* was *Pierre Bayle*. His weapon was *scepticism*, which he forged out of metaphysics' own magic formulas. He himself proceeded at first from Cartesian metaphysics. Just as *Feuerbach* by combating speculative theology was driven further to combat *speculative philosophy*, precisely because he recognised in speculation the last drop of theology, because he had to force theology to retreat from pseudo-science to *crude*, repulsive *faith*, so Bayle too was driven by religious doubt to doubt about the metaphysics which was the prop of that faith. He therefore critically investigated metaphysics in its entire historical development. He became its historian in order to write the history of its death. He refuted chiefly *Spinoza* and *Leibniz*.

Pierre Bayle not only prepared the reception of materialism and of the philosophy of common sense in France by shattering metaphysics with his scepticism. He heralded the *atheistic society* which was soon to come into existence by proving that a society consisting only of atheists is *possible*, that an atheist can be a man worthy of respect, and that it is not by atheism but by superstition and idolatry that man debases himself.

To quote a French writer, *Pierre Bayle* was “the last metaphysician in the sense of the seventeenth century and *the first philosopher in the sense of the eighteenth century*”.

Besides the negative refutation of seventeenth-century theology and metaphysics, a *positive, anti-metaphysical* system was required. A book was needed which would systematise and theoretically substantiate the life practice of that time. *Locke's* treatise *An Essay Concerning Humane Understanding* came from across the Channel as if in answer to a call. It was welcomed enthusiastically like a long-awaited guest.

The question arises: Is *Locke* perhaps a disciple of *Spinoza*? “Profane” history can answer:

Materialism is the *natural-born* son of *Great Britain*. Already the British schoolman, *Duns Scotus*, asked, “*whether it was impossible for matter to think?*”

In order to effect this miracle, he took refuge in God's omnipotence, i.e., he made *theology* preach *materialism*. Moreover, he was a nominalist. Nominalism, the *first form* of materialism, is chiefly found among the *English* schoolmen.

The real progenitor of *English materialism* and all *modern experimental* science is *Bacon*. To him natural philosophy is the only true philosophy, and *physics* based upon the experience of the senses is the chiefest part of natural philosophy. *Anaxagoras* and his *homoeomeriae*, *Democritus* and his atoms, he often quotes as his authorities. According to him the *senses* are infallible and the *source* of all knowledge. All science is based on *experience*, and consists in subjecting the data furnished by the senses to a *rational method* of investigation. Induction, analysis, comparison, observation, experiment, are the principal forms of such a rational method. Among the qualities inherent in *matter*, *motion* is the first and foremost, not only in the form of *mechanical* and *mathematical* motion, *but* chiefly in the form of an *impulse*, a *vital spirit*, a *tension* — or a ‘*Qual*’, to use a term of

Jakob Böhme's — of matter. The primary forms of matter are the living, individualising *forces of being* inherent in it and producing the distinctions between the species.

In *Bacon*, its first creator, materialism still holds back within itself in a naive way the germs of a many-sided development. On the one hand, matter, surrounded by a sensuous, poetic glamour, seems to attract man's whole entity by winning smiles. On the other, the aphoristically formulated doctrine pullulates with inconsistencies imported from theology.

In its further evolution, materialism becomes *one-sided*. *Hobbes* is the man who *systematises Baconian* materialism. Knowledge based upon the senses loses its poetic blossom, it passes into the abstract experience of the *geometrician*. *Physical* motion is sacrificed to *mechanical* or *mathematical* motion; *geometry* is proclaimed as the queen of sciences. Materialism takes to *misanthropy*. If it is to overcome its opponent, *misanthropic*, *fleshless* spiritualism, and that on the latter's own ground, materialism has to chastise its own flesh and turn *ascetic*. Thus it passes into an *intellectual entity*; but thus, too, it evolves all the consistency, regardless of consequences, characteristic of the intellect.

Hobbes, as Bacon's continuator, argues thus: if all human knowledge is furnished by the senses, then our concepts, notions, and ideas are but the phantoms of the real world, more or less divested of its sensual form. Philosophy can but give names to these phantoms. One name may be applied to more than one of them. There may even be names of names. But it would imply a contradiction if, on the one hand, we maintained that all ideas had their origin in the world of sensation, and, on the other, that a word was more than a word; that besides the beings known to us by our senses, beings which are one and all individuals, there existed also beings of a general, not individual, nature. An *unbodily substance* is the same absurdity as an *unbodily body*. *Body*, *being*, *substance*, are but different terms for the same *reality*. It is impossible to separate thought from matter *that* thinks. This matter is the substratum of all changes going on in the world. The word *infinite* is *meaningless*, unless it states that our mind is capable of performing an endless process of addition. Only material things being perceptible, knowable to us, we cannot know *anything* about the existence of God. My own existence alone is certain. Every human passion is a mechanical movement which has a beginning and an end. The objects

of impulse are what we call good. Man is subject to the same laws as nature. Power and freedom are identical.

Hobbes had systematised Bacon without, however, furnishing a proof for Bacon's fundamental principle, the origin of all human knowledge and ideas from the world of sensation.

It was *Locke* who, in his *Essay on the Humane Understanding*, supplied this proof.

Hobbes had shattered the *theistic* prejudices of Baconian materialism; Collins, Dodwell, Coward, Hartley, Priestley, similarly shattered the last theological bars that still hemmed in Locke's sensationalism. At all events, for materialists, deism is but an easy-going way of getting rid of religion.

We have already mentioned how opportune Locke's work was for the French. Locke founded the philosophy of *bon sens*, of common sense; i.e., he said indirectly that there cannot be any philosophy at variance with the healthy human senses and reason based on them.

Locke's *immediate* pupil, *Condillac*, who translated him into *French*, at once applied Locke's sensualism against seventeenth-century *metaphysics*. He proved that the French had rightly rejected this metaphysics as a mere botch work of fancy and theological prejudice. He published a refutation of the systems of *Descartes*, *Spinoza*, *Leibniz* and *Malebranche*.

In his *Essai sur l'origine des connaissances humaines* he expounded Locke's ideas and proved that not only the soul, but the senses too, not only the art of creating ideas, but also the art of sensuous perception, are matters of *experience* and *habit*. The whole development of man therefore depends on *education* and *external circumstances*. It was only by *eclectic* philosophy that Condillac was ousted from the French schools.

The difference between *French* and *English* materialism reflects the difference between the two nations. The French imparted to English materialism wit, flesh and blood, and eloquence. They gave it the temperament and grace that it lacked. They *civilised* it.

In *Helvétius*, who also based himself on Locke, materialism assumed a really French character. Helvétius conceived it immediately in its application to social life (Helvétius, *De l'homme*). The sensory qualities and self-love, enjoyment and correctly understood personal interest are the basis of all morality. The natural equality of human intelligences, the unity of progress of reason and progress of industry, the natural goodness of man, and the omnipotence of education, are the main features in his system.

In *Lamettrie's* works we find a synthesis of Cartesian and English materialism. He makes use of Descartes' physics in detail. His *Man Machine* is a treatise after the model of Descartes' animal-machine. The physical part of Holbach's *Système de la nature* is also a result of the combination of French and English materialism, while the moral part is based essentially on the morality of Helvétius. Robinet (*De la nature*), the French materialist who had the most connection with metaphysics and was therefore praised by Hegel, refers explicitly to *Leibniz*.

We need not dwell on Volney, Dupuis, Diderot and others, any more than on the physiocrats, after we have proved the dual origin of French materialism from Descartes' physics and English materialism, and the opposition of French materialism to seventeenth-century *metaphysics*, to the metaphysics of Descartes, Spinoza, Malebranche, and Leibniz. This opposition only became evident to the Germans after they themselves had come into opposition to *speculative metaphysics*.

Just as *Cartesian* materialism passes into *natural science proper*, the other trend of French materialism leads directly to *socialism* and *communism*.

There is no need for any great penetration to see from the teaching of materialism on the original goodness and equal intellectual endowment of men, the omnipotence of experience, habit and education, and the influence of environment on man, the great significance of industry, the justification of enjoyment, etc., how necessarily materialism is connected with communism and socialism. If man draws all his knowledge, sensation, etc., from the world of the senses and the experience gained in it, then what has to be done is to arrange the empirical world in such a way that man experiences and becomes accustomed to what is truly human in it and that he becomes aware of himself as man. If correctly understood interest is the principle of all morality, man's private interest must be made to coincide with the interest of humanity. If man is unfree in the materialistic sense, i.e., is free not through the negative power to avoid this or that, but through the positive power to assert his true individuality, crime must not be punished in the individual, but the anti-social sources of crime must be destroyed, and each man must be given social scope for the vital manifestation of his being. If man is shaped by environment, his environment must be made human. If man is social by nature, he will develop his true nature only in society, and the power of his nature must be measured not by the power of

the separate individual but by the power of society. These and similar propositions are to be found almost literally even in the oldest French materialists. This is not the place to assess them. The apologia of vices by Mandeville, one of Locke's early English followers, is typical of the socialist tendencies of materialism. He proves that in *modern* society vice is *indispensable* and *useful*. This was by no means an apologia for modern society.

Fourier proceeds directly from the teaching of the French materialists. The *Babouvists* were crude, uncivilised materialists, but developed communism, too, derives *directly* from *French materialism*. The latter returned to its mother-country, *England*, in the form *Helvétius* gave it. *Bentham* based his system of *correctly understood interest* on *Helvétius'* morality, and *Owen* proceeded from *Bentham's* system to found English communism. Exiled to England, the Frenchman *Cabet* came under the influence of communist ideas there and on his return to France became the most popular, if the most superficial, representative of communism. Like *Owen*, the more scientific French Communists, *Dézamy*, *Gay* and others, developed the teaching of *materialism* as the teaching of *real humanism* and the *logical* basis of *communism*.

Where, then, did Herr Bauer or, *Criticism*, manage to acquire the documents for the Critical history of French materialism?

1) Hegel's *Geschichte der Philosophie* presents French materialism as the *realisation* of the Substance of Spinoza, which at any rate is far more comprehensible than "the French school of Spinoza".

2) Herr *Bauer* read Hegel's *Geschichte der Philosophie* as saying that French materialism was the *school* of Spinoza. Then, as he found in another of Hegel's works that deism and materialism are *two parties* representing *one and the same* basic principle, he concluded that Spinoza had *two* schools which disputed over the meaning of his system. Herr Bauer could have found the supposed explanation in Hegel's *Phänomenologie*, where it is said:

"Regarding that Absolute Being, *Enlightenment* itself fails out with itself ... and is divided between the views of *two parties*.... The one ... calls *Absolute Being* that predicateless Absolute ... the other calls it *matter* Both are entirely the *same* notion — the distinction lies not in the objective

fact, but purely in the diversity of starting-point adopted by the two developments” (Hegel, *Phänomenologie*, p, 421, 422)

3) Finally Herr Bauer could find, again in Hegel, that when Substance does not develop into a concept and self-consciousness, it degenerates into “romanticism”. The journal *Hallische Jahrbücher* at one time developed a similar theory.

But at all costs *the “Spirit”* had to decree a “*foolish destiny*” for its “*adversary*”, *materialism*.

Note. French materialism’s connection with Descartes and Locke and the opposition of eighteenth-century philosophy to seventeenth-century metaphysics are presented in detail in most recent *French* histories of philosophy. In this respect, we had only to repeat against Critical Criticism what was already known. But the connection of eighteenth-century materialism with English and French *communism* of the nineteenth century still needs to be presented in detail. We confine ourselves here to quoting a few typical passages from Helvétius, Holbach and Bentham.

1) *Helvétius*. “Man is not wicked, but he is subordinate to his interests. One must not therefore complain of the wickedness of man but of the ignorance of the legislators, who have always placed the particular interest in opposition to the general interest.”— “The moralists have so far had no success because we have to dig into legislation to pull out the roots which create vice. In New Orleans women have the right to repudiate their husbands as soon as they are tired of them. In countries like that women are not faithless, because they have no interest in being so.”— “Morality is but a frivolous science when not combined with politics and legislation The hypocritical moralists can be recognised on the one hand by the equanimity with which they consider vices which undermine the state, and on the other by the fury with which they condemn private vice”— “Human beings are born neither good nor bad but ready to become one or the other according as a common interest unites or divides them.”— “If citizens could not achieve their own particular good without achieving the general good, there would be no vicious people except fools” (*De l’esprit*. 1, Paris, 1822, p, 240, 241, 249, 251, 369 and 339).

As, according to Helvétius, it is education, by which he means (cf. loc. cit.,) not only education in the ordinary sense but the totality of the individual’s conditions of life, which forms man, if a reform is necessary to abolish the contradiction between particular interests and those of society,

so, on the other hand, a transformation of consciousness is necessary to carry out such a reform:

“Great reforms can be implemented only by weakening the stupid respect of peoples for old laws and customs” (loc. cit.,)

or, as he says elsewhere, by abolishing ignorance.

2) *Holbach*. “Man can only love himself in the objects he loves: he can have affection only for himself in the other beings of his-kind.” “Man can never separate himself from himself for a single instant in his life, he cannot lose sight of himself.” “It is always our convenience, our interest ... that makes us hate or love things.” (*Système social*, t. 1, Paris, 1822, 56 p, 112), but “In his own interest man must love other men, because they are necessary to welfare.... Morality proves to him that of all beings the most necessary to man is man.” . “True morality, and true politics as well, is that which seeks to bring men nearer to one another to make them work by united efforts for their common happiness. Any morality which separates our interests from *those of* our associates, is false, senseless, unnatural.” . “To love others ... is to merge our interests with *those of* our associates, to work for the common benefit.... Virtue is but the usefulness of men united in *society*” . . “A man without desires or passions would cease to be a man.... Perfectly detached from himself, how could one make him decide to attach himself to others? A man indifferent to everything and having no passions, sufficient to himself, would cease to be a social being.... Virtue is but the communication of good.” (loc. cit.,). “ Religious morality never served to make mortals more sociable.” (loc. cit.,).

3) *Bentham*. We only quote one passage from Bentham in which he opposes “*intérêt général* in the political sense” “The interest of individuals ... must give way to the public interest. But ... what does that mean? Is not each individual part of the public as much as any other? This public interest that you personify is but an abstract term: it represents but the mass of individual interests.... If it were good to sacrifice the fortune of one individual to increase that of others, it would be better to sacrifice that of a second, a third, and so on ad infinitum.... Individual interests are the only real interests.” (Bentham, *Théorie des peines et des récompenses*, Paris, 1826, 3ème 6d., II, p. , 230).

e) Final Defeat of Socialism

“The French set up a series of *systems* of *how* the *mass* should be *organised*, but they had to resort to *fantasy* because they considered the mass, as it is, to be usable material.”

Actually, the French and the English have proved, and proved in great detail, that the present social system organises the “mass *as it is*” and is therefore its *organisation*. *Criticism*, following the example of the *Allgemeine Zeitung*, disposes of all socialist and communist systems by means of the *fundamental* word “*fantasy*”. Having thus shattered foreign socialism and communism, *Criticism* transfers its war-like operations to Germany.

“When the *German Enlighteners* suddenly found themselves disappointed in their hopes of 1842 and, in their embarrassment, did not know *what to do*, news of the recent *French* systems came in the nick of time. They were henceforth able to speak of raising the lower classes of the people and at that price they were able to dispense with the question whether they did not themselves belong to the mass, which is to be found not only in the lowest strata.”

Criticism has obviously so exhausted its entire provision of well meaning motives in the apologia for Bauer’s literary past that it can find no other explanation for the German socialist movement than the “embarrassment” of the Enlighteners in 1842. “Fortunately they received news of the recent *French* systems.” Why not of the *English*? For the decisive *Critical* reason that Herr Bauer received no news of the recent English systems through Stein’s book: *Der Communismus und Socialismus des heutigen Frankreichs*. This is also the decisive reason why only *French systems* ever exist for *Criticism* in all its talk about socialist systems.

The German Enlighteners, *Criticism* goes on to explain, committed a sin against the Holy Ghost. They busied themselves with the “lower classes of the people”, already in existence in 1842, in order to get rid of the question, which did not yet exist then, as to what rank they were destined to occupy in the *Critical world system* that was to be instituted in anno 1843: sheep or goat, Critical Critic or impure Mass, *Spirit* or *Matter*. But above all they should have thought seriously of the *Critical salvation of their own souls*, for of what profit is it to me if I gain the whole world, including the lower classes of the people, and suffer the loss of my own soul?

“But a spiritual being cannot be raised to a higher level unless it is altered, and it cannot be altered before it has experienced extreme resistance.”

Were *Criticism* better acquainted with the movement of the lower classes of the people it would know that the extreme resistance that they have experienced from practical life is changing them every day. Modern prose and poetry emanating in England and France from the lower classes of the people would show it that the lower classes of the people know how to raise themselves spiritually even without being directly *overshadowed* by the *Holy Ghost of Critical Criticism*.

“They,” Absolute Criticism continues to indulge in fancy, “whose *whole wealth* is the word ‘*organisation of the mass*’”, etc.

A lot has been said about “organisation of labour”, although even this “catchword” came not from the Socialists themselves but from the politically radical party in France, which tried to be an intermediary between politics and socialism. But nobody before Critical Criticism spoke of “organisation of the mass” as of a question yet to be solved. It was proved, on the contrary, that *bourgeois society*, the dissolution of the old *feudal* society, is this organisation of the mass.

Criticism puts its discovery in quotation marks . The goose that cackled to Herr Bauer the watchword for saving the Capitol is none but his *own goose*, *Critical Criticism*. It organised the mass anew by speculatively constructing it as *the* Absolute Opponent of *the* Spirit. The antithesis between spirit and mass is the Critical “organisation of society”, in which *the* Spirit, or *Criticism*, represents the organising *work*, the mass — the *raw material*, and history — the *product*.

After Absolute Criticism’s great victories over revolution, materialism and socialism in its third campaign, we may ask: What is the *final result* of these Herculean feats? Only that these movements *perished* without any result because they were still *criticism adulterated by mass* or *spirit adulterated by matter*. Even in Herr Bauer’s own literary past *Criticism* discovered manifold adulterations of criticism by the mass. But *here* it writes an apologia instead of a criticism, “*places in safety*” instead of *surrendering*; instead of seeing in the *adulteration of the spirit* by the *flesh* the death of the spirit too, it reverses the case and finds in the adulteration of the *flesh by the spirit* the life even of *Bauer’s* flesh. On the other hand, it

is all the more ruthless and decisively *terroristic* as soon as imperfect criticism still adulterated by mass is no longer the *work* of Herr Bauer but of whole peoples and of a number of ordinary Frenchmen and Englishmen; as soon as imperfect criticism is no longer entitled *Die Judenfrage*, or *Die gute Sache der Freiheit*, or *Staat, Religion und Parthei*, but revolution, materialism, socialism or communism. Thus *Criticism* did away with the adulteration of spirit by matter and of criticism by mass by sparing its own flesh and crucifying the flesh of others.

One way or the other, the “spirit adulterated by flesh” or “Criticism adulterated by mass” has been cleared out of the way. Instead of this un-Critical adulteration, there appears absolutely Critical *disintegration* of spirit and flesh, criticism and mass, their pure opposition. This opposition in its *world-historic* form in which it constitutes the true historical interest of the present time, is the opposition of Herr Bauer and Co., or *the Spirit*, to the rest of the human race as Matter.

Revolution, materialism and communism *therefore* have fulfilled their historic mission. By their *downfall* they have prepared the way for the Critical *Lord*. Hosanna!

f) The Speculative Cycle of Absolute Criticism and the Philosophy of Self-Consciousness

Criticism, having supposedly attained *perfection* and purity in *one* domain, *therefore* committed only one *oversight* “only” one “inconsistency”, that of not being “pure” and “perfect” in all domains. The “one” Critical domain is none other than that of *theology*. The *pure* area of this domain extends from the *Kritik der Synoptiker* by Bruno Bauer to *Das entdeckte Christenthum* by Bruno Bauer, as the farthest frontier post.

“Modern Criticism,” we are told, “had finally dealt with Spinozism; it was therefore inconsistent of it naively to presuppose Substance in one domain, even if only in individual, falsely expounded points.”

Criticism's earlier admission that it had been involved in political prejudice was immediately followed by the extenuating circumstance that this involvement had been “*basically so slight!*” Now “the admission of *inconsistency* is tempered by the parenthesis that it committed only in *individual, falsely expounded points*. It was not Herr Bauer who was to

blame, but the *false points* which *ran away with Criticism* like recalcitrant mounts.

A few quotations will show that by overcoming *Spinozism Criticism* ended up in *Hegelian idealism*, that from “*Substance*” it arrived at another *metaphysical monster*; the “*Subject*”, “*Substance as a process*”, “*infinite self-consciousness*”, and that the final result of “perfect” and “pure” Criticism is the *restoration of the Christian theory of creation* in a *speculative, Hegelian* form.

Let us first open the *Kritik der Synoptiker*.

“Strauss remains true to the view that Substance is the Absolute. Tradition in this form of universality, which has not yet attained the real and rational certitude of universality, that certitude which can be attained only in self-consciousness, in the *o~* and infinity of self-consciousness, is nothing but Substance which has emerged from its logical simplicity and has assumed a definite form of existence as the *power of the community*.” (*Kritik der Synoptiker*, Vol. I, Preface, pp. vi).

Let us leave to their fate “*the universality which attains certitude*”, the “*oneness and infinity*” (the *Hegelian Notion*). — Instead of saying that the view put forward in *Strauss’* theory on the “*power of the community*” and “*tradition*” has its abstract expression, its logical and metaphysical *hieroglyphic*, in the Spinozist conception of *Substance*, Herr Bauer makes “*Substance emerge from its logical simplicity and assume a definite form of existence in the power of the community*”. He applies the *Hegelian* miracle apparatus by which the “*metaphysical categories*” — abstractions extracted out of *reality* — emerge from *logic*, where they are dissolved in the “*simplicity*” of thought, and assume “*a definite form*” of physical or human existence; he makes them become incarnate. Help, *Hinrichs*!

“Mysterious,” *Criticism* continues its argument against Strauss, “mysterious is this view because whenever it wishes to explain and make visible the process to which the gospel history owes its origin, it can only bring out the *semblance* of a press The sentence: ‘The gospel history has its source and origin in tradition’, posits the same thing *twice*— ‘tradition’ and the ‘gospel history’; admittedly it does posit a relation between them, but it does not tell us to what *internal process of Substance* the development and exposition owe their origin.”

According to *Hegel*, *Substance* must be conceived as an *internal process*. He characterises *development* from the viewpoint of Substance as follows:

“But if we look more closely at this *expansion*, we find that it has not come about by one and the same principle taking shape in diverse ways; it is only the shapeless *repetition of one and the same thing* ... keeping up a tedious *semblance* of diversity” (*Phänomenologie*, Preface,).

Help, Hinrichs!

“Criticism,” Herr Bauer continues, “according to this, must turn against itself and look for the solution of the *mysterious substantiality* ... in what the *development of Substance itself* leads to, in the universality and certitude of the idea and its real existence, in *infinite self-consciousness*.”

Hegel's criticism of the substantiality view continues:

“The compact solidity of Substance is to be opened up and Substance raised to *self-consciousness*” (loc. cit.,).

Bauer's *self-consciousness*, too, is *Substance raised* to self-consciousness or *self-consciousness as Substance*; self-consciousness is transformed from an *attribute of man* into a *self-existing subject*. This is the *metaphysical-theological* caricature of man in his *severance* from nature. The *being* of this self-consciousness is therefore not *man*, but *the idea* of which self-consciousness is the *real existence*. It is the idea *become man*, and therefore it is *infinite*. All *human* qualities are thus transformed in a *mysterious way* into qualities of imaginary “*infinite self-consciousness*”. Hence, Herr Bauer says *expressly* that *everything* has its *origin* and its *explanation* in this “infinite selfconsciousness”, i.e., finds in it the *basis* of its *existence*. Help, *Hinrichs*!

Herr Bauer continues:

“The power of the *substantiality relation* lies in its impulse, which leads us to the concept, the idea and self-consciousness.”

Hegel. says:

“Thus the *concept* is the *truth* of the substance.” “The transition of the *substantiality relation* takes place through its own immanent necessity and consists in this only, that *the concept* is the truth of the substance.” “The *idea* is the adequate concept.” “The concept ... having achieved *free existence* ... is nothing but the *ego* or *pure self-consciousness*” (*Logik*, *Hegel's Werke*, 2nd ed., Vol. 5, p, 9, 229, 13).

Help, *Hinrichs*!

It seems comic in the extreme when Herr Bauer says in his *Literatur-Zeitung*:

“*Strauss* came to grief because he was unable to *complete the criticism of Hegel’s system*, although he proved by his half-way criticism the necessity for its completion”, etc.

It was not a *complete criticism* of Hegel’s system that Herr Bauer himself thought he was giving in his *Kritik der Synoptiker* but at the most the *completion of Hegel’s system*, at least in its application to theology.

He describes his criticism (*Kritik der Synoptiker*, Preface, p. xxi) as “the last act of a definite system”, which is no other than *Hegel’s system*.

The dispute between *Strauss* and *Bauer* over *Substance* and *Self-Consciousness* is a dispute *within Hegelian* speculation. In *Hegel* there are *three* elements, *Spinoza’s Substance*, *Fichte’s Self-Consciousness* and *Hegel’s necessarily antagonistic unity* of the two, the *Absolute Spirit*. The first element is metaphysically disguised *nature separated* from man; the second is metaphysically disguised *spirit separated* from nature; the third is the metaphysically disguised *unity* of both, *real man* and the *real human species*.

Within the domain of theology, *Strauss* expounds *Hegel* from *Spinoza’s point of view*, and *Bauer* does so from *Fichte’s point of view*, both quite consistently. They both *criticised* *Hegel* insofar as with him each of the two elements was *falsified* by the other, whereas they carried each of these elements to its *one-sided* and hence consistent development. — Both of them therefore go *beyond* *Hegel* in their criticism, but both also remain *within* his speculation and each represents only *one* side of his system. *Feuerbach*, who completed and criticised *Hegel* from *Hegel’s point of view* by resolving the metaphysical *Absolute Spirit* into “*real man on the basis of nature*”, was the first to complete the *criticism of religion* by sketching in a grand and masterly manner the *basic features* of the *criticism of Hegel’s speculation* and hence of *all metaphysics*.

With Herr Bauer it is, admittedly, no longer the *Holy Ghost*, but nevertheless *infinite self-consciousness* that dictates the writings of the evangelist.

“We ought not any longer to conceal the fact that the correct conception of the gospel history also has its *philosophical basis*, namely, the *philosophy of self-consciousness*” (Bruno Bauer, *Kritik der Synoptiker*, Preface, p. xv).

This philosophy of Herr Bauer, the *philosophy of self-consciousness*, like the *results* he achieved by his criticism of theology, must be characterised by a few extracts from *Das entdeckte Christenthum*, his *last* work on the philosophy of religion.

Speaking of the *French materialists*, he says:

“When the *truth* of materialism, the *philosophy of self-consciousness*, is revealed and *self-consciousness* is recognised as the *Universe*, as the solution of the riddle of *Spinoza’s substance* and as the true *causa sui* ..., what is the purpose of *the Spirit*? *What is the purpose of self-consciousness*? As if *self-consciousness*, by positing the *world*, did not posit *distinction* and did not produce itself in all it produces, since it does away again with *the distinction of what it produced from itself*, and since, consequently it is itself only in production and in movement — as if *self-consciousness* in this movement, which is itself, had not its purpose and did not possess itself!” (*Das entdeckte Christenthum*, .)

“The French materialists did, indeed, conceive the movement of selfconsciousness as the movement of the universal being, matter, but they could *not yet* see that the *movement of the universe* became *real* for itself and achieved unity with itself *only* as the *movement of self-consciousness*” (1. c., pp. 115).

Help, *Hinrichs*!

In plain language the *first* extract means: the truth of *materialism* is the *opposite* of materialism, *absolute*, i.e., exclusive, unmitigated *idealism*. Self-consciousness, *the Spirit*, is the *Universe*. Outside of it there is *nothing*. “Self-consciousness”, “*the Spirit*”, is the almighty creator of the world, of heaven and earth. The *world* is a manifestation of the life of self-consciousness which has to *alienate* itself and take on *the form of a slave*, but the difference between the world and self-consciousness is only an *apparent difference*. Self-consciousness distinguishes *nothing real* from itself. The world is, rather, only a metaphysical *distinction*, a phantom of its ethereal brain and an *imaginary* product of the latter. Hence selfconsciousness does away again with the appearance, which it conceded for a moment, that something exists outside of it, and it recognises in what it has “produced” no real object, i.e., no object which in reality, is distinct from it. By this movement, however, *self-consciousness* first produces itself as absolute, for the *absolute* idealist, in order to be an absolute idealist, must

necessarily constantly go through the *sophistical process* of first transforming the world *outside himself* into an appearance, a mere fancy of *his* brain, and afterwards declaring this *fantasy* to be what it really is, i.e., a mere fantasy, so as finally to be able to proclaim his sole, exclusive existence, which is no longer disturbed even by the semblance of an external world.

In plain language the *second* extract means: The French materialists did, of course, conceive the movements of matter as movements involving spirit, but they were not yet able to see that they are not *material* but *ideal* movements, movements of selfconsciousness, consequently pure movements of thought. They were not yet able to see that the real movement of the universe became true and real only as the *ideal* movement of selfconsciousness free and freed from *matter*, that is, from reality; in other words, that a *material* movement distinct from ideal brain movement exists only in *appearance*. Help, *Hinrichs*!

This speculative *theory of creation* is almost word for word in *Hegel*; it can be found in his *first* work, his *Phänomenologie*.

“The alienation of *self-consciousness* itself establishes *thinghood*.... In this alienation self-consciousness establishes itself as object or sets up the object as *itself*. On the other hand, there is also this other moment in the process that it has just as much *abolished* this *alienation* and *objectification* and resumed them into itself.... This is the *movement of consciousness*” (Hegel, *Phänomenologie*, p-75).

“Self-consciousness has a *content* which it distinguishes *from itself*... This content in its *distinction* is itself the *ego*, for it is the *movement* of superseding itself.... More precisely stated, this content is nothing but the *very movement just spoken of*; for the content is *the Spirit* which traverses the whole range of its own being, and does this *for itself as Spirit*” (*loc. cit.*, pp. 583).

Referring to this theory of creation of Hegel’s, *Feuerbach* observes:

“Matter is the self-alienation of the spirit. Thereby matter itself acquires spirit and reason — but at the same time it is assumed as a *nothingness*, an *unreal* being, inasmuch as being producing itself from this alienation, i.e., being divesting itself of matter, of sensuousness, is pronounced to be being in its perfection, in its true shape and form. Therefore the natural, the

material, the sensuous, is what is to be *negated* here too, as *nature poisoned by original sin* is in theology” (*Philosophie der Zukunft*).

Herr Bauer therefore defends materialism against *un-Critical theology*, at the same time as he reproaches it with “not yet” being *Critical theology, theology of reason, Hegelian speculation. Hinrichs! Hinrichs!*

Herr Bauer, who in all domains carries through *his* opposition to *Substance, his philosophy of self-consciousness* or of *the Spirit*, must therefore in all domains have only the *figments* of his own *brain* to deal with. In his hands, *Criticism* is the instrument to sublimate into mere *appearance* and *pure thought* all that affirms a *finite* material existence *outside infinite self-consciousness*. What he combats in *Substance* is not the *metaphysical illusion* but its *mundane* kernel — *nature*; nature both as it exists *outside* man and as man’s nature. Not to presume *Substance* in any domain — he still uses this language — means therefore for him not to recognise any *being* distinct from thought, any *natural energy* distinct from the *spontaneity of the spirit*, any *power of human nature* distinct from *reason*, any *passivity* distinct from *activity*, any *influence of others* distinct from *one’s own action* any *feeling* or *willing* distinct from *knowing*, any *heart* distinct from the *head*, any *object* distinct from the *subject*, any *practice* distinct from *theory*, any *man* distinct from the *Critic*, any *real community* distinct from *abstract generality*, any *Thou* distinct from *I*. Herr Bauer is therefore consistent when he goes on to identify *himself* with *infinite self-consciousness*, with the *Spirit*, i.e., to replace these creations of his by their creator. He is just as consistent in rejecting as *stubborn mass* and *matter* the *rest of the world* which obstinately insists on being something *distinct* from what *he*, Herr Bauer, has produced. And so he hopes:

*It will not belong
Before all bodies perish.*

His own ill-humour at so far being unable to master “the *something* of this *clumsy world*” he interprets equally consistently as the *self-discontent* of this world, and the indignation of his *Criticism* at the development of mankind as the *mass-type* indignation of mankind against *his* *Criticism*, against the *Spirit*, against Herr Bruno Bauer and Co.

Herr Bauer was a *theologian* from the very beginning, but no ordinary one; he was a *Critical theologian* or a *theological Critic*. While still the extreme representative of *old Hegelian* orthodoxy who put in a speculative form all *religious* and *theological nonsense*, he constantly proclaimed *Criticism* his *private domain*. At that time he called *Strauss'* criticism *human* criticism and expressly asserted the right of divine criticism in opposition to it. He later stripped the great *self-reliance* or *self-consciousness*, which was the hidden kernel of this divinity, of its religious shell, made it self-existing as an independent being, and raised it, under the trade-mark "*Infinite Self-consciousness*", to the rank of the principle of Criticism. Then he accomplished in his own movement the movement that the "philosophy of self-consciousness" describes as the absolute act of life. He abolished anew the "distinction" between "the product", *infinite self-consciousness*, and the producer, *himself*, and acknowledged that infinite self-consciousness in its movement "*was only he himself*", and that therefore the movement of the universe only becomes *true* and *real* in his ideal self-movement.

Divine criticism in its *return into itself* is restored in a rational, conscious, Critical way; *being in-itself* is transformed into *being in-and-for-itself* and only at the *end* does the fulfilled, realised, revealed *beginning* take place. *Divine* criticism, as *distinct* from *human* criticism, reveals itself as *Criticism, pure Criticism, Critical Criticism*. The apologia for the Old and the New Testament is replaced by the apologia for the old and new works of Herr Bauer. The *theological* antithesis of God and man, spirit and flesh, infinity and finiteness is transformed into the *Critical-theological* antithesis of the Spirit, Criticism, or Herr Bauer, and the *matter* of the mass, or the secular world. The theological antithesis of faith and reason has been resolved into the Critical-theological antithesis of *common sense* and pure Critical thought. The *Zeitschrift für spekulative Theologie* has been transformed into the Critical *Literatur-Zeitung*. The *religious redeemer of the world* has finally become a reality in the *Critical redeemer of the world*, Herr Bauer.

Herr Bauer's last stage is not an anomaly in his development; it is the *return* of his development *into* itself from its *alienation*. Naturally, the point at which *divine* Criticism *alienated* itself and came out of itself coincided

with the point at which it became partly untrue to itself and created something *human*.

Returning to its starting-point, *Absolute Criticism* has ended the *speculative cycle* and thereby its own *life's career*. Its further movement is *pure*, lofty *circling within itself*, above all interest of a mass nature and therefore devoid of any further interest for the Mass.

Chapter VII. Critical Criticism's Correspondence

1) The Critical Mass

Where can one feel better
Than in the bosom of one's family?

In its *Absolute* existence as Herr *Bruno*, Critical Criticism has declared the *mass* of mankind, the whole of mankind that is not Critical Criticism, to be its *opposite*, its *essential object*; *essential*, because the Mass exists *ad maiorem gloriam dei*, the glory of *Criticism*, of *the Spirit*; *its object*, because it is only the *matter* on which Critical Criticism operates. Critical Criticism has proclaimed its relationship to the Mass as the *world-historic relationship* of the present time.

No *world-historic opposition* is formed, however, by the statement that one is in opposition to the whole world. One can imagine that one is a stumbling-block for the world because one is clumsy enough to stumble everywhere. But for a world-historic opposition it is not enough for me to declare the world *my opposite*; the *world* for its part must declare me to be its essential opposite, and must treat and *recognise* me as such. Critical Criticism ensures itself this recognition by its *correspondence*, which is called upon to *bear witness* before the world to Criticism's function of redeemer and equally to the general *irritation* of the world at the Critical gospel. Critical Criticism is its own object as the *object of the world*. The correspondence is intended to *show it as such*, as the *world interest* of the present time.

Critical Criticism is in its own eyes the *Absolute Subject*. The Absolute Subject requires a cult. A real cult requires other believing individuals. The *Holy Family of Charlottenburg* therefore receives from its correspondents the cult due to it. The correspondents tell it *what it is* and what its adversary, the Mass, *is not*.

However, Criticism falls into an inconsistency by thus having its opinion of itself represented as the opinion of the world and by its *concept* being

converted into *reality*. Within *Criticism itself* a sort of *Mass* is forming, a Critical Mass whose simple function is untiringly to echo the stock phrases of Criticism. For consistency's sake this inconsistency may be forgiven. Not feeling at home in the sinful world, Critical Criticism must set up a sinful world in its own home.

The path of Critical Criticism's correspondent, a member of the Critical Mass, is not a rosy one. It is a difficult, thorny path, a Critical path. Critical Criticism is a spiritualistic lord, pure spontaneity, *actus purus*, intolerant of any influence *from without*. The correspondent can therefore be a *subject* only *in appearance*, can only *seem* to behave *independently* towards Critical Criticism, can only *seemingly* want to communicate something new and of his own to it. In *reality* he is Critical Criticism's own *product*, its perception of its own voice made for an instant *objective* and self-existing.

That is why the correspondents do not fail to assert incessantly that Critical Criticism itself *knows, realises, understands, grasps, and experiences* what at the same moment is being communicated to it for *appearance's sake*. Thus *Zerrleder*, for instance, uses the expressions: "Do you grasp it? You know. You know for the second and third time. You' have probably heard enough to be able to see for yourself."

So too the Breslau correspondent *Fleischhammer* says: "But the fact," etc., "will be as little of a puzzle to you as to me." Or the Zurich correspondent *Hirzel*: "You will probably find out for yourself." The Critical correspondent has such anxious respect for the absolute understanding of *Critical Criticism* that he attributes understanding to it even where there is absolutely nothing to understand. For example, *Fleischhammer* says:

You will *perfectly understand* me when I tell you that one can hardly go out without meeting young Catholic priests in their long black cowls and cloaks."

Indeed, in their *fear* the correspondents *hear* Critical Criticism — *saying, answering, exclaiming, deriding!*

Zeerleder, for example, says: "But — you *say*. Well, then, listen." And *Fleischhammer*. "Yes, I hear what you *say* — I *only* mean that..." And *Hirzel*: "Good for you, you *will exclaim!*" And a Tübingen correspondent: "*Do not laugh at me!*"

The correspondents, therefore, also express themselves as though they were communicating *facts* to Critical Criticism and expect from it the *spiritual interpretation*; they provide it with *premises* and leave the *conclusion* to it, or they even *apologise* for repeating things Criticism has known for a long time.

Zerrleder, for example, says:

“Your correspondent can only give a picture, a description of the facts. The Spirit which animates these things is *certainly* not unknown to *you*.” Or again: “Now you will *surely* draw the *conclusion for yourself*.”

And Hirzel says:

“*I shall not presume* to entertain you with the speculative proposition that every creation arises out of its extreme opposite.”

Sometimes, too, the *experiences* of the correspondents are merely the *fulfilment* and *confirmation* of Criticism’s *prophecies*.

Fleischhammer, for example, says:

“Your *prediction* has come true.”

And Zerrleder:

“Far from being disastrous, the tendencies that I have described to you as gaining ever greater scope in Switzerland, are very *fortunate*; they *only confirm* the *thought you* have already often expressed,” etc.

Critical Criticism sometimes feels urged to express the condescension involved by its participation in the correspondence and motivates this condescension by the fact that the correspondent has successfully carried out some *task*. Thus Herr Bruno writes to the Tübingen correspondent:

“It is really inconsistent on my part to answer your letter. — On the other hand, you have again ... made such an *apt remark* that I ... *cannot refuse* the explanation you request.”

Critical Criticism has letters written to it *from the provinces*; not the provinces in the political sense, which, as we know, do not exist anywhere in Germany, but from the *Critical provinces* of which. Berlin is the capital, *Berlin*, the seat of the Critical patriarchs and of the Holy Critical Family, whereas the provinces are where the Critical Mass resides. The *Critical provincials* dare not engage the attention of the *supreme Critical authority* without bows and apologies.

Thus, someone writes anonymously to Herr *Edgar*, who, being a member of the Holy Family, is also an eminent personage:

“Honourable Sir, I hope you will *excuse* these lines on the grounds that young people like to unite in common strivings (there is not more than two years’ *difference* in our ages).”

The coeval of Herr Edgar describes *himself* incidentally as the *essence of modern philosophy*. Is it not in the nature of things that *Criticism* should correspond with *the essence* of philosophy? If Herr Edgar’s coeval affirms that he has already lost his *teeth*, that is only an allusion to his *allegorical* essence. This “essence of modern philosophy” has “learned from *Feuerbach* to set the factor of education in objective view”. It at once gives a sample of its *education* and *views* by assuring Herr Edgar that it has acquired a “*complete view* of his short story”, “*Es leben feste Grundsätze!*” At the same time it openly admits that Herr Edgar’s point of view is by no means quite clear to it, and finally invalidates the assurance concerning the complete view by the question: “Or have I *completely misunderstood* you?” After this sample it will be found quite normal that the essence of modern philosophy, referring to the Mass, should say:

“We must at least once *condescend* to examine and untie the magic knot which bars *common human reason* from access to the *unrestricted flood of thought*.”

In order to get a complete view of the Critical Mass one should read the *correspondence* of Herr *Hirzel* from Zurich (Heft V). This unfortunate man memorises the stock phrases of Criticism with really touching docility and praiseworthy power of recall, not omitting Herr Bruno’s favourite phrases about the battles he has waged and the campaigns he has planned and led. But Herr *Hirzel* exercises his profession as a member of the Critical Mass especially by raging against the *profane Mass* and its attitude to *Critical Criticism*.

He speaks of the Mass claiming a part in history, “of the pure Mass”, of “pure Criticism”, of the “purity of this contradiction”— “a contradiction purer than any that history has provided” — of the “*discontented being*”, of the “perfect emptiness, ill humour, dejection, heartlessness, timidity, fury and bitterness of the Mass towards Criticism”; of “the Mass which only exists in order by its resistance to make Criticism sharper and more vigilant”. He speaks of “creation from the extreme opposite”, of how Criticism is above *hate* and similar profane sentiments. The whole of Herr *Hirzel*’s contribution to the *Literatur-Zeitung* is confined to this profusion of

Critical stock phrases. While reproaching the Mass for being satisfied with mere “disposition”, “good will”, “the phrase”, “faith”, etc., he himself, as a member of the *Critical Mass*, a content with phrases, expressions of his “Critical disposition”, his “Critical faith”, his “Critical good will” and leaves “action, work, struggle” and “works” to Herr Bruno and Co.

Despite the terrible picture of the world-historic tension between the profane world and “Critical Criticism” which the members of the “Critical Mass” outline, for the non-believer at least not even the fact of the matter is stated, the factual existence of this *world-historic* tension. The obliging and un-Critical repetition of Criticism’s “imaginations” and “pretensions” by the correspondents only proves that the fixed ideas of the master are the fixed ideas of the servant as well. It is true that one of the Critical correspondents makes an attempt at a proof based on *fact*.

“You see,” he writes to the Holy Family, “that the *Literatur-Zeitung* is fulfilling its purpose, ie., that it meets with *no approval*. It could meet with approval only if it sounded in unison with the general thoughtlessness, if you strode proudly before it with the jingling of hackneyed phrases of a whole janissary band of current categories.”

The jingling of hackneyed phrases of a whole janissary band of current categories It is evident that the Critical correspondent does his best to keep pace with non-”current” hackneyed phrases. But his explanation of the fact that the *Literatur-Zeitung* meets with no approval must be rejected as purely *apologetic*. This fact could be better explained in just the opposite way by saying that Critical Criticism is in *unison* with the great mass, to be precise, the great *mass* of scribblers who meet with no approval.

It is therefore not enough for the *Critical* correspondent to address Critical hackneyed phrases to the Holy Family as “prayers” and at the same time to the Mass as “anathemas”. *Un-Critical, mass-type* correspondents, *real* delegates of the *Mass* to Critical Criticism, are needed to show the real tension between the Mass and Criticism.

That is why Critical Criticism also assigns a place to the *un-Critical Mass*. It makes unbiased *representatives* of the latter *correspond* with it, acknowledge the opposition to itself, Criticism, as important and absolute, and utter a *fearful cry* for redemption from this opposition.

2) The “Un-Critical Mass” and “Critical Criticism”

a) The “Obdurate Mass” and the “Unsatisfied Mass”

The hardness of heart, the obduracy and blind unbelief of “the Mass” has one rather determined representative. This representative speaks of the exclusively “Hegelian philosophical education of the Berlin Couleur”

“The only true progress that we can make,” he says, “lies in the acknowledgment of reality. But we learn from you that our knowledge was not knowledge of reality but of something unreal.”

He calls “natural science” the basis of philosophy.

“A good naturalist stands in the same relation to the philosopher as. the philosopher to the theologian.”

Further he comments as follows on the “Berlin Couleur”.

“I do not think it would be exaggerating to try to explain the state of these people by saying that, although they have gone through a process of spiritual moulting, they have not yet altogether got rid of their old skin in order to be able to absorb the elements of renovation and rejuvenation.” “We must yet assimilate this” (natural-scientific and industrial) “knowledge”. “The knowledge of the world and of man, which we need most of all, cannot be acquired only by acuity of thought; all the senses must collaborate and all the aptitudes of man must be applied as indispensable instruments; otherwise contemplation and knowledge will always remain defective — and will lead to *moral death*.”

This correspondent, however, sweetens the pill that he hands out to Critical Criticism. He “makes *Bauer’s words* find their correct application”, he has “followed *Bauer’s thoughts*”, he agrees that “*Bauer has spoken* the truth” and in the end he seems to polemise, not against *Criticism* itself, but against a “Berlin Couleur” which is distinct from it.

Critical Criticism, feeling itself hit and, moreover, being as sensitive as an old maid in all *matters of faith*, is not taken in by these distinctions and this semi-homage.

“You are *mistaken*,” it answers, “if you have taken the party you described at the beginning of your letter for *your opponent*. Rather *admit*” (and now comes the crushing sentence of excommunication) “that *you are an opponent of Criticism itself!*”

The miserable wretch! The man of the Mass! An opponent of *Criticism itself!* But as far as the content of that *mass-type* polemic is concerned,

Critical Criticism declares its respect for its critical attitude to *natural science and industry*".

"*All respect for natural science! All respect for James Watt and*" (a really noble turn!) "no respect at all for the millions that he made for his relatives."

All respect for the respect of Critical Criticism! In the same letter in which Critical Criticism reproaches the above-mentioned *Berlin Couleur* with too easily disposing of thorough and solid works without studying them and having *finished* with a work when they have merely remarked that it is epoch-making, etc. — in that same letter *Criticism itself disposes* of the whole of natural science and *industry* by merely declaring its respect for them. The clause which it appends to its' declaration of respect for *natural science* reminds one of the first fulminations of the deceased knight *Krug* against natural philosophy.

"Nature is not the only reality *because we eat and drink it in its individual products*."

Critical Criticism knows this much about the *individual products* of nature that "we *eat and drink* them". All respect for the natural science of Critical Criticism!

Criticism is consistent in countering the embarrassingly importunate demand to study "nature" and "industry" with the following indisputably witty rhetorical exclamation:

"Or" (!) "do you think that the knowledge of *historical* reality is *already complete*? Or" (!) "do you know of any single period in history which is already *actually* known?"

Or does Critical Criticism believe that it has reached even the *beginning* of a knowledge of historical reality so long as it excludes *from* the historical movement the theoretical and practical relation of man to nature, i.e., natural science and industry? Or does it think that it actually knows any period without knowing, for example, the industry of that period, the immediate mode of Production of life itself? Of course, spiritualistic, *theological* Critical Criticism only knows (at least it imagines it knows) the main political, literary and theological acts of history. Just as it separates thinking from the senses, the soul from the body and itself from the world, it separates history from natural science and industry and sees the origin of

history not in vulgar *material* production on the earth but in vaporous clouds in the heavens.

The representative of the “obdurate” and “hard-hearted” Mass with his trenchant reproofs and counsels is disposed of as a *mass-type materialist*. Another correspondent, not so malicious or mass-like, who places his hopes in Critical Criticism but finds them unsatisfied ‘fares no better. The representative of the “*unsatisfied*” Mass writes:

“I must, however, admit that the first number of your paper was *by no means satisfying*. We expected something else.”

The *Critical patriarch* answers in person:

“I knew beforehand that it would not satisfy expectations, because I could rather easily imagine those expectations. One is so exhausted that one wishes to have *everything at once*. Everything? No! If possible everything and nothing at the same time. An everything that costs no trouble, an everything that one can absorb without going through any development, an everything that is contained in a single word.”

In his vexation at the undue demands of the “Mass”, which demands *something*, indeed everything, from Criticism, which by principle and disposition “*gives nothing*”, the Critical patriarch relates an *anecdote* in the way that old men do. Not long ago a Berlin *acquaintance* complained bitterly of the verbosity and profusion of detail of his works — Herr Bruno is known to make a bulky work out of the tiniest semblance of a thought. He was consoled with the promise of being sent the ink necessary for the printing of the book in a small pellet so that he could easily absorb it. The patriarch explains the length of his “works” by the bad spreading of the ink, as he explains the nothingness of his *Literatur-Zeitung* by the emptiness of the “profane Mass”, which, in order to be full, wants to swallow everything and nothing at the same time.

Just as it is difficult to deny the importance of what has so far been related, it is equally difficult to see a *world-historic contradiction* in the fact that a mass-type acquaintance of Critical Criticism considers Criticism empty, while Criticism, for its part, declares him to be un-Critical; that a second acquaintance does not find that the *Literatur-Zeitung* satisfies his expectations, and that a third acquaintance and friend of the family finds Criticism’s works too bulky. However, acquaintance No. 2, who entertains expectations, and friend of the family No. 3, who wishes at least to find out

the secrets of Critical Criticism, constitute the transition to a *more substantial* and tenser relationship between Criticism and the ‘un-Critical Mass’. Cruel as Criticism is to the “hard-hearted” Mass which has only “common human reason”, we shall find it condescending to the Mass that is pining for *redemption* from contradiction. The Mass which approaches Criticism with a contrite heart, a spirit of repentance and a humble mind will be rewarded for its honest striving with many a *wise, prophetic and outspoken* word.

b) The “Soft-Hearted” Mass “Pining for Redemption”

The representative of the *sentimental, soft-hearted Mass pining for redemption* cringes and implores Critical Criticism for a kind word with effusions of the heart, deep bows and rolling of the eyes, as follows:

“Why am I writing this to you? Why am I justifying myself before you? Because I *respect* you and therefore *desire* your *respect*; because I owe you deepest *thanks* for my development and therefore *love* you. *My heart* impels me to justify myself before you ... who have upbraided me.... *Far be* it from me to *obtrude* upon you; judging *by myself*, I thought you *might be pleased* to have proof of *sympathy* from a man who is still little known to you. I *make no claim whatsoever* that you should answer my letter: I wish neither to take up your time, of which you can make better use, nor to be irksome to you, nor to expose myself to the mortification of seeing something that I hoped for remain *unfulfilled*. You *may* interpret my letter as *sentimentality*, importunity or vanity” (!) “or whatever you like; you may answer me or not, I cannot resist the *impulse* to send it and I only hope that you will realise the *friendly feeling* which inspired it” (!!).

Just as from the beginning God has had mercy on the *poor in spirit*, this mass-like but humble correspondent, too, who whimpers for mercy from Critical Criticism, has his wish *fulfilled*. Critical Criticism gives him a kind answer. More than that! It gives him most Profound explanations on the objects of his curiosity.

“Two years ago,” Critical Criticism teaches, “it was opportune to remember the Enlightenment of the French in the eighteenth century in order to be able to make use of those *light troops*, too, at a place in the battle that was then being waged. The situation is now *quite different*.

Truths now change very quickly. What was then *opportune* is now an *oversight*.”

Of course it was only “an *oversight*” then too, but an “*opportune*” one, when the Absolute Critical All-high itself (cf. *Anekdotas*, Book II,) called those *light troops* “*our saints*”, our “*prophets*”, “*patriarchs*” etc. Who would call *light troops* a *troop of “patriarchs”*? It was an “opportune” oversight when it spoke with enthusiasm of the self-denial, moral energy and inspiration with which these *light troops* “thought, worked — and studied — throughout their lives for the truth”. It was an “oversight” when, in the preface to *Das entdeckte Christenthum*, it was stated that these “*light*” troops seemed invincible and *any one well-informed* would have wagered that they would *put the world out of joint*” and that “it seemed beyond doubt that they would succeed in giving the world a new shape”. *Those light troops*?

Critical Criticism continues to teach the inquisitive representative of the “*cordial Mass*”:

“Although it was a new historical merit of the French to attempt to set up a social theory, they are none *the less* now exhausted; their new theory was not yet pure, their social fantasies and their peaceful democracy are by no means free from the assumptions of the old state of things.”

Criticism is talking here about *Fourierism* — if it is talking about anything — and in particular of the Fourierism of *La Démocratie pacifique*. But this is far from being the “social theory” of the French. The French have *social theories*, but not a social theory; the diluted Fourierism that *La Démocratie pacifique* preaches is nothing but the social doctrine of a section of the philanthropic bourgeoisie. The people is *communistic*, and, as a matter of fact, split into a multitude of different groups; the true movement and the elaboration of these different social shades is not only not *exhausted*, it is really only *beginning*. But it will not end in pure, i.e., abstract, *theory* as Critical Criticism would like it to; it will end in a quite *practical practice* that will not bother at all about the categorical categories of Criticism.

“No nation,” Criticism chatters on, “has *so far* any advantage over another. If one can succeed in winning some spiritual superiority over the others, it will be the one which is in a position to criticise itself and the others and to discover the causes of the universal decay.”

Every nation has so far some advantage over another. But if the Critical prophecy is right, no nation will have any advantage over another, because all the civilised peoples of Europe — the English, the Germans, the French — now “criticise themselves and others” and “are in a position to discover the causes of the universal decay”. Finally, it is high-sounding tautology to say that “criticising”, “discovering”, i.e., spiritual activities, give a spiritual superiority, and Criticism, which in its infinite self-consciousness places itself above the nations and expects them to kneel at its feet and implore it for enlightenment, only shows by this caricatured Christian-Germanic idealism that it is still up to its neck in the mire of German nationalism.

The criticism of the French and the English is not an abstract, preternatural personality outside mankind; it is the *real human activity* of individuals who are active members of society and who suffer, feel, think and act as human beings. That is why their criticism is at the same time practical, their communism a socialism in which they give practical, concrete measures, and in which they not only think but even more act, it is the living, real criticism of existing society, the recognition of the causes of “the decay”.

After Critical Criticism’s explanations for the inquisitive member of the Mass, it is entitled to say of its *Literatur-Zeitung*:

“Here Criticism that is *pure*, graphic, relevant and adds nothing is practised.”

Here “*nothing self-existing is given*”; here *nothing* at all *is given* except *criticism that gives nothing*, that is, criticism which culminates in extreme non-criticism. *Criticism* has underlined passages printed and reaches its full bloom in *excerpts*. *Wolfgang Menzel* and *Bruno Bauer* stretch a brotherly hand to each other and Critical Criticism stands where the *philosophy of identity* stood at the beginning of this century, when *Schelling* protested against the mass-like supposition that he wanted to give something, anything except *pure, entirely philosophical philosophy*.

c) Grace Bestowed on the Mass

The soft-hearted correspondent whose instruction we have just witnessed stood in a *comfortable* relationship to Criticism. In his case there was only an idyllic hint of the tension between the *Mass* and *Criticism*. Both sides of

the *world-historic* contradiction behaved *kindly* and *politely*, and therefore *exoterically*, to each other.

Critical Criticism, in its *unhealthy*, soul-shattering effect on the Mass, is seen first in regard to a correspondent who has one foot already in Criticism and the other still in the profane world. He represents the “Mass” in its *inner* struggle with Criticism.

At times it seems to him “that Herr Bruno and his friends do not understand *mankind*”, that “they are the ones who are really blinded”. Then he immediately corrects himself:

“Yes, it is *as clear as daylight* to me that you are right and that your thoughts are correct; but *excuse* me, the people is not wrong *either*.... Oh yes! The people is right.... I cannot deny that you are right.... I really do not know what it will all lead to: you will say ... well, stay at home.... *Alas!* I can no longer stand it.... *Alas!* One might otherwise go *mad* in the end.... *Kindly* accept... Believe me, the knowledge one has acquired sometimes makes one feel as *stupid* as if a mill-wheel were turning in one’s head.”

Another correspondent, too, writes that he “is *occasionally disconcerted*”. One can see that *Critical grace* is about *to be bestowed* on this mass-type correspondent. The poor wretch! The sinful Mass is tugging at him on one side and Critical Criticism on the other. It is not the knowledge he has acquired that reduces this pupil of Critical Criticism to a state of stupor; it is the question of *faith* and *conscience*; Critical Christ or the people, God or the world, Bruno Bauer and his friends or the profane Mass! But just as bestowal of *divine* grace is preceded by extreme wretchedness of the sinner, Critical grace is preceded by a crushing *stupefaction*. And when it is at last bestowed, the chosen one loses not stupidity but the *consciousness of stupidity*.

3) The Un-Critically Critical Mass Or “Criticism” and The “Berlin Couleur”

Critical Criticism has not succeeded in depicting itself as the *essential opposite*, and hence at the same time as the *essential object*, of the mass of humanity. Apart from the representatives of the *obdurate* Mass which reproaches Critical Criticism for its *objectlessness* and gives it to

understand in the most courteous possible way that it has not yet gone through the *process* of its spiritual “*moult*” and must first of all acquire solid knowledge, there is the *soft-hearted* correspondent. He is no *opposite* at all, but then the actual reason for his approach to Critical Criticism is a *purely personal* one. As we can see a little further on in his letter, he really only wants to reconcile his devotion to Herr Arnold Ruge with his devotion to Herr *Bruno Bauer*. This attempt at reconciliation does credit to his kind heart, but it in no way constitutes an *interest of a mass nature*. Finally, the last correspondent to appear was no longer a *real* member of the Mass, he was only a catechumen of Critical Criticism.

In general, the *Mass* is an *indefinite* object, and therefore can neither carry out a definite action nor enter into a definite relationship. *The Mass*, as the object of Critical Criticism, has nothing in common with the *real* masses who, for their part, form among themselves oppositions of a pronounced mass nature. *Critical Criticism’s* mass is “made” by Criticism itself, as would be the case if a naturalist, instead of speaking of definite classes, contrasted *the Class* to himself.

Hence, in order to have an opposite of a really mass nature, *Critical Criticism* needs, besides this *abstract Mass* which is the figment of its own brain, a *definite Mass* that can be empirically demonstrated and not just conjured up. This Mass must see in Critical Criticism both its *essence and the annihilation of its essence*. It must wish to be Critical Criticism, non-Mass, without *being able to*. This Critically un-Critical Mass is the above-mentioned “*Berlin Couleur*”. The *mass* of humanity which is seriously concerned with Critical Criticism is confined to a Berlin Couleur.

The “Berlin Couleur”, the “*essential object*” of Critical Criticism, of which it is always thinking and which, Critical Criticism imagines, is always thinking of Critical Criticism, consists, as far as we know, of a few *ci-devant Young Hegelians* in whom Critical Criticism claims to inspire partly a *horror vacui* and partly a feeling of *futility*. We are not investigating the actual state of affairs, we rely on what *Criticism* says.

The *Correspondence* is mainly intended to expound *at length* to the public this *world-historic* relation of *Criticism* to the “Berlin Couleur”, to reveal its profound significance, to show why *Criticism* must necessarily be cruel towards this “Mass”, and finally to make it appear that *the whole world* is in fearful agitation over this opposition, expressing itself now in

favour of, and then against the actions of *Criticism*. For example, *Absolute Criticism* writes to a correspondent who sides with the “Berlin Couleur”:

“I have *already* heard things like that *so often* that I have made up my mind not to take any more notice of them.”

The world has no idea how often it has dealt with Critical things *like that*.

Let us now hear what a member of the Critical Mass reports on the Berlin Couleur:

“‘If anyone recognises the Bauers’” (the Holy Family must always be recognised *pêle-mêle*) “began his answer — *I am the one*. But the *Literaturzeitung*! Let us be quite fair!’ It was interesting for me to hear what one of those radicals, those clever men of anno 42, thought of you....”

The correspondent goes on to report that the unfortunate man had all sorts of reproaches to make to the *Literatur-Zeitung*.

Herr Edgar’s short story, *Die drei Biedermannen* he found lacking in polish and exaggerated. He could not understand that *censorship* is not so much a fight of man against man, an external fight, as an internal one. They do not take the trouble to bethink themselves and to replace the *phrase the censor objects to* by a *cleverly* expressed and thoroughly developed *Critical thought*. He found Herr Edgar’s essay on Béraud lacking in thoroughness. The Critical reporter thinks it was thorough. True he admitted himself: “I have *not* read Béraud’s book.” But he *believes* that Herr Edgar has *succeeded*, etc., and belief, we know, is *bhss*. “In general,” the Critical believer continues, “he” (the one from the Berlin Couleur) “is *not at all satisfied* with Herr Edgar’s works.” He also finds that “*Proudhon* is not dealt with *thoroughly* enough”. And here the reporter gives Herr Edgar a testimonial:

“*It is true*” (1?) “*that I am acquainted with Proudhon*. I know that Edgar’s presentation took the *characteristic* points from him and set them out clearly.”

The only reason why Herr Edgar’s *excellent* criticism of Proudhon is not liked, the reporter says, can only be that Herr Edgar does *not fulminate* against property. And just imagine it, the opponent finds Herr Edgar’s essay on the “*Union ouvrière*” *unimportant*. To console Herr Edgar the reporter says:

“Of course, it does not give anything *independent*, and these people have really gone back to *Gruppe's* point of view, which, to be sure, they have *always maintained*. Criticism must give, give and *give!*”

As though Criticism had not given quite new linguistic, historical, philosophical, economic, and juridical discoveries! And it is so modest as to let itself be told that it has not given anything *independent*! Even our Critical correspondent gave mechanics something that it had not hitherto known when he made people *go back to the same* point of view which they had always *maintained*. It is clumsy to recall *Gruppe's* point of view. In his pamphlet, which is otherwise miserable and not worth mentioning, Gruppe asked Herr Bruno what criticism he could give on *speculative logic*. Herr Bruno referred him to future generations and —

“a fool is waiting for an answer”.

As God punished the unbelieving Pharaoh by hardening his heart and did *not think* him *worthy* of being enlightened, so the reporter assures us:

“They are therefore *not at all worthy* of seeing or knowing the contents of your *Literatur-Zeitung*.”

And instead of advising his friend Edgar to acquire thoughts and knowledge he gives him the following advice:

“Let Edgar get a *bag of phrases* and draw blindly out of it when he writes essays in future, in order to acquire a style in harmony with the public.”

Besides assurances of “a certain fury, ill-favour, emptiness, thoughtlessness, an inkling of something which they are not able to fathom, and a feeling of nullity” (all these epithets apply, of course, to the Berlin Couleur), eulogies like the following are made of the Holy Family:

“Lightness of treatment penetrating the matter, command of the categories, insight acquired by study, in a word, *command of the Objects*. He” (of the Berlin Couleur) “takes an easy attitude to the thing, you make the thing easy.” Or: “Your criticism in the *Literatur-Zeitung* is pure, graphic and relevant.”

Finally it is stated:

“I have written it all to you at such length because I know that I shall give you *pleasure* by reporting the opinions of my friend. From this you can see that the *Literatur-Zeitung* is fulfilling its purpose.”

Its purpose is opposition to the Berlin Couleur. Having just witnessed the *Berlin Couleur's* polemic against Critical Criticism and the reproof it received for that polemic, we are now given a double picture of its efforts to obtain mercy from Critical Criticism.

One correspondent writes:

“My acquaintances in Berlin told me when I was there at the beginning of the year that you repel all and keep all at a distance; that you keep yourself to yourself and let nobody approach you, assiduously avoiding all intercourse. I, of course, cannot tell which side is to blame.”

Absolute Criticism replies:

“Criticism does *not* form any *party* and will have no party of its own; it is *solitary* because it is engrossed in *its*” (!) “object and opposes itself to it. It *isolates itself from everything*.”

Critical Criticism thinks it rises above all dogmatic antitheses by substituting for the real antitheses the imaginary antithesis between *itself and the world*, between the *Holy Ghost* and the *profane Mass*. In the same way it thinks it rises *above parties* by falling *below the party point of view*, by counterposing itself as a *party* to the rest of mankind and concentrating all interest in the personality of Herr Bruno and Co. The truth of Criticism's *admission* that it sits enthroned in the solitude of *abstraction*, that even when it seems to be occupied with some *object* it does not come out of its objectless solitude into a truly social relation to a *real object*, because *its object* is only the object of its *imagination*, only an imaginary object — the truth of this Critical *admission* is proved by the whole of our exposition. Equally correctly Criticism defines its *abstraction* as *absolute* abstraction, in the sense that “it *isolates itself from everything*”, and precisely this isolation of *nothing from everything*, from *all* thought., contemplation, etc., is *absolute nonsense*. Incidentally, the solitude which it achieves by isolating and abstracting itself from *everything* is no more free from the object from which it abstracts itself than *Origen* was from the *genital organ* that he *isolated* from himself.

Another correspondent begins by describing *one* of the members of the “Berlin Couleur”, whom he saw and spoke with, as “gloomy”, “depressed”, “no longer able to open his mouth” (although he was formerly always “ready with a quite *impudent* word”), and “despondent”. This member of

the “Berlin Couleur” related the following to the correspondent, who in turn reported it to Criticism:

“He cannot grasp how people like you two, who formerly respected the principle of humanity, can behave in such an aloof, repelling, indeed arrogant manner.” He does not know “why there are some people who, it seems, Intentionally cause a split. Have we not all the same point of view? Do we not all *pay homage* to the extreme, to Criticism? Are we not all capable, if not of producing, at least of grasping and applying an extreme thought?” He “finds that this split is motivated by no other principle than egoism and arrogance”.

Then the correspondent puts in a good word:

“Have not at least some of our friends grasped *Criticism*, or perhaps *the good will of Criticism* .. ‘*ut desint vires, tamen est laudanda voluntas*’.”

Criticism replies with the following *antitheses* between itself and the Berlin Couleur:

“There are *various* standpoints on criticism.” The members of the Berlin Couleur “thought they had criticism in their pocket”, but Criticism “really knows and applies the force of criticism”, i.e., does not keep it in its pocket. For the former, criticism is pure form, whereas for Criticism, on the other hand, it is the “*most substantial* or rather the only substantial thing”. Just as Absolute Thought considers itself the whole of reality, so does Critical Criticism. That is why it sees no content *outside itself* and is therefore not the criticism of *real* objects existing outside the Critical subject; on the contrary, it *makes* the object, it is the Absolute *Subject-Object*. Further! “The former kind of criticism disposes of everything, of the investigation of things, by means of phrases. The latter isolates itself *from everything* by means of phrases.” The former is “*clever in ignorance*”, the latter is “learning”. The latter, at any rate, is not clever, it learns *par ça, par là* , but only in appearance, only in order to be able to fling what it has superficially learnt from the Mass back at the Mass in the form of a “catchword”, as wisdom that it itself has discovered, and to resolve it into the nonsense of Critical Criticism.

“For the former, words such as ‘extreme’, ‘proceed’, ‘not go far enough’ are of importance and highly revered categories; the latter investigates the *standpoints* and does not apply to them the *measures* of those abstract categories.”

The exclamations of Criticism No. 2 that it is no longer a question of politics, that philosophy is done away with, and its dismissal of social systems and developments by means of words like “fantastic”, “utopian”, etc. — what is all that if not a *Critically revised* version of “proceeding” and “not going far enough”? And are not its “measures”, such as “*History*”, “*Criticism*”, “summing up of objects”, “the old and the new”, “Criticism and Mass”, “investigation of standpoints” — in a word, are not all its catch-words *categorical measures* and abstractly categorical ones at that! ?

“The former is theological, spiteful, envious, petty, presumptuous, the latter is the *opposite* of all that.”

After thus praising itself a dozen times in one breath and ascribing to itself all that the Berlin Couleur lacks, just as God is all that *man is not*, *Criticism* bears witness to itself that:

“It has achieved a clarity, a thirst for learning, a tranquillity in which it is *unassailable* and *invincible*.”

Hence it can “at the most treat” its opponent, the Berlin Couleur, “with *Olympic laughter*”. This *laughter* — it explains with its customary thoroughness what it is and what it is not— “this laughter is not arrogance”. By no means! It is the negation of the negation. It is “*only the process* that *the Critic must apply* in all ease and equanimity against a *subordinate standpoint* which *thinks* itself *equal* to him” (what conceit!). When *the Critic* laughs, therefore, he is *applying a process*! And “in all equanimity” he applies the *process of laughter* not against *persons*, but against a *standpoint*! Even *laughter* is a category which he applies and even *must* apply!

Extramundane Criticism is not an *essential activity* of the *human subject* who is *real* and therefore lives and suffers in *present-day* society, sharing in its pains and pleasures. The *real* individual is only an *accidental feature*, an earthly vessel of *Critical Criticism*, which reveals itself in it as *eternal Substance*. The subject is not the human individual’s criticism, but the *non-human individual of Criticism*. Criticism is not a *manifestation of man*, but man is an *alienation of Criticism*, and that is why the Critic lives completely outside society.

“Can the Critic live in the society which he criticises?”

It should be asked instead: Must he not live in that society? Must he not himself be a manifestation of the life of that society? Why does the Critic

sell the products of his mind, for thereby he makes the worst law of present-day society his own law?

“*The Critic must not even dare to mix personally with society.*”

That is why he creates for himself a *Holy Family*, just as the solitary God endeavours in the Holy Family to end his tedious isolation from society. If the Critic *wants to free himself from bad society* he must first of all free himself from *his own society*.

“Thus the Critic dispenses with *all the pleasures of society*, but *its sufferings*, too, stay remote from him. He knows neither friendship” (except that of Critical friends) “nor love” (except *self-love*) “but on the other hand calumny is powerless against him; nothing can offend him; no hatred, no envy can affect him; vexation and grief are *feelings unknown* to him.”

In short, the Critic is free from all *human passions*, he is a *divine person*; he can apply to himself the song of the nun.

*I think not of a lover,
I think not of a spouse.
I think of God the Father
For he my life endows.*

Criticism cannot write a single passage without contradicting itself. Thus it tells us finally:

“The Philistinism that stones the Critic” (he has to be stoned by analogy with the Bible), “that misjudges him and ascribes *impure* motives to him” (ascribes *impure* motives to *pure* Criticism!) “in order to make *him equal to itself*” (the conceit of equality reproved above!), “is *not laughed at* by him, because it is not worth it, but is seen through and calmly reiezzated to its own insignificant significance.”

Earlier the Critic *had to* apply the *process of laughter* to the “subordinate standpoint that thought itself equal to him”. Critical Criticism’s unclarity about its mode of procedure with the godless “Mass” seems almost to indicate an interior irritation, a sort of bile to which “feelings” are not “unknown”.

However, there should be no misunderstanding. Having waged a Herculean struggle *to free* itself from the uncritical “profane Mass” and “everything”, Critical Criticism has at last succeeded in achieving its

solitary, god-like, self-sufficient, absolute existence. If in its first pronouncement in this, its “new phase”, the old world of *sinful feelings* seems still to have some power over it, we shall now see Criticism find aesthetic relaxation and *transfiguration* in an “*artistic form*” and complete its *penance* so it can finally as a second triumphant *Christ* accomplish the *Critical last judgment* and after its victory over the dragon ascend calmly to heaven.

Chapter VIII. The Earthly Course and Transfiguration Of “Critical Criticism”, Or “Critical Criticism” As Rudolph, Prince of Geroldstein

Rudolph, Prince of Geroldstein, *does penance* in his *earthly course* for a *double* crime: his *personal* crime and that of *Critical Criticism*. In a furious dialogue he drew his sword against his father; *Critical Criticism*, also in a furious dialogue, let itself be carried away by sinful feelings against the Mass. *Critical Criticism* did not reveal a *single* mystery. *Rudolph* does penance for that and reveals *all* mysteries.

Rudolph, Herr Szeliga informs us, is the *first* servant of the *state* of humanity (the *Humanitätsstaat* of the Swabian *Egidius*. See *Konstitutionelle Jahrbücher* by Dr. Karl Weil, 1844, Bd. 266).

For *the world not to be destroyed*, Herr Szeliga asserts, it is necessary that

“Men of ruthless criticism appear.... *Rudolph* is *such* a man.... *Rudolph* grasps the thought of *pure criticism*. And that thought is more fruitful for him and mankind than *all* the experiences of the latter in its *history*, than *all* the knowledge that *Rudolph*, guided even by the most reliable teacher, was able to derive from that history.... The impartial judgment by which *Rudolph* perpetuates his *earthly course* is, *in fact*, nothing but

the revelation of the mysteries of society.”

He is: “*the revealed mystery of all mysteries.*”

Rudolph has far more external means at his disposal than the other men of *Critical Criticism*. But the latter consoles itself:

“Unattainable for those less favoured by destiny are *Rudolph’s results*” (!), “not unattainable is the splendid goal

That is why *Criticism* leaves the *realisation* of its own *thoughts* to *Rudolph*, who is so favoured by destiny. It sings to him:

Hahnemann, go on ahead.

You've waders on, you won't get wet!

Let us accompany Rudolph in his Critical earthly course, which "is *more fruitful for mankind* than *all the experiences* of the latter in its history, than *all the knowledge*" etc., and which twice saves the world from *destruction*.

1) Critical Transformation of a Butcher into a Dog, Or Chourineur

Chourineur was a butcher by trade. Owing to a concurrence of circumstances, this mighty son of nature becomes a murderer. Rudolph comes across him accidentally just when he is molesting Fleur de Marie. Rudolph gives the dexterous brawler a few impressive, masterly punches on the head, and thus wins his respect. Later, in the tavern frequented by criminals, Chourineur's kind-hearted disposition is revealed. "You still have heart and honour," Rudolph says to him. By these words he instils in Chourineur respect for himself. Chourineur is reformed or, as Herr Szeliga says, is transformed into a "*moral being*". Rudolph takes him under his protection. Let us follow the course of Chourineur's education under the guidance of Rudolph.

Ist Stage. The first lesson Chourineur receives is a lesson in hypocrisy, faithlessness, craft and *dissimulation*. Rudolph uses the reformed Chourineur in exactly the same way as *Vidocq* used the criminals he had reformed, i.e., he makes him a *mouchard* and *agent provocateur*. He advises him to "*pretend*" to the "*maître d'école*" that he has altered his "principle of not stealing" and to suggest a robbery so as to lure him into a trap set by Rudolph. Chourineur feels that he is being made a fool of. He protests against the suggestion of playing the role of *mouchard* and *agent provocateur*. Rudolph easily convinces the son of nature by the "*pure*" *casuistry* of Critical Criticism that a foul trick is not foul when it is done for "*good, moral*" reasons. Chourineur, as an *agent provocateur* and under the pretence of friendship and confidence, lures his former companion to destruction. For the first time in his life he commits an act of *infamy*.

2nd Stage. We next find Chourineur acting as *garde-malade* to Rudolph, whom he has saved from mortal danger.

Chourineur has become such a *respectable moral* being that he rejects the Negro doctor David's suggestion to sit on the floor, for fear of dirtying

the carpet. He is indeed too *shy* to sit on a chair. He first lays the chair on its back and then sits on the front legs. He never fails to apologise when he addresses Rudolph, whom he saved from a mortal danger, as “friend” or “*Monsieur*” instead of “*Monseigneur*”.

What a wonderful training of the ruthless son of nature! Chourineur expresses the innermost secret of his Critical transformation when he admits to Rudolph that he has the same attachment for him as a *bulldog* for its master: “Je me sens pour vous, comme qui dirait *l’attachement* d’un *bouledogue* pour son maître.” The former butcher is transformed into a dog. Henceforth all his virtues will be reduced to the virtue of a dog, pure “*dévouement*” to its master. His independence, his individuality will disappear completely. But just as bad painters have to label their pictures to say what they are supposed to represent, Eugène Sue has to put a label on “*bulldog*” Chourineur, who constantly affirms: “The two words, ‘You still have heart and honour’, made a man out of me.” Until his very last breath, Chourineur will find the motive for his actions, not in his human individuality, but in that label. As proof of his moral reformation he will often reflect on his own excellence and the wickedness of other individuals. And every time he throws out moral sentences, Rudolph will say to him: “I like to hear you *speak* like that.” Chourineur has not become an ordinary *bulldog* but a *moral one*.

3rd Stage. We have already admired the *petty-bourgeois respectability* which has taken the place of Chourineur’s coarse but *daring* unceremoniousness. We now learn that, as befits a “*moral being*”, he has also adopted the gait and demeanour of the *petty bourgeois*.

“*A le voir marcher — on l’eût pris pour le bourgeois le plus inoffensif du monde.*”

Still sadder than this form is the content that Rudolph gives his Critically reformed life. He sends him to Africa “to serve as a living and salutary example of repentance to the world of unbelievers”. In future, he will have to represent, not his own human nature, but a Christian dogma.

4th Stage. The Critically moral transformation has made Chourineur a quiet, cautious man who behaves according to the rules of fear and worldly wisdom.

“Le Chourineur”, reports Murph, who in his indiscreet simplicity continually tells tales out of school “n’a pas dit un mot de l’exécution du maître d’école, de *peur* de se trouver compromise”

So Chourineur knows that the punishment of the maître *d’école* was an illegal act. But he does not talk about it for fear of compromising himself. *Wise Chourineur!*

5th Stage. Chourineur has carried his moral education to such perfection that he gives his *dog-like* attitude to Rudolph a civilised form—he becomes conscious of it. After saving *Germain* from a mortal danger he says to him:

“I have a protector who is to me what *God* is to *priests* — he is such as to make one kneel before him.”

And in imagination he kneels before his God.

“Monsieur Rudolph,” he says to Germain, “protects you. I say ‘*Monsieur*’ though I should say ‘*Monseigneur*’. But I am used to calling him ‘*Monsieur Rudolph*’, and he allows me to.”

“Magnificent awakening and flowering!” exclaims Szeliga in Critical delight.

6th Stage. Chourineur worthily ends his career of pure *dévouement*, or moral bulldogishness, by finally letting himself be stabbed to death for his gracious lord. At the moment when Squelette threatens the prince with his knife, Chourineur stays the murderer’s arm. Squelette stabs him. But, dying, Chourineur says to Rudolph:

“I was right when I said that a *lump of earth*” (a bulldog) “like me can sometimes be useful to a *great and gracious master* like you.”

To this dog-like utterance, which sums up the whole of Chourineur’s Critical life like an epigram, the label put in his mouth adds:

“We are quits, Monsieur Rudolph. You told me that I had heart and honour.”

Herr Szeliga cries as loud as he can:

“What a merit it was for ‘Rudolph to have restored the *Schuriman* (?)’
“to *mankind* (!)”

2) Revelation of The Mystery of Critical Religion, Or Fleur De Marie

a) The Speculative “Marguerite”

A word more about Herr Szeliga's speculative "Marguerite" before we go on to Eugène Sue's *Fleur de Marie*.

The speculative "Marguerite" is above all a *correction*. The fact is that the reader could conclude from Herr Szeliga's construction that Eugène Sue had

"separated the presentation of the objective basis" (of the "world system") "from the development of the acting individual forces which can be understood only against that background".

Besides the task of correcting this erroneous conjecture that the reader may have made from Herr Szeliga's presentation, Marguerite has also a metaphysical mission in our, or rather Herr Szeliga's, "epic".

"The *world system* and an epic event *would still not* be artistically united in a really *single* whole if they were only interspersed in a motley mixture — now here a bit of world system and then there some stage play. If *real unity* is to result, both things, the mysteries of this prejudiced *world* and the clarity, frankness and confidence with which *Rudolph* penetrates and reveals them, must clash in a *single* individual ... This is the task of Marguerite."

Herr Szeliga speculatively constructs Marguerite by analogy with *Bauer's* construction of the *Mother of God*.

On one side is the "*divine element*" (*Rudolph*) to, which "all power and freedom" are attributed, the only *active* principle. On the other side is the passive "*world system*" and the human beings belonging to it. The world system is the "ground of reality". If this ground is not to be "entirely abandoned" or "the last remnant of the natural condition is not to be abolished"; if the world itself is to have some share in the "principle of development" that Rudolph, in contrast to the world, concentrates in himself; if "the human element is not to be represented simply as unfree and inactive", Herr Szeliga is bound to fall into the "contradiction of religious consciousness". Although he tears apart the world system and its activity as the dualism of a dead Mass and Criticism (*Rudolph*), he is nevertheless obliged to concede some attributes of divinity to the world system and the mass and to give in Marguerite a speculative construction of the unity of the two, Rudolph and the world (see *Kritik der Synoptiker*, Band 1,).

Besides the real relations of the *house-owner*, the acting "individual force", to his *house* (the "objective basis"), mystical speculation, and

speculative aesthetics too, need a third *concrete, speculative unity*, a *Subject-Object* which is the house and the house-owner in *one*. As speculation does not like natural mediations in their extensive circumstantiality, it does not realise that the same “bit of world system”, the house, for example, which for one, the house-owner, for example, is an “objective basis”, is for the other, the builder of the house, an “epic event”. In order to get a “really single whole” and “real unity” Critical Criticism, which reproaches “romantic art” with the “dogma of unity”, replaces the natural and human connection between the world system and world events by a fantastic connection, a mystical Subject-Object, just as *Hegel* replaces the real connection between man and nature by an absolute Subject-Object which is at one and the same time the whole of nature and the whole of humanity, the *Absolute Spirit*.

In the Critical Marguerite “the universal guilt of the time, the guilt of mystery”, becomes the “*mystery of guilt*”, just as the universal debt of mystery becomes *the mystery of debts* in the indebted *Epicier* .

According to the Mother-of-God construction, Marguerite should really have been the *mother of Rudolph*, the redeemer of the world. Herr Szeliga expressly says:

“According to the *logical sequence*, Rudolph should have been the *son* of Marguerite.”

Since, however, he is not her son, but her father, Herr Szeliga finds in this “the new mystery that the present often bears in its womb the long departed past instead of the future”. He even reveals another mystery, a still greater one, a mystery which directly contradicts mass-type statistics, the mystery that

“a child, if it does not, in its turn, become a father or mother, but goes to its grave pure and innocent, is ... *essentially ... a daughter*”.

Herr Szeliga faithfully follows Hegel’s speculation when, according to the “*logical sequence*”, he regards the daughter as the mother of her father. In Hegel’s philosophy of history, as in his philosophy of nature, the son engenders the mother, the spirit nature, the Christian religion paganism, the result the beginning.

After proving that according to the “*logical sequence*” Marguerite ought to have been Rudolph’s mother, Herr Szeliga proves the opposite:

“in order to conform fully to the *idea* she embodies in *our* epic, she must *never become a mother*”.

This shows at least that the idea of our epic and Herr Szeliga's logical sequence are mutually contradictory.

The speculative Marguerite is nothing but the "*embodiment of an idea*". But what idea?

"She has the task of representing, *as it were*, the last tear of grief that the past sheds prior to its final passing away."

She is the representation of an allegorical tear, and even this little that she is, is only "*as it were*".

We shall not follow Herr Szeliga in his further description of Marguerite. We shall leave her the satisfaction, according to Herr Szeliga's prescription, of "constituting *the most decisive* antithesis to *everyone*", a mysterious antithesis, as mysterious as the attributes of God.

Neither shall we delve into the "*true mystery*" that is "deposited *by God* in the breast of man" and at which the speculative Marguerite "as it were" hints. We shall pass from Herr Szeliga's Marguerite to Eugène Sue's Fleur de Marie and to the Critical miraculous cures Rudolph accomplishes on her.

b) Fleur de Marie

We meet Marie surrounded by criminals, as a prostitute in bondage to the proprietress of the criminals' tavern. In this debasement she preserves a human nobleness of soul, a human unaffectedness and a human beauty that impress those around her, raise her to the level of a poetical flower of the criminal world and win for her the name of Fleur de Marie.

We must observe Fleur de Marie attentively from her first appearance in order to be able to compare her *original form* with her *Critical transformation*.

In spite of her frailty, Fleur de Marie at once gives proof of vitality, energy, cheerfulness, resilience of character — qualities which alone explain her human development in her *inhuman* situation.

When Chourineur ill-treats her, she defends herself with her scissors. That is the situation in which we first find her. She does not appear as a defenceless lamb who surrenders without any resistance to overwhelming brutality; she is a girl who can vindicate her rights and put up a fight.

In the criminals' tavern in the Rue aux Fèves she tells Chourineur and Rudolph the story of her life. As she does so she *laughs* at Chourineur's wit. She blames herself because on being released from prison she spent the 300

francs she had earned there on amusements instead of looking for work. “But,” she said, “I had no one to advise me.” The memory of the catastrophe of her life — her selling herself to the proprietress of the criminals’ tavern — puts her in a melancholy mood. It is the first time since her childhood that she has recalled these events.

“Le fait est, que ça me chagrine de regarder ainsi derrière moi ... a doit être bien bon d’être honnête.”

When Chourineur makes fun of her and tells her she must become honest, she exclaims:

“Honnête, mon dieu! et avec quoi donc veux-tu que je sois honnête?”

She insists that she is not one “to have fits of tears”: “*Je ne suis pas pleurnicheuse*” ; but her position in life is sad—”*Ça nest pas gai.*” Finally, contrary to Christian *repentance*, she pronounces on the past the human sentence, at once *Stoic* and *Epicurean*, of a free and strong nature:

Enfin ce qui est fait, est fait.”

Let us accompany Fleur de Marie on her first outing with Rudolph.

“The consciousness of your terrible situation has probably often distressed you,” Rudolph says, itching to moralise.

“Yes,” she replies, “more than once I looked over the embankment of the Seine; but then I would gaze at the flowers and the sun and say to myself: the river will always be there and I am not yet seventeen years old. Who can say? “*On such occasions it seemed to me that I had not deserved my fate, that I had something good in me. People have tormented me enough, I used to say to myself, but at least I have never done any harm to anyone.*”

Fleur de Marie considers her situation not as one she has freely created, not as the expression of her own personality, but as a fate she has not deserved. Her bad fortune can change. She is still young.

Good and evil, as Marie conceives them, are not the *moral abstractions* of good and evil. She is *good* because she has never caused *suffering* to anyone, she has always been *human* towards her inhuman surroundings. She is *good* because the sun and the flowers reveal to her her own sunny and blossoming nature. She is good because she is still *young*, full of hope and vitality. Her situation is *not good*, because it puts an unnatural constraint on her, because it is not the expression of her human impulses, not the fulfilment of her human desires; because it is full of torment and without joy. She measures her situation in life by ‘ her own *individuality*, her *essential nature*, not by *the ideal of what is good*.

In *natural* surroundings, where the chains of bourgeois life fall away and she can freely manifest her own nature, Fleur de Marie bubbles over with love of life, with a wealth of feeling, with human joy at the beauty of nature; these show that her social position has only grazed the surface of her and is a mere misfortune, that she herself is neither good nor bad, but *human*.

“*Monsieur Rudolph, what happiness! ... grass, fields! If you would allow me to get out, the weather is so fine ... I should love so much to run about in these meadows.*”

Alighting from the carriage, she plucks flowers for Rudolph, can hardly speak for joy”, etc., etc.

Rudolph tells her that he is going to take her to *Madame George’s farm*. There she can see dove-cotes, cow-stalls and so forth; there they have milk, butter, fruit, etc. Those are real *blessings* for this child. She will be merry, that is her main thought. “*You can’t believe how I am longing for some fun!*” She explains to Rudolph in the most unaffected way her own share of responsibility for her misfortune. “*My whole fate is due to the fact that I did not save up my money.*” She therefore advises him to be thrifty and to put money in the savings-bank. Her fancy runs wild in the castles in the air that Rudolph builds for her. She becomes sad only because she

“has forgotten the present” and “the contrast of that present with the dream of a joyous and laughing existence reminds her of the cruelty of her situation”.

So far we have seen Fleur de Marie in her original un-Critical form. Eugène Sue has risen above the horizon of his narrow world outlook. He has slapped bourgeois prejudice in the face. He will hand over Fleur de

Marie to the hero Rudolph to atone for his temerity and to reap applause from all old men and women, from the whole of the Paris police, from the current religion and from “Critical Criticism”.

Madame George, to whom Rudolph entrusts Fleur de Marie, is an unhappy, hypochondriacal religious woman. She immediately welcomes the child with the unctuous words: “*God* blesses those who love and fear him, who have been unhappy and who *repent*.” Rudolph, the man of “pure Criticism”, has the wretched priest *Laporte*, whose hair has greyed in superstition, called in. He has the mission of accomplishing Fleur de Marie’s Critical reform.

Joyfully and unaffectedly Marie approaches the old priest. In his Christian brutality, *Eugène Sue* makes a “marvellous instinct” at once whisper in her ear that “*shame* ends where *repentance* and *penance* begin”, that is, in the church, which alone saves. He forgets the unconstrained merriness of the outing, a merriness which nature’s grace and Rudolph’s friendly sympathy had produced, and which was troubled only by the thought of having to go back to the criminals’ landlady.

The priest Laporte immediately adopts a *supermundane* attitude. His first words are:

“*God’s* mercy is infinite, my dear child! He has proved it to you by not abandoning you in your severe trials.... The magnanimous man who saved you fulfilled the *word of the Scriptures*” (note — the word of the Scriptures, not a human purpose!): “Verily the Lord is nigh to those who invoke him; he will fulfil their desires ... he will hear their voice and will save them ... the Lord will accomplish *his* work.”

Marie cannot yet understand the evil meaning of the priest’s exhortations. She answers:

“I shall pray for those who pitied me and brought me back to God.”

Her first thought is *not* for God, it is for her *human* saviour and she wants to pray for *him*, not for her *own* absolution. She attributes to her prayer some influence on the salvation of others. Indeed, she is still so naive that she supposes she has *already been brought back* to God. The priest feels it is his duty to destroy this unorthodox illusion.

“Soon,” he says, interrupting her, “soon you will deserve absolution, absolution from your great errors ... for, to quote the prophet once more, the Lord holdeth up those who are on the brink of falling.”

One should not fail to see the inhuman expressions the priest uses. Soon you will deserve absolution. Your sins are *not yet forgiven*.

As Laporte, when he receives the girl, bestows on her the *consciousness of her sins*, so Rudolph, when he leaves her, presents her with a gold *cross*, the symbol of the *Christian crucifixion* awaiting her.

Marie has already been living for some time on Madame George's farm. Let us first listen to a dialogue between the old priest Laporte and Madame George.

He considers "marriage" out of the question for Marie "because no man, in spite of the priest's guarantee, will have the courage to face the past that has soiled her youth". He adds: "she has great errors to atone for, her moral sense ought to have kept her upright."

He proves, as the commonest of bourgeois would, that she could have remained good: "There are many virtuous people in Paris today." The hypocritical priest knows quite well that at any hour of the day, in the busiest streets, those virtuous people of Paris pass indifferently by little girls of seven or eight years who sell *allumettes*, and the like until about midnight as Marie herself used to do and who, almost without exception, will have the same fate as Marie.

The priest has made up his mind concerning Marie's *penance*; in his own mind he has already *condemned* her.. Let us follow Marie when she is accompanying Laporte home in the evening.

"See, my child," he begins with unctuous eloquence, "the boundless horizon the limits of which are no longer visible" (for it is evening), "it seems to me that the calm and the vastness almost give us an idea of eternity.... I am telling you this, Marie, because you are sensitive to the beauties of creation.... I have often been moved by the religious admiration which they inspire in you-you who for so long were deprived of religious feeling."

The priest has already succeeded in changing Marie's immediate naive pleasure in the beauties of nature into a *religious* admiration. For her, *nature* has already become devout, *Christianised* nature, debased to *creation*. The transparent sea of space is desecrated and turned into the dark symbol of stagnant *eternity*. She has already learnt that all human manifestations of her being were "*profane*", devoid of religion, of real consecration, that they were impious and godless. The priest must soil her in her own eyes, he must trample underfoot her natural, spiritual resources and means of grace, in

order to make her receptive to the supernatural means of grace he promises her, *baptism*.

When Marie wants to make a confession to him and asks him to be lenient he answers:

“The *Lord* has shown you that he is merciful.”

In the clemency which she is shown Marie must not see a natural, self-evident attitude of a related human being to her, another human being. She must see in it an extravagant, supernatural, superhuman mercy and condescension; in *human leniency* she must see *divine mercy*. She must transcendentalise all human and natural relationships by making them *relationships to God*. The way Fleur de Marie in her answer accepts the priest’s chatter about divine mercy shows how far she has already been spoiled by religious doctrine.

As soon as she entered upon her improved situation, she said, she had felt only her *new happiness*.

“Every instant I thought of Monsieur Rudolph. I often raised my eyes to heaven, to look there, not for God, but for Monsieur Rudolph, and to thank him. Yes, *I confess*, Father, *I thought more* of him than of God; for *he* did for me what God alone could have done.... I was *happy*, as happy as someone who has escaped a great danger for ever.”

Fleur de Marie already finds it wrong that she took a new happy situation in life simply for what it *really* was, that she felt it as a new happiness, that her attitude to it was a natural, not a supernatural one. She accuses herself of seeing in the man who rescued her what he *really* was, her rescuer, instead of supposing some imaginary saviour, *God*, in his place. She is already caught in religious hypocrisy, which takes away from *another* man what he has deserved in respect of me in order to give it to God, and which in general regards everything human in man as alien to him and everything inhuman in him as *really* belonging to him.

Marie tells us that the *religious transformation* of her thoughts, her sentiments, her attitude to life was effected by Madame George and Laporte.

“When Rudolph took me away from the *Cité*, I already had a vague consciousness of my degradation. But the education, the advice and examples I got from you and Madame George made me understand ... that I

had been more guilty than unfortunate.... You and Madame George made me *realise the infinite depth of my damnation.*”

That is to say she owes to the priest Laporte and Madame George the replacement of the human and therefore bearable consciousness of her degradation by the Christian and hence unbearable consciousness of eternal damnation. The priest and the bigot have taught her to judge herself from the *Christian point of view.*

Marie feels the depth of the spiritual misfortune into which she has been cast. She says:

“Since the consciousness of good and evil had to be so frightful for me, why was I not left to my wretched lot?... Had I not been snatched away from infamy, misery and blows would soon have killed me. At least I should have died in ignorance of a purity that I shall always wish for in vain.”

The heartless priest replies:

“Even the most noble nature, were it to be plunged only for a day in the filth from which you have been saved, would be *indelibly branded.* That is the *immutability of divine justice!*”

Deeply wounded by this *priestly curse* uttered in such honeyed tones, Fleur de Marie exclaims:

“You see therefore, I must despair!”

The grey-headed slave of religion answers:

“You must renounce hope of effacing this desolate page from your life, but you must trust in the *infinite mercy of God.* Here *below,* my poor child, you will have tears, remorse and penance, but one day *up above,* forgiveness and *eternal bliss!*”

Marie is not yet stupid enough to be satisfied with eternal bliss and forgiveness up above.

“Pity, pity, my God!” she cries. “I am so young.... *Malheur à moi!*”

Then the hypocritical sophistry of the priest reaches its peak:

“On the contrary, happiness for you, Marie; happiness for you to whom the Lord sends this bitter but saving remorse! It shows the religious susceptibility of your soul.... Each of your sufferings is counted up above. Believe me, God left you awhile on the path of evil only to reserve for you the *glory of repentance* and the eternal reward due to *atonement.*”

From this moment Marie is *enslaved by the consciousness of sin.* In her former most unhappy situation in life she was able to develop a lovable,

human individuality; in her outward debasement she was conscious that *her human essence* was *her true essence*. Now the filth of modern society, which has touched her externally, becomes her innermost being, and continual hypochondriacal self-torture because of that filth becomes her duty, the task of her life appointed by God himself, the self-purpose of her existence. Formerly she said of herself “*Je ne suis pas pleurnicheuse*” and knew that “*ce qui est fait, est fait*”. Now self-torment will be her good and remorse will be her *glory*.

It turns out later that Fleur de Marie is Rudolph’s daughter. We come across her again as Princess of Geroldstein. We overhear a conversation she has with her father:

“*In vain I pray to God to deliver me from these obsessions, to fill my heart solely with his pious love and his holy hopes; in a word, to take me entirely, because I wish to give myself entirely to him ... he does not grant my wishes, doubtless because my earthly preoccupations make me unworthy of communion with him.*”

When man has realised that his transgressions are *infinite* crimes against God he can be sure of *salvation* and *mercy* only if he gives himself *wholly* to God and becomes *wholly* dead to the world and worldly concerns. When Fleur de Marie realises that her delivery from her inhuman situation in life was a miracle of *God* she *herself* has to become a *saint* in order to be worthy of such a *miracle*. Her human love must be transformed into religious love, the striving for happiness into striving for eternal bliss, worldly satisfaction into holy hope, communion with people into communion with God. God must take her entirely. She herself reveals to us why he does not take her entirely. She has not yet *given* herself entirely to him, her heart is still preoccupied and engaged with earthly affairs. This is the last flickering of her strong nature. She gives herself entirely up to God by becoming wholly dead to the world and entering a *convent*.

A monastery is no place for him
Who has no stock of sins laid in,
So numerous and great
That be it early, be it late
He may not miss the sweet delight

Of penance for a heart contrite.

In the convent Fleur de Marie is promoted to *abbess* through the intrigues of Rudolph. At first she refuses to accept this appointment because she feels unworthy. The old abbess persuades her:

“I shall say more, my dear daughter: if before entering the fold your life had been as full of error as, on the contrary, it was pure and praiseworthy ... the evangelical virtues of which you have given an example since you have been here would have atoned for and redeemed your past in the eyes of the Lord, no matter how sinful it was.”

From what the abbess says, we see that Fleur de Marie’s earthly virtues have changed into evangelical virtues, or rather that her real virtues can no longer appear otherwise than as evangelical caricatures.

Marie answers the abbess:

“Holy Mother, I now believe that I can accept.”

Convent life does not suit Marie’s individuality — she dies. Christianity consoles her only in imagination, or rather her Christian consolation is precisely the annihilation of her real life and essence — her death.

So Rudolph first changed Fleur de Marie into a repentant sinner, then the repentant sinner into a nun and finally the nun into a corpse. At her funeral not only the Catholic priest, but also the Critical priest Szeliga preaches a sermon over her grave.

Her “*innocent*” existence he calls her “*transient*” existence, opposing it to “eternal and unforgettable guilt”. He praises the fact that her “*last breath*” was a “prayer for forgiveness and pardon”. But just as the Protestant Minister, after expounding the necessity of the Lord’s mercy, the participation of the deceased in universal original sin and the intensity of his consciousness of sin, must praise the virtues of the departed in *earthly* terms, so, too, Herr Szeliga uses the expression:

“And yet personally, she has nothing to ask forgiveness for.”

Finally he throws on Marie’s grave the most faded flower of pulpit eloquence:

“Inwardly pure as human beings seldom are, she has closed her eyes to this world.”

Amen!

3) Revelation of the Mysteries of Law

a) The *maître d'école*, or the New Penal Theory.

The Mystery of Solitary Confinement Revealed.

Medical Mysteries

The *maître d'école* is a criminal of Herculean strength and great intellectual vigour. He was brought up an educated and well-schooled man. This passionate athlete comes into conflict with the laws and customs of bourgeois society, whose universal yardstick is mediocrity, delicate morals and quiet trade. He becomes a murderer and abandons himself to all the excesses of a violent temperament that can nowhere find a fitting human occupation.

Rudolph captures this criminal. He wants to reform him critically and set him up as an example for the world of law. He quarrels with the world of law not over “*punishment*” itself, but over *kinds and methods* of punishment. He invents, as the Negro doctor David aptly expresses it, a penal theory which would be worthy of the “*greatest German criminal expert*”, and which has since had the good fortune to be defended by a German criminal expert with German earnestness and German thoroughness. Rudolph has not the slightest idea that one can rise *above* criminal experts: his ambition is to be “the greatest criminal expert”, *primus inter pares*. He has the *maître d'école* blinded by the Negro doctor David.

At first Rudolph repeats all the trivial objections to capital punishment: that it has no effect on the criminal and no effect on the people, for whom it seems to be an entertaining spectacle.

Further Rudolph establishes a difference between the *maître d'école* and the *soul* of the *maître d'école*. It is not the man, not the *real maître d'école* whom he wishes to save; he wants the *spiritual salvation* of his soul.

“The salvation of a soul,” he teaches, “is something holy.... Every crime can be *atoned for* and redeemed, the Saviour said, but only if the criminal earnestly desires to repent and *atone*. The transition from the court to the scaffold is too short.... You” (the *maître d'école*) “have criminally misused your *strength*. I shall *paralyse* your strength ... you will tremble before the weakest, your punishment will be equal to your crime ... but this terrible

punishment will at least leave you the boundless horizon of *atonement*.... I shall cut you off only from the outer world in order to plunge you into impenetrable night and leave you *alone* with the memory of your ignominious deeds.... You will be forced to look into yourself ... your intelligence, which you have degraded, will be roused and will lead you to atonement.”

Since Rudolph regards the *soul* as *holy* and man's *body* as *profane*, since he thus considers only the soul to be the true essence, because — according to Herr Szeliga's Critical description of humanity — it belongs to heaven, the body and the strength of the *maître d'école* do not belong to humanity, the manifestation of their essence cannot be given human form or claimed for humanity and cannot be treated as essentially human. The *maître d'école* has misused his strength; Rudolph paralyses, lames, destroys that strength. There is no more *Critical* means of getting rid of the perverse manifestations of a human essential strength than the destruction of this essential strength. This is the Christian means — plucking out the eye if it offends or cutting off the hand if it offends, in a word, killing the body if the body gives offence; for the eye, the hand, the body are really only superfluous sinful appendages of man. Human nature must be killed in order to heal its ailments. Mass-type jurisprudence, too, in agreement here with the Critical, sees in the *laming* and paralysing of human strength the antidote to the objectionable manifestations of that strength.

What Rudolph, the man of pure Criticism, objects to in profane criminal justice is the too swift transition from the court to the scaffold. He, on the other hand, wants to link *vengeance* on the criminal with *penance* and *consciousness of sin* in the criminal, corporal punishment with spiritual punishment, sensuous torture with the non-sensuous torture of remorse. Profane punishment must at the same time be a means of Christian moral education,

This penal theory, which links *jurisprudence* with *theology*, this “revealed mystery of the mystery”, is no other than the penal theory of the *Catholic Church*, as already expounded at length by *Bentham* in his work *Punishments and Rewards*. In that book Bentham also proved the moral futility of the punishments of today. He calls legal penalties “*legal parodies*”.

The punishment that Rudolph imposed on the *maître d'école* is the same as that which *Origen* imposed on himself. He *emasculates* him, robs him of a *productive organ*, the eye. "The eye is the light of the body." It does great credit to Rudolph's religious instinct that he should hit, of all things, upon the idea of *blinding*. This punishment was current in the thoroughly Christian empire of Byzantium and came to full flower in the vigorous youthful period of the Christian-Germanic states of England and France. Cutting man off from the perceptible outer world, throwing him back into his abstract inner nature in order to correct him — blinding — is a necessary consequence of the Christian doctrine according to which the consummation of this cutting off, the pure isolation of man in his spiritualistic "ego", is *good itself*. If Rudolph does not shut the *maître d'école* up in a real monastery, as was the case in Byzantium and in Franconia, he at least shuts him up in an ideal monastery, in the cloister of an impenetrable night which the light of the outer world cannot pierce, the cloister of an idle conscience and consciousness of sin filled with nothing but the phantoms of memory.

A certain speculative bashfulness prevents Herr Szeliga from discussing openly the penal theory of his hero Rudolph that worldly punishment must be linked with Christian repentance and atonement. Instead he imputes to him — naturally as a mystery which is only just being revealed to the world — the theory that punishment must make the criminal the "*judge*" of his "*own*" crime.

The mystery of this revealed mystery is *Hegel's* penal theory. According to Hegel, the criminal in his punishment passes sentence on himself. *Gans* developed this theory at greater length. In Hegel this is the *speculative disguise* of the old *jus talionis*, which Kant expounded as the *only juridical* penal theory. For Hegel, self-judgment of the criminal remains a mere "*Idea*", a mere speculative interpretation of the *current empirical punishments* for criminals. He thus leaves the mode of application to the respective stage of development of the state, i.e., he leaves punishment as it is. Precisely in that he shows himself more critical than his Critical echo. A *penal* theory which at the same time sees in the criminal the man can do so only in *abstraction*, in imagination, precisely because *punishment, coercion*, is contrary to *human* conduct. Moreover, this would be impossible to carry out. Purely subjective arbitrariness would take the place of the abstract law

because it would always depend on the official, “honourable and decent” men to adapt the penalty to the individuality of the criminal. Plato long ago realised that the *law* must be one-sided and *take no account* of the individual. On the other hand, under *human* conditions punishment will *really* be nothing but the sentence passed by the culprit on himself. No one will want to convince him that *violence* from *without*, done to him by others, is violence which he had done to himself. On the contrary, he will see in *other* men his natural saviours from the punishment which he has imposed on himself; in other words, the relation will be reversed.

Rudolph expresses his innermost thought — the purpose of blinding the *maître d’école* — when he says to him:

“*Chacune de tu paroles sera une prière.*”

He wants to teach him to *pray*. He wants to convert the Herculean robber into a *monk* whose only work is prayer. Compared with this Christian cruelty, how humane is the ordinary penal theory that just chops a man’s head off when it wants to destroy him. Finally, it goes without saying that whenever real mass-type legislation was seriously concerned with improving the criminal it acted incomparably more sensibly and humanely than the German Harun al-Rashid. The four Dutch agricultural colonies and the Ostwald penal colony in Alsace are truly human attempts in comparison with the blinding of the *maître d’école* just as Rudolph kills Fleur de Marie by handing her over to the priest and consciousness of sin, just as he kills Chourineur by robbing him of his human independence and degrading him into a bulldog, so he kills the *maître d’école* by having his eyes gouged out in order that he can learn to “*pray*”.

This is, of course, the way in which all reality emerges “*simply*” out of “*pure Criticism*”, namely, as a distortion and *senseless abstraction* of reality.

Immediately after the blinding of the *maître d’école* Herr Szeliga causes a *moral miracle* to take place.

“The terrible *maître d’école*,” he reports, “*suddenly* recognises the power of honesty and decency and says to Schurimann: ‘*Yes, I can trust you, you have never stolen anything.*’”

Unfortunately Eugène Sue recorded a statement of the *maître d'école* about Chourineur which contains the same recognition and cannot be the effect of his having been blinded, since it was made earlier. In talking to Rudolph alone, the *maître d'école* said about Chourineur:

“Besides, he is not capable of betraying a friend. No, there's something good in him ... he has always had strange ideas.”

This would seem to do away with Herr Szeliga's moral miracle. Now we shall see the *real* results of Rudolph's Critical cure.

We next meet the *maître d'école* as he is going with a woman called Chouette to Bouqueval farm to play a foul trick on Fleur de Marie. The thought that dominates him is, of course, the thought of *revenge* on Rudolph. But the only way he knows of wreaking vengeance on him is metaphysically, by thinking and hatching “*evil*” to spite him.

“*He has taken away my sight but not the thought of evil.*”

He tells Chouette why he had sent for her:

“I was bored all alone with those honest people.”

When Eugène Sue satisfies his monkish, bestial lust in the *self-humiliation* of man to the extent of making the *maître d'école* implore on his knees the old hag Chouette and the little imp Tortillard not to abandon him, the great moralist forgets that that is the height of diabolical satisfaction for Chouette. Just as Rudolph, precisely by the *violent act* of *blinding* the criminal, proved to him the power of *physical force*, which he wants to show him is insignificant, so Eugène Sue now teaches the *maître d'école* really to recognise the full power of the *senses*. He teaches him to understand that without it man is *unmanned* and becomes a helpless object of mockery for children. He convinces him that the world deserved his crimes, for he had only to lose his sight to be ill-treated by it. He robs him of his last human illusion, for so far the *maître d'école* believed in Chouette's attachment to him. He had said to Rudolph: “She would let herself be thrown into the fire for me.” Eugène Sue, on the other hand, has the satisfaction of hearing the *maître d'école* cry out in the depths of despair:

“*Mon dieu! Mon dieu! Mon dieu!*”

He has learnt to “*pray*”! In this “*appel involontaire de la commisération divine*,” Eugène Sue sees “*quelque chose de providentiel*”.

The first result of Rudolph's Criticism is this *spontaneous prayer*. It is followed immediately by an involuntary *atonement* at Bouqueval farm, where the ghosts of those whom the *maître d'école* murdered appear to him in a dream.

We shall not give a detailed description of this dream. We next find the Critically reformed *maître d'école* fettered in the cellar of the "Bras rouge", half devoured by rats, half starving and half insane as a result of being tortured by Chouette and Tortillard, and roaring like a beast. Tortillard had delivered Chouette to him. Let us watch the treatment he inflicts on her. He *copies* the hero *Rudolph* not only outwardly, by scratching out Chouette's eyes, but *morally* too by repeating Rudolph's hypocrisy and embellishing his cruel treatment with pious phrases. As soon as the *maître d'école* has Chouette in his power he gives vent to "*une joie effrayante*", and his voice trembles with rage.

"You realise that I do not want to get it over at once.... Torture for torture.... I must have a long talk with you before killing you.... It is going to be terrible for you. First of all, you see ... since that dream at Bouqueval farm which brought all our crimes back before me, since that dream which nearly drove me mad ... and which will drive me mad ... a strange change has come over me.... I have become horrified at my past cruelty.... At first I would not let you torture the songstress , but that was nothing.... By bringing me to this cellar and making me suffer cold and hunger.... you left me to the terror of my own thoughts.... Oh, you don't know what it is to be alone.... isolation purified me. I should not have thought it possible ... a proof that I am perhaps less of a blackguard than before ... what an infinite joy I feel to have you in my power, you monster ... not in order to revenge myself but ... to avenge our victims.... Yes, I shall have done my duty when I have punished my accomplice with my own hand I am now horrified at my past murders, and yet ... don't you find it strange? it is without fear and quite calmly that I am going to commit a terrible murder on you, with terrible refinements ... tell me, tell me ... do you understand that?"

In those few words the *maître d'école* goes through a whole gamut of *moral casuistry*.

His first words are a *frank* expression of his desire for vengeance. He wants to give torture for torture. He wants to murder Chouette and he wants to prolong her agony by a long sermon. And — delightful sophistry!-the speech with which he tortures her is a sermon on morals. He asserts that his

dream at Bouqueval has improved him. At the same time he reveals the real effect of the dream by admitting that it almost drove him mad and that it will actually do so. He gives as a proof of his reform that he prevented Fleur de Marie from being tortured. Eugène Sue's personages -earlier Chourineur and now the *maître d'école* — must express, as the result of their thoughts, as the conscious motive of their actions, his own intention as a writer, which causes him to make them behave in a certain way and no other. They must continually say: I have reformed myself 'in this, in that, etc. Since their life has no real content, their words must give vigorous tones to insignificant features like the protection of Fleur de Marie.

Having reported the salutary effect of his Bouqueval dream, the *maître d'école* must explain why Eugène Sue had him locked up in a cellar. He must find the novelist's procedure reasonable. He must say to Chouette: by locking me up in a cellar, causing me to be gnawed by rats and to suffer hunger and thirst, you have completed my reform. Solitude has Purified me.

The beastly roar, the 'wild fury, the terrible lust for vengeance with which the *maître d'école* welcomes Chouette are in complete contradiction to this moralising talk. They betray what kind of thoughts occupied him in his dungeon.

The *maître d'école* himself seems to realise this, but being a Critical moralist, he will know how to reconcile the contradictions.

He declares that the "infinite joy" of having Chouette in his power is precisely a sign of his reform, for his lust for vengeance is not a natural one but a *moral* one. He wants to avenge, not himself, but the common *victims* of Chouette and himself. If he murders her, he does not commit *murder*, he fulfils a *duty*. He does not *avenge* himself on her, he *punishes* his accomplice like an impartial judge. He shudders at his past murders and, nevertheless, marvelling at his own casuistry, he asks Chouette: "Don't you find it strange? Without fear and quite calmly I am going to kill you." On moral grounds that he does not reveal, he gloats at the same time over the picture of the murder that he is going to commit, as being *terrible murder ... murder with terrible refinements*.

It is in accord with the character of the *maître d'école* that he should murder Chouette, especially after the cruelty with which she treated him. But that he should commit murder on moral grounds, that he should give a moral interpretation to his savage pleasure in the *terrible murder* and the *terrible refinements* that he should show his remorse for the past murders

precisely by committing a fresh one, that from a simple murderer he should become *a murderer in a double sense, a moral murderer* — all this is the glorious result of Rudolph's Critical cure.

Chouette tries to get away from the *maître d'école*. He notices it and holds her fast.

“Keep still, Chouette, I must finish explaining to you how I gradually came to repentance.... This revelation will be hateful to you ... and it will also show you how pitiless I must be in the vengeance I want to wreak on you in the name of our victims.... I must hurry.... The joy of having you here in my hands makes the blood pound in my veins.... I shall have time to make the approach of your death terrifying to you by forcing you to listen to me.... I am blind ... and my thoughts take a shape, a body, such that they incessantly present to me visibly, almost palpably ... the features of my victims.... The ideas are reflected almost materially in my brain. When repentance is linked with an atonement of terrifying severity, an atonement that changes our life into a long sleeplessness filled with hallucinations of revenge or desperate reflections ... then, perhaps, the pardon of men follows remorse and atonement.”

The *maître d'école* continues with his hypocrisy which every minute betrays itself as such. Chouette must hear how he came by degrees to repentance. This revelation will be hateful to her, for it will prove that it is his *duty* to take a pitiless revenge on her, not in his own name, but in the name of their common victims. Suddenly the *maître d'école* interrupts his didactic lecture. He must, he says, “hurry” with his lecture, for the pleasure of having her in his hands makes the blood pound in his veins; that is a moral reason for cutting the lecture short! Then he calms his blood again. The long time that he takes in preaching her a moral sermon is not wasted for his revenge. It will “make the approach of death terrifying” for her. That is a different moral reason, one for protracting his sermon! And having such moral reasons he can safely resume his moral text where he left off.

The *maître d'école* describes correctly the condition to which isolation from the outer world reduces a man. For one to whom the *sensuously perceptible world* becomes a *mere idea*, for him mere ideas are transformed into *sensuously perceptible beings*. The figments of his brain assume corporeal form. A world of tangible, palpable ghosts is begotten within his mind. That is the secret of all pious visions and at the same time it is the general form of insanity. When the *maître d'école* repeats Rudolph's words

about the “power of repentance and atonement linked with terrible torments”, he does so in a state of semi-madness, thus proving in fact the connection between Christian consciousness of sin and insanity. Similarly, when the *maître d’école* considers the transformation of *life* into a *night of dream* filled with ghosts as the real result of repentance and atonement, he is expressing the true mystery of pure Criticism and of Christian reform, which consists in changing man into a ghost and his life into a life of dream.

At this point Eugène Sue realises how the *salutary thoughts* which he makes the blind robber prate after Rudolph will be made ridiculous by the robber’s treatment of Chouette. That is why he makes the *maître d’école* say:

“The salutary influence of these thoughts is such that my rage is appeased.”

So the *maître d’école* now admits that his moral wrath was nothing but *profane rage*.

“I lack courage ... strength ... will to kill you.... No, it is not for me to shed Your blood ... it would be ... murder.... Excusable murder, perhaps, but murder all the same.”

Chouette wounds the *maître d’école* with a dagger just in time. Eugène Sue can now let him kill her without any further moral casuistry.

“He uttered a cry of pain ... his fierce passion of vengeance, of rage and of bloodthirsty instinct, suddenly aroused and exacerbated by this attack, had a sudden and terrible outburst in which his already badly shaken reason was shattered.... Viper! I have felt your fang ... you will be *sightless as I am*.”

And he scratches her eyes out.

When the nature of the *maître d’école*, which has been only hypocritically, sophistically disguised, only ascetically repressed by Rudolph’s cure, breaks out, the *outburst* is all the more violent and terrifying. We must be grateful to Eugène Sue for his admission that the reason of the *maître d’école* was badly shaken by all the events which Rudolph has prepared.

“The last spark of his reason was extinguished in that cry of terror, in that cry of a damned soul” (he sees the ghosts of his murdered victims) “... the *maître d’école* rages and roars like a *frenzied beast*.... He tortures Chouette to death...

Herr Szeliga mutters under his breath:

“With the *maître d’école* there cannot be such a *swift*” (!) “and *fortunate*” (!) “*transformation*” (!) “as with Schurimann.”

Just as Rudolph sends Fleur de Marie into a convent, he makes the *maître d’école* an inmate of the *Bicêtre* asylum. He has paralysed his *spiritual* as well as his physical strength. And rightly. For the *maître d’école* sinned with his spiritual as well as his physical strength, and according to Rudolph’s penal theory the *sinning forces* must be annihilated.

But Eugène Sue has not yet consummated the “repentance and atonement linked with a terrible revenge”. The *maître d’école* recovers his reason, but fearing to be delivered to justice he remains in *Bicêtre* and *pretends* to be mad. Monsieur Sue forgets that “every word he said was to be a *prayer*”, whereas finally it is much more like the inarticulate howling and raving of a madman. Or does Monsieur Sue perhaps ironically put these manifestations of life on the same level as praying?

The idea underlying the punishment that Rudolph carried out in blinding the *maître d’école* — the isolation of the man and his soul from the outer world, the combination of legal punishment with theological torture — finds its ultimate expression in *solitary confinement*. That is why Monsieur Sue glorifies this system.

“How many centuries had to pass before it was realised that there is only one means of overcoming the rapidly spreading leprosy” (i.e., the corruption of morals in prisons) “which is threatening the body of society: isolation.”

Monsieur Sue shares the opinion of the worthy people who explain the spread of crime by the organisation of prisons. To remove the criminal from bad society he is left to his own society.

Eugène Sue says:

“I should consider myself lucky if my weak voice could be heard among all those which so rightly and so insistently demand the *complete* and *absolute* application of solitary confinement.”

Monsieur Sue’s wish has been only *partially* fulfilled. In the debates on solitary confinement in the Chamber of Deputies this year, even the official supporters of that system had to acknowledge that it leads sooner or later to insanity in the criminal. All sentences of imprisonment for more than ten years had therefore to be converted into deportation.

Had Messieurs Tocqueville and Beaumont studied Eugène Sue's novel thoroughly they would certainly have secured complete and absolute application of solitary confinement.

If Eugène Sue deprives criminals with a sane mind of society in order to make them insane, he gives insane persons society to make them sane.

"Experience proves that isolation is as fatal for the insane as it is salutary for imprisoned criminals."

If Monsieur Sue and his Critical hero Rudolph have not made law poorer by any mystery, whether through the *Catholic penal theory* or the *Methodist solitary confinement*, they have, on the other hand, enriched medicine with new mysteries, and after all, it is just as much of a service to *discover new* mysteries as to *disclose old* ones. In its report on the blinding of the *maître d'école*, Critical Criticism fully agrees with Monsieur Sue:

"When he is told he is deprived of the light of his eyes he does not even believe it."

The *maître d'école* could not believe in the loss of his sight because in reality he could still see. Monsieur Sue is describing a new kind of cataract and is reporting a real mystery for mass-type, un-Critical *ophthalmology*.

The *pupil* is *white* after the operation, so it is a case of *cataract of the crystalline lens*. So far, this could, of course, be caused by injury to the envelope of the lens without causing much pain, though not entirely without pain. But as doctors achieve this result only by natural, not by *Critical* means, the only resort was to wait until inflammation set in after the injury and the exudation dimmed the lens.

A still greater *miracle* and greater *mystery* befall the *maître d'école* in the third chapter of the third book.

The man who has been blinded *sees* again,

"Chouette, the *maître d'école* and Tortillard saw the priest and Fleur de Marie."

If we do not interpret this restoration of the *maître d'école's* ability to see as an author's miracle after the method of the *Kritik der Synoptiker*, the *maître d'école* must have had his cataract operated on again. Later he is blind again. So he used his eyes too soon and the irritation of the light caused inflammation which ended in paralysis of the *retina* and incurable *amaurosis*. It is another *mystery* for un-Critical ophthalmology that this process takes place here in a single second.

b) Reward and Punishment. Double Justice

(with a Table)

The hero Rudolph reveals a new theory to keep society upright by *rewarding the good* and *punishing the wicked*. Un-Critically considered, this theory is nothing but the theory of society as it is today. How little lacking it is in rewards for the good and punishments for the wicked! Compared with this revealed mystery, how un-Critical is the mass-type Communist *Owen*, who sees in punishment and reward the consecration of differences in social rank and the complete expression of a servile abasement.

It could be considered as a new revelation that Eugène Sue makes rewards derive from the judiciary — from a new appendix to the Penal Code — and not satisfied with *one* jurisdiction he invents a *second*. Unfortunately this revealed mystery, too, is the repetition of an old theory expounded in detail by *Bentham* in his work already mentioned . On the other hand, we cannot deny Monsieur Eugène Sue the honour of having motivated and developed Bentham's suggestion in an incomparably more Critical way than the latter. Whereas the mass-type Englishman keeps his feet on the ground, Sue's deduction rises to the Critical region of the heavens. His argument is as follows:

“The supposed effects of heavenly wrath are materialised to deter the wicked. Why should not the effect of the divine reward of the good be similarly materialised and anticipated on earth?”

In the *un-Critical* view it is the other way round: the heavenly criminal theory has only idealised the earthly theory, just as divine reward is only an idealisation of human wage service. It is absolutely necessary that society should not reward all good people so that divine justice will have some advantage over human justice.

In depicting his Critical rewarding justice, Monsieur Sue gives an example of the *feminine dogmatism* that must have a formula and forms it according to the categories of *what exists*”, dogmatism which was censured with all the “tranquillity of knowledge” by Herr Edgar in *Flora Tristan*. For each point of the present *penal code*, which he retains, Monsieur Sue projects the addition of a counterpart in a *reward code* copied from it to the

last detail. For easier survey we shall give his description of the complementary pairs in tabular form:

Table of Critically Complete Justice

<p>Existing Justice</p> <p>Name: Criminal Justice</p> <p>Description: holds in its hand a <i>sword</i> to shorten the wicked by a head.</p> <p>Purpose: Punishment of the wicked — imprisonment, infamy, deprivation of life. The people is notified of the terrible chastisements for the wicked.</p> <p>Means of discovering the wicked: Police spying, <i>mouchards</i>, to keep watch over the wicked.</p> <p>Method of ascertaining whether someone is wicked: <i>Les assises du crime</i>, criminal assizes. The public ministry points out and indicts the crimes of the accused for public vengeance.</p> <p>Condition of the criminal after sentence: Under <i>surveillance de la haute police</i>. Is fed in prison. The state defrays expenses.</p> <p>Execution: The criminal stands on the <i>scaffold</i>.</p>	<p>Critically Supplementing Justice</p> <p>Name: Virtuous Justice</p> <p>Description: holds in its hand a crown to raise the good by a head.</p> <p>Purpose: Reward of the good, free board, honour, maintenance of life. The people is notified of the brilliant triumphs for the good.</p> <p>Means of discovering the Good: <i>Espionnage de vertu</i>, <i>mouchards</i> to keep watch over the virtuous.</p> <p>Method of ascertaining whether someone is good: <i>Assises de la vertu</i>, virtue assizes. The public ministry points out and proclaims the noble deeds of the accused for public recognition.</p> <p>Condition of the virtuous after sentence: Under <i>surveillance de la haute charité morale</i>. Is fed at home. The state defrays expenses.</p> <p>Execution: Immediately opposite the scaffold of the criminal a <i>pedestal</i> is erected on which the <i>grand homme de bien</i> stands. — <i>A pillory of virtue</i>.</p>
--	---

Moved by the sight of this picture, Monsieur Sue exclaims:

“ Alas! It is a utopia! But suppose a society were organised in this way!”

That would be the *Critical organisation of society*. We must defend this organisation against Eugène Sue’s reproach that up to now it has remained a utopia. Sue has again forgotten the “*Virtue Prize*” which is awarded every

year in Paris and which he himself mentions. This prize is even organised in duplicate: the material *prix Montyon* for noble acts of men and women, and the *prix rosière* for girls of highest morality. There is even the *wreath* of roses demanded by Eugène Sue.

As far as spying on virtue and the supervision of supreme moral charity are concerned, they were organised long ago by the Jesuits. Moreover, the *Journal des Débats*, *Siècle*, *Petites affiches de Paris*, etc., point out and proclaim the virtues, noble acts and merits of all the Paris stockjobbers daily and at cost price not counting the pointing out and proclamation of political noble acts, for which each party has its own organ.

Old Voss remarked long ago that Homer is better than his gods. The “revealed mystery of all mysteries”, Rudolph, can therefore be made responsible for Eugène Sue’s ideas.

In addition, Herr *Szeliga* reports:

“Besides, the passages in which Eugène Sue interrupts the narration and introduces or concludes episodes are very numerous, and all are *Critical*.”

c) Abolition of Degeneracy Within Civilisation and of Rightlessness in the State

The juridical *preventive means* for the abolition of crime and hence of degeneracy within civilisation consists in the

“protective guardianship assumed by the state over the children of executed criminals or of those condemned to a life sentence”.

Sue wants to organise the subdivision of crime in a more liberal way. No family should any longer have a hereditary privilege to crime; free competition in crime should triumph over monopoly.

Monsieur Sue abolishes “rightlessness in the state” by reforming the section of the *Code pénal* on *confidence tricks*, and especially by the institution of *paid lawyers for the poor*. He finds that in Piedmont, Holland, etc., where there are lawyers for the poor, rightlessness in the state has been abolished. The only failing of French legislation is that it does not provide for payment of lawyers for the poor, has no lawyers restricted to serving the poor, and makes the legal limits of poverty too narrow. As if rightlessness did not begin in the very lawsuit itself, and as if it had not already been known for a long time in France that the law gives nothing, but only

sanctions what exists. The already trivial differentiation between *droit* and *fait* seems still to be a *mystère de Paris* for the Critical novelist.

If we add to the Critical revelation of the mysteries of law the great reforms which Eugène Sue wants to institute in respect of *huissiers*, we shall understand the Paris Journal *Satan*. There we see the residents of a district in the city write to the “*grand réformateur à tant la ligne*”, that there is no gaslight yet in their streets. Monsieur Sue replies that he will deal with this shortcoming in the sixth volume of his *Wandering Jew*. Another part of the city complains of the shortcomings of preliminary education. He promises a preliminary education reform for that district of the city in the tenth volume of the *Wandering Jew*.

4) The Revealed Mystery of The “Standpoint”

“Rudolph does not remain at his lofty” (!) ..*standpoint* ... he does not shirk the trouble of adopting by free choice the *standpoints* on the right and on the left, above and below” (Szeliga).

One of the principal mysteries of Critical Criticism is the “*standpoint*” and *judgment from the standpoint of the standpoint*. For Criticism every man, like every product of the spirit, is turned into a standpoint.

Nothing is easier than to see through the mystery of the standpoint when one has seen through the general mystery of Critical Criticism, that of warming up old speculative trash.

First of all, let Criticism itself expound its theory of the “standpoint” in the words of its patriarch, Herr *Bruno Bauer*.

“Science ... *never* deals with a *given single individual* or a *given definite standpoint* ... it will not fail, of course, *to do away with the limitations of a standpoint* if it is worth the trouble and if these limitations have really general human significance; but it conceives them as *pure category and determinations of selfconsciousness* and accordingly speaks only for those who have the courage to rise to the *generality of self-consciousness*, i.e., who do not wish with all their strength to remain within those limitations” (*Anekdotas*, t. II,).

The *mystery* of this courage of Bauer's is *Hegel's Phänomenologie*. Because Hegel here substitutes *self-consciousness* for *man*, the *most varied* manifestations of human reality appear only as *definite* forms, as *determinateness of self-consciousness*. But mere determinateness of self-consciousness is a "*pure category*", a mere "*thought*", which I can consequently also transcend in "*pure*" thought and overcome through pure thought. In Hegel's *Phänomenologie* the *material, sensuously perceptible, objective* foundations of the various estranged forms of human self-consciousness are allowed to remain. The whole destructive work results in the *most conservative philosophy* because it thinks it has overcome the *objective world*, the sensuously perceptible real world, by transforming it into a "*Thing of Thought*", a mere *determinateness of self-consciousness*, and can therefore also dissolve its opponent, which has become *ethereal*, in the "*ether of pure thought*". The *Phänomenologie* is therefore quite consistent in that it ends by replacing human reality by "*absolute knowledge*" — *knowledge*, because this is the only mode of existence of self-consciousness, and because self-consciousness is considered the only mode of existence of man — *absolute knowledge* for the very reason that self-consciousness knows *only itself* and is no longer disturbed by any objective world. Hegel makes man the *man of self-consciousness* instead of making self-consciousness the *self-consciousness of man*, of real man, i.e., of man living also in a real, objective world and determined by that world. He stands the world *on its head* and can therefore *in his head* also dissolve all limitations, which nevertheless remain in existence *for bad sensuousness*, for *real* man. Moreover, everything that betrays the *limitations of general self-consciousness* — all sensuousness, reality, individuality of men and of their world — is necessarily held by him to be a limit. The whole of the *Phänomenologie* is intended to prove that *self-consciousness* is the *only reality* and *all reality*.

Herr Bauer has recently re-christened absolute knowledge *Criticism*, and given the more profane sounding name *standpoint* to the determinateness of self-consciousness. In the *Anekdoten* both names are still to be found side by side, and standpoint is still explained as the determinateness of self-consciousness.

Since the "*religious world as such*" exists only as the world of *self-consciousness*, the Critical Critic — the theologian *ex professo* — cannot by

any means entertain the thought that there is a world in which *consciousness* and *being* are distinct; a world which continues to exist when I merely abolish its existence in thought, its existence as a category or as a standpoint; i.e., when I modify my own subjective consciousness without altering the objective reality in a really objective way, that is to say, without altering my own *objective* reality and that of other men. Hence the speculative *mystical identity* of *being* and *thinking* is repeated in Criticism as the equally mystical identity of *practice* and *theory*. That is why Criticism is so vexed with practice which wants to be something distinct from theory, and with theory which wants to be something other than the dissolution of a definite *category* in the “*boundless generality of self-consciousness*”. Its own theory is confined to stating that everything determinate is an opposite of the boundless generality of self-consciousness and is, therefore, of no significance; for example, the state, private property, etc. It must be shown, on the contrary, how the state, private property, etc., turn human beings into abstractions, or are products of abstract man, instead of being the reality of individual, concrete human beings.

Finally, it goes without saying that whereas Hegel’s *Phänomenologie*, in spite of its speculative original sin, gives in many instances the elements of a true description of human relations, Herr Bruno and Co., on the other hand, provide only an empty caricature, a caricature which is satisfied with deriving any determinateness out of a product of the spirit or even out of real relations and movements, changing this determinateness into a determinateness of thought, into a *category*, and making out that this category is the *standpoint* of the product, of the relation and the movement, in order then to be able to look down on this determinateness triumphantly with old-man’s wisdom from the standpoint of abstraction, of the general category and of general self-consciousness.

Just as in Rudolph’s opinion all human beings maintain the standpoint of good or bad and are judged by these two immutable conceptions, so for Herr Bauer and Co. all human beings adopt the standpoint of Criticism or that of the *Mass*. But both turn *real human beings* into *abstract standpoints*.

5) Revelation of The Mystery of the Utilisation of Human Impulses, Or Clémence D’Harville

So far Rudolph has been unable to do more than reward the good and punish the wicked in his own way. We shall now see an example of how he makes the passions useful and “gives the good natural disposition of Clémence d’Harville an appropriate development”.

“Rudolph,” says Herr Szeliga, “draws her attention to the entertaining aspect of charity, a thought which testifies to a knowledge of human beings that can only arise in the soul of Rudolph after it has been through trial.”

The expressions which Rudolph uses in his conversation with Clémence:

“To make attractive”, “to utilise natural *taste*”, “to regulate intrigue”, “to utilise *the* propensity to dissimulation and craft”, “to change imperious, inexorable instincts into noble qualities” *etc.*,

these expressions just as ‘ much as the *impulses* themselves, which are mostly attributed here to woman’s nature, betray the secret source of Rudolph’s wisdom — *Fourier*. He has come across some popular presentation of Fourier’s theory.

The *application* is again just as much Rudolph’s Critical own as is the exposition of Bentham’s theory given above.

It is not in charity *as such* that the young marquise is to find the satisfaction of her essential human nature, a human content and purpose of her activity, and hence entertainment. Charity offers rather only the external occasion, only the *pretext*, only the *material*, for a kind of entertainment that could just as well use any other material as its content. Misery is exploited consciously to procure the charitable person “the piquancy of a novel, the satisfaction of curiosity, adventure, disguise, enjoyment of his or her own excellence, violent nervous excitement”, and the like.

Rudolph has thereby unconsciously expressed the mystery which was revealed long ago, that human misery itself, the infinite abjectness which is obliged to receive alms, must serve the aristocracy of money and education as a *plaything* to satisfy its self-love, tickle its arrogance and amuse it.

The numerous charitable associations in Germany, the numerous charitable societies in France and the great number of charitable quixotic societies in England, the concerts, balls, plays, meals for the poor, and even the public subscriptions for victims of accidents, have no other object. It seems then that along these lines charity, too, has long been *organised* as entertainment.

The sudden, unmotivated transformation of the marquise at the mere word “*amusant*” makes us doubt the durability of her cure; or rather this

transformation is sudden and unmotivated only in appearance and is caused only in appearance by the description of *charité* as an amusement. The marquise *loves* Rudolph and Rudolph wants to disguise himself *along with her*, to intrigue and to indulge in charitable adventures. Later, when the marquise pays a charity visit to the prison of Saint-Lazare, her jealousy of Fleur de Marie becomes apparent and out of charity towards her jealousy she conceals from Rudolph the fact of Marie's detention. At the best, Rudolph has succeeded in teaching an unhappy woman to play a silly comedy with unhappy beings. The mystery of the *philanthropy* he has hatched is betrayed by the Paris fop who invites his partner to supper after the dance in the following words:

"Ah, Madame, it is not enough to have danced for the benefit of these poor Poles.... Let us be philanthropy to the end.... Let us have supper now for the benefit *of the poor!*"

6) Revelation of the Mystery of the Emancipation of Women, Or Louise Morel

On the occasion of the arrest of *Louise Morel*, Rudolph indulges in reflections which he sums up as follows:

"The master often ruins the maid, either by fear, surprise or other use of the opportunities provided by the nature of *the servants' condition*. He reduces her to misery, shame and crime. The *law is not concerned* with this.... The criminal who has in fact driven a girl to infanticide is not *punished*."

Rudolph's reflections do not go so far as to make the *servants' condition* the object of his most gracious Criticism. Being a *petty* ruler he is a *great* patroniser of servants' conditions. Still less does he go so far as to understand that the general position of women in modern society is inhuman. Faithful in all respects to his previous theory, he deplores only that there is no *law which punishes* a seducer and links repentance and atonement with terrible chastisement.

Rudolph has only to take a look at the existing legislation in other countries. *English* laws fulfil all his wishes. In their delicacy, which *Blackstone* so highly praises, they go so far as to declare it a *felony* to seduce even a prostitute.

Herr Szeliga exclaims with a *flourish*:

“So” (!)— “*thinks*” (!)— “*Rudolph*” (!)— “and now compare *these thoughts* with your *fantasies* about the *emancipation of woman*. The act of this emancipation can be almost physically grasped from them, but you are much too practical to start with, and that is why your attempts have failed so often.”

In any case we must thank Herr Szeliga for revealing the mystery that an act can be almost physically grasped from thoughts. As for his ridiculous comparison of Rudolph with men who taught the emancipation of woman, compare Rudolph’s thoughts with the following “fantasies” of *Fourier*.

“Adultery, seduction, are a credit to the seducer, are good tone.... But, poor girl! Infanticide! What a crime! If she prizes her honour she must efface all traces of dishonour. But if she sacrifices her child to the prejudices of the world her ignominy is all the greater and she is a victim of the prejudices of the law.... That is the vicious circle which every civilised mechanism describes.”

“Is not the young daughter a ware held up for sale to the first bidder who wishes to obtain exclusive ownership of her?... just as in grammar two negations are the equivalent of an affirmation, we can say that in the marriage trade two prostitutions are the equivalent of virtue.”

“The change in a historical epoch can always be determined by women’s progress towards freedom, because here, in the relation of woman to man, of the weak to the strong, the victory of human nature over brutality is most evident. The degree of emancipation of woman is the natural measure of general emancipation.”

“The humiliation of the female sex is an essential feature of civilisation as well as of barbarism. The only difference is that the civilised system raises every vice that barbarism practises in a simple form to a compound, equivocal, ambiguous, hypocritical mode of existence.... No one is punished more severely for keeping woman in slavery than man himself” (*Fourier*).

It is superfluous to contrast Rudolph’s thoughts with Fourier’s masterly characterisation of *marriage*, or with the works of the materialist section of French communism.

The most pitiful off-scourings of socialist literature, a sample of which is to be found in this novelist, reveal “mysteries” still unknown to Critical Criticism.

7) Revelation of Political Economic Mysteries

a) Theoretical Revelation of Political Economic Mysteries

First revelation: Wealth often leads to waste, waste to ruin.

Second revelation: The above-mentioned effects of wealth arise from a lack of instruction in rich youth.

Third revelation: *Inheritance* and *private property* are and *must* be inviolable and sacred.

Fourth revelation: The rich man is *morally* responsible to the workers for the way he uses his fortune. A large fortune is a hereditary deposit — a *feudal tenement* — entrusted to clever, firm, skilful and magnanimous hands, which are at the same time charged with making it fruitful and using it in such a way that everything which has the *good luck* to be within the range of the dazzling and wholesome radiation of that large fortune is fructified, vitalised and improved.

Fifth revelation: The state must give inexperienced rich youth the rudiments of *individual economy*. It must give a moral character to riches.

Sixth revelation: Finally, the state must tackle the vast question of *organisation of labour*. It must give the wholesome example of the *association of capitals and labour*, of an association which is honest, intelligent and fair, which ensures the well-being of the *worker without* prejudice to the *fortune of the rich*, which establishes links of sympathy and gratitude *between* these *two classes* and thus ensures tranquillity in the state *for ever*.

Since the state at present does not yet accept this theory *Rudolph* himself gives some practical examples. They reveal the mystery that the most generally known *economic relations* are still „mysteries” for Monsieur Sue, Monsieur Rudolph and Critical Criticism.

b) “The Bank for the Poor”

Rudolph institutes a *Bank for the Poor*. The statute of this *Critical Bank* for the Poor is as follows:

It must give support during periods of unemployment to honest workers with families. It must replace alms and pawnshops. It has at its disposal an annual income of 12,000 francs and distributes interest-free assistance loans of 20 to 40 francs. At first it extends its activity only to the *seventh arrondissement* of Paris, where most of the workers live. Working men and

women applying for relief must have a certificate from their last employer vouching for their good behaviour and giving the cause and date of the interruption of work. These loans are to be paid off in monthly instalments of one-sixth or one-twelfth of the sum at the choice of the borrower, counting from the day on which he finds employment again. The loan is guaranteed by a the borrower's word of honour. Moreover, the latter's *parole jurée* must be guaranteed by two other workers.

As the Critical purpose of the Bank for the Poor is to remedy one of the most grievous misfortunes in the life of the worker — *interruption in employment* — assistance would be given only to unemployed manual workers. Monsieur Germain, the manager of this institution, draws a yearly salary of 10,000 francs.

Let us now cast a mass-type glance at the practice of Critical political economy. The annual income is 12,000 francs. The amount loaned per person is from 20 to 40 francs, hence an average of 30 francs. The number of workers in the seventh *arrondissement* who are officially recognised as “needy” is at least 4,000. Hence, in a year only 400, or one-tenth, of the neediest workers in the seventh *arrondissement* can receive relief. If we estimate the *average length* of unemployment in Paris at 4 months, i.e., 16 weeks, we shall be considerably below the actual figure. Thirty francs divided over 16 weeks gives somewhat less than 37 sous and 3 centimes a week, not even 27 centimes a day. The daily expense on *one prisoner* in France is on the average a little over 47 centimes, somewhat over 30 centimes being spent on food alone. But the worker to whom Monsieur Rudolph pays relief has a family. Let us take the average family as consisting of man, wife and only two children; that means that 27 centimes must be divided among four persons. From this we must deduct rent — a minimum of 15 centimes a day — so that 12 centimes remain. The average amount of *bread* eaten by a *single* prisoner costs about 14 centimes. Therefore, even disregarding all other needs, the worker and his family will not be able to buy even a quarter of the bread they need with the help obtained from the Critical Bank for the Poor. They will certainly starve if they do not resort to the means that the bank is intended to obviate — the pawnshop, begging, thieving and prostitution.

The manager of the Bank for the Poor, on the other hand, is all the more brilliantly provided for by the man of ruthless Criticism. The income he administers is 12,000 francs, his salary is 10,000. The management

therefore costs 85 per cent of the total, nearly three times as much as the mass-type administration of poor relief in Paris, which costs about 17 per cent of the total.

Let us suppose for a moment that the assistance that the Bank for the Poor provides is real, not just illusory. In that case the institution of the revealed mystery of all mysteries rests on the illusion that only a different *distribution* of wages is required to enable the workers to live through the year.

Speaking in the prosaic sense, the income of 7,500,000 French workers averages no more than 91 francs per head, that of another 7,500,000 is only 120 francs per head; hence for at least 15,000,000 it is less than is absolutely necessary for life.

The idea of the Critical Bank for the Poor, if it is rationally conceived, amounts to this: during the time the worker is employed as much will be deducted from his wages as he needs for his living during unemployment. It comes to the same thing whether I advance him a certain sum during his unemployment and he gives it back when he has employment, or he gives up a certain sum when he has employment and I give it back to him when he is unemployed. In either case he gives me when he is working what he gets from me when he is unemployed.

Thus, the “Pure” *Bank for the Poor* differs from the mass-type *savings-banks* only in two very original, very Critical qualities. The first is that the Bank for the Poor lends money “à fonds perdus” , on the senseless assumption that the worker could pay back if he wanted to and that he would always want to pay back if he could. The second is that it pays no *interest* on the sum put aside by the worker. As this sum is given the form of an advance, the Bank for the Poor thinks it is doing the worker a favour by not charging him any interest.

The difference between the Critical Bank for the Poor and the mass-type savings-banks is therefore that the worker loses his interest and the Bank its capital.

c) Model Farm at Bouqueval

Rudolph founds a *model farm* at *Bouqueval*. The choice of the place is all the more fortunate as it preserves memories of feudal times. namely of a *château seigneurial* .

Each of the six men employed on this farm is paid 150 écus, or 450 francs a year, while the women get 60 écus, or 180 francs. Moreover they get board and lodging free. The ordinary daily fare of the people at Bouqueval consists of a “formidable” plate of ham, an equally formidable plate of mutton and, finally, a no less massive piece of veal supplemented by two kinds of winter salad, two large cheeses, potatoes, cider, etc. Each of the six men does twice the work of the ordinary French agricultural labourer.

As the total annual income produced by France, if divided equally, would come to no more than 93 francs per person, and as the total number of inhabitants employed directly in agriculture is two-thirds of the population of France, it will be seen what a revolution the general imitation of the German caliph’s model farm would cause not only in the distribution, but also in the production of the national wealth.

According to what has been said, Rudolph achieved this enormous increase in production solely by making each labourer work twice as much and eat six times as much as before.

Since the French peasant is very industrious, labourers who work twice as much must be *superhuman athletes*, as the “formidable” meat dishes also seem to indicate. Hence we may assume that each of the six men eats at least a pound of meat a day.

If all the meat produced in France were distributed equally there would not be even a quarter of a pound per person per day. It is therefore obvious what a revolution Rudolph’s example would cause in this respect too. The agricultural population *alone* would consume more meat than is produced in France, so that as a result of this Critical reform France would be left without any livestock.

The fifth part of the gross product which Rudolph, according to the report of the manager of Bouqueval, Father Chatelain, allows the labourers, in addition to the high wage and sumptuous board, is nothing else than his *rent*. It is assumed that, on the average, after deduction of all production costs and profit on the working capital, one-fifth of the gross product remains for the French landowner, that is to say, the ratio of the rent to the gross product is one to five. Although it is beyond doubt that Rudolph decreases the profit on his working capital beyond all proportion by increasing the expenditure for the labourers beyond all proportion — according to Chaptal (*De l’industrie française*, t. 1, 39) the average yearly

income of the French agricultural labourer is 120 francs — although Rudolph gives his whole rent away to the labourers, Father Chatelain nevertheless reports that the prince thereby increases his revenue and thus inspires un-Critical landowners to farm in the same way.

The Bouqueval model farm is nothing but a fantastic illusion; its *hidden fund* is not the natural land of the Bouqueval estate, it is a magic purse of Fortunatus that Rudolph has!

In this connection Critical Criticism exultantly declares:

“You can see from the *whole* plan at a *first glance* that it is *not a utopia*.”

Only Critical Criticism can see at a first glance at a *Fortunatus*’ purse that it is not a utopia. The first glance of Criticism is — the glance of “the evil eye”!

8) Rudolph, “The Revealed Mystery of All Mysteries”

The miraculous means by which Rudolph accomplishes all his redemptions and miracle cures is not his fine words but his *ready money*. That is what the moralists are like, says Fourier. You must be a millionaire to be able to imitate their heroes.

Moral is “*impotence in action*”. Every time it fights a vice it is defeated. And Rudolph does not even rise to the standpoint of independent morality, which is based at least on the consciousness of *human dignity*. His morality, on the contrary, is based on the consciousness of human weakness. His is the *theological* morality. We have investigated in detail the heroic feats that he accomplished with his fixed, Christian ideas, by which he measures the world, with his “*charité*”, “*dévouement*”, “*abnégation*”, “*repentir*”, “*bons*” and “*méchants*”, “*récompense*” and “*punition*”, “*châtiments terribles*”, “*isolement*”, “*salut de l’âme*” etc. We have proved that they are mere *Eulenspiegel* tricks. All that we still have to deal with here is the personal character of Rudolph, the “revealed mystery of all mysteries” or the revealed mystery of “*pure Criticism*”.

The antithesis of “good” and “evil” confronts the Critical Hercules when he is still a youth in two personifications, *Murph* and *Polidori*, both of them Rudolph’s teachers. The former educates him in good and is “the *Good One*”. The latter educates him in evil and is “the *Evil One*”. So that this conception should by no means be inferior in triviality to similar conceptions in other novels, *Murph*, the personification of “*the good*”,

cannot be “*savant*” or “particularly endowed intellectually”. But he is *honest, simple, and laconic*; he feels himself great when he applies to evil such monosyllabic words as “*foul*” or “*vile*”, and he has a *horreur* of anything which is *base*. To use Hegel’s expression, he honestly sets the melody of the good and the true in an equality of tones, i.e., on *one note*.

Polidori, on the contrary, is a prodigy of cleverness, knowledge and education, and at the same time of the “most dangerous immorality”, having, in particular, what Eugène Sue, as a member of the young pious French bourgeoisie, could not forget— “*Le plus effrayant scepticisme*” . We can judge the spiritual energy and education of Eugène Sue and his hero by their panic fear of scepticism.

Murph,” says Herr Szeliga, “is at the same time the perpetuated guilt of January 13 and the perpetual redemption of that guilt by his incomparable love and self-sacrifice for the person of Rudolph.”

Just as Rudolph is the *deus ex machina* and the mediator of the world, so Murph, for his part, is the personal *deus ex machina* and mediator of Rudolph.

“Rudolph and the salvation of mankind, Rudolph and the realisation of man’s essential perfections, are for Murph an inseparable unity, a unity to which he dedicates himself not with the stupid dog-like devotion of the slave, but knowingly and independently.”

So Murph is an enlightened, knowing and independent slave. Like every prince’s valet, he sees in his master the salvation of mankind personified. Graun flatters Murph with the words: “*intrépide garde du corps*” . Rudolph himself calls him *modèle d’un valet* and truly he is a *model servant*. Eugène Sue tells us that Murph scrupulously addresses Rudolph as “Monseigneur” when alone with him. In the presence of others he calls him *Monsieur* with his lips to keep his incognito, but “Monseigneur” with his heart.

“Murph helps to raise the veil from the mysteries, but only for Rudolph’s sake. He helps in the work of destroying the power of mystery.”

The denseness of the veil which conceals the simplest conditions of the world from Murph can be seen from his conversation with the envoy Graun. From the legal right of self-defence in case of emergency he concludes that Rudolph, as *judge of the secret court*, was entitled to blind the *maître d’école*, although the latter was in chains and “defenceless”. His description of how Rudolph will tell of his “noble” actions before the assizes, will make

a display of eloquent phrases, and will let his great heart pour forth, is worthy of a grammar-school boy who has just read Schiller's *Raüber*. The only mystery which Murph lets the world solve is whether he blacked his face with coal-dust or black paint when he played the *charbonnier* .

“The angels shall come forth and sever the wicked from among the just” (Mat. 13:49). “Tribulation and anguish, upon every soul of man that doeth evil ... ; But glory, honour, and peace, to every man that worketh good” (Rom. 2:9-10).

Rudolph makes himself one of those *angels*. He goes forth into the world to sever the wicked from among the just, to punish the wicked and reward the good. The conception of good and evil has sunk so deep into his weak brain that he really believes in a corporeal Satan and wants to catch the devil alive, as at one time Professor *Sack* wanted to in Bonn. On the other hand, he tries to copy on a small scale the opposite of the devil, *God*. He likes “*de jouer un peu le rôle de la providence*” . Just as in *reality* all differences become merged more and more in the difference between *poor* and *rich*, so *all* aristocratic differences become dissolved in *idea* in the opposition between *good* and *evil*. This distinction is the last form that the aristocrat gives to his prejudices. Rudolph regards himself as a good man and thinks that the wicked exist to afford him the self-satisfaction of his own ‘ excellence. Let us consider this personification of “the good” a little more closely.

Herr Rudolph indulges in charity and extravagance like the Caliph of Baghdad in the Arabian Nights. He cannot possibly lead that kind of life without sucking the blood out of his little principality in Germany to the last drop like a vampire. As Monsieur Sue tells us, he would have been among the German princes who were victims of mediation had he not been saved from involuntary abdication by the protection of a French *marquis*. This gives us an idea of the size of his territory. We can form a further idea of how *Critically* Rudolph appraises his *own situation* by the fact that he, a minor German *Serenissimus*, thinks it necessary to live semi-incognito in Paris in order not to attract attention. He specially takes with him one of his *chancellors* for the Critical purpose of the latter representing for him “*le côté théâtral et puéril du pouvoir souverain*” , as though a minor German *Serenissimus* needed another representative of the theatrical and childish side of sovereign power besides himself and his mirror. Rudolph has

succeeded in imposing on his suite the same *Critical self-delusion*. Thus his servant *Murph* and his envoy *Graun* do not notice that the Parisian *homme d'affaires*, Monsieur *Badinot*, makes fun of them when he pretends to take their private instructions as matters of state and sarcastically chatters about

“*occult relations that can exist between the most varying interests and the destinies of empires*” “Yes,” says Rudolph’s envoy, “he has the impudence to say to me sometimes: ‘How many complications unknown to the people there are in the government of a state! Who would think, Herr Baron, that the notes which I deliver to you doubtless have their influence on the course of *European affairs*?’”

The envoy and *Murph* do not find it impudent that influence on European affairs is ascribed to them, but that *Badinot* idealises his lowly occupation in such a way.

Let us first recall a scene from *Rudolph’s* domestic life. Rudolph tells *Murph* “he was having moments of pride and bliss”. Immediately afterwards he becomes furious because *Murph* will not answer a question of his. “*Je vous ordonne de parier.*” *Murph* will not let himself be ordered. Rudolph says: “*Je n’aime pas les réticences*” He forgets himself so far as to be base enough to remind *Murph* that he *pays* him for all his services. He will not be calmed until *Murph* reminds him of January 13. *Murph’s* servile nature reasserts itself after its momentary abeyance. He tears out his “hair”, which he luckily has’ not got, and is desperate at having been somewhat rude to his exalted master who calls him “a model servant”, “his good old faithful *Murph*”.

After these samples of evil in him, Rudolph repeats his fixed ideas on “good” and “evil” and reports the progress he is making in regard to the good. He calls alms and compassion the chaste and pious consolers of his wounded soul. It would be horrible, impious, a sacrilege, to prostitute them to abject, unworthy beings. Of course alms and compassion are the consolers of *his* soul. That is why it would be a sacrilege to desecrate them. It would be “to inspire doubt in God, and he who gives must make people believe in Him”. To give alms to one abject is unthinkable!

Rudolph considers every motion of his soul as infinitely important. That is why he constantly observes and appraises them. Thus the simpleton consoles himself as far as his outburst against *Murph* is concerned by the fact that he was moved by *Fleur de Marie*. “I was moved to tears, and I am accused of being *blasé*, hard and inflexible!” After thus proving *his own*

goodness, he waxes furious over “evil”, over the wickedness of Marie’s unknown mother, and says with the greatest possible solemnity to Murph:

“You know — *some vengeance are very dear to me, some sufferings very precious*”.

In speaking, he makes such diabolical grimaces that his faithful servant cries out in fear: “Hélas, Monseigneur!” This great lord is like the members of *Young England*, who also wish to reform the world, perform noble deeds, and are subject to similar hysterical fits.

The explanation of the adventures and situations in which Rudolph finds himself involved is to be found above all in Rudolph’s *adventurous disposition*. He loves “the piquancy of novels, distractions, adventures, disguise”, his “curiosity” is “insatiable”, he feels a “need for vigorous, stimulating sensations”, he is “eager for *violent nervous excitement*”.

This disposition of Rudolph is reinforced by his craze for *playing the role of Providence* and arranging the world according to his fixed ideas.

His attitude to other persons is determined either by an abstract fixed idea or by quite personal, fortuitous motives.

He frees the Negro doctor David and his beloved, for example, not because of the direct human sympathy which they inspire, not to free *them*, but to play *Providence* to the slave-owner Willis and to punish him for *not believing in God*. In the same way the *maître d’école* seems to him a god-sent opportunity for *applying* the penal theory that he invented so long ago. Murph’s conversation with the envoy Graun enables us from another aspect to see deeply into the purely personal motives that determine Rudolph’s noble acts.

The prince’s interest in Fleur de Marie is based, as Murph says, “apart from” the pity which the poor girl inspires, on the fact that the daughter whose loss caused him such bitter grief would now be of the same age. Rudolph’s sympathy for the Marquise d’Harville has, “apart from” his philanthropic idiosyncrasies, the personal ground that without the old Marquise d’Harville and his friendship with the Emperor Alexander, Rudolph’s father would have been deleted from the line of German sovereigns.

His kindness towards Madame George and his interest in Germain, her son, have the same motive. Madame George belongs to the d’Harville family.

“It is no less to her misfortunes and her virtues than to this relationship that Poor Madame George owes the ceaseless kindness of His Highness.”

The apologist Murph tries to gloss over the ambiguity of Rudolph’s motives by such expressions as: *“surtout, à part, non moins que”* .

The whole of Rudolph’s character is finally summed up in the *“pure”* hypocrisy by which he manages to see and make others see the *outbursts of his evil passions* as *outbursts against the passions of the wicked*, in a way similar to that in which Critical Criticism represents *its own stupidities* as the *stupidities of the Mass*, its spiteful rancour at the progress of the world outside itself as the rancour of the world outside itself at progress, and finally its egoism, which thinks it has absorbed all Spirit in itself, as the egoistic opposition of the Mass to the Spirit.

We shall prove Rudolph’s *“pure”* hypocrisy in his attitude to the *maître d’école*, to Countess Sarah MacGregor and to the notary Jacques Ferrand.

In order to lure the *maître d’école* into a trap and seize him, Rudolph persuades him to break into his apartment. The interest he has in this is a purely personal one, not a general human one. The fact is that the *maître d’école* has a *portfolio* belonging to Countess MacGregor, and Rudolph is greatly interested in gaining possession of *it*. Speaking of Rudolph’s *tête-à-tête* with the *maître d’école*, the author says explicitly:

“Rudolph was cruelly anxious; if he let slip this opportunity of seizing the maître d’école, he would probably never have another; the brigand would carry away the secrets that Rudolph was so keen to find out.”

With the *maître d’école*, Rudolph obtains possession of Countess MacGregor’s *portfolio*; he *seizes* the *maître d’école* out of purely personal interest; he has him *blinded* out of personal passion.

When Chourineur tells Rudolph of the struggle of the *maître d’école* with Murph and gives as the reason for his resistance the fact that he knew what was in store for him, Rudolph replies: *“He did not know”*, and he says *“with a sombre mien, his features contracted by the almost ferocious expression of which we have spoken.”* The thought of vengeance flashes across his mind, he anticipates the savage pleasure that the barbarous punishment of the *maître d’école* will afford him.

On the entrance of the Negro doctor David, whom he intends to make the instrument of his *revenge*, Rudolph cries out:

“‘Vengeance!... Vengeance!’ s’écria Rodolphe avec une furtur froide et concentrée”

A cold and concentrated fury is seething in him. Then he whispers his plan in the doctor’s ear, and when the latter recoils at it, he immediately finds a “pure” theoretical motive to substitute for *personal vengeance*. It is only a case, he says, of “*applying an idea*” that has often flashed across his noble mind, and he does not forget to add unctuously: “He will still have before him the boundless horizon of atonement.” He follows the example of the Spanish Inquisition which, when handing over to civil justice the victim condemned to be burnt at the stake, added a hypocritical request for mercy for the repentant sinner.

Of course, when the interrogation and sentencing of the *maître d’école* is to take place, His Highness is seated in a most comfortable study in a long, deep black dressing-gown, his features impressively pale, and in order to copy the court of justice more faithfully, he is sitting at a long table on which are the exhibits of the case. He must now discard the expression of rage and revenge with which he told Chourineur and the doctor of his plan for blinding the *maître d’école*. He must show himself “calm, sad and composed”, and display the extremely comic, solemn attitude of a self-styled world judge.

In order to leave no doubt as to the “pure” motive of the blinding, the silly Murph admits to the envoy Graun:

“The cruel punishment of the *maître d’école* was intended *chiefly* to give me my revenge against the assassin.”

In a *tête-à-tête* with Murph, Rudolph says:

“My hatred of the wicked ... has become stronger, my aversion for Sarah Bags, doubtless because of the grief caused by the death of my daughter.”

Rudolph tells us how much stronger his hatred of the wicked has become. Needless to say, his hatred is a Critical, pure, moral hatred — hatred of the wicked *because* they are wicked. That is why he regards this hatred as his own progress in the good.

At the same time, however, he betrays that this growth of moral hatred is nothing but a *hypocritical justification* to excuse the growth of his *personal aversion* for Sarah. The vague moral idea of his increasing hatred of the wicked is only a mask for the definite immoral fact of his increased aversion for Sarah. This aversion has a very natural and a very personal

basis, his personal grief, which is also the measure of his aversion. *Sans doute!*

Still more repugnant is the hypocrisy to be seen in Rudolph's meeting with the dying Countess MacGregor.

After the revelation of the mystery that Fleur de Marie is the daughter of Rudolph and the Countess, Rudolph goes up to her "*l'air menaçant, impitoyable*" She begs for mercy.

"Pas de grace," he replies, ..malédiction sur vous ... vous ... mon mauvais génie et celui de ma race."

So it is his "race" that he wishes to avenge. He goes on to inform the Countess how, to atone for his attempted murder of his father, he has taken upon himself a world crusade for the reward of the good and the punishment of the wicked. He tortures the Countess, he abandons himself to his *rage*, but in his *own* eyes he is only carrying out the task which he took upon himself after January 13, of "*poursuivre le mal*".

As he is leaving, Sarah cries out:

"'Pitié! Je meurs!' 'Mourez donc, maudite!' dit Rodolphe effrayant de fureur".

The last words "effrayant de fureur" betray the pure, Critical and moral motives of his actions. It was the same rage that made him draw his sword against his father, his *blessed* father, as Herr Szeliga calls him. Instead of fighting this evil in himself he fights it, like a pure Critic, in others.

In the end, Rudolph himself discards his Catholic penal theory. He wanted to abolish capital punishment, to change punishment into penance, but only as long as the murderer murdered strangers and spared members of Rudolph's family. He adopts the death penalty as soon as one of his kin is murdered; he needs a double set of laws, one for his own person and one for ordinary persons.

He learns from Sarah that Jacques Ferrand was the cause of the death of Fleur de Marie. He says to himself:

"No, it is not enough!... What a burning desire for revenge!... What a thirst for blood!... What calm, deliberate rage!... Until I knew that one of the monster's victims was my child I said to myself: this man's death would be fruitless.... Life without money, life without satisfaction of his frenzied

sensuality will be a long and double torture.... But it is my daughter!... I shall kill this man!”

And he rushes out to kill him, but finds him in a state which makes murder superfluous.

The “good” Rudolph! Burning with desire for revenge, thirsting for blood, with calm, deliberate rage, with a hypocrisy which excuses every evil impulse with its casuistry, he has all the evil passions for which he gouges out the eyes of others. Only accidental strokes of luck, money and rank in society save this “good” man from the penitentiary.

“The *power of Criticism*”, to compensate for the otherwise complete nullity of this Don Quixote, makes him “*bon locataire*”, “*bon voisin*”, “*bon ami*”, “*bon père*”, “*bon bourgeois*”, “*bon citoyen*”, “*bon prince*”, and so on, according to Herr Szeliga’s gamut of eulogy. *That is more than all the results* — that “*mankind in its entire history*” has achieved. That is enough for *Rudolph* to save “the world” twice from “*downfall*”!

Chapter IX. The Critical Last Judgment

Through *Rudolph*, Critical Criticism has twice saved the world from downfall. but only that it may now *itself* decree the *end of the world*.

And I saw and heard a mighty angel, Herr *Hirzel*, flying from Zurich across the heavens. And he had in his hand a little book open like the fifth number of the *Allgemeine Literatur-Zeitung.*, and he set his right foot upon the Mass and his left foot upon Charlottenburg; and he cried with a loud voice as when a lion roareth, and his words rose like a dove — chirp! chirp! — to the regions of pathos and thunder-like aspects of the *Critical Last judgment*.

“When, finally, all is united against Criticism and — *verily, verily I say unto you* — this time is no longer far off — when the whole world in dissolution — to it it was given to fight against the Holy — groups around Criticism for the last onslaught; then the courage of Criticism and its significance will have found the greatest recognition. We can have no fear of the outcome. It will all end by our settling accounts with the various groups — *and we shall separate them from one another as the shepherd separateth the sheep from the goats; and we shall set the sheep on our right hand and the goats on our left* — and we shall give a general certificate of poverty to the hostile knights — *they are spirits of the devil, they go out into the breadth of the world and they gather to fight on the great day of God the Almighty — and all who dwell on earth will wonder.*”

And when the angel had cried, seven thunders uttered their voices:

That day of wrath
Will reduce the world to ashes.
When the judge takes his seat
All that is hidden will come to light,
Nothing will remain unpunished.
What shall I, wretch, say then? etc.

Ye shall hear of wars and rumours of wars. All this must first of all come to pass. For there shall rise false Christs and false prophets, Messieurs *Buchez* and *Roux* from Paris, Herr *Friedrich Rohmer* and *Theodor Rohmer*

from Zurich, and they will say: Here is Christ! But then the sign of the *Bauer* brothers will appear in Criticism and the words of the Scripture on *Bauer's work* will be accomplished:

*With the oxen paired together.
Ploughing goes much better!*

Historical Epilogue

As we learned later, it was not the world, but the Critical *Literatur-Zeitung* that came to an end.

THESES ON FEUERBACH, 1845

Translated by Carl Manchester

I

The main deficiency, up to now, in all materialism – including that of Feuerbach – is that the external object, reality and sensibility are conceived only in the form of the object and of our contemplation of it, rather than as sensuous human activity and as practice – as something non-subjective. For this reason, the active aspect has been developed by idealism, in opposition to materialism, though only abstractly, since idealism naturally does not know real, sensuous activity as such. Feuerbach wants sensuous objects, clearly distinguished from mental objects, but he does not conceive human activity in terms of subject and object. That is why, in *The Essence of Christianity*, he regards only theoretical activity as authentically human, whilst practice is conceived and defined only in its dirty Jewish manifestation. He therefore does not understand the meaning of “revolutionary”, of practical-critical activity.

II

The question whether objective truth can be attributed to human thinking is not a question of theory but a practical question. Man must prove in practice the truth - i.e. the reality and power, the worldliness - of his thinking. Isolated from practice, the controversy over the reality or unreality of thinking is a purely scholastic question.

III

The materialist doctrine that humans are products of circumstances and upbringing and that, therefore, men who change are products of new circumstances and a different upbringing, forgets that circumstances are changed by men themselves, and that it is essential to educate the educator.

Necessarily, then, this doctrine divides society into two parts, one of which is placed above society (for example, in the work of Robert Owen).

The coincidence of changing circumstance on the one hand, and of human activity or self-changing on the other, can be conceived only as revolutionary practice, and rationally understood.

IV

Feuerbach starts out from the fact of religious self-alienation and the duplication of the world into an imagined religious world and a real world. His work consists in resolving the religious world into its secular basis. He overlooks that, once this work is completed, the central task remains to be done. But the fact that the secular basis detaches from itself and fixes in the clouds as an independent realm can be explained only by the self-negation and self-contradiction within it. This must be first of all understood in the context of its contradictions, and then be revolutionised by the removal of those contradictions. Thus, for instance, once the earthly family is discovered to be the secret of the holy family, the former must then be theoretically critiqued and practically overthrown.

V

Feuerbach, not satisfied with abstract thinking, appeals to sensory intuition; but he does not conceive the realm of the senses in terms of practical, human sensuous activity.

VI

Feuerbach resolves the religious essence into the human essence. But the human essence is not an abstraction inherent in each single individual. In its reality, it is the ensemble of social conditions.

Feuerbach, who does not undertake a criticism of this real essence, is therefore compelled:

1. To abstract from the historical process and to fix the religious sentiment as something by itself and to presuppose an abstract – isolated – human individual;

2. For this reason, he can consider the human essence only as a “genus”, as an internal, mute generality which naturally unites the multiplicity of

individuals.

VII

Feuerbach therefore does not see that “religious sentiment” is itself a social product, and that the abstract individual that he analyses belongs in reality to a particular social form.

VIII

Social life is essentially practical. All the mysteries which turn theory towards mysticism find their rational solution in human practice and in the understanding of this practice.

IX

The highest point reached by intuitive materialism - that is, materialism which does not comprehend the activity of the senses as practical activity - is the point-of-view of single individuals in “bourgeois society”.

X

The standpoint of the old materialism is “bourgeois” society; the standpoint of the new is human society, or socialised mankind.

XI

Philosophers have only interpreted the world in different ways. What is crucial, however, is to change it.

THE POVERTY OF PHILOSOPHY, 1847

Anonymous translation, 1900

This 1847 book was published in Paris and Brussels, where Marx was living as an exile from 1843 until 1849. It was originally written in French as an answer to the economic and philosophical arguments of French anarchist Pierre-Joseph Proudhon (1809-1865) set forth in his 1846 book *The System of Economic Contradictions, or The Philosophy of Poverty*. Proudhon was a theoretician that wrote extensively on the relationship between the individual and the state. He believed in an orderly society, but argued that the state represented an illegitimate concentration of official violence that effectively undercut any effort to build a just society. Rejecting all political action as a form of class collaboration, Proudhon argued instead that the working class could achieve its salvation through economic action alone; abstention from politics was advocated with a view to the ultimate eradication of the existing state and its political apparatus.

Marx had left Germany following the repression of the newspaper he edited, the *Rheinische Zeitung*, by the government of Prussia early in 1843. He went to Paris, where he lived from October 1843 until December 1845. It was there that he first met Proudhon, who was already a well known radical writer. Despite an appeal being made as a prospective French collaborator, Proudhon declined to participate in the ill-fated Deutsch-französische Jahrbücher project with which Marx was closely associated. Although contact between the two was limited, Marx read Proudhon's writings at this time, discussions of which may be found in his work of the period, including the book written against Bruno Bauer, *The Holy Family* (1845), in which Marx lent critical support to some of the ideas of Proudhon against competing ideas of Bauer.

Marx was particularly attracted to the comprehensive nature of Proudhon's writings up until 1845 and the latter's willingness to make larger connections from smaller observations. Marx's praise of Proudhon was not limitless, however, as he felt Proudhon did not fully grasp the way in which wages and money, for example, were themselves forms of private

property. He read Proudhon's book late in 1846 and responded strongly and negatively, authoring a lengthy letter to his Russian correspondent P.V. Annenkov on December 28, 1846 with a detailed exposition of his views that became the core of his 1847 book. He began working on a book-length formal reply the following January, completing the work in the spring and going to press in April 1847. *The Poverty of Philosophy* was regarded by the political circle around Marx, organised as the Communist League, as a key part of their contemporary program, delineating the views of the League from those espoused by Proudhon and his followers.

Proudhon addressing the French Assembly in July 1848

FOREWORD

M. Proudhon has the misfortune of being peculiarly misunderstood in Europe. In France, he has the right to be a bad economist, because he is reputed to be a good German philosopher. In Germany, he has the right to be a bad philosopher, because he is reputed to be one of the ablest French economists. Being both German and economist at the same time, we desire to protest against this double error.

The reader will understand that in this thankless task we have often had to abandon our criticism of M. Proudhon in order to criticize German philosophy, and at the same time to give some observations on political economy.

Karl Marx

Brussels, June 15, 1847

M. Proudhon's work is not just a treatise on political economy, an ordinary book; it is a bible. "Mysteries", "Secrets Wrested from the Bosom of God", "Revelations" – it lacks nothing. But as prophets are discussed nowadays more conscientiously than profane writers, the reader must resign himself to going with us through the arid and gloomy eruditions of "Genesis", in order to ascend later, with M. Proudhon, into the ethereal and fertile realm of *super-socialism*. (See Proudhon, *Philosophy of Poverty*, Prologue, p.III, line 20.)

PREFACE TO THE FIRST GERMAN EDITION

The present work was produced in the winter of 1846-47, at a time when Marx had cleared up for himself the basic features of his new historical and economic outlook. Proudhon's *Système des contradictions économiques, ou Philosophie de la misère*, which had just appeared, gave him the opportunity to develop these basic features, setting them against the views of a man who, from then on, was to occupy the most important place among living French socialists. Since the time in Paris when the two of them had often spent whole nights discussing economic questions, their paths had increasingly diverged: Proudhon's book proved that there was already an unbridgeable gulf between them. To ignore it was at that time impossible, and so Marx put on record the irreparable rupture in this reply of his.

Marx's general opinion of Proudhon is to be found in the article which appeared in the Berlin *Social-Demokrat* Nos 16, 17 and 18 for 1865. It was the only article Marx wrote for that paper; Herr von Schweitzer's attempts to guide it along feudal and government lines, which became evident soon afterwards, compelled us to publicly terminate our collaboration after only a few weeks.

For Germany, the present work has at this precise moment a significance which Marx himself never imagined. How could he have known that, in trouncing Proudhon, he was hitting Rodbertus, the idol of the careerists of today, who was unknown to him even by name at that time?

This is not the place to deal with relations between Marx and Rodbertus; an opportunity for that is sure to present itself to me very soon. Suffice it to note here that when Rodbertus accuses Marx of having "plundered" him and of having "freely used in his *Capital* without quoting him" his work *Zur Erkenntnis*, he allows himself to indulge in an act of slander which is only explicable by the irksomeness of unrecognised genius and by his remarkable ignorance of things taking place outside Prussia, and especially of socialist and economic literature. Neither these charges, nor the above-mentioned work by Rodbertus ever came to Marx's sight; all he knew of Rodbertus was the three *Sociale Briefe* and even these certainly not before 1858 or 1859.

With greater reason Rodbertus asserts in these letters that he had already discovered “Proudhon’s constituted value” *before* Proudhon; but here again it is true he erroneously flatters himself with being the *first* discoverer. In any case, he is thus one of the targets of criticism in the present work, and this compels me to deal briefly with his “fundamental” piece: *Zur Erkenntnis unsrer staatswirthschaftlichen Zustände*, 1842, insofar as this brings forth anticipations of Proudhon as well as the communism of Weitling likewise (again unconsciously) contained in it.

Insofar as modern socialism, no matter of what tendency, starts out from bourgeois political economy, it almost without exception takes up the Ricardian theory of value. The two propositions which Ricardo proclaimed in 1817 right at the beginning of his *Principles*,

1) that the value of any commodity is purely and solely determined by the quantity of labour required for its production, and

2) that the product of the entire social labour is divided among the three classes: landowners (rent), capitalists (profit) and workers (wages)

These two propositions had ever since 1821 been utilised in England for socialist conclusions, and in part with such pointedness and resolution that this literature, which had then almost been forgotten and was to a large extent only rediscovered by Marx, remained unsurpassed until the appearance of *Capital*. About this another time. If, therefore, in 1842 Rodbertus for his part drew socialist conclusions from the above propositions, that was certainly a very considerable step forward for a German at that time, but it could rank as a new discovery only for Germany at best. That such an application of the Ricardian theory was far from new was proved by Marx against Proudhon, who suffered from a similar conceit.

“Anyone who is in any way familiar with the trend of political economy in England cannot fail to know that almost all the socialists in that country have, at different periods, proposed the *equalitarian* (i.e. socialist) application of Ricardian theory. We could quote for M. Proudhon: Hodgskin, *Political Economy*, 1827; William Thompson, *An Inquiry into the Principles of the Distribution of Wealth Most Conducive to Human Happiness*, 1824; T. R. Edmonds, *Practical Moral and Political Economy*, 1828, etc., etc., and four pages more of etc. We shall content ourselves with listening to an English Communist, Mr. Bray ... in his remarkable work, *Labour’s Wrongs and Labour’s Remedy*, Leeds, 1839.”

And the quotations given here from Bray on their own put an end to a good part of the priority claimed by Rodbertus.

At that time Marx had never yet entered the reading room of the British Museum. Apart from the libraries of Paris and Brussels, apart from my books and extracts, he had only examined such books as were obtainable in Manchester during a six-week journey to England we made together in the summer of 1845. The literature in question was, therefore, by no means so inaccessible in the forties as it may be now. If, all the same, it always remained unknown to Rodbertus, that is to be ascribed solely to his Prussian local bigotry. He is the actual founder of specifically Prussian socialism and is now at last recognised as such.

However, even in his beloved Prussia, Rodbertus was not to remain undisturbed. In 1859, Marx's *A Contribution to the Critique of Political Economy*, Part I, was published in Berlin. Therein, among the economists' objections to Ricardo, the following was put forward as the second objection :

"If the exchange value of a product equals the labour time contained in the product, then the exchange value of a working day is equal to the product it yields, in other words, wages must be equal to the product of labour. But in fact the opposite is true."

On this there was the following note:

"This objection, which was advanced against Ricardo by economists, was later taken up by socialists. Assuming that the formula was theoretically sound, they alleged that practice stood in conflict with the theory and demanded that bourgeois society should draw the practical conclusions supposedly arising from its theoretical principles. In this way at least English socialists turned Ricardo's formula of exchange value against political economy."

In the same note there was a reference to Marx's *Misère de la philosophie*, which was then obtainable in all the bookshops.

Rodbertus, therefore, had sufficient opportunity of convincing himself whether his discoveries of 1842 were really new. Instead he proclaims them again and again and regards them as so incomparable that it never occurs to him that Marx might have drawn his conclusions from Ricardo independently, just as well as Rodbertus himself. Absolutely impossible! Marx had "plundered" him – the man whom the same Marx had offered every opportunity to convince himself how long before both of them these

conclusions, at least in the crude form which they still have in the case of Rodbertus, had previously been enunciated in England!

The simplest socialist application of the Ricardian theory is indeed that given above. It has led in many cases to insights into the origin and nature of surplus value which go far beyond Ricardo, as in the case of Rodbertus among others. Quite apart from the fact that on this matter he nowhere presents anything which has not already been said at least as well, before him, his presentation suffers like those of his predecessors from the fact that he adopts, uncritically and without examining their content, economic categories – labour, capital, value, etc. – in the crude form, clinging to their external appearance, in which they were handed down to him by the economists. He thereby not only cuts himself off from all further development – in contrast to Marx who was the first to make something of these propositions so often repeated for the last sixty-four years – but, as will be shown, he opens for himself the road leading straight to utopia.

The above application of the Ricardian theory that the entire social product belongs to the workers as *their* product, because they are the sole real producers, leads directly to communism. But, as Marx indeed indicates in the above-quoted passage, it is incorrect in formal economic terms, for it is simply an application of morality to economics. According to the laws of bourgeois economics, the greatest part of the product does *not* belong to the workers who have produced it. If we now say: that is unjust, that ought not to be so, then that has nothing immediately to do with economics. We are merely saying that this economic fact is in contradiction to our sense of morality. Marx, therefore, never based his communist demands upon this, but upon the inevitable collapse of the capitalist mode of production which is daily taking place before our eyes to an ever growing degree; he says only that surplus value consists of unpaid labour, which is a simple fact. But what in economic terms may be formally incorrect, may all the same be correct from the point of view of world history. If mass moral consciousness declares an economic fact to be unjust, as it did at one time in the case of slavery and statute labour, that is proof that the fact itself has outlived its day, that other economic facts have made their appearance due to which the former has become unbearable and untenable. Therefore, a very true economic content may be concealed behind the formal economic incorrectness. This is not the place to deal more closely with the significance and history of the theory of surplus value.

At the same time other conclusions can be drawn, and have been drawn, from the Ricardian theory of value. The value of commodities is determined by the labour required for their production. But now it turns out that in this imperfect world commodities are sold sometimes above, sometimes below their value, and indeed not only as a result of ups and downs in competition. The rate of profit tends just as much to balance out at the same level for all capitalists as the price of commodities does to become reduced to the labour value by agency of supply and demand. But the rate of profit is calculated on the total capital invested in an industrial business. Since now the annual products in two different branches of industry may incorporate equal quantities of labour, and, consequently, may represent equal values and also wages may be at an equal level in both, while the capital advanced in one branch may be, and often is, twice or three times as great as in the other, consequently the Ricardian law of value, as Ricardo himself discovered, comes into contradiction here with the law of the equal rate of profit. If the products of both branches of industry are sold at their values, the rates of profit cannot be equal; if, however, the rates of profit are equal, then the products of the two branches of industry cannot always be sold at their values. Thus, we have here a contradiction, the antinomy of two economic laws, the practical resolution of which takes place according to Ricardo (Chapter I, Section 4 and 5) as a rule in favour of the rate of profit at the cost of value.

But the Ricardian definition of value, in spite of its ominous characteristics, has a feature which makes it dear to the heart of the honest bourgeois. It appeals with irresistible force to his sense of justice. Justice and equality of rights are the cornerstones on which the bourgeois of the eighteenth and nineteenth centuries would like to erect his social edifice over the ruins of feudal injustice, inequality and privilege. And the determination of value of commodities by labour and the free exchange of the products of labour, taking place according to this measure of value between commodity owners with equal rights, these are, as Marx has already proved, the real foundations on which the whole political, juridical and philosophical ideology of the modern bourgeoisie has been built. Once it is recognised that labour is the measure of value of a commodity, the better feelings of the honest bourgeois cannot but be deeply wounded by the wickedness of a world which, while recognising the basic law of justice in name, still in fact appears at every moment to set it aside without

compunction. And the petty bourgeois especially, whose honest labour – even if it is only that of his workmen and apprentices – is daily more and more depreciated in value by the competition of large-scale production and machinery, this small-scale producer especially must long for a society in which the exchange of products according to their labour value is at last a complete and invariable truth. In other words, he must long for a society in which a single law of commodity production prevails exclusively and in full, but in which the conditions are abolished in which it can prevail at all, viz., the other laws of commodity production and, later, of capitalist production.

How deeply this utopia has struck roots in the way of thinking of the modern petty bourgeois – real or ideal – is proved by the fact that it was systematically developed by John Gray back in 1831, that it was tried in practice and theoretically propagated in England in the thirties, that it was proclaimed as the latest truth by Rodbertus in Germany in 1842 and by Proudhon in France in 1846, that it was again proclaimed by Rodbertus as late as 1871 as the solution to the social question and, as, so to say, his social testament, and that in 1884 it again finds adherents among the horde of careerists who in the name of Rodbertus set out to exploit Prussian state socialism.

The critique of this utopia has been so exhaustively furnished by Marx both against Proudhon and against Gray (see the appendix to this work) that I can confine myself here to a few remarks on the form of substantiating and depicting it peculiar to Rodbertus.

As already noted, Rodbertus adopts the traditional definitions of economic concepts entirely in the form in which they have come down to him from the economists. He does not make the slightest attempt to investigate them. Value is for him

“the valuation of one thing against others according to quantity, this valuation being conceived as measure”

This, to put it mildly, extremely slovenly definition gives us at the best an idea of what value approximately looks like, but says absolutely nothing of what it is. Since this, however, is all that Rodbertus is able to tell us about value, it is understandable that he looks for a measure of value located outside value. After thirty pages in which he mixes up use value and exchange value in higgledy-piggledy fashion with that power of abstract thought so infinitely admired by Herr Adolf Wagner, he arrives at the

conclusion that there is no real measure of value and that one has to make do with a substitute measure. Labour could serve as such but only if products of an equal quantity of labour were always exchanged against products of an equal quantity of labour whether this “is already the case of itself, or whether precautionary measures are adopted” to ensure that it is. Consequently value and labour remain without any sort of material connection in spite of the fact that the whole first chapter is taken up to expound to us that commodities “cost labour” and nothing but labour, and why this is so.

Labour, again, is taken uncritically in the form in which it occurs among the economists. And not even that. For, although there is a reference in a couple of words to differences in intensity of labour, labour is still put forward quite generally as something which “costs”, hence as something which measures value, quite irrespective of whether it is expended under normal average social conditions or not. Whether the producers take ten days, or only one, to make products which could be made in one day; whether they employ the best or the worst tools; whether they expend their labour time in the production of socially necessary articles and in the socially required quantity, or whether they make quite undesired articles or desired articles in quantities above or below demand – about all this there is not a word: labour is labour, the product of equal labour must be exchanged against the product of equal labour. Rodbertus, who is otherwise always ready, whether rightly or not, to adopt the national standpoint and to survey the relations of individual producers from the high watchtower of general social considerations, is anxious to avoid doing so here. And this, indeed, solely because from the very first line of his book he makes directly for the utopia of labour money, and because any investigation of labour seen from its property of creating value would be bound to put insuperable obstacles in his way. His instinct was here considerably stronger than his power of abstract thought which, by the by, is revealed in Rodbertus only by the most concrete absence of ideas.

The transition to utopia is now made in the turn of a hand. The “measures”, which ensure exchange of commodities according to labour value as the invariable rule, cause no difficulty. The other utopians of this tendency, from Gray to Proudhon, rack their brains to invent social institutions which would achieve this aim. They attempt at least to solve the economic question in an economic way through the action of the owners

themselves who exchange the commodities. For Rodbertus it is much easier. As a good Prussian he appeals to the state: a decree of the state authority orders the reform.

In this way then, value is happily “constituted”, but by no means the priority in this constitution as claimed by Rodbertus. On the contrary, Gray as well as Bray – among many others – before Rodbertus, at length and frequently *ad nauseam*, repeated this idea, viz. the pious desire for measures by means of which products would always and under all circumstances be exchanged only at their labour value.

After the state has thus constituted value – at least for a part of the products, for Rodbertus is also modest – it issues its labour paper money, and gives advances therefrom to the industrial capitalists, with which the latter pay the workers, whereupon the workers buy the products with the labour paper money they have received, and so cause the paper money to flow back to its starting point. How very beautifully this is effected, one must hear from Rodbertus himself:

“In regard to the second condition, the necessary measure that the value certified in the note should be actually present in circulation is realised in that only the person who actually delivers a product receives a note, on which is accurately recorded the quantity of labour by which the product was produced, Whoever delivers a product of two days’ labour receives a note marked ‘two days’. By the strict observance of this rule in the issue of notes, the second condition too would necessarily be fulfilled. For according to our supposition the real value of the goods always coincides with the quantity of labour which their production has cost and this quantity of labour is measured by the usual units of time, and therefore someone who hands in a product on which two days’ labour has been expended and receives a certificate for two days, has received, certified or assigned to him neither more nor less value than that which he has in fact supplied. Further, since *only* the person who has actually put a product into circulation receives such a certificate, it is also certain that the value marked on the note is available for the satisfaction of society. However extensive we imagine the circle of division of labour to be, if this rule is strictly followed *the sum total of available value must be exactly equal to the sum total of certified value*. Since, however, the sum total of certified value is exactly equal to the sum total of value assigned, the latter must *necessarily coincide*

with the available value, all claims will be satisfied and the liquidation correctly brought about”

(p-67).

If Rodbertus has hitherto always had the misfortune to arrive too late with his new discoveries, this time at least he has the merit of *one* sort of originality: none of his rivals has dared to express the stupidity of the labour money utopia in this childishly naive, transparent, I might say truly Pomeranian, form. Since for every paper certificate a corresponding object of value has been delivered, and no object of value is supplied except in return for a corresponding paper certificate, the sum total of paper certificates must always be covered by the sum total of objects of value. The calculation works out without the smallest remainder, it is correct down to a second of labour time, and no governmental chief revenue office accountant, however many years of faithful service he may have behind him, could prove the slightest error in calculation. What more could one want?

In present-day capitalist society each industrial capitalist produces off his own bat what, how and as much as he likes. The social demand, however, remains an unknown magnitude to him, both in regard to quality, the kind of objects required, and in regard to quantity. That which today cannot be supplied quickly enough, may tomorrow be offered far in excess of the demand. Nevertheless, demand is finally satisfied in one way or another, good or bad, and, taken as a whole, production is ultimately geared towards the objects required. How is this evening-out of the contradiction effected? By competition. And how does competition bring about this solution? Simply by depreciating below their labour value those commodities which by their kind or amount are useless for immediate social requirements, and by making the producers feel, through this roundabout means, that they have produced either absolutely useless articles or ostensibly useful articles in unusable, superfluous quantity. Two things follow from this:

First, continual deviations of the prices of commodities from their values are the necessary condition in and through which the value of the commodities as such can come into existence. Only through the fluctuations of competition, and consequently of commodity prices, does the law of value of commodity production assert itself and the determination of the value of the commodity by the socially necessary labour time become a reality. That thereby the form of manifestation of value, the price, as a rule

looks somewhat different from the value which it manifests, is a fate which value shares with most social relations. A king usually looks quite different from the monarchy which he represents. To desire, in a society of producers who exchange their commodities, to establish the determination of value by labour time, by forbidding competition to establish this determination of value through pressure on prices in the only way it can be established, is therefore merely to prove that, at least in this sphere, one has adopted the usual utopian disdain of economic laws.

Secondly, competition, by bringing into operation the law of value of commodity production in a society of producers who exchange their commodities, precisely thereby brings about the only organisation and arrangement of social production which is possible in the circumstances. Only through the undervaluation or overvaluation of products is it forcibly brought home to the individual commodity producers what society requires or does not require and in what amounts. But it is precisely this sole regulator that the utopia advocated by Rodbertus among others wishes to abolish. And if we then ask what guarantee we have that necessary quantity and not more of each product will be produced, that we shall not go hungry in regard to corn and meat while we are choked in beet sugar and drowned in potato spirit, that we shall not lack trousers to cover our nakedness while trouser buttons flood us by the million – Rodbertus triumphantly shows us his splendid calculation, according to which the correct certificate has been handed out for every superfluous pound of sugar, for every unsold barrel of spirit, for every unusable trouser button, a calculation which “works out” exactly, and according to which “all claims will be satisfied and the liquidation correctly brought about.” And anyone who does not believe this can apply to governmental chief revenue office accountant X in Pomerania who has checked the calculation and found it correct, and who, as one who has never yet been caught lacking with the accounts, is thoroughly trustworthy.

And now consider the naiveté with which Rodbertus would abolish industrial and commercial crises by means of his utopia. As soon as the production of commodities has assumed world market dimensions, the evening-out between the individual producers who produce for private account and the market for which they produce, which in respect of quantity and quality of demand is more or less unknown to them, is established by means of a storm on the world market, by a commercial crisis. If now

competition is to be forbidden to make the individual producers aware, by a rise or fall in prices, how the world market stands, then they are completely blindfolded. To institute the production of commodities in such a fashion that the producers can no longer learn anything about the state of the market for which they are producing – that indeed is a cure for the crisis disease which could make Dr. Eisenbart envious of Rodbertus.

It is now comprehensible why Rodbertus determines the value of commodities simply by “labour” and at most allows for different degrees of intensity of labour. If he had investigated by what means and how labour creates value and therefore also determines and measures it, he would have arrived at socially necessary labour, necessary for the individual product, both in relation to other products of the same kind and also in relation to society’s total demand. He would thereby have been confronted with the question as to how the adjustment of the production of separate commodity producers to the total social demand takes place, and his whole utopia would thereby have been made impossible. This time he preferred in fact to “make an abstraction”, namely of precisely that which mattered.

Now at last we come to the point where Rodbertus really offers us something new; something which distinguishes him from all his numerous fellow supporters of the labour money exchange economy. They all demand this exchange organisation for the purpose of abolishing the exploitation of wage labour by capital. Every producer is to receive the full labour value of his product. On this they all agree, from Gray to Proudhon. Not at all, says Rodbertus. Wage labour and its exploitation remain.

In the first place, in no conceivable condition of society can the worker receive the full value of his product for consumption. A series of economically unproductive but necessary functions have to be met from the fund produced, and consequently also the persons connected with them maintained. This is only correct so long as the present-day division of labour applies. In a society in which general productive labour is obligatory, which is also “conceivable” after all, this ceases to apply. But the need for a social reserve and accumulation fund would remain and consequently even in that case, the workers, i.e., *all*, would remain in possession and enjoyment of their total product, but each separate worker would not enjoy the “full returns of his labour”. Nor has the maintenance of economically unproductive functions at the expense of the labour product been overlooked by the other labour money utopians. But they leave the workers

to tax themselves for this purpose in the usual democratic way, while Rodbertus, whose whole social reform of 1842 is geared to the Prussian state of that time, refers the whole matter to the decision of the bureaucracy, which determines from above the share of the worker in his own product and graciously permits him to have it.

In the second place, however, rent and profit are also to continue undiminished. For the landowners and industrial capitalists also exercise certain socially useful or even necessary functions, even if economically unproductive ones, and they receive in the shape of rent and profit a sort of pay on that account – a conception which was, it will be recalled, not new even in 1842. Actually they get at present far too much for the little that they do, and badly at that, but Rodbertus has need, at least for the next five hundred years, of a privileged class, and so the present rate of surplus value, to express myself correctly, is to remain in existence but is not to be allowed to be increased. This present rate of surplus value Rodbertus takes to be 200 per cent, that is to say, for twelve hours of labour daily the worker is to receive a certificate not for twelve hours but only for four, and the value produced in the remaining eight hours is to be divided between landowner and capitalist. Rodbertus' labour certificates, therefore, are a direct lie. Again, one must be a Pomeranian manor owner in order to imagine that a working class would put up with working twelve hours in order to receive a certificate for four hours of labour. If the hocus-pocus of capitalist production is translated into this naïve language, in which it appears as naked robbery, it is made impossible. Every certificate given to a worker would be a direct instigation to rebellion and would come under § 110 of the German Imperial Criminal Code. One need never have seen any other proletariat than the day-labourer proletariat, still actually in semi-serfdom, of a Pomeranian manor where the rod and the whip reign supreme, and where all the beautiful women in the village belong to his lordship's harem, in order to imagine one can treat the workers in such a shamefaced manner. But, after all, our conservatives are our greatest revolutionaries.

If, however, our workers are sufficiently docile to be taken in that they have in reality only worked four hours during a whole twelve hours of hard work, they are, as a reward, to be guaranteed that for all eternity their share in their own product will never fall below a third. That is indeed pie in the sky of the most infantile kind and not worth wasting a word over. Insofar, therefore, as there is anything novel in the labour money exchange utopia of

Rodbertus, this novelty is simply childish and far below the achievements of his numerous comrades both before and after him.

For the time when Rodbertus' *Zur Erkenntnis*, etc., appeared, it was certainly an important book. His development of Ricardo's theory of value in that one direction was a very promising beginning. Even if it was new only for him and for Germany, still as a whole, it stands on a par with the achievements of the better ones among his English predecessors. But it was only a beginning, from which a real gain for theory could be achieved only by further thorough and critical work. But he cut himself off from further development by also tackling the development of Ricardo's theory from the very beginning in the second direction, in the direction of utopia. Thereby he surrendered the first condition of all criticism – freedom from bias. He worked on towards a goal fixed in advance, he became a *Tendenzökonom*. Once imprisoned by his utopia, he cut himself off from all possibility of scientific advance. From 1842 up to his death, he went round in circles, always repeating the same ideas which he had already expressed or suggested in his first work, feeling himself unappreciated, finding himself plundered, where there was nothing to plunder, and finally refusing, not without intention, to recognise that in essence he had only rediscovered what had already been discovered long before.

In a few places the translation departs from the printed French original. This is due to handwritten alterations by Marx, which will also be inserted in the new French edition that is now being prepared.

It is hardly necessary to point out that the terminology used in this work does not entirely coincide with that in *Capital*. Thus this work still speaks of *labour* as a commodity, of the purchase and sale of labour, instead of labour *power*.

Also added as a supplement to this edition are:

1) a passage from Marx's work *A Contribution to the Critique of Political Economy*, Berlin, 1859, dealing with the *first* labour money exchange utopia of John Gray, and

2) a translation of Marx's speech on free trade in Brussels (1848), which belongs to the same period of the author's development as the *Misère*.

London, October 23, 1884

ENGELS' 1892 INTRODUCTION

For the second edition I have only to remark that the name wrongly written Hopkins in the French text (on page 45) has been replaced by the correct name Hodgskin and that in the same place the date of the work of William Thompson has been corrected to 1824. It is to be hoped that this will appease the bibliographical conscience of Professor Anton Menger.

Frederick Engels
London, March 29, 1892

CHAPTER ONE: A SCIENTIFIC DISCOVERY

1. The Antithesis of Use Value and Exchange Value

“The capacity for all products, whether natural or industrial, to contribute to man’s subsistence is specifically termed use value; their capacity to be given in exchange for one another, exchange value.... How does use value become exchange value?... The genesis of the idea of (exchange) value has not been noted by economists with sufficient care. It is necessary, therefore, for us to dwell upon it. Since a very large number of the things I need occur in nature only in moderate quantities, or even not at all, I am forced to assist in the production of what I lack. And as I cannot set my hand to so many things, I shall propose to other men, my collaborators in various functions, to cede to me a part of their products in exchange for mine.”

(Proudhon, Vol. I, Chap.II)

M. Proudhon undertakes to explain to us first of all the double nature of value, the “distinction in value,” the process by which use value is transformed into exchange value. It is necessary for us to dwell with M. Proudhon upon this act of transubstantiation. The following is how this act is accomplished, according to our author.

A very large number of products are not to be found in nature, they are products of industry. If man’s needs go beyond nature’s spontaneous production, he is forced to have recourse to industrial production. What is this industry in M. Proudhon’s view? What is its origin? A single individual, feeling the need for a very great number of things, “cannot set his hand to so many things.” So many things to produce presuppose at once more than one man’s hand helping to produce them. Now, the moment you postulate more than one hand helping in production, you at once presuppose a whole production based on the division of labour. Thus need, as M. Proudhon presupposes it, itself presupposes the whole division of labour. In presupposing the division of labour, you get exchange, and, consequently, exchange value. One might as well have presupposed exchange value from the very beginning.

But M. Proudhon prefers to go the roundabout way. Let us follow him in all his detours, which always bring him back to his starting point.

In order to emerge from the condition in which everyone produces in isolation and to arrive at exchange, “I turn to my collaborators in various

functions,” says M. Proudhon. I, myself, then, have collaborators, all with different function. And yet, for all that, I and all the others, always according to M. Proudhon’s supposition, have got no farther than the solitary and hardly social position of the Robinsons. The collaborators and the various functions, the division of labour and the exchange it implies, are already at hand.

To sum up: I have certain needs which are founded on the division of labour and on exchange. In presupposing these needs, M. Proudhon has thus presupposed exchange, exchange value, the very thing of which he purposes to “note the genesis with more care than other economists.”

M. Proudhon might just as well have inverted the order of things, without in any way affecting the accuracy of his conclusions. To explain exchange value, we must have exchange. To explain exchange, we must have the division of labour. To explain the division of labour, we must have needs which render necessary the division of labour. To explain these needs, we must “presuppose” them, which is not to deny them – contrary to the first axiom in M. Proudhon’s prologue: “To presuppose God is to deny him.” (Prologue, p.1)

How does M. Proudhon, who assumes the division of labour as the known, manage to explain exchange value, which for him is always the unknown?

“A man” sets out to “*propose* to other men, his collaborators in various functions,” that they establish exchange, and make a distinction between ordinary value and exchange value. In accepting this proposed distinction, the collaborators have left M. Proudhon no other “care” than that of recording the fact, or marking, of “noting” in his treatise on political economy “the genesis of the idea of value.” But he has still to explain to us the “genesis” of this proposal, to tell us finally how this single individual, this Robinson [Crusoe], suddenly had the idea of making “to his collaborators” a proposal of the type *known* and how these collaborators accepted it without the slightest protest.

M. Proudhon does not enter into these genealogical details. He merely places a sort of historical stamp upon the fact of exchange, by presenting it in the form of a motion, made by a third party, that exchange be established.

That is a sample of the “historical and descriptive method” of M. Proudhon, who professes a superb disdain for the “historical and descriptive methods” of the Adam Smiths and Ricardos.

Exchange has a history of its own. It has passed through different phases. There was a time, as in the Middle Ages, when only the superfluous, the excess of production over consumption, was exchanged.

There was again a time, when not only the superfluous, but all products, all industrial existence, had passed into commerce, when the whole of production depended on exchange. How are we to explain this second phase of exchange – marketable value at its second power?

M. Proudhon would have a reply ready-made: Assume that a man has “*proposed* to other men, his collaborators in various functions,” to raise marketable value to its second power.

Finally, there came a time when everything that men had considered as inalienable became an object of exchange, of traffic and could be alienated. This is the time when the very things which till then had been communicated, but never exchanged; given, but never sold; acquired, but never bought – virtue, love, conviction, knowledge, conscience, etc. – when everything, in short, passed into commerce. It is the time of general corruption, of universal venality, or, to speak in terms of political economy, the time when everything, moral or physical, having become a marketable value, is brought to the market to be assessed at its truest value.

How, again, can we explain this new and last phase of exchange – marketable value at its third power?

M. Proudhon would have a reply ready-made: Assume that a person has “*proposed* to other persons, his collaborators in various functions,” to make a marketable value out of virtue, love, etc., to raise exchange value to its third and last power.

We see that M. Proudhon’s “historical and descriptive method” is applicable to everything, it answers everything, explains everything. If it is a question above all of explaining historically “the genesis of an economic idea,” it postulates a man who proposes to other men, “his collaborators in various functions,” that they perform this act of genesis and that is the end of it.

We shall hereafter accept the “genesis” of exchange value as an accomplished act; it now remains only to expound the relation between exchange value and use value. Let us hear what M. Proudhon has to say:

“Economists have very well brought out the double character of value, but what they have not pointed out with the same precision is its contradictory nature; this is where our criticism begins. ...

“It is a small thing to have drawn attention to this surprising contrast between use value and exchange value, in which economists have been wont to see only something very simple: we must show that this alleged simplicity conceals a profound mystery into which it is our duty to penetrate....

“In technical terms, use value and exchange value stand in inverse ratio to each other.”

If we have thoroughly grasped M. Proudhon’s thought the following are the four points which he sets out to establish:

1. Use value and exchange value form a “surprising contrast,” they are in opposition to each other.

2. Use value and exchange value are in inverse ratio, in contradiction, to each other.

3. Economists have neither observed nor recognized either the opposition or the contradiction.

4. M. Proudhon’s criticism begins at the end.

We, too, shall begin at the end, and, in order to clear the economists from M. Proudhon’s accusations, we shall let two sufficiently well-known economists speak for themselves.

SISMONDI:

“It is the opposition between use value and exchange value to which commerce has reduced everything, etc.”

(*Etudes*, Volume II, p.162, Brussels edition)

LAUDERDALE:

“In proportion as the riches of individuals are increased by an augmentation of the value of any commodity, the wealth of the society is generally diminished; and in proportion as the mass of individual riches is diminished, by the diminution of the value of any commodity, its opulence is generally increased.”

(*Recherches sur la nature et l’origine de la richesse publique*; translated by Langentie de Lavaisse, Paris 1808 [p.33])

Sismondi founded on the opposition between use value and exchange value his principal doctrine, according to which diminution in revenue is proportional to the increase in production.

Lauderdale founded his system on the inverse ratio of the two kinds of value, and his doctrine was indeed so popular in Ricardo's time that the latter could speak of it as of something generally known.

"It is through confounding the ideas of value and wealth, or riches that it has been asserted, that by diminishing the quantity of commodities, that is to say, of the necessities, conveniences, and enjoyments of human life, riches may be increased."

(Ricardo, *Principles de l'économie politique*

translated by Constancio, annotations by J. B. Say.

Paris 1835; Volume II, chapter *Sur la valeur et les richesses*)

We have just seen that the economists before M. Proudhon had "drawn attention" to the profound mystery of opposition and contradiction. Let us now see how M. Proudhon explains this mystery after the economists.

The exchange value of a product falls as the supply increases, the demand remaining the same; in other words, the more abundant a product is relatively to the demand, the lower is its exchange value, or price. Vice versa: The weaker the supply relatively to the demand, the higher rises the exchange value or the price of the product supplied: in other words, the greater the scarcity in the products supplied, relatively to the demand, the higher the prices. The exchange value of a product depends upon its abundance or its scarcity; but always in relation to the demand. Take a product that is more than scarce, unique of its kind if you will: this unique product will be more than abundant, it will be superfluous, if there is no demand for it. On the other hand, take a product multiplied into millions, it will always be scarce if it does not satisfy the demand, that is, if there is too great a demand for it.

These are what we should almost call truisms, yet we have had to repeat them here in order to render M. Proudhon's mysteries comprehensible.

"So that, following up the principle to its ultimate consequences, one would come to the conclusion, the most logical in the world, that the things whose use is indispensable and whose quantity is unlimited should be had for nothing, and those whose utility is nil and whose scarcity is extreme should be of incalculable worth. To cap the difficulty, these extremes are impossible in practice: on the one hand, no human product could ever be unlimited in magnitude; on the other, even the scarcest things must perforce be useful to a certain degree, otherwise they would be quite valueless. Use

value and exchange value are thus inexorably bound up with each other, although by their nature they continually tend to be mutually exclusive.”

(Volume I,)

What caps M. Proudhon's difficulty? That he has simply forgotten about demand, and that a thing can be scarce or abundant only in so far as it is in demand. The moment he leaves out demand, he identifies exchange value with scarcity and use value with abundance. In reality, in saying that things “whose utility is nil and scarcity extreme are of incalculable worth,” he is simply declaring that exchange value is merely scarcity. “Scarcity extreme and utility nil” means pure scarcity. “Incalculable worth” is the maximum of exchange value, it is pure exchange value. He equates these two terms. Therefore exchange value and scarcity are equivalent terms. In arriving at these alleged “extreme consequences,” M. Proudhon has in fact carried to the extreme, not the things, but the terms which express them, and, in so doing, he shows proficiency in rhetoric rather than in logic. He merely rediscovers his first hypotheses in all their nakedness, when he thinks he has discovered new consequences. Thanks to the same procedure he succeeds in identifying use value with pure abundance.

After having equated exchange value and scarcity, use value and abundance, M. Proudhon is quite astonished not to find use value in scarcity and exchange value, nor exchange value in abundance and use value; and seeing that these extremes are impossible in practice, he can do nothing but believe in mystery. Incalculable worth exists for him, because buyers do not exist, and he will never find any buyers, so long as he leaves out demand.

On the other hand, M. Proudhon's abundance seems to be something spontaneous. He completely forgets that there are people who produce it, and that it is to their interest never to lose sight of demand. Otherwise, how could M. Proudhon have said that things which are very useful must have a very low price, or even cost nothing? On the contrary, he should have concluded that abundance, the production of very useful things, should be restricted if their price, their exchange value is to be raised.

The old vine-growers of France in petitioning for a law to forbid the planting of new vines; the Dutch in burning Asiatic spices, in uprooting clove trees in the Moluccas, were simply trying to reduce abundance in order to raise exchange value. During the whole of the Middle Ages this same principle was acted upon, in limiting by laws the number of journeymen a single master could employ and the number of implements he

could use. (See Anderson, *History of Commerce*.) [A. Anderson, *An Historical and Chronological Deduction of the Origin of Commerce from the Earliest Accounts to the Present Time*. First edition appeared in London in 1764.]

After having represented abundance as use value and scarcity as exchange value – nothing indeed is easier than to prove that abundance and scarcity are in inverse ratio – M. Proudhon identifies use value with *supply* and exchange value with *demand*. To make the antithesis even more clear-cut, he substitutes a new term, putting “estimation value” instead of exchange value. The battle has now shifted its ground, and we have on one side *utility* (use value, supply), on the other side, *estimation* (exchange value, demand).

Who is to reconcile these two contradictory forces? What is to be done to bring them into harmony with each other? Is it possible to find in them even a single point of comparison?

“Certainly,” cries M. Proudhon, “there is one – free will. The price resulting from this battle between supply and demand, between utility and estimation will not be the expression of eternal justice.”

M. Proudhon goes on to develop this antithesis.

“In my capacity as a free buyer, I am judge of my needs, judge of the desirability of an object, judge of the price I am willing to pay for it. On the other hand, in your capacity as a free producer, you are master of the means of execution, and in consequence, you have the power to reduce your expenses.”

(Volume I,)

And as demand, or exchange value, is identical with estimation, M. Proudhon is led to say:

“It is proved that it is man’s free will that gives rise to the opposition between use value and exchange value. How can this opposition be removed, so long as free will exists? And how can the latter be sacrificed without sacrificing mankind?”

(Volume I,)

Thus there is no possible way out. There is a struggle between two as it were incommensurable powers, between utility and estimation, between the free buyer and the free producer.

Let us look at things a little more closely.

Supply does not represent exclusively utility, demand does not represent exclusively estimation. Does not the demander also supply a certain product or the token representing all products – viz., money; and as supplier, does he not represent, according to M. Proudhon, utility or use value?

Again, does not the supplier also demand a certain product or the token representing all product – viz., money? And does he not thus become the representative of estimation, of estimation value or of exchange value?

Demand is at the same time a supply, supply is at the same time a demand. Thus M. Proudhon's antithesis, in simply identifying supply and demand, the one with utility, the other with estimation, is based only on a futile abstraction.

What M. Proudhon calls use value is called estimation value by other economists, and with just as much right. We shall quote only Storch (*Cours d'économie politique*, Paris 1823, pp.48 and 49).

According to him, *needs* are the things for which we feel the need; *values* are things to which we attribute value. Most things have value only because they satisfy needs engendered by estimation. The estimation of our needs may change; therefore the utility of things, which expresses only the relation of these things to our needs, may also change. Natural needs themselves are continually changing. Indeed, what could be more varied than the objects which form the staple food of different peoples!

The conflict does not take place between utility and estimation; it takes place between the marketable value demanded by the supplier and the marketable value supplied by the demander. The exchange value of the product is each time the resultant of these contradictory appreciations.

In final analysis, supply and demand bring together production and consumption, but production and consumption based on individual exchanges.

The product supplied is not useful in itself. It is the consumer who determines its utility. And even when its quality of being useful is admitted, it does not exclusively represent utility. In the course of production, it has been exchanged for all the costs of production, such as raw materials, wages of workers, etc., all of which are marketable values. The product, therefore, represents, in the eyes of the producer, a sum total of marketable values. What he supplies is not only a useful object, but also and above all a marketable value.

As to demand, it will only be effective on condition that it has means of exchange at its disposal. These means are themselves products, marketable value.

In supply and demand, then, we find on the one hand a product which has cost marketable values, and the need to sell; on the other, means which have cost marketable values, and the desire to buy.

M. Proudhon opposes the free buyer to the free producer. To the one and to the other he attributes purely metaphysical qualities. It is this that makes him say:

“It is proved that it is man’s free will that gives rise to the opposition between use value and exchange value.”

[Volume I,]

The producer, the moment he produces in a society founded on the division of labour and on exchange (and that is M. Proudhon’s hypothesis), is forced to sell. M. Proudhon makes the producer master of the means of production; but he will agree with us that his means of production do not depend on free will. Moreover, many of these means of production are products which he gets from the outside, and in modern production he is not even free to produce the amount he wants. The actual degree of development of the productive forces compels him to produce on such or such a scale.

The consumer is no freer than the producer. His judgment depends on his means and his needs. Both of these are determined by his social position, which itself depends on the whole social organisation. True, the worker who buys potatoes and the kept woman who buys lace both follow their respective judgments. But the difference in their judgements is explained by the difference in the positions which they occupy in the world, and which themselves are the product of social organisation.

Is the entire system of needs on estimation or on the whole organisation of production? Most often, needs arise directly from production or from a state of affairs based on production. Thus, to choose another example, does not the need for lawyers suppose a given civil law which is but the expression of a certain development of property, that is to say, of production?

It is not enough for M. Proudhon to have eliminated the elements just mentioned from the relation of supply and demand. He carries abstraction to the furthest limits when he fuses all producers into one single producer, all

consumers into one single consumer, and sets up a struggle between these two chimerical personages. But in the real world, things happen otherwise. The competition among the suppliers and the competition among the demanders form a necessary part of the struggle between buyers and sellers, of which marketable value is the result.

After having eliminated competition and the cost of production, M. Proudhon can at his ease reduce the formula of supply and demand to an absurdity.

“Supply and demand,” he says, “are merely two ceremonial forms that serve to bring use value and exchange value face to face, and to lead to their reconciliation. They are the two electric poles which, when connected, must produce the phenomenon of affinity called exchange.”

(Volume I, pp.49 and 50)

One might as well say that exchange is merely a “ceremonial form” for introducing the consumer to the object of consumption. One might as well say that all economic relations are “ceremonial forms” serving immediate consumption as go-betweens. Supply and demand are neither more nor less relations of a given production than are individual exchanges.

What, then, does all M. Proudhon’s dialectic consist in? In the substitution for use value and exchange value, for supply and demand, of abstract and contradictory notions like scarcity and abundance, utility and estimation, *one* producer and *one* consumer, both of them knights of free will.

And what was he aiming at?

At arranging for himself a means of introducing later on one of the elements he had set aside, the cost of production, as the synthesis of use value and exchange value. And it is thus that in his eyes the cost of production constitutes synthetic value or constituted value.

2. Constituted Value or Synthetic Value

Value (marketable value) is the corner-stone of the economic structure. “Constituted” value is the corner-stone of the system of economic contradictions.

What then is this “constituted value” which is all M. Proudhon has discovered in political economy?

Once utility is admitted, labor is the source of all value. The measure of labor is time. The relative value of products is determined by the labor time required for their production. Price is the monetary expression of the relative value of a product. Finally, the the constituted value of a product is purely and simply the value which is constituted by the labor time incorporated in it.

Just as Adam Smith discovered the division of labor, so he, M. Proudhon, claims to have discovered “constituted value.” This is not exactly “something unheard of,” but then it must be admitted that there is nothing unheard of in any discovery of economic science. M. Proudhon, who fully appreciates the importance of his own invention, seeks nevertheless to tone down the merit therefore “in order to reassure the reader to as his claims to originality, and to win over minds whose timidity renders them little favorable to new ideas.” But in apportioning the contribution made by each of his predecessors to the understanding of value, he is forced to confess openly that the largest portion, the lion’s share, of the merit falls to himself.

“The synthetic idea of value had been vaguely perceived by Adam Smith.... But with Adam Smith the idea of value was entirely intuitive. Now, society does not change its habits merely on the strength of intuitions: its decisions are made only on the authority of facts. The antinomy had to be stated more palpably and more clearly: J.B. Say was its chief interpreter.”

[I 66]

Here, in a nutshell, is the history of the discovery of synthetic value: Adam Smith – vague intuition; J. B. Say – antinomy; M. Proudhon – constituting and “constituted” truth. And let there be no mistake about it: all the other economists, from Say to Proudhon, have merely been trudging along in the rut of antimony.

“It is incredible that for the last 40 years so many men of sense should have fumed and fretted at such a simple idea. But no, values are compared without there being any point of comparison between them and with no unit of measurements; this, rather than embrace the revolutionary theory of equality, is what the economists of the 19th century are resolved to uphold against all comers. What will posterity say about it?”

(Vol.I, p.68)

Posterity, so abruptly invoked, will begin by getting muddled over the chronology. It is bound to ask itself: are not Ricardo and his school

economists of the 19th century? Ricardo's system, putting as a principle that "the relative value of commodities corresponds exclusively to their production", dates from 1817. Ricardo is the head of a whole school dominant in England since the Restoration. [The Restoration began after the termination of the Napoleonic wars and the restoration of the Bourbon dynasty in France in 1815.] The Ricardian doctrine summarizes severely, remorselessly, the whole of the English bourgeoisie. "What will posterity say about it?" It will not say that M. Proudhon did not know Ricardo, for he talks about him, he talks at length about him, he keeps coming back to him, and concludes by calling his system "trash". If ever posterity does interfere, it will say perhaps that M. Proudhon, afraid of offending his readers' Anglophobia, preferred to make himself the responsible editor of Ricardo's ideas. In any case, it will think it very naive that M. Proudhon should give as a "revolutionary theory of the future" what Ricardo expounded scientifically as the theory of present-day society, of bourgeois society, and that he should thus take for the solution of the antinomy between utility and exchange value what Ricardo and his school presented long before him as the scientific formula of one single side of this antinomy, that of exchange value. But let us leave posterity alone once and for all, and confront M. Proudhon with his predecessor Ricardo. Here are some extracts from this author which summarize his doctrine on value:

"Utility then is not the measure of exchangeable value, although it is absolutely essential to it."

(Vol.I, p.3, *Principles de l'economie politique, etc.*, translated from the English by F.S. Constancio, Paris 1835)

"Possessing utility, commodities derive their exchangeable value from two sources: from their scarcity, and from the quantity of labor required to obtain them. There are some commodities, the value of which is determined by their scarcity alone. No labor can increase the quantity of such goods, and therefore their value cannot be lowered by an increased supply. Some rare statues and pictures, scarce books... are all of this description. Their value... varies with the varying wealth and inclinations of those who are desirous to possess them."

(Vol.I, pp.4 and 5, l. c.)

“These commodities, however, form a very small part of the mass of commodities daily exchanged in the market. By far the greatest part of these goods which are the objects of desire, are procured by labor; and they may be multiplied, not in one country alone, but in many, almost without any assignable limit, if we are disposed to bestow the labor necessary to obtain them.”

(Vol.I, pp.5, l. c.)

“In speaking then of commodities, of their exchangeable value, and of the laws which regulate their relative prices, we mean always such commodities only as can be increased in quantity by the exertion of human industry, and on the production of which competition operates without restraint.”

(Vol.I, pp.5)

Ricardo quotes Adam Smith, who, according to him, “so accurately defined the original source of exchangeable value” (Adam Smith, *Wealth of Nations*, Book I, Chap 5 [*An Inquiry into the Nature and Causes of the Wealth of Nations*, first edition appearing in London, 1776]), and he adds:

“That this (i.e., labor time) is really the foundation of the exchangeable value of all things, excepting those which cannot be increased by human industry, is a doctrine of the utmost importance in political economy; for from no source do so many errors, and so much difference of opinion in that science proceed, as from the vague ideas which are attached to the word value.”

(Vol.I, p.8)

“If the quantity of labor realized in commodities regulate their exchangeable value, every increase of the quantity of labor must augment the value of that commodity on which it is exercised, as every diminution must lower it.”

(Vol.I, p.8)

Ricardo goes on to reproach Smith:

1. With having “himself erected another standard measure of value” than labor. “Sometimes he speaks of corn, at other times of labor, as a standard measure; not the quantity of labor bestowed on the production of any object, but the quantity it can command in the market.” (Vol.I, pp.9 and 10)

2. With having “admitted the principle without qualification and at the same time restricted its application to that early and rude state of society,

which precedes both the accumulation of stock and the appropriation of land.” (Vol.I, p.21)

Ricardo sets out to prove that the ownership of land, that is, ground rent, cannot change the relative value of commodities and that the accumulation of capital has only a passing and fluctuation effect on the relative values determined by the comparative quantity of labor expended on their production. In support of this thesis, he gives his famous theory of ground rent, analyses capital, and ultimately finds nothing in it but accumulated labor. Then he develops a whole theory of wages and profits, and proves that wages and profits rise and fall in inverse ratio to each other, without affecting the relative value of the product. He does not neglect the influence that the accumulation of capital and its different aspects (fixed capital and circulating capital), as also the rate of wages, can have on the proportional value of products. In fact, they are the chief problems with which Ricardo is concerned.

“Economy in the use of labor never fails to reduce the relative value of a commodity, whether the saving be in the labor necessary to the manufacture of the commodity itself, or in that necessary to the formation of the capital, by the aid of which it is produced.”

(Vol.I, p.28)

“Under such circumstance the value of the deer, the produce of the hunter’s day’s labor, would be exactly equal to the value of the fish, the produce of the fisherman’s day’s labor. The comparative value of the fish and the game would be entirely regulated by the quantity of labor realized in each, whatever might be the quantity of production, or however high or low general wages or profits might be.”

(Vol.I, p.28)

“In making labor the foundation of the value of commodities and the comparative quantity of labor which is necessary to their production, the rule which determines the respective quantities of goods which shall be given in exchange for each other, we must not be supposed to deny the accidental and temporary deviations of the actual or market price of commodities from this, their primary and natural price.”

(Vol.I, p.105, l. c.)

“It is the cost of production which must ultimately regulate the price of commodities, and not, as has been often said, the proportion between supply and demand.”

(Vol.II, p.253)

Lord Lauderdale had developed the variations of exchange value according to the law of supply and demand, or of scarcity and abundance relatively to demand. In his opinion the value of a thing can increase when its quantity decreases or when the demand for it increases; it can decrease owing to an increase of its quantity or owing to the decrease in demand. Thus the value of a thing can change through eight different causes, namely, four causes that apply to money or to any other commodity which serves as a measure of its value. Here is Ricardo's refutation:

"Commodities which are monopolized, either by an individual, or by a company, vary according to the law which Lord Lauderdale has laid down: they fall in proportion as the sellers augment their quantity, and rise in proportion to the eagerness of the buyers to purchase them; their price has no necessary connexion with their natural value; but the prices of commodities, which are subject to competition, and whose quantity may be increased in any moderate degree, will ultimately depend, not on the state of demand and supply, but on the increased or diminished cost of their production."

(Vol.II, p.259)

We shall leave it to the reader to make the comparison between this simple, clear, precise language of Ricardo's and M. Proudhon's rhetorical attempts to arrive at the determination of relative value by labor time.

Ricardo shows us the real movement of bourgeois production, which constitutes value. M. Proudhon, leaving the real movement out of account, "fumes and frets" in order to invent new processes and to achieve the reorganization of the world on a would-be new formula, which formula is no more than the theoretical expression of the real movement which exists and which is so well described by Ricardo. Ricardo takes his starting point from present-day society to demonstrate to us how it constitutes value – M. Proudhon takes constituted value as his starting point to construct a new social world with the aid of this value. For him, M. Proudhon, constituted value must move around and become once more the constituting factor in a world already completely constituted according to this mode of evaluation. The determination of value by labor time, is, for Ricardo, the law of exchange value; for M. Proudhon. it is the synthesis of use value and exchange value. Ricardo's theory of values is the scientific interpretation of actual economic life; M. Proudhon's theory of values is the utopian

interpretation of Ricardo's theory. Ricardo establishes the truth of his formula by deriving it from all economic relations, and by explaining in this way all phenomena, even those like ground rent, accumulation of capital and the relation of wages to profits, which at first sight seems to contradict it; it is precisely that which makes his doctrine a scientific system: M. Proudhon, who has rediscovered this formula of Ricardo's by means of quite arbitrary hypotheses, is forced thereafter to seek out isolated economic facts which he twists and falsifies to pass them off as examples, already existing applications, beginning of realization of his regenerating idea. (See our S.3. Application of Constituted Value)

Now let us pass on to the conclusions M. Proudhon draws from value constituted (by labor time).

- A certain quantity of labor is equivalent to the product created by this same quantity of labor.

- Each day's labor is worth as much as another day's labor; that is to say, if the quantities are equal, one man's labor is worth as much as another man's labor: there is no qualitative difference. With the same quantity of work, one man's product can be given in exchange for another man's product. All men are wage workers getting equal pay for an equal time of work. Perfect equality rules the exchanges.

Are these conclusions the strict, natural consequences of value "constituted" or determined by labor time?

If the relative value of a commodity is determined by the quantity of labor required to produce it, it follows naturally that the relative value of labor, or wages, is likewise determined by the quantity of labor needed to produce the wages. Wages, that is, the relative value or the price of labor, are thus determined by the labor time needed to produce all that is necessary for the maintenance of the worker.

"Diminish the cost of production of hats, and their price will ultimately fall to their own new natural price, although the demand should be doubled, trebled, or quadrupled. Diminish the cost of subsistence of men, by diminishing the natural price of food and clothing, by which life is sustained, and wages will ultimately fall, notwithstanding the demand for laborers may very greatly increase."

(Ricardo, Vol.II, p.253)

Doubtless, Ricardo's language is as cynical as can be. To put the cost of manufacture of hats and the cost of maintenance of men on the same plane

is to turn men into hats. But do not make an outcry at the cynicism of it. The cynicism is in the facts and not in the words which express the facts. French writers like M.M. Droz, Blanqui, Rossi and others take an innocent satisfaction in proving their superiority over the English economists, by seeking to observe the etiquette of a “humanitarian” phraseology; if they reproach Ricardo and his school for their cynical language, it is because it annoys them to see economic relations exposed in all their crudity, to see the mysteries of the bourgeoisie unmasked.

To sum up: Labor, being itself a commodity, is measured as such by the labor time needed to produce the labor-commodity. And what is needed to produce this labor-commodity? Just enough labor time to produce the objects indispensable to the constant maintenance of labor, that is, to keep the worker alive and in a condition to propagate his race. The natural price of labor is no other than the wage minimum. If the current rate of wages rises above this natural price, it is precisely because the law of value put as a principle by M. Proudhon happens to be counterbalanced by the consequences of the varying relations of supply and demand. But the minimum wage is nonetheless the centre towards which the current rates of wages gravitate.

Thus relative value, measured by labor time, is inevitably the formula of the present enslavement of the worker, instead of being, as M. Proudhon would have it, the “revolutionary theory” of the emancipation of the proletariat.

Let us now see to what extent the application of labor time as a measure of value is incompatible with the existing class antagonism and the unequal distribution of the product between the immediate worker and the owner of accumulated labor.

Let us take a particular product: broadcloth, which has required the same quantity of labor as the linen.

If there is an exchange of these two products, there is an exchange of equal quantities of labor. In exchanging these equal quantities of labor time, one does not change the reciprocal position of the producers, any more than one changes anything in the situation of the workers and manufacturers among themselves. To say that this exchange of products measured by labor time results in an equality of payment for all the producers is to suppose that equality of participation in the product existed before the exchange. When the exchange of broadcloth for linen has been accomplished, the

producers of broadcloth will share in the linen in a proportion equal to that in which they previously shared in the broadcloth.

M. Proudhon's illusion is brought about by his taking for a consequence what could be at most but a gratuitous supposition.

Let us go further.

Does labor time, as the measure of value, suppose at least that the days are equivalent, and that one man's day is worth as much as another's? No.

Let us suppose for a moment that a jeweller's day is equivalent to three days of a weaver; the fact remains that any change in the value of jewels relative to that of woven materials, unless it be the transitory result of the fluctuations of supply and demand, must have as its cause a reduction or an increase in the labor time expended in the production of one or the other. If three working days of different workers be related to one another in the ratio of 1:2:3, then every change in the relative value of their products will be a change in this same proportion of 1:2:3. Thus values can be measured by labor time, in spite of the inequality of value of different working days; but to apply such a measure we must have a comparative scale of the different working days: it is competition that sets up this scale.

Is your hour's labor worth mine? That is a question which is decided by competition.

Competition, according to an American economist, determines how many days of simple labor are contained in one day's compound labor. Does not this reduction of days of compound labor to days of simple labor suppose that simple labor is itself taken as a measure of value? If the mere quantity of labor functions as a measure of value regardless of quality, it presupposes that simple labor has become the pivot of industry. It presupposes that labor has been equalized by the subordination of man to the machine or by the extreme division of labor; that men are effaced by their labor; that the pendulum of the clock has become as accurate a measure of the relative activity of two workers as it is of the speed of two locomotives. Therefore, we should not say that one man's hour is worth another man's hour, but rather that one man during an hour is worth just as much as another man during an hour. Time is everything, man is nothing; he is, at the most, time's carcase. Quality no longer matters. Quantity alone decides everything; hour for hour, day for day; but this equalizing of labor is not by any means the work of M. Proudhon's eternal justice; it is purely and simply a fact of modern industry.

In the automatic workshop, one worker's labor is scarcely distinguishable in any way from another worker's labor: workers can only be distinguished one from another by the length of time they take for their work. Nevertheless, this quantitative difference becomes, from a certain point of view, qualitative, in that the time they take for their work depends partly on purely material causes, such as physical constitution, age and sex; partly on purely negative moral causes, such as patience, imperturbability, diligence. In short, if there is a difference of quality in the labor of different workers, it is at most a quality of the last kind, which is far from being a distinctive speciality. This is what the state of affairs in modern industry amounts to in the last analysis. It is upon this equality, already realized in automatic labor, that M. Proudhon wields his smoothing-plane of "equalization," which he means to establish universally in "time to come!"

All the "equalitarian" consequences which M. Proudhon deduces from Ricardo's doctrine are based on a fundamental error. He confounds the value of commodities measured by the quantity of labor embodied in them with the value of commodities measured by "the value of labor." If these two ways of measuring the value of commodities were equivalent, it could be said indifferently that the relative value of any commodity is measured by the quantity of labor embodied in it; or that it is measured by the quantity of labor it can buy; or again that it is measured by the quantity of labor which can acquire it. But this is far from being so. The value of labor can no more serve as a measure of value than the value of any other commodity. A few examples will suffice to explain still better what we have just stated.

If a quarter of corn cost two days' labor instead of one, it would have twice its original value; but it would not set in operation double the quantity of labor, because it would contain no more nutritive matter than before. Thus the value of the corn, measured by the quantity of labor used to produce it, would have doubled; but measured either by the quantity of labor it can buy or the quantity of labor with which it can be bought, it would be far from having doubled. On the other hand, if the same labor produced twice as many clothes as before, their relative value would fall by half; but, nevertheless, this double quantity of clothing would not thereby be reduced to disposing over only half the quantity of labor, nor could the same labor command the double quantity of clothing; for half the clothes would still go on rendering the worker the same service as before.

Thus it is going against economic facts to determine the relative value of commodities by the value of labor. It is moving in a vicious circle, it is to determine relative value by a relative value which itself needs to be determined.

It is beyond doubt that M. Proudhon confuses the two measures, measure by the labor time needed for the production of a commodity and measure by the value of the labor. "Any man's labor," he says, "can buy the value it represents." Thus, according to him, a certain quantity of labor embodied in a product is equivalent to the worker's payment, that is, to the value of labor. It is the same reasoning that makes him confuse cost of production with wages.

"What are wages? They are the cost price of corn, etc., the integral price of all things."

Let us go still further.

"Wages are the proportionality of the elements which compose wealth." What are wages? They are the value of labor.

Adam Smith takes as the measure of value, now the time of labor needed for the production of a commodity, now the value of labor. Ricardo exposes this error by showing clearly the disparity of these two ways of measuring. M. Proudhon goes one better than Adam Smith in error by identifying the two things which the latter had merely put in juxtaposition.

It is in order to find the proper proportion in which workers should share in the products, or, in other words, to determine the relative value of labor, that M. Proudhon seeks a measure for the relative value of commodities. To find out the measure for the relative value of commodities he can think of nothing better than to give as the equivalent of a certain quantity of labor the sum total of the products it has created, which is as good as supposing that the whole of society consists merely of workers who receive their own produce as wages. In the second place, he takes for granted the equivalence of the working days of different workers. In short, he seeks the measure of the relative value of commodities in order to arrive at equal payment for the workers, and he takes the equality of wages as an already established fact, in order to go off on the search for the relative value of commodities. What admirable dialectics!

"Say and the economists after him have observed that labor being itself subject to valuation, being a commodity like any other commodity, it is moving in a vicious circle to treat it as the principle and the determining

cause of value. In so doing, these economists, if they will allow me to say so, show a prodigious carelessness. Labor is said to have value not as a commodity itself, but in view of the values which it is supposed potentially to contain. The value of labor is a figurative expression, an anticipation of the cause for the effect. It is a fiction of the same stamp as the productivity of capital. Labor produces, capital has value....

“By a sort of ellipsis one speaks of the value of labor....

“Labor like liberty... is a thing vague and indeterminate by nature, but defined qualitatively by its object, that is to say, it becomes a reality by the product.”

[I 61]

“But is there any need to dwell on this? The moment the economist (read M. Proudhon) changes the name of things, *vera rerum vocabula* [the true name of things], he is implicitly confessing his impotence and proclaiming himself not privy to the cause.”

(Proudhon, I, 188)

We have seen that M. Proudhon makes the value of labor the “determining cause” of the value of products to such an extent that for him wages, the official name for the “value of labor,” form the integral price of all things: that is why Say’s objection troubles him. In labor as a commodity, which is a grim reality, he sees nothing but a grammatical ellipsis. Thus the whole of existing society, founded on labor as a commodity, is henceforth founded on a poetic licence, a figurative expression. If society wants to “eliminate all the drawbacks” that assail it, well, let it eliminate all the ill-sounding terms, change the language; and to this end it has only to apply to the Academy for a new edition of its dictionary. After all that we have just seen, it is easy for us to understand why M. Proudhon, in a work on political economy, has to enter upon long dissertations on etymology and other parts of grammar. Thus he is still learnedly discussing the antiquated derivation of *servus* [a slave, servant] from *servare* [To preserve]. These philological dissertations have a deep meaning, an esoteric meaning – they form an essential part of M. Proudhon’s argument.

Labor, inasmuch as it is bought and sold, is a commodity like any other commodity, and has, in consequence, an exchange value. But the value of labor, or labor as a commodity, produces as little as the value of wheat, or wheat as a commodity, serves as food.

Labor “is worth” more or less, according to whether food commodities are more or less dear, whether the supply and demand of hands exist to such or such a degree, etc., etc.

Labor is not a “vague thing”; it is always some definite labor, it is never labor in general that is bought and sold. It is not only labor that is qualitatively defined by the object; but also the object which is determined by the specific quality of labor.

Labor, in so far as it is bought and sold, is itself a commodity. Why is it bought? “Because of the values it is supposed potentially to contain.” But if a certain thing is said to be a commodity, there is no longer any question as to the reason why it is bought, that is, as to the utility to be derived from it, the application to be made of it. It is a commodity as an object of traffic. All M. Proudhon’s arguments are limited to this: labor is not bought as an immediate object of consumption. No, it is bought as an instrument of production, as a machine would be bought. As a commodity, labor has no value and does not produce. M. Proudhon might just as well have said that there is no such thing as a commodity, since every commodity is obtained merely for some utilitarian purpose, and never as a commodity in itself.

In measuring the value of commodities by labor, M. Proudhon vaguely glimpses the impossibility of excluding labor from this same measure, in so far as labor has a value, as labor is a commodity. He has a misgiving that it is turning the wage minimum into the natural and normal price of immediate labor, that it is accepting the existing state of society. So, to get away from this fatal consequence, he faces about and asserts that labor is not a commodity, that it cannot have value. He forgets that he himself has taken the value of labor as a measure, he forgets that his whole system rests on labor as a commodity, on labor which is bartered, bought, sold, exchanged for produce, etc., on labor, in fact, which is an immediate source of income for the worker. He forgets everything.

To save his system, he consents to sacrifice its basis.

Et propter vitam vivendi perdere causas!

We now come to a new definition of “constituted value.”

“Value is the proportional relation of the products which constitute wealth.”

Let us note in the first place that the single phrase “relative or exchange value” implies the idea of some relation in which products are exchanged reciprocally. By giving the name “proportional relation” to this relation, no

change is made in the relative value, except in the expression. Neither the depreciation nor the enhancement of the value of a product destroys its quality of being in some “proportional relation” with the other products which constitute wealth.

Why then this new term, which introduces no new idea?

“Proportional relation” suggests many other economic relations, such as proportionality in production, the true proportion between supply and demand, etc., and M. Proudhon is thinking of all that when he formulates this didactic paraphrase of marketable value.

In the first place, the relative value of products being determined by the comparative amount of labor used in the production of each of them, proportional relations, applied to this special case, stand for the respective quota of products which can be manufactured in a given time, and which in consequence are given in exchange for one another.

Let us see what advantage M. Proudhon draws from this proportional relation.

Everyone knows that when supply and demand are evenly balanced, the relative value of any product is accurately determined by the quantity of labor embodied in it, that is to say, that this relative value expresses the proportional relation precisely in the sense we have just attached to it. M. Proudhon inverts the order of things. Begin, he says, by measuring the relative value of a product by the quantity of labor embodied in it, and supply and demand will infallibly balance one another. Production will correspond to consumption, the product will always be exchangeable. Its current price will express exactly its true value. Instead of saying like everyone else: when the weather is fine, a lot of people are to be seen going out for a walk. M. Proudhon makes his people go out for a walk in order to be able to ensure them fine weather.

What M. Proudhon gives as the consequence of marketable value determined a priori by labor time could be justified only by a law couched more or less in the following terms:

Products will in future be exchanged in the exact ratio of the labor time they have cost. Whatever may be the proportion of supply to demand, the exchange of commodities will always be made as if they had been produced proportionately to the demand. Let M. Proudhon take it upon himself to formulate and lay down such a law, and we shall relieve him of the necessity of giving proofs. If, on the other hand, he insists on justifying his

theory, not as a legislator, but as an economist, he will have to prove that the time needed to create a commodity indicates exactly the degree of its utility and marks its proportional relation to the demand, and in consequence, to the total amount of wealth. In this case, if a product is sold at a price equal to its cost of production, supply and demand will always be evenly balanced; for the cost of production is supposed to express the true relation between supply and demand.

Actually, M. Proudhon sets out to prove that labor time needed to create a product indicates its true proportional relation to needs, so that the things whose production costs the least time are the most immediately useful, and so on, step by step. The mere production of a luxury object proves at once, according to this doctrine, that society has spare time which allows it to satisfy a need for luxury.

M. Proudhon finds the very proof of his thesis in the observation that the most useful things cost the least time to produce, that society always begins with the easiest industries and successively “starts on the production of objects which cost more labor time and which correspond to a higher order of needs.”

M. Proudhon borrows from M. Dunoyer the example of extractive industry – fruit-gathering, pasturage, hunting, fishing, etc. – which is the simplest, the least costly of industries, and the one by which man began “the first day of his second creation.” The first day of his first creation is recorded in Genesis, which shows God as the world’s first manufacturer.

Things happen in quite a different way from what M. Proudhon imagines. The very moment civilization begins, production begins to be founded on the antagonism of orders, estates, classes, and finally on the antagonism of accumulated labor and actual labor. No antagonism, no progress. This is the law that civilization has followed up to our days. Till now the productive forces have been developed by virtue of this system of class antagonisms. To say now that, because all the needs of all the workers were satisfied, men could devote themselves to the creation of products of a higher order – to more complicated industries – would be to leave class antagonism out of account and turn all historical development upside down. It is like saying that because, under the Roman emperors, muraena were fattened in artificial fishponds, therefore there was enough to feed abundantly the whole Roman population. Actually, on the contrary, the

Roman people had not enough to buy bread with, while the Roman aristocrats had slaves enough to throw as fodder to the muraena.

The price of food has almost continuously risen, while the price of manufactured and luxury goods has almost continuously fallen. Take the agricultural industry itself; the most indispensable objects, like corn, meat, etc., rise in price, while cotton, sugar, coffee, etc., fall in a surprising proportion. And even among comestibles proper, the luxury articles, like artichokes, asparagus, etc., are today relatively cheaper than foodstuffs of prime necessity. In our age, the superfluous is easier to produce than the necessary. Finally, at different historical epochs, the reciprocal price relations are not only different, but opposed to one another. In the whole of the Middle Ages, agricultural products were relatively cheaper than manufactured products; in modern times they are in inverse ratio. Does this mean that the utility of agricultural products has diminished since the Middle Ages?

The use of products is determined by the social conditions in which the consumers find themselves placed, and these conditions themselves are based on class antagonism.

Cotton, potatoes and spirits are objects of the most common use. Potatoes have engendered scrofula; cotton has to a great extent driven out flax and wool, although wool and flax are, in many cases, of greater utility, if only from the point of view of hygiene; finally, spirits have got the upper hand of beer and wine, although spirits used as an alimentary substance are everywhere recognized to be poison. For a whole century, governments struggled in vain against the European opium; economics prevailed, and dictated its orders to consumption.

Why are cotton, potatoes and spirits the pivots of bourgeois society? Because the least amount of labor is needed to produce them, and, consequently, they have the lowest price. Why does the minimum price determine the maximum consumption? Is it by any chance because of the absolute utility of these objects, their intrinsic utility, their utility inasmuch as they correspond, in the most useful manner, in the needs of the worker as a man, and not to the man as a worker? No, it is because in a society founded on poverty the poorest products have the fatal prerogative of being used by the greatest number.

To say now that because the least costly things are in greater use, they must be of greater utility, is saying that the wide use of spirits, because of

their low cost of production, is the most conclusive proof of their utility; it is telling the proletarian that potatoes are more wholesome for him than meat; it is accepting the present state of affairs; it is, in short, making an apology, with M. Proudhon, for a society without understanding it.

In a future society, in which class antagonism will have ceased, in which there will no longer be any classes, use will no longer be determined by the minimum time of production; but the time of production devoted to different articles will be determined by the degree of their social utility.

To return to M. Proudhon's thesis: the moment the labor time necessary for the production of an article ceases to be the expression of its degree of utility, the exchange value of this same article, determined beforehand by the labor time embodied in it, becomes quite usable to regulate the true relation of supply to demand, that is, the proportional relation in the sense M. Proudhon at the moment attributes to it.

It is not the sale of a given product at the price of its cost of production that constitutes the "proportional relation" of supply to demand, or the proportional quota of this product relatively to the sum total of production; it is the variations in supply and demand that show the producer what amount of a given commodity he must produce in order to receive in exchange at least the cost of production. And as these variations are continually occurring, there is also a continual movement of withdrawal and application of capital in the different branches of industry.

"It is only in consequence of such variations that capital is apportioned precisely, in the requisite abundance and no more, to the production of the different commodities which happen to be in demand. With the rise or fall of price, profits are elevated above, or depressed below their general level, and capital is either encouraged to enter into, or is warned to depart from, the particular employment in which the variation has taken place."

"When we look at the markets of a large town, and observe how regularly they are supplied both with home and foreign commodities, in the quantity in which they are required, under all the circumstances of varying demand, arising from the caprice of taste, or a change in the amount of population, without often producing either the effects of a glut from a too abundant supply, or an enormously high price from the supply being unequal to the demand, we must confess that the principle which apportions capital to each trade in the precise amount that is required, is more active than is generally supposed."

(Ricardo, Vol.I, pp.105 and 108)

If M. Proudhon admits that the value of products is determined by labor time, he should equally admit that it is the fluctuating movement alone that in society founded on individual exchanges make labor the measure of value. There is no ready-made constituted “proportional relation,” but only a constituting movement.

We have just seen in what sense it is correct to speak of “proportion” as of a consequence of value determined by labor time. We shall see now how this measure by time, called by M. Proudhon the “law of proportion,” becomes transformed into a law of *disproportion*.

Every new invention that enables the production in one hour of that which has hitherto been produced in two hours depreciates all similar products on the market. Competition forces the producer to sell the product of two hours as cheaply as the product of one hour. Competition carries into effect the law according to which the relative value of a product is determined by the labor time needed to produce it. Labor time serving as the measure of marketable value becomes in this way the law of the continual depreciation of labor. We will say more. There will be depreciation not only of the commodities brought into the market, but also of the instruments of production and of whole plants. This fact was already pointed out by Ricardo when he said:

“By constantly increasing the facility of production, we constantly diminish the value of some of the commodities before produced.”

(Vol.II, p.59)

Sismondi goes further. He sees in this “value constituted” by labor time, the source of all the contradictions of modern industry and commerce.

“Mercantile value,” he says, “is always determined in the long run by the quantity of labor needed to obtain the thing evaluated: it is not what it has actually cost, but what it would cost in the future with, perhaps, perfected means; and this quantity, although difficult to evaluate, is always faithfully established by competition....

“It is on this basis that the demand of the seller as well as the supply of the buyer is reckoned. The former will perhaps declare that the thing has cost him 10 days’ labor; but if the latter realizes that it can henceforth be produced with eight days’ labor, in the event of competition proving this to the two contracting parties, the value will be reduced, and the market price fixed at eight days only. Of course, each of the parties believes that the

thing is useful, that it is desired, that without desire there would be no sale; but the fixing of the price has nothing to do with utility.”

(*Etudes, etc.*, Vol.II, p.267)

It is important to emphasize the point that what determines value is not the time taken to produce a thing, but the minimum time it could possibly be produced in, and the minimum is ascertained by competition. Suppose for a moment that there is no more competition and consequently no longer any means to ascertain the minimum of labor necessary for the production of a commodity; what will happen? It will suffice to spend six hours' work on the production of an object, in order to have the right, according to M. Proudhon, to demand in exchange six times as much as the one who has taken only one hour to produce the same object.

Instead of a “proportional relation,” we have a disproportional relation, at any rate if we insist on sticking to relations, good or bad.

The continual depreciation of labor is only one side, one consequence of the evaluation of commodities by labor time. The excessive raising of prices, overproduction and many other features of industrial anarchy have their explanation in this mode of evaluation.

But does labor time used as a measure of value give rise at least to the proportional variety of products that so delights M. Proudhon?

On the contrary, monopoly in all its monotony follows in its wake and invades the world of products, just as to everybody's knowledge monopoly invades the world of the instruments of production. It is only in a few branches of industry, like the cotton industry, that very rapid progress can be made. The natural consequence of this progress is that the products of cotton manufacture, for instance, fall rapidly in price: but as the price of cotton goes down, the price of flax will be replaced by cotton. In this way, flax has been driven out of almost the whole of North America. And we have obtained, instead of the proportional variety of products, the dominance of cotton.

What is left of this “proportional relation”? Nothing but the pious wish of an honest man who would like commodities to be produced in proportions which would permit of their being sold at an honest price. In all ages good-natured bourgeois and philanthropic economists have taken pleasure in expressing this innocent wish.

Let us hear what old Boisguillebert says:

“The price of commodities,” he says, “must always be proportionate; for it is such mutual understanding alone that can enable them to exist together so as to give themselves to one another at any moment (here is M. Proudhon’s continual exchangeability) and reciprocally give birth to one another. ...

“As wealth, then, is nothing but this continual intercourse between man and man, craft and craft, etc., it is a frightful blindness to go looking for the cause of misery elsewhere than in the cessation of such traffic brought about by a disturbance of proportion in prices.”

(*Dissertation sur la nature des richesses*,
Daire’s ed. [pp.405 and 408])

[Boisguillebert’s work is quoted from the symposium
Economistes-financiers du XVIII siecle. Prefaced
by a historical sketch on each author and accompanied
by commentaries and explanatory notes by Eugene Daire;
Paris 1843.]

Let us listen also to a modern economist:

“The great law as necessary to be affixed to production, that is, the law of proportion, which alone can preserve the continuity of value....

“The equivalent must be guaranteed....

“All nations have attempted, at various periods of their history, by instituting numerous commercial regulations and restrictions, to effect, in some degree, the object here explained....

“But the natural and inherent selfishness of man... has urged him to break down all such regulations. Proportionate Production is the realization of the entire truth of the Science of Social Economy.”

(W. Atkinson, *Principles of Political Economy*,
London 1840, pp.170-95)

Fuit Troja. [Troy is no more.] This true proportion between supply and demand, which is beginning once more to be the object of so many wishes, ceased long ago to exist. It has passed into the stage of senility. It was possible only at a time when the means of production were limited, when the movement of exchange took place within very restricted bounds. With

the birth of large-scale industry this true proportion had to come to an end, and production is inevitably compelled to pass in continuous succession through vicissitudes of prosperity, depression, crisis, stagnation, renewed prosperity, and so on.

Those who, like Sismondi, wish to return to the true proportion of production, while preserving the present basis of society, are reactionary, since, to be consistent, they must also wish to bring back all the other conditions of industry of former times.

What kept production in true, or more or less true, proportions? It was demand that dominated supply, that preceded it. Production followed close on the heels of consumption. Large-scale industry, forced by the very instruments at its disposal to produce on an ever-increasing scale, can no longer wait for demand. Production precedes consumption, supply compels demands.

In existing society, in industry based on individual exchange, anarchy of production, which is the source of so much misery, is at the same time the source of all progress.

Thus, one or the other:

Either you want the true proportions of past centuries with present-day means of production, in which case you are both reactionary and utopian.

Or you want progress without anarchy: in which case, in order to preserve the productive forces, you must abandon individual exchange.

Individual exchange is suited only to the small-scale industry of past centuries with its corollary of “true proportion,” or else to large-scale industry with all its train of misery and anarchy.

After all, the determination of value by labor time – the formula M. Proudhon gives us as the regenerating formula of the future – is therefore merely the scientific expression of the economic relations of present-day society, as was clearly and precisely demonstrated by Ricardo long before M. Proudhon.

But does the “equalitarian” application of this formula at least belong to M. Proudhon? Was he the first to think of reforming society by transforming all men into actual workers exchanging equal amounts of labor? Is it really for him to reproach the Communists – these people devoid of all knowledge of political economy, these “obstinately foolish men,” these “paradise dreamers” – with not having found, before him, this “solution of the problem of the proletariat”?

Anyone who is in any way familiar with the trend of political economy in England cannot fail to know that almost all the Socialists in that country have, at different periods, proposed the equalitarian application of the Ricardian theory. We quote for M. Proudhon: Hodgskin, *Political Economy*, 1827; William Thompson, *An Inquiry into the Principles of the Distribution of Wealth Most Conducive to Human Happiness*, 1824; T. R. Edmonds, *Practical Moral and Political Economy*, 1828 , etc., etc., and four pages more of etc. We shall content ourselves with listening to an English Communist, Mr. Bray. We shall give the decisive passages in his remarkable work, *Labor's Wrongs and Labor's Remedy*, Leeds, 1839, and we shall dwell some time upon it, firstly, because Mr. Bray is still little known in France, and secondly, because we think that we have discovered in him the key to the past, present and future works of M. Proudhon.

“The only way to arrive at truth is to go at once to First Principles.... Let us... go at once to the source from whence governments themselves have arisen.... By thus going to the origin of the thing, we shall find that every form of government, and every social and governmental wrong, owes its rise to the existing social system – to the institution of property as it at present exists – and that, therefore, if we would end our wrongs and our miseries at once and for ever, the present arrangements of society must be totally subverted.... By thus fighting them upon their own ground, and with their own weapons, we shall avoid that senseless clatter respecting ‘visionaries’ and ‘theorists’, with which they are so ready to assail all who dare move one step from that beaten track which ‘by authority’, has been pronounced to be the right one. Before the conclusions arrived at by such a course of proceeding can be overthrown, the economists must unsay or disprove those established truths and principles on which their own arguments are founded.”

(Bray, pp.17 and 41)

“It is labor alone which bestows value....

“Every man has an undoubted right to all that his honest labor can procure him. When he thus appropriates the fruits of his labor, he commits no injustice upon any other human being; for he interferes with no other man’s right of doing the same with the produce of his labor....

“All these ideas of superior and inferior – of master and man – may be traced to the neglect of First Principles, and to the consequent rise of inequality of possessions; and such ideas will never be subverted, so long as

this inequality is maintained. Men have hitherto blindly hoped to remedy the present unnatural state of things... by destroying existing inequality; but it will be shortly seen... that misgovernment is not a cause, but a consequence – that it is not the creator, but the created – that is the offspring of inequality of possessions; and that the inequality of possessions is inseparably connected with our present social system.”

(Bray, pp.33, 36 and 37)

“Not only are the greatest advantages, but strict justice also, on the side of a system of equality.... Every man is a link, in the chain of effects – the beginning of which is but an idea, and the end, perhaps, the production of a piece of cloth. Thus, although we may entertain different feelings towards the several parties, it does not follow that one should be better paid for his labor than another. The inventor will ever receive, in addition to his just pecuniary reward, that which genius only can obtain from us – the tribute of our admiration....

“From the very nature of labor and exchange, strict justice not only requires that all exchangers should be mutually, but that they should likewise be equally, benefited. Men have only two things which they can exchange with each other, namely, labor, and the produce of labor....

“If a just system of exchanges were acted upon, the value of articles would be determined by the entire cost of production; and equal values should always exchange for equal values. If, for instance, it takes a hatter one day to make a hat, and a shoemaker the same time to make a pair of shoes – supposing the material used by each to be of the same value – and they exchange these articles with each other, they are not only mutually but equally benefited: the advantage derived by either party cannot be a disadvantage to the other, as each has given the same amount of labor, and the materials made use of by each were of equal value. But if the hatter should obtain two pair of shoes for one hat – time and value of material being as before – the exchange would clearly be an unjust one. The hatter would defraud the shoemaker of one day’s labor; and were the former to act thus in all his exchanges, he would receive, for the labor of half a year, the product of some other person’s whole year. We have heretofore acted upon no other than this most unjust system of exchanges – the workmen have given the capitalist the labor of a whole year, in exchange for the value of only half a year – and from this, and not from the assumed inequality of bodily and mental powers in individuals, has arisen the inequality of wealth

and power which at present exists around us. It is an inevitable condition inequality of exchanges – of buying at one price and selling at another – that capitalists shall continue to be capitalists, and working men to be working men – the one a class of tyrants and the other a class of slaves – to eternity....

“The whole transaction, therefore, plainly shews that the capitalists and proprietors do no more than give the working man, for his labor of one week, a part of the wealth which they obtained from him the week before! – which amounts to giving him nothing for something....

“The whole transaction, therefore, between the producer and the capitalist is a palpable deception, a mere farce: it is, in fact, in thousands of instances, no other than a barefaced though legalized robbery.”

(Bray, pp.45, 48, 49 and 50)

“... the gain of the employer will never cease to be the loss of the employed – until the exchanges between the parties are equal; and exchanges never can be equal while society is divided into capitalists and producers – the last living upon their labor and the first bloating upon the profit of that labor.

“It is plain that, establish whatever form of government we will... we may talk of morality and brotherly love... no reciprocity can exist where there are unequal exchanges. Inequality of exchanges, as being the cause of inequality of possessions, is the secret enemy that devours us.”

(Bray, pp.51 and 52)

“It has been deduced, also, from a consideration of the intention and end of society, not only that all men should labor, and thereby become exchangers, but that equal values should always exchange for equal values – and that, as the gain of one man ought never to be the loss of another, value should be determined by cost of production. But we have seen, that, under the present arrangements of society... the gain of the capitalist and the rich man is always the loss of the workman – that this result will invariably take place, and the poor man be left entirely at the mercy of the rich man, under any and every form of government, so long as there is inequality of exchanges – and that equality of exchanges can be ensured only under social arrangements in which labor is universal....

“If exchanges were equal, would the wealth of the present capitalists gradually go from them to the working classes.”

(Bray, pp.53-55)

“So long as this system of unequal exchanges is tolerated, the producers will be almost as poor and as ignorant and as hardworked as they are at present, even if every governmental burthen be swept away and all taxes be abolished... nothing but a total change of this system – an equality of labor and exchanges – can alter this state of rights....

“The producers have but to make an effort – and by them must every effort for their own redemption be made – and their chains will be snapped asunder forever....

“As an end, the political equality is there a failure, as a means, also, it is there a failure.

“Where equal exchanges are maintained, the gain of one man cannot be the loss of another; for every exchange is then simply a transfer, and not a sacrifice of labor and wealth. Thus, although under a social system based on equal exchanges, a parsimonious man may become rich, his wealth will be no more than the accumulated produce of his own labor. He may exchange his wealth, or he may give it to others... but a rich man cannot continue wealthy for any length of time after he has ceased to labor. Under equality of exchanges, wealth cannot have, as it now has, a procreative and apparently self-generating power, such as replenishes all waste from consumption; for, unless it be renewed by labor, wealth, when once consumed, is given up for ever. That which is now called profit and interest cannot exist as such in connection with equality of exchanges; for producer and distributor would be alike remunerated, and the sum total of their labor would determine the value of the article created and brought to the hands of the consumer....

“The principle of equal exchanges, therefore, must from its very nature ensure universal labor.”

(Bray, pp.67, 88, 89, 94, 109-10)

After having refuted the objections of the economists to communism, Mr. Bray goes on to say:

“If, then a changed character be essential to the success of the social system of community in its most perfect form – and if, likewise, the present system affords no circumstances and no facilities for effecting the requisite change of character and preparing man for the higher and better state desired – it is evident that these things must necessarily remain as they are.... or else some preparatory step must be discovered and made use of – some movement partaking partly of the present and partly of the desired

system – some intermediate resting place, to which society may go with all its faults and its follies, and from which it may move forward, imbued with those qualities and attributes without which the system of community and equality cannot as such have existence.”

(Bray, p.134)

“The whole movement would require only co-operation in its simplest form.... Cost of production would in every instance determine value; and equal values would always exchange for equal values. If one person worked a whole week, and another worked only half a week, the first would receive double the remuneration of the last; but this extra pay of the one would not be at the expense of the other, nor would the loss incurred by the last man fall in any way upon the first. Each person would exchange the wages he individually received for commodities of the same value as his respective wages; and in no case could the gain of one man or one trade be a loss to another man or another trade. The labor of every individual would alone determine his gains of his losses....

“... By means of general and local boards of trade... the quantities of the various commodities required for consumption – the relative value of each in regard to each other – the number of hands required in various trades and descriptions of labor – and all other matters connected with production and distribution, could in a short time be as easily determined for a nation as for an individual company under the present arrangements....

“As individuals compose families, and families towns, under the existing system, so likewise would they after the joint-stock change had been effected. The present distribution of people in towns and villages, bad as it is, would not be directly interfered with....

“Under this joint-stock system, the same as under that now existing, every individual would be at liberty to accumulate as much as he pleased, and to enjoy such accumulations when and where he might think proper....

“The great productive section of the community... is divided into an indefinite number of smaller sections, all working, producing and exchanging their products on a footing of the most perfect equality....

“And the joint-stock modification (which is nothing but a concession to present-day society in order to obtain communism), by being so constituted as to admit of individual property in productions in connection with a common property in productive powers – making every individual dependent on his own exertions, and at the same time allowing him an equal

participation in every advantage afforded by nature and art – is fitted to take society as it is, and to prepare the way for other and better changes.”

(Bray, pp.158, 160, 162, 168 and 194)

We now only need to reply in a few words to Mr. Bray who without us and in spite of us had managed to supplant M. Proudhon, except that Mr. Bray, far from claiming the last word on behalf of humanity, proposes merely measures which he thinks good for a period of transition between existing society and a community regime.

One hour of Peter’s labor exchanges for one hour of Paul’s labor. That is Mr. Bray’s fundamental axiom.

Let us suppose Peter has 12 hours’ labor before him, and Paul only six. Peter will consequently have six hours’ labor left over. What will he do with these six hours’ labor?

Either he will do nothing with them – in which case he will have worked six hours for nothing; or else he will remain idle for another six hours to get even; or else, as a last resource, he will give these six hours’ labor, which he has no use for, to Paul into the bargain.

What in the end will Peter have earned more than Paul? Some hours of labor? No! He will have gained only hours of leisure; he will be forced to play the loafer for six hours. And in order that this new right to loaf might be not only relished but sought after in the new society, this society would have to find in idleness its highest bliss, and to look upon labor as a heavy shackle from which it must break free at all costs.

And indeed, to return to our example, if only these hours of leisure that Peter had gained in excess of Paul were really a gain! Not in the least. Paul, beginning by working only six hours, attains by steady and regular work a result that Peter secures only by beginning with an excess of work. Everyone will want to be Paul, there will be a competition to occupy Paul’s position, a competition in idleness.

Well, then! What has the exchange of equal quantities of labor brought us? Overproduction, depreciation, excess of labor followed by unemployment; in short, economic relations such as we see in present-day society, minus the competition of labor.

No! We are wrong! There is still an expedient which may save this new society of Peters and Pauls. Peter will consume by himself the product of the six hours’ labor which he has left. But from the moment he has no longer to exchange because he has produced, he has no need to produce for

exchange; and the whole hypothesis of a society founded on the exchange and division of labor will fall to the ground. Equality of exchange will have been saved by the simple fact that exchange will have ceased to be: Paul and Peter would arrive at the position of Robinson.

Thus, if all the members of society are supposed to be actual workers, the exchange of equal quantities of hours of labor is possible only on condition that the number of hours to be spent on material production is agreed on before hand. But such an agreement negates individual exchange.

We still come to the same result, if we take as our starting point not the distribution of the products created but the act of production. In large-scale industry, Peter is not free to fix for himself the time of his labor, for Peter's labor is nothing without the co-operation of all the Peters and all the Pauls who make up the workshop. This explains very well the dogged resistance which the English factory owners put up to the Ten Hours' Bill. They knew only too well that a two-hours' reduction of labor granted to women and children would carry with it an equal reduction of working hours for adult men. It is in the nature of large-scale industry that working hours should be equal for all. What is today the result of capital and the competition of workers among themselves will be tomorrow, if you sever the relation between labor and capital, an actual agreement based upon the relation between the sum of productive forces and the sum of existing needs.

But such an agreement is a condemnation of individual exchange, and we are back again at our first conclusion!

In principle, there is no exchange of products – but there is the exchange of the labor which co-operated in production. The mode of exchange of products depends upon the mode of exchange of the productive forces. In general, the form of exchange of products corresponds to the form of production. Change the latter, and the former will change in consequence. Thus in the history of society we see that the mode of exchanging products is regulated by the mode of producing them. Individual exchange corresponds also to a definite mode of production which itself corresponds to class antagonism. There is thus no individual exchange without the antagonism of classes.

But the respectable conscience refuses to see this obvious fact. So long as one is a bourgeois, one cannot but see in this relation of antagonism a relation of harmony and eternal justice, which allows no one to gain at the expense of another. For the bourgeois, individual exchange can exist

without any antagonism of classes. For him, these are two quite unconnected things. Individual exchange, as the bourgeois conceives it, is far from resembling individual exchange as it actually exists in practice.

Mr. Bray turns the illusion of the respectable bourgeois into an ideal he would like to attain. In a purified individual exchange, freed from all the elements of antagonism he finds in it, he sees an “equalitarian” relation which he would like society to adopt generally.

Mr. Bray does not see that this equalitarian relation, this corrective ideal that he would like to apply to the world, is itself nothing but the reflection of the actual world; and that therefore it is totally impossible to reconstitute society on the basis of what is merely an embellished shadow of it. In proportion as this shadow takes on substance again, we perceive that this substance, far from being the transfiguration dreamt of, is the actual body of existing society.

3. Application of the Law of the Proportionality of Value

A) Money

“Gold and silver were the first commodities to have their value constituted.”

[Vol, I]

Thus, gold and silver are the first applications of “value constituted” ... by M. Proudhon. And as M. Proudhon constitutes the value of products determining it by the comparative amount of labour embodied in them, the only thing he had to do was to prove that variations in the value of gold and silver are always explained by variations in the labour time taken to produce them. M. Proudhon has no intention of doing so. He speaks of gold and silver not as commodities, but as money.

His only logic, if logic it be, consists in juggling with the capacity of gold and silver to be used as money for the benefit of all the commodities which have the property of being evaluated by labour time. Decidedly there is more naïveté than malice in this jugglery.

A useful product, once it has been evaluated by the labour time needed to produce it, is always acceptable in exchange; witness, cries M. Proudhon, gold and silver, which exist in my desired conditions of “exchangeability”! Gold and silver, then, are value which has reached a state of constitution:

they are the incorporation of M. Proudhon's idea. He could not have been happier in his choice of an example. Gold and silver, apart from their capacity of being commodities, evaluated like other commodities, in labour time, have also the capacity of being the universal agents of exchange, of being money. By now considering gold and silver as an application of "value constituted" by labour time, nothing is easier than to prove that all commodities whose value is constituted by labour time will always be exchangeable, will be money.

A very simple question occurs to M. Proudhon. Why have gold and silver the privilege of typifying "constituted value"?

"The special function which usage has devolved upon the precious metal, that of serving as a medium for trade, is purely conventional, and any other commodity could, less conveniently perhaps, but just as reliably, fulfil this function. Economists recognize this, and cite more than one example. What then is the reason for this universal preference for metals as money? And what is the explanation of this specialization of the function of money – which has no analogy in political economy?... Is it possible to reconstruct the series from which money seems to have broken away, and hence to trace it back to its true principle?"

[Vol. I, p-69]

Straight away, by formulating the question in these terms, M. Proudhon has presupposed the existence of *money*. The first question he should have asked himself was, why, in exchanges as they are actually constituted, it has been necessary to individualize exchangeable value, so to speak, by the creation of a special agent of exchange. Money is not a thing, it is a social relation. Why is the money relation a production relation like any other economic relation, such as the division of labour, etc.? If M. Proudhon had properly taken account of this relation, he would not have seen in money an exception, an element detached from a series unknown or needing reconstruction.

He would have realised, on the contrary, that this relation is a link, and, as such, closely connected with a whole chain of other economic relations; that this relation corresponds to a definite mode of production neither more nor less than does individual exchange. What does he do? He starts off by detaching money from the actual mode of production as a whole, and then makes it the first member of an imaginary series, of a series to be reconstructed.

Once the necessity for a specific agency of exchange, that is, for money, has been recognized, all that remains to be explained is why this particular function has developed upon gold and silver rather than upon any commodity. This is a secondary question, which is explained not by the chain of production relations, but by the specific qualities inherent in gold and silver as substances. If all this has made economists for once “go outside the domains of their own science, to dabble in physics, mechanics, history and so on,” as M. Proudhon reproaches them with doing, they have merely done what they were compelled to do. The question was no longer within the domain of political economy.

“What no economist,” says M. Proudhon, “has either seen or understood is the economic reason which has determined, in favour of the precious metals, the favor they enjoy.”

[Vol. I,]

This economic reason which nobody – with good ground indeed – has seen or understood, M. Proudhon has seen, understood and bequeathed to posterity.

“What nobody else has noticed is that, of all commodities, gold and silver were the first to have their value attain constitution. In the patriarchal period, gold and silver were still bartered and exchanged in ingots but even then they showed a visible tendency to become dominant and received a marked degree of preference. Little by little the sovereigns took possession of them and affixed their seal to them: and of this sovereign consecration was born money, that is, the commodity par excellence. which, notwithstanding all the shocks of commerce, retains a definite proportional value and makes itself accepted for all payments....

“The distinguishing character of gold and silver is due, I repeat, to the fact that, thanks to their metallic properties, to the difficulties of their production, and above all to the intervention of state authority, they early won stability and authenticity as commodities.”

To say that, of all commodities, gold and silver were the first to have their value constituted, is to say, after all that has gone before, that gold and silver were the first to attain the status of money. This is M. Proudhon’s great revelation, this is the truth that none had discovered before him.

If, by these words, M. Proudhon means that of all commodities, gold and silver are the ones whose time of production was known the earliest, this would be yet another of the suppositions with which he is so ready to regale

his readers. If we wished to harp on this patriarchal erudition, we would inform M. Proudhon that it was the time needed to produce objects of prime necessity, such as iron, etc., which was the first to be known. We shall spare him Adam Smith's classic bow.

But, after all that, how can M. Proudhon go on talking about the constitution of a value, since a value is never constituted by itself? It is constituted, not by the time needed to produce it by itself, but in relation to the quota of each and every other product which can be created in the same time. Thus the constitution of the value of gold and silver presupposes an already completed constitution of a number of other products.

It is then not the commodity that has attained, in gold and silver, the status of "constituted value," it is M. Proudhon's "constituted value" that has attained, in gold and silver, the status of money.

Let us now make a closer examination of these "economic reasons" which, according to M. Proudhon, have bestowed upon gold and silver the advantage of being raised to the status of money sooner than other products, thanks to their having passed through the constitutive phase of value.

These economic reasons are: the "visible tendency to become dominant," the "marked preferences" even in the "patriarchal period," and other circumlocutions about the actual fact – which increase the difficulty, since they multiply the fact by multiplying the incidents which M. Proudhon brings in to explain the fact. M. Proudhon has not yet exhausted all the so-called economic reasons. Here is one of sovereign, irresistible force:

"Money is born of sovereign consecration: the sovereigns take possession of gold and silver and affix their seal to them."

[Vol. I,]

Thus, the whim of sovereigns is for M. Proudhon the highest reason in political economy.

Truly, one must be destitute of all historical knowledge not to know that it is the sovereigns who in all ages have been subject to economic conditions, but they have never dictated laws to them. Legislation, whether political or civil, never does more than proclaim, express in words, the will of economic relations.

Was it the sovereign who took possession of gold and silver to make them the universal agents of exchange by affixing his seal to them? Or was it not, rather, these universal agents of exchange which took possession of

the sovereign and forced him to affix his seal to them and thus give them a political consecration?

The impress which was and is still given to money is not that of its value but of its weight. The stability and authenticity M. Proudhon speaks of apply only to the standard of the money ; and this standard indicates how much metallic matter there is in a coined piece of money.

“The sole intrinsic value of a silver mark,” says Voltaire, with his habitual good sense, “is a mark of silver, half a pound weighing eight ounces. The weight and the standard alone form this intrinsic value.”

(Voltaire, *Systeme de Law*)

[Marx quotes a chapter from Voltaire’s *Historie de parlement*. It is entitled “France in the Period of the Regency and Law’s System.”]

But the question: how much is an ounce of gold or silver worth, remains nonetheless. If a cashmere from the *Grand Colbert* stores bore the trademark pure wool, this trademark would not tell you the value of the cashmere. There would still remain the question: how much is wool worth?

“Philip I, King of France,” says M. Proudhon, “mixes with Charlemagne’s gold pound a third of alloy, imagining that, having the monopoly of the manufacture of money, he could do what is done by every tradesman who has the monopoly of a product. What was actually this debasement of the currency from which Philip and his successors have been so much blamed? It was perfectly sound reasoning from the point of view of commercial practice, but very unsound economic science, viz., to suppose that, as supply and demand regulate value, it is possible, either by producing an artificial scarcity or by monopolizing manufacture, to increase the estimation and consequently the value of things; and that this is true of gold and silver as of corn, wine, oil or tobacco. But Philip’s fraud was no sooner suspected than his money was reduced to its true value, and he himself lost what he had thought to gain from his subjects. The same thing has happened as a result of every similar attempt.”

[Vol. I, p-71]

It has been proved times without number that, if a prince takes into his head to debase the currency, it is he who loses. What he gains once at the first issue he loses every time the falsified coinage returns to him in the

form of taxes, etc. But Philip and his successors were able to protect themselves more or less against this loss, for, once the debased coinage was put into circulation, they hastened to order a general re-minting of money on the old footing.

And besides, if Philip I had really reasoned like M. Proudhon, he would not have reasoned well “from the commercial point of view.” Neither Philip I nor M. Proudhon displays any mercantile genius in imagining that it is possible to alter the value of gold as well as that of every other commodity merely because their value is determined by the relation between supply and demand.

If King Philip had decreed that one quarter of corn was in future to be called two quarters of wheat, he would have been a swindler. He would have deceived all the rentiers, all the people who were entitled to receive 100 quarters of corn. He would have been the cause of all these people receiving only 50 quarters of corn; he would have had to pay only 50. But in commerce 100 such quarters would never have been worth more than 50. By changing the name we do not change the thing. The quantity of corn, whither supplied or demanded, will be neither decreased nor increased by this mere change of name. Thus, the relation between supply and demand being just the same in spite of this change of name, the price of corn will undergo no real change. When we speak of the supply and demand of things, we do not speak of the supply and demand of the name of things. Philip I was not a maker of gold and silver, as M. Proudhon says; he was a maker of names for coins. Pass off your French cashmeres as Asiatic cashmeres, and you may deceive a buyer or two; but once the fraud becomes known, your so-called Asiatic cashmeres will drop to the price of French cashmeres. When he put a false label on gold and silver, King Philip could deceive only so long as the fraud was not known. Like any other shopkeeper, he deceived his customers by a false description of his wares, which could not last for long. He was bound sooner or later to suffer the rigour of commercial laws. Is this what M. Proudhon wanted to prove? No. According to him, it is from the sovereign and not from commerce that money gets its value. And what has he really proved? That commerce is more sovereign than the sovereign. Let the sovereign decree that one mark shall in future be two marks, commerce will keep on saying that these two marks are worth no more than one mark was formerly.

But, for all that, the question of value determined by the quantity of labour has not been advanced a step. It still remains to be decided whether the value of these two marks (which have become what one mark was once) is determined by the cost of production or by the law of supply and demand.

M. Proudhon continues: "It should even be borne in mind that if, instead of debasing the currency, it had been in the king's power to double its bulk, the exchange value of gold and silver would immediately have dropped by half, always from reasons of proportion and equilibrium."

[(Vol. I,]

If this opinion, which M. Proudhon shares with the other economists, is valid, it argues in favor of the latter's doctrine of supply and demand, and in no way in favor of M. Proudhon's proportionality. For, whatever the quantity of labour embodied in the doubled bulk of gold and silver, its value would have dropped by half, the demand having remained the same and the supply having doubled. Or can it be, by any chance, that the "law of proportionality" would have become confused this time with the so much disdained law of supply and demand? This true proportion of M. Proudhon's is indeed so elastic, is capable of so many variations, combinations and permutations, that it might well coincide for once with the relation between supply and demand.

To make "every commodity acceptable in exchange, if not in practice then at least by right," on the basis of the role of gold and silver is, then, to misunderstand this role. Gold and silver are acceptable by law only because they are acceptable in practice; and they are acceptable in practice because the present organization of production needs a universal medium of exchange. Law is only the official recognition of fact.

We have seen that the example of money as an application of value which has attained constitution was chosen by M. Proudhon only to smuggle through his whole doctrine of exchangeability, that is to say, to prove that every commodity assessed by its cost of production must attain the status of money. All this would be very fine, were it not for the awkward fact that precisely gold and silver, as money, are of all commodities the only ones not determined by their cost of production; and this is so true that in circulation they can be replaced by paper. So long as there is a certain proportion observed between the requirements of circulation and the amount of money issued, be it paper, gold, platinum, or copper money, there can be no question of a proportion to be observed

between the intrinsic value (cost of production) and the nominal value of money. Doubtless, in international trade, money is determined, like any other commodity, by labour time. But it is also true that gold and silver in international trade are means of exchange as products and not as money. In other words, they lose this characteristic of “stability and authenticity,” of “sovereign consecration,” which, for M. Proudhon, forms their specific characteristic. Ricardo understood the truth so well that, after basing his whole system on value determined by labour time, and after saying:

“Gold and silver, like all other commodities, are valuable only in proportion to the quantity of labour necessary to produce them, and bring them to market,”

He adds, nevertheless, that the value of *money* is not determined by the labour time its substance embodies, but by the law of supply and demand only.

“Though it [paper money] has no intrinsic value, yet, by limiting its quantity, its value in exchange is as great as an equal denomination of coin, or of bullion in that coin. On the same principle, too, namely, by limitation of its quantity, a debased coin would circulate at the value it should bear, if it were of the legal weight and fineness, and not at the value of the quantity of metal which it actually contained. In the history of the British coinage, we find, accordingly, that the currency was never depreciated in the same proportion that it was debased; the reason of which was, that it never was increased in quantity, in proportion to its diminished intrinsic value.”

(Ricardo, loc. cit. [pp.206-07])

This is what J. B. Say observes on this passage of Ricardo’s:

“This example should suffice, I think, to convince the author that the basis of all value is not the amount of labour needed to make a commodity, but the need felt for that commodity, balanced by its scarcity.”

[The reference is to Say’s note on the French edition of Ricardo’s book, Vol.II, pp.206-07]

Thus money, which for Ricardo is no longer a value determined by labour time, and which J. B. Say therefore takes as an example to convince Ricardo that the other values could not be determined by labour time either, this money, I say, taken by J. B. Say as an example of a value determined

exclusively by supply and demand, becomes for M. Proudhon the example par excellence of the application of value constituted... by labour time.

To conclude, if money is not a value “constituted” by labour time, it is all the less likely that it could have anything in common with M. Proudhon’s true “proportion.” Gold and silver are always exchangeable, because they have the special function of serving as the universal agent of exchange, and in no wise because they exist in a quantity proportional to the sum total of wealth; or, to put it still better, they are always proportional because, alone of all commodities, they serve as money, the universal agent of exchange, whatever their quantity in relation to the sum total of wealth.

“A circulation can never be so abundant as to overflow; for by diminishing its value, in the same proportion you will increase its quantity, and by increasing its value, diminish its quantity.”

(Ricardo [Vol. II,])

“What an imbroglio this political economy is!” cries M. Proudhon. [Vol. I,]

“Cursed gold!” cries a Communist flippantly [through the mouth of M. Proudhon]. You might as well say: “Cursed wheat, cursed vines, cursed sheep! – for just like gold and silver, *every commercial value* must attain its strictly exact determination.” [Vol. I,]

The idea of making sheep and vines attain the status of money is not new. In France, it belongs to the age of Louis XIV. At that period, money having begun to establish its omnipotence, the depreciation of all other commodities was being complained of, and the time when “every commercial value” might attain its strictly exact determination, the status of money, was being eagerly invoked. Even in the writings of Boisguillebert, one of the oldest of French economists, we find:

“Money, then, by the arrival of innumerable competitors in the form of commodities themselves, re-established in their true values, will be thrust back again within its natural limits.”

(Economistes financiers du dix-huitieme siecle, Daire edition, p.422)

One sees that the first illusions of the bourgeoisie are also their last.

B) Surplus labour

“In works on political economy we read this absurd hypothesis: If the price of everything were doubled.... As if the price of everything were not the proportion of things – and one could double a proportion, a relation, a law!”
(Proudhon, Vol.I, p.81)

Economists have fallen into this error through not knowing how to apply the “law of proportionality” and of “constituted value.”

Unfortunately in the very same work by M. Proudhon, Volume I, p.110, we read the absurd hypothesis that, “if wages rose generally, the price of every thing else would rise.” Furthermore, if we find the phrase in question in works on political economy, we also find an explanation of it.

“When one speaks of the price of all commodities going up or down, one always excludes some one commodity going up or down. The excluded commodity is, in general, money or labour.”

(Encyclopedia Metropolitana or Universal Dictionary of Knowledge, Vol.IV, Article “Political Economy”, by [N. W.] Senior, London, 1836. Regarding the phrase under discussion, see also J. St. Mill: Essays on Some Unsettled Questions of Political Economy, London 1844, and Tooke: A History of Prices, etc., London 1838.) [Full reference is Th. Tooke, A History of Prices, and of the State of the Circulation, from 1793 to 1837, Vols.I-II, London, 1838]

Let us pass now to the second application of “constituted value,” and of other proportions – whose only defect is their lack of proportion. And let us see whether M. Proudhon is happier here than in the monetarization of sheep.

“An axiom generally admitted by economists is that all labour must leave a surplus. In my opinion this proposition is universally and absolutely true: it is the corollary of the law of proportion, which may be regarded as the summary of the whole of economic science. But, if the economists will permit me to say so, the principle that all labour must leave a surplus is meaningless according to their theory, and is not susceptible of any demonstration.”

(Proudhon [3Vol. I, 1])

To prove that all labour must leave a surplus, M. Proudhon personifies society; he turns it into a person, Society – a society which is not by any means a society of persons, since it has its law apart, which have nothing in common with the persons of which society is composed, and its “own intelligence,” which is not the intelligence of common men, but an intelligence devoid of common sense. M. Proudhon reproaches the economists with not having understood the personality of this collective being. We have pleasure in confronting him with the following passage from an American economist, who accuses the economists of just the opposite:

“The moral entity – the grammatical being called a nation, has been clothed in attributes that have no real existence except in the imagination of those who metamorphose a word into a thing.... This has given rise to many difficulties and to some deplorable misunderstanding in political economy.”

(Th. Cooper, *Lectures on the Elements of Political Economy*, Columbia, 1826)

[The first edition of the book was published in Colombia in 1826. A second, enlarged edition appeared in London in 1831.]

“This principle of surplus labour,” continues M. Proudhon, “is true of individuals only because it emanates from society, which thus confers on them the benefit of its own laws.”

[Vol. I,]

Does M. Proudhon mean thereby merely that the production of the social individual exceeds that of the isolated individual? Is M. Proudhon referring to this excess of the production of associated individuals over that of non-associated individuals? If so, we could quote for him a hundred economists who have expressed this simple truth without any of the mysticism with which M. Proudhon surrounds himself. This, for example, is what Mr. Sadler says:

“Combined labour produces results which individual exertion could never accomplish. As mankind, therefore, multiply in number, the products of their united industry would greatly exceed the amount of any mere arithmetical addition calculated on such an increase.... In the mechanical

arts, as well as in pursuits of science, a man may achieve more in a day... than a solitary... individual could perform in his whole life.... Geometry says... that the whole is only equal to the sum of all its parts; as applied to the subject before us, this axiom would be false. Regarding labour, the great pillar of human existence, it may be said that the entire product of combined exertion almost infinitely exceeds all which individual and disconnected efforts could possibly accomplish.”

(T.Sadler, *The Law of Population*, London 1830)
[Vol. I, p and 84]

To return to M. Proudhon. Surplus labour, he says, is explained by the person, Society. The life of this person is guided by laws, the opposite of those which govern the activities of man as an individual. He desires to prove this by “facts.”

“The discovery of an economic process can never provide the inventor with a profit equal to that which he procures for society.... It has been remarked that railway enterprises are much less a source of wealth for the contractors than for the state.... The average cost of transporting commodities by road is 18 centimes per ton per kilometre, from the collection of the goods to their delivery. It has been calculated that at this rate an ordinary railway enterprise would not obtain 10 per cent net profit, a result approximately equal to that of a road-transport enterprise. But let us suppose that the speed of rail transport compared with that of road transport is as 4 is to 1. Since in society time is value itself, the railway would, prices being equal, present an advantage of 400 per cent over road-transport. Yet this enormous advantage, very real for society, is far from being realised in the same proportion for the carrier, who, while bestowing upon society an extra value of 400 per cent, does not for his own part draw 10 per cent. To bring the matter home still more pointedly, let us suppose, in fact, that the railway puts up its rate to 25 centimes, the cost of road transport remaining at 18: it would instantly lose all its consignments. Senders, receivers, everybody would return to the van, to the primitive waggon if necessary. The locomotive would be abandoned. A social advantage of 400 per cent would be sacrificed to a private loss of 35 per cent. The reason for this is easily grasped: the advantage resulting from the speed of the railway is entirely social, and each individual participates in it only in a minute

proportion (it must be remembered that at the moment we are dealing only with the transport of goods), while the loss strikes the consumer directly and personally. A social profit equal to 400 represents for the individual, if society is composed only of a million men, four ten-thousandths; while a loss of 33 per cent for the consumer would suppose a social deficit of 33 million.

(Proudhon [Vol. I, , 76])

Now, we may even overlook the fact that M. Proudhon expresses a quadrupled speed as 400 per cent of the original speed; but that he should bring into relation the percentage of speed and the percentage of profit and establish a proportion between two relations which, although measured separately by percentages, are nevertheless incommensurate with each other, is to establish a proportion between the percentages without reference to denominations.

Percentages are always percentages, 10 per cent and 400 per cent are commensurable; they are to each other as 10 is to 400. Therefore, concludes M. Proudhon, a profit of 10 per cent is worth 40 times less than a quadrupled speed. To save appearances, he says that, for society, time is money. This error arises from his recollecting vaguely that there is a connection between labour value and labour time, and he hastens to identify labour time with transport time; that is, he identifies the few firemen, drivers and others, whose labour time is actually transport time, with the whole of society. Thus at one blow, speed has become capital, and in this case he is fully right in saying: "A profit of 400 per cent will be sacrificed to a loss of 35 per cent." After establishing this strange proposition as a mathematician, he gives us the explanation of it as an economist.

"A social profit equal to 400 represents for the individual, in a society of only a million men, four ten-thousandths."

Agreed; but we are dealing not with 400, but with 400 per cent, and a profit of 400 per cent represents for the individual 400 per cent, neither more nor less. Whatever be the capital, the dividends will always be in the ratio of 400 per cent. What does M. Proudhon do? He takes percentages for capital, and, as if he were afraid of his confusion not being manifest enough, "pointed" enough, he continues:

"A loss of 33 per cent for the consumer would suppose a social deficit of 33 million."

A loss of 33 per cent for the consumer remains a loss of 33 per cent for a million consumers. How then can M. Proudhon say pertinently that the social deficit in the case of a 33 per cent loss amounts to 33 million, when he knows neither the social capital nor even the capital of a single one of the persons concerned? Thus it was not enough for M. Proudhon to have confused capital with percentage; he surpasses himself by identifying the capital sunk in an enterprise with the number of interested parties.

“To bring the matter home still more pointedly let us suppose in fact” a given capital. A social profit of 400 per cent divided among a million participants, each of them interested to the extent of 1 franc, would give 4 francs profit per head – and not 0.0004, as M. Proudhon alleges. Likewise a loss of 33 per cent for each of the participants represents a social deficit of 330,000 francs and not of 33 million ($100:33 = 1,000,000:330,000$).

M. Proudhon, preoccupied with his theory of the person, Society, forgets to divide by 100, which entails a loss of 330,000 francs; but 4 francs profit per head make 4 million francs profit for society. There remains for society a net profit of 3,670,000 francs. This accurate calculation proves precisely the contrary of what M. Proudhon wanted to prove: namely, that the profits and losses of society are not in inverse ratio to the profits and losses of individuals.

Having rectified these simple errors of pure calculation, let us take a look at the consequences which we would arrive at, if we admitted this relation between speed and capital in the case of railways, as M. Proudhon gives it – minus the mistakes in calculation. Let us suppose that a transport four times as rapid costs four times as much; this transport would not yield less profit than cartage, which is four times slower and costs a quarter the amount. Thus, if cartage takes 18 centimes, rail transport could take 72 centimes. This would be, according to “the rigor of mathematics,” the consequence of M. Proudhon’s suppositions – always minus his mistakes in calculation. But here he is all of a sudden telling us that if, instead of 72 centimes, rail transport takes only 25, it would instantly lose all its consignments. Decidedly we should have to go back to the van, to the primitive waggon even. Only, if we have any advice to give M. Proudhon, it is not to forget, in his *Programme of the Progressive Association*, to divide by 100. But, alas! it is scarcely to be hoped that our advice will be listened to, for M. Proudhon is so delighted with his “progressive association,” that he cries most emphatically:

“I have already shown in Chapter II, by the solution of the antinomy of value, that the advantage of every useful discovery is incomparably less for the inventor, whatever he may do, than for society. I have carried the demonstration in regard to this point in the rigor of mathematics!”

Let us return to the fiction of the person, Society, a fiction which has no other aim than that of proving this simple truth – that a new invention which enables a given amount of labour to produce a greater number of commodities, lowers the marketable value of the product. Society, then, makes a profit, not by obtaining more exchange values, but by obtaining more commodities for the same value. As for the inventor, competition makes his profit fall successively to the general level of profits. Has M. Proudhon proved this proposition as he wanted to? No. This does not prevent him from reproaching the economists with failure to prove it. To prove to him on the contrary that they *have* proved it, we shall cite only Ricardo and Lauderdale – Ricardo, the head of the school which determines value by labour time, and Lauderdale, one of the most uncompromising defenders of the determination of value by supply and demand. Both have expounded the same proposition:

“By constantly increasing the facility of production, we constantly diminish the value of some of the commodities before produced, though by the same means we not only add to the national riches, but also to the power of future production.... As soon as by the aid of machinery, or by the knowledge of natural philosophy, you oblige natural agents to do the work which was before done by man, the exchangeable value of such work falls accordingly. If 10 men turned a corn mill, and it be discovered that by the assistance of wind, or of water, the labour of these 10 men may be spared, the flour which is the produce partly of the work performed by the mill, would immediately fall in value, in proportion to the quantity of labour saved; and the society would be richer by the commodities which the labour of the 10 men could produce, the funds destined for their maintenance being in no degree impaired.”

(Ricardo [Ricardo, Vol. II,])

Lauderdale, in his turn, says:

In every instance where capital is so employed as to produce a profit, it uniformly arises, either – from its supplanting a portion of labour, which would otherwise be performed by the hand of man; or – from its performing a portion of labour, which is beyond the reach of the personal exertion of

man to accomplish. The small profit which the proprietors of machinery generally acquire, when compared with the wages of labour, which the machine supplants, may perhaps create a suspicion of the rectitude of this opinion. Some fire-engines, for instance, draw more water from a coalpit in one day than could be conveyed on the shoulder of 300 men, even assisted by the machinery of buckets; and a fire-engine undoubtedly performs its labour at a much smaller expense than the amount of the wages of those whose labour it thus supplants. This is, in truth, the case with all machinery. All machines must execute the labour that was antecedently performed at a cheaper rate than it could be done by the hand of man....

If such a privilege is given for the invention of a machine, which performs, by the labour of one man, a quantity of work that used to take the labour of four; as the possession of the exclusive privilege prevents any competition in doing the work, but what proceeds from the labour of the workmen, their wages, as long as the patent continues, must obviously form the measure of the patentee's charge; that is to secure employment, he has only to charge a little less than the wages of the labour which the machine supplants. But when the patent expires, other machines of the same nature are brought into competition; and then his charge must be regulated on the same principle as every other, according to the abundance of machines....

The profit of capital employed..., though it arises from supplanting labour, comes to be regulated, not by the value of the labour it supplants but, as in all other cases, by the competition among the proprietors of capital that presents itself for performing the duty, and the demand for it.

[P, 123, 124, 125, 134]

Finally, then, so long as the profit is greater than in other industries, capital will be thrown into the new industry until the rate of profit falls to the general level.

We have just seen that the example of the railway was scarcely suited to throw any light on his fiction of the person, Society. Nevertheless, M. Proudhon boldly resumes his discourse:

“With these points cleared up, nothing is easier than to explain how labour must leave a surplus for each producer.”

[Vol. I,]

What now follows belongs to classical antiquity. It is a poetical narrative intended to refresh the reader after the fatigue which the rigor of the preceding mathematical demonstrations must have caused him. M.

Proudhon gives the person, Society, the name of Prometheus, whose high deeds he glorifies in these terms:

First of all, Prometheus emerging from the bosom of nature awakens to life, in a delightful inertia, etc., etc. Prometheus sets to work, and on this first day, the first day of the second creation, Prometheus' product, that is, his wealth, his well-being, is equal to 10. On the second day, Prometheus divides his labour, and his product becomes equal to 100. On the third day and on each of the following days, Prometheus invents machines, discovers new utilities in bodies, new forces in nature.... With every step of his industrial activity, there is an increase in the number of his products, which marks an enhancement of happiness for him. And since, after all, to consume is for him to produce, it is clear that every day's consumption, using up only the product of the day before, leaves a surplus product for the next day."

[Vol. I, p-78]

This Prometheus of M. Proudhon's is a queer character, as weak in logic as in political economy. So long as Prometheus merely teaches us the division of labour, the application of machinery, the exploitation of natural forces and scientific power, multiplying the productive forces of men and giving a surplus compared with the produce of labour in isolation, this new Prometheus has the misfortune only of coming too late. But the moment Prometheus starts talking about production and consumption he becomes really ludicrous. To consume, for him, is to produce; he consumes the next day what he produced the day before, so that he is always one day in advance; this day in advance is his "surplus labour." But, if he consumes the next day what he has produced the day before, he must, on the first day, which had no day before, have done two days' work in order to be one day in advance later on. How did Prometheus earn this surplus on the first day, when there was neither division of labour, nor machinery, nor even any knowledge of physical forces other than fire? Thus the question, for all its being carried back "to the first day of the second creation," has not advanced a single step forward. This way of explaining things savours both of Greek and of Hebrew, it is at once mystical and allegorical. It gives M. Proudhon a perfect right to say:

"I have proved by theory and by facts the principle that all labour must have a surplus."

The “facts” are the famous progressive calculation; the theory is the myth of Prometheus.

“But,” continues M. Proudhon, “this principle, while being as certain as an arithmetical proposition, is as yet far from being realised by everyone. Whereas, with the progress of collective industry, every day’s individual labour produces a greater and greater product, and whereas therefore, by a necessary consequence, the worker with the same wage ought to become richer every day, there actually exist estates in society which profit and others which decay.”

[Vol. I, p-80]

In 1770 the population of the United Kingdom of Great Britain was 15 million, and the productive population was 3 million. The scientific power of production equalled a population of about 12 million individuals more. Therefore there were, altogether, 15 million of productive forces. Thus the productive power was to the population as 1 is to 1; and the scientific power was to the manual power as 4 is to 1.

In 1840 the population did not exceed 30 million: the productive population was 6 million. But the scientific power amounted to 650 million; that is, it was to the whole population as 21 is to 1, and to manual power as 108 is to 1.

In English society the working day thus acquired in 70 years a surplus of 2,700 per cent productivity; that is, in 1840 it produced 27 times as much as in 1770. According to M. Proudhon, the following question should be raised: why was not the English worker of 1840 27 times as rich as the one of 1770? In raising such a question one would naturally be supposing that the English could have produced this wealth without the historical conditions in which it was produced, such as: private accumulation of capital, modern division of labour, automatic workshops, anarchical competition, the wage system – in short, everything that is based upon class antagonism. Now, these were precisely the necessary conditions of existence for the development of productive forces and of surplus labour. Therefore, to obtain this development of productive forces and this surplus labour, there had to be classes which profited and classes which decayed.

What then, ultimately, is this Prometheus resuscitated by M. Proudhon? It is society, social relations based on class antagonism. These relations are not relations between individual and individual, but between worker and capitalist, between farmer and landlord, etc. Wipe out these relations and

you annihilate all society, and your Prometheus is nothing but a ghost without arms or legs; that is, without automatic workshops, without division of labour – in a word, without everything that you gave him to start with in order to make him obtain this surplus labour.

If then, in theory, it sufficed to interpret, as M. Proudhon does, the formula of surplus labour in the equalitarian sense, without taking into account the actual conditions of production, it should suffice, in practice, to share out equally among the workers all the wealth at present acquired, without changing in any way the present conditions of production. Such a distribution would certainly not assure a high degree of comfort to the individual participants.

But M. Proudhon is not so pessimistic as one might think. As proportion is everything for him, he has to see in his fully equipped Prometheus, that is, in present-day society, the beginnings of a realisation of his favorite idea.

“But everywhere, too, the progress of wealth, that is, the proportion of values, is the dominant law; and when economists hold up against the complaints of the social party the progressive growth of the public wealth, and the improved conditions of even the most unfortunate classes, they unwittingly proclaim a truth which is the condemnation of their theories.”

[Vol. I,]

What is, exactly, collective wealth, public fortune? It is the wealth of the bourgeoisie – not that of each bourgeois in particular. Well, the economists have done nothing but show how, in the existing relations of production, the wealth of the bourgeoisie has grown and must grow still further. As for the working classes, it still remains a very debatable question whether their condition has improved as a result of the increase in so-called public wealth. If economists, in support of their optimism, cite the example of the English workers employed in the cotton industry, they see the condition of the latter only in the rare moments of trade prosperity. These moments of prosperity are to the periods of crisis and stagnation in the “true proportion” of 3 to 10. But perhaps also, in speaking of improvement, the economists were thinking of the millions of workers who had to perish in the East Indies so as to procure for the million and a half workers employed in England in the same industry three years’ prosperity out of ten.

As for the temporary participation in the increase of public wealth, that is a different matter. The fact of temporary participation is explained by the theory of the economists. It is the confirmation of this theory and not its

“condemnation,” as M. Proudhon calls it. If there were anything to be condemned, it would surely be the system of M. Proudhon, who would reduce the worker, as we have shown, to the minimum wage, in spite of the increase of wealth. It is only by reducing the worker to the minimum wage that he would be able to apply the true proportion of values, of “value constituted” by labour time. It is because wages, as a result of competition, oscillate now above, now below, the price of food necessary for the sustenance of the worker, that he can participate to a certain extent in the development of collective wealth, and can also perish from want. This is the whole theory of the economists who have no illusions on the subject.

After his lengthy digressions on railways, on Prometheus, and on the new society to be reconstituted on “constituted value,” M. Proudhon collects himself; emotion overpowers him and he cries in fatherly tones:

“I beseech the economists to ask themselves for one moment, in the silence of their hearts – far from the prejudices that trouble them and regardless of the employment they are engaged in or hope to obtain, of the interests they subserve, or the approbation to which they aspire, of the honors which nurse their vanity – let them say whether before this day the principle that all labour must leave a surplus appeared to them with this chain of premises and consequences that we have revealed.”

CHAPTER TWO: THE METAPHYSICS OF POLITICAL ECONOMY

The Method

Here we are, right in Germany! We shall now have to talk metaphysics while talking political economy. And in this again we shall but follow M. Proudhon's "contradictions." Just now he forced us to speak English, to become pretty well English ourselves. Now the scene is changing. M. Proudhon is transporting us to our dear fatherland and is forcing us, whether we like it or not, to become German again.

If the Englishman transforms men into hats, the German transforms hats into ideas. The Englishman is Ricardo, rich banker and distinguished economist; the German is Hegel, simple professor at the University of Berlin.

Louis XV, the last absolute monarch and representative of the decadence of French royalty, had attached to his person a physician who was himself France's first economist. This doctor, this economist, represented the imminent and certain triumph of the French bourgeoisie. Doctor Quesnay made a science out of political economy; he summarized it in his famous *Tableau économique*. Besides the thousand and one commentaries on this table which have appeared, we possess one by the doctor himself. It is the "Analysis of the Economic Table," followed by "seven important observations."

M. Proudhon is another Dr. Quesnay. He is the Quesnay of the metaphysics of political economy.

Now metaphysics – indeed all philosophy – can be summed up, according to Hegel, in method. We must, therefore, try to elucidate the method of M. Proudhon, which is at least as foggy as the Economic Table. It is for this reason that we are making seven more or less important observations. If Dr. Proudhon is not pleased with our observations, well, then, he will have to become an Abbe Baydeau and give the "explanation of the economico-metaphysical method" himself.

First Observation

“We are not giving a history according to the order in time, but according to the sequence of ideas. Economic phases or categories are in their manifestation sometimes contemporary, sometimes inverted.... Economic theories have nonetheless their logical sequence and their serial relation in the understanding: it is this order that we flatter our- selves to have discovered.”

(Proudhon, Vol. I,)

M. Proudhon most certainly wanted to frighten the French by flinging quasi-Hegelian phrases at them. So we have to deal with two men: firstly with M. Proudhon, and then with Hegel. How does M. Proudhon distinguish himself from other economists? And what part does Hegel play in M. Proudhon's political economy?

Economists express the relations of bourgeois production, the division of labour, credit, money, etc., as fixed, immutable, eternal categories. M. Proudhon, who has these ready-made categories before him, wants to explain to us the act of formation, the genesis of these categories, principles, laws, ideas, thoughts.

Economists explain how production takes place in the above-mentioned relations, but what they do not explain is how these relations themselves are produced, that is, the historical movement which gave them birth. M. Proudhon, taking these relations for principles, categories, abstract thoughts, has merely to put into *order* these thoughts, which are to be found alphabetically arranged at the end of every treatise on political economy. The economists' material is the active, energetic life of man; M. Proudhon's material is the dogmas of the economists. But the moment we cease to pursue the historical movement of production relations, of which the categories are but the theoretical expression, the moment we want to see in these categories no more than ideas, spontaneous thoughts, independent of real relations, we are forced to attribute the origin of these thoughts to the movement of pure reason. How does pure, eternal, impersonal reason give rise to these thoughts? How does it proceed in order to produce them?

If we had M. Proudhon's intrepidity in the matter of Hegelianism we should say: it is distinguished in itself from itself. What does this mean? Impersonal reason, having outside itself neither a base on which it can pose itself, nor an object to which it can oppose itself, nor a subject with which it

can compose itself, is forced to turn head over heels, in posing itself, opposing itself and composing itself – position, opposition, composition. Or, to speak Greek – we have thesis, antithesis and synthesis. For those who do not know the Hegelian language, we shall give the ritual formula: affirmation, negation and negation of the negation. That is what language means. It is certainly not Hebrew (with due apologies to M. Proudhon); but it is the language of this pure reason, separate from the individual. Instead of the ordinary individual with his ordinary manner of speaking and thinking we have nothing but this ordinary manner purely and simply – without the individual.

Is it surprising that everything, in the final abstraction – for we have here an abstraction, and not an analysis – presents itself as a logical category? Is it surprising that, if you let drop little by little all that constitutes the individuality of a house, leaving out first of all the materials of which it is composed, then the form that distinguishes it, you end up with nothing but a body; that, if you leave out of account the limits of this body; you soon have nothing but a space – that if, finally, you leave out of the account the dimensions of this space, there is absolutely nothing left but pure quantity, the logical category? If we abstract thus from every subject all the alleged accidents, animate or inanimate, men or things, we are right in saying that in the final abstraction, the only substance left is the logical category. Thus the metaphysicians who, in making these abstractions, think they are making analyses, and who, the more they detach themselves from things, imagine themselves to be getting all the nearer to the point of penetrating to their core – these metaphysicians in turn are right in saying that things here below are embroideries of which the logical categories constitute the canvas. This is what distinguishes the philosopher from the Christian. The Christian, in spite of logic, has only one incarnation of the *Logos*; the philosopher has never finished with incarnations. If all that exists, all that lives on land, and under water, can be reduced by abstraction to a logical category – if the whole real world can be drowned thus in a world of abstractions, in the world of logical categories – who need be astonished at it?

All that exists, all that lives on land and under water, exists and lives only by some kind of movement. Thus, the movement of history produces social relations; industrial movement gives us industrial products, etc.

Just as by means of abstraction we have transformed everything into a logical category, so one has only to make an abstraction of every characteristic distinctive of different movements to attain movement in its abstract condition – purely formal movement, the purely logical formula of movement. If one finds in logical categories the substance of all things, one imagines one has found in the logical formula of movement the *absolute method*, which not only explains all things, but also implies the movement of things.

It is of this absolute method that Hegel speaks in these terms:

“Method is the absolute, unique, supreme, infinite force, which no object can resist; it is the tendency of reason to find itself again, to recognize itself in every object.”

(*Logic*, Vol. III)

All things being reduced to a logical category, and every movement, every act of production, to method, it follows naturally that every aggregate of products and production, of objects and of movement, can be reduced to a form of applied metaphysics. What Hegel has done for religion, law, etc., M. Proudhon seeks to do for political economy.

So what is this absolute method? The abstraction of movement. What is the abstraction of movement? Movement in abstract condition. What is movement in abstract condition? The purely logical formula of movement or the movement of pure reason. Wherein does the movement of pure reason consist? In posing itself, opposing itself, composing itself; in formulating itself as thesis, antithesis, synthesis; or, yet, in affirming itself, negating itself, and negating its negation.

How does reason manage to affirm itself, to pose itself in a definite category? That is the business of reason itself and of its apologists.

But once it has managed to pose itself as a thesis, this thesis, this thought, opposed to itself, splits up into two contradictory thoughts – the positive and the negative, the yes and no. The struggle between these two antagonistic elements comprised in the antithesis constitutes the dialectical movement. The yes becoming no, the no becoming yes, the yes becoming both yes and no, the no becoming both no and yes, the contraries balance, neutralize, paralyze each other. The fusion of these two contradictory thoughts constitutes a new thought, which is the synthesis of them. This thought splits up once again into two contradictory thoughts, which in turn fuse into a new synthesis. Of this travail is born a group of thoughts. This

group of thoughts follows the same dialectic movement as the simple category, and has a contradictory group as antithesis. Of these two groups of thoughts is born a new group of thoughts, which is the antithesis of them.

Just as from the dialectic movement of the simple categories is born the group, so from the dialectic movement of the groups is born the series, and from the dialectic movement of the series is born the entire system.

Apply this method to the categories of political economy and you have the logic and metaphysics of political economy, or, in other words, you have the economic categories that everybody knows, translated into a little-known language which makes them look as if they had never blossomed forth in an intellect of pure reason; so much do these categories seem to engender one another, to be linked up and intertwined with one another by the very working of the dialectic movement. The reader must not get alarmed at these metaphysics with all their scaffolding of categories, groups, series, and systems. M. Proudhon, in spite of all the trouble he has taken to scale the heights of the system of contradictions, has never been able to raise himself above the first two rungs of simple thesis and antithesis; and even these he has mounted only twice, and on one of these two occasions he fell over backwards.

Up to now we have expounded only the dialectics of Hegel. We shall see later how M. Proudhon has succeeded in reducing it to the meanest proportions. Thus, for Hegel, all that has happened and is still happening is only just what is happening in his own mind. Thus the philosophy of history is nothing but the history of philosophy, of his own philosophy. There is no longer a “history according to the order in time,” there is only “the sequence of ideas in the understanding.” He thinks he is constructing the world by the movement of thought, whereas he is merely reconstructing systematically and classifying by the absolute method of thoughts which are in the minds of all.

Second Observation

Economic categories are only the theoretical expressions, the abstractions of the social relations of production, M. Proudhon, holding this upside down like a true philosopher, sees in actual relations nothing but the incarnation of the principles, of these categories, which were slumbering –

so M. Proudhon the philosopher tells us – in the bosom of the “impersonal reason of humanity.”

M. Proudhon the economist understands very well that men make cloth, linen, or silk materials in definite relations of production. But what he has not understood is that these definite social relations are just as much produced by men as linen, flax, etc. Social relations are closely bound up with productive forces. In acquiring new productive forces men change their mode of production; and in changing their mode of production, in changing the way of earning their living, they change all their social relations. The hand-mill gives you society with the feudal lord; the steam-mill, society with the industrial capitalist.

The same men who establish their social relations in conformity with the material productivity, produce also principles, ideas, and categories, in conformity with their social relations.

Thus the ideas, these categories, are as little eternal as the relations they express. They are *historical and transitory products*.

There is a continual movement of growth in productive forces, of destruction in social relations, of formation in ideas; the only immutable thing is the abstraction of movement – *mors immortalis*.

[Marx quotes these words from the following passage of Lucretius’s poem *On The Nature of Things* (Book III, line 869): “mortalem vitam mors cum immortalis ademit” (“when mortal life has been taken away by immortal death”).]

Third Observation

The production relations of every society form a whole. M. Proudhon considers economic relations as so many social phases, engendering one another, resulting one from the other like the antithesis from the thesis, and realizing in their logical sequence the impersonal reason of humanity.

The only drawback to this method is that when he comes to examine a single one of these phases, M. Proudhon cannot explain it without having recourse to all the other relations of society; which relations, however, he has not yet made his dialectic movement engender. When, after that, M. Proudhon, by means of pure reason, proceeds to give birth to these other

phases, he treats them as if they were new-born babes. He forgets that they are of the same age as the first.

Thus, to arrive at the constitution of value, which for him is the basis of all economic evolutions, he could not do without division of labour, competition, etc. Yet in the *series*, in the *understanding* of M. Proudhon, in the *logical sequence*, these relations did not yet exist.

In constructing the edifice of an ideological system by means of the categories of political economy, the limbs of the social system are dislocated. The different limbs of society are converted into so many separate societies, following one upon the other. How, indeed, could the single logical formula of movement, of sequence, of time, explain the structure of society, in which all relations coexist simultaneously and support one another?

Fourth Observation

Let us see now to what modifications M. Proudhon subjects Hegel's dialectics when he applies it to political economy.

For him, M. Proudhon, every economic category has two sides – one good, the other bad. He looks upon these categories as the petty bourgeois looks upon the great men of history: *Napoleon* was a great man; he did a lot of good; he also did a lot of harm.

The *good side* and the *bad side*, the *advantages* and *drawbacks*, taken together form for M. Proudhon the *contradiction* in every economic category.

The problem to be solved: to keep the good side, while eliminating the bad.

Slavery is an economic category like any other. Thus it also has its two sides. Let us leave alone the bad side and talk about the good side of slavery. Needless to say, we are dealing only with direct slavery, with Negro slavery in Surinam, in Brazil, in the Southern States of North America.

Direct slavery is just as much the pivot of bourgeois industry as machinery, credits, etc. Without slavery you have no cotton; without cotton you have no modern industry. It is slavery that gave the colonies their value; it is the colonies that created world trade, and it is world trade that is the

precondition of large-scale industry. Thus slavery is an economic category of the greatest importance.

Without slavery North America, the most progressive of countries, would be transformed into a patriarchal country. Wipe North America off the map of the world, and you will have anarchy – the complete decay of modern commerce and civilization. Cause slavery to disappear and you will have wiped America off the map of nations.

Thus slavery, because it is an economic category, has always existed among the institutions of the peoples. Modern nations have been able only to disguise slavery in their own countries, but they have imposed it without disguise upon the New World.

What would M. Proudhon do to save slavery? He would formulate the *problem* thus: preserve the good side of this economic category, eliminate the bad.

Hegel has no problems to formulate. He has only dialectics. M. Proudhon has nothing of Hegel's dialectics but the language. For him the dialectic movement is the dogmatic distinction between good and bad.

Let us for a moment consider M. Proudhon himself as a category. Let us examine his good and bad side, his advantages and his drawbacks.

If he has the advantage over Hegel of setting problems which he reserves the right of solving for the greater good of humanity, he has the drawback of being stricken with sterility when it is a question of engendering a new category by dialectical birth-throes. What constitutes dialectical movement is the coexistence of two contradictory sides, their conflict and their fusion into a new category. The very setting of the problem of eliminating the bad side cuts short the dialectic movement. It is not the category which is posed and opposed to itself, by its contradictory nature, it is M. Proudhon who gets excited, perplexed and frets and fumes between the two sides of the category.

Caught thus in a blind alley, from which it is difficult to escape by legal means, M. Proudhon takes a real flying leap which transports him at one bound into a new category. Then it is that, to his astonished gaze, is revealed the *serial relation in the understanding*.

He takes the first category that comes handy and attributes to it arbitrarily the quality of supplying a remedy for the drawbacks of the category to be purified. Thus, if we are to believe M. Proudhon, taxes

remedy the drawbacks of monopoly; the balance of trade, the drawbacks of taxes; landed property, the drawbacks of credit.

By taking the economic categories thus successively, one by one, and making one the *antidote* to the other, M. Proudhon manages to make with this mixture of contradictions and antidotes to contradictions, two volumes of contradictions, which he rightly entitles: *Le Système des contradictions économiques*. [The System of Economic Contradictions]

Fifth Observation

“In the absolute reason all these ideas... are equally simple, and general.... In fact, we attain knowledge only by a *sort of scaffolding* of our ideas. But truth in itself is independent of these dialectical symbols and freed from the combinations of our minds.”

(Proudhon, Vol. II,)

Here all of a sudden, by a kind of switch-over of which we now know the secret, the metaphysics of political economy has become an illusion! Never has M. Proudhon spoken more truly. Indeed, from the moment the process of the dialectic movement is reduced to the simple process of opposing good to bad, and of administering one category as an antidote to another, the categories are deprived of all spontaneity; the idea “ceases to *function*”; there is no life left in it. It is no longer posed or decomposed into categories. The sequence of categories has become a sort of *scaffolding*. Dialectics has ceased to be the movement of absolute reason. There is no longer any dialectics but only, at the most, absolutely pure morality.

When M. Proudhon spoke of the *serial relation in understanding*, of the *logical sequence of categories*, he declared positively that he did not want to give *history according to the order in time*, that is, in M. Proudhon’s view, the historical sequence in which the categories have *manifested* themselves. Thus for him everything happened in the *pure ether of reason*. Everything was to be derived from this ether by means of dialectics. Now that he has to put this dialectics into practice, his reason is in default. M. Proudhon’s dialectics runs counter to Hegel’s dialectics, and now we have M. Proudhon reduced to saying that the order in which he gives the economic categories is no longer the order in which they engender one another. Economic evolutions are no longer the evolutions of reason itself.

What then does M. Proudhon give us? Real history, which is, according to M. Proudhon's understanding, the sequence in which the categories have *manifested* themselves in order of time? No! History as it takes place in the idea itself? Still less! That is, neither the profane history of categories, nor their sacred history! What history does he give us then? The history of his own contradictions. Let us see how they go, and how they drag M. Proudhon in their train.

Before entering upon this examination, which gives rise to the sixth important observation, we have yet another, less important observation to make.

Let us admit with M. Proudhon that real history, history according to the order in time, is the historical sequence in which ideas, categories and principles have manifested themselves.

Each principle has had its own century in which to manifest itself. The principle of authority, for example, had the 11th century, just as the principle of individualism had the 18th century. In logical sequence, it was the century that belonged to the principle, and not the principle which belonged to the century. When, consequently, in order to save principles as much as to save history, we ask ourselves why a particular principle was manifested in the 11th century or in the 18th century rather than in any other, we are necessarily forced to examine minutely what men were like in the 11th century, what they were like in the 18th, what were their respective needs, their productive forces, their mode of production, the raw materials of their production – in short, what were the relations between man and man which resulted from all these conditions of existence. To get to the bottom of all these questions – what is this but to draw up the real, profane history of men in every century and to present these men as both the authors and the actors of their own drama? But the moment you present men as the actors and authors of their own history, you arrive – by detour – at the real starting point, because you have abandoned those eternal principles of which you spoke at the outset.

M. Proudhon has not even gone far enough along the crossroad which an ideologist takes to reach the main road of history.

Sixth Observation

Let us take the crossroad with M. Proudhon.

We shall concede that economic relations, viewed as immutable *laws*, *eternal principles*, *ideal categories*, existed before active and energetic men did; we shall concede further that these laws, principles and categories had, since the beginning of time, slumbered “in the impersonal reason of humanity.” We have already seen that, with all these changeless and motionless eternities, there is no history left; there is at most history in the idea, that is, history reflected in the dialectic movement of pure reason. M. Proudhon, by saying that, in the dialectic movement ideas are no longer “*differentiated*,” has done away with both the *shadow of movement* and the *movement of shadows*, by means of which one could still have created at least a semblance of history. Instead of that, he imputes to history his own impotence. He lays the blame on everything, even the French language.

“It is not correct then,” says M. Proudhon, the philosopher, “to say that something *appears*, that something *is produced*: in civilization as in the universe, everything has existed, has acted, from eternity. *This applies to the whole of social economy.*”

(Vol. II,)

So great is the productive force of the contradictions which *function* and which made M. Proudhon function, that, in trying to explain history, he is forced to deny it; in trying to explain the successive appearance of social relations, he denies that *anything* can *appear*: in trying to explain production, with all its phases, he questions whether *anything can be produced*!

Thus, for M. Proudhon, there is no longer any history: no longer any sequence of ideas. And yet his book still exists; and it is precisely that book which is, to use his own expression, “*history according to the sequence of ideas*.” How shall we find a formula, for M. Proudhon is a man of formulas, to help him to clear all these contradictions *in one leap*?

To this end he has invented a new reason, which is neither the pure and virgin absolute reason, nor the common reason of men living and acting in different periods, but a reason quite apart – the reason of the person, Society – of the subject, *Humanity* – which under the pen of M. Proudhon figures at times also as “*social genius*,” “*general reason*,” or finally as “*human reason*.” This reason, decked out under so many names, betrays itself

nevertheless, at every moment, as the individual reason of M. Proudhon, with its good and its bad side, its antidotes and its problems.

“Human reason does not create truth,” hidden in the depths of absolute, eternal reason. It can only unveil it. But such truths as it has unveiled up to now are incomplete, insufficient, and consequently contradictory. Hence, economic categories, being themselves truths discovered, revealed by human reason, by social genius, are equally incomplete and contain within themselves the germ of contradictions. Before M. Proudhon, social genius saw only the *antagonistic elements*, and not the *synthetic formula*, both hidden simultaneously in *absolute reason*. Economic relations, which merely realize on earth these insufficient truths, these incomplete ideas, are consequently contradictory in themselves, and present two sides, one good, the other bad.

To find complete truth, the idea, in all its fullness, the synthetic formula that is to annihilate the contradiction, this is the problem of social genius. This again is why, in M. Proudhon’s illusion, this same social genius has been harried from one category to another without ever having been able, despite all its battery of categories, to snatch from God or from absolute reason, a synthetic formula.

“At first, society (social genius) states a primary fact, puts forward a hypothesis... a veritable antinomy, whose antagonistic results develop in the social economy in the same way as its consequences could have been deduced in the mind; so that industrial movement, following in all things the deduction of ideas, splits up into two currents, one of useful effects, the other of subversive results. To bring harmony into the constitution of this two-side principle, and to solve this antinomy, society gives rise to a second, which will soon be followed by a third; and progress of social genius will take place in this manner, until, having exhausted all its contradictions – I suppose, but it is not proved that there is a limit to human contradictions – it returns in one leap to all its former positions and with a single formula solves all its problems.”

(Vol. I)

Just as the *antithesis* was before turned into an *antidote*, so now the *thesis* becomes a *hypothesis*. This change of terms, coming from M. Proudhon, has no longer anything surprising for us! Human reason, which is anything but pure, having only incomplete vision, encounters at every step new problems to be solved. Every new thesis which it discovers in

absolute reason and which is the negation of the first thesis, becomes for it a synthesis, which it accepts rather naively as the solution of the problem in question. It is thus that this reason frets and fumes in ever renewing contradictions until, coming to the end of the contradictions, it perceives that all its theses and syntheses are merely contradictory hypotheses. In its perplexity, “human reason, social genius, returns in one leap to all its former positions, and in a single formula, solves all its problems.” This unique formula, by the way, constitutes M. Proudhon’s true discovery. It is *constituted value*.

Hypotheses are made only in view of a certain aim. The aim that social genius, speaking through the mouth of M. Proudhon, set itself in the first place, was to eliminate the bad in every economic category, in order to have nothing left but the good. For it, the good, the supreme well-being, the real practical aim, is *equality*. And why did the social genius aim at equality rather than inequality, fraternity, Catholicism, or any other principle? Because “humanity has successively realized so many separate hypotheses only in view of a superior hypothesis,” which precisely is equality. In other words: because equality is M. Proudhon’s ideal. He imagines that the division of labour, credit, the workshop – all economic relations – were invented merely for the benefit of equality, and yet they always ended up by turning against it. Since history and the fiction of M. Proudhon contradict each other at every step, the latter concludes that there is a contradiction. If there is a contradiction, it exists only between his fixed idea and real movement.

Henceforth, the good side of an economic relation is that which affirms equality; the bad side, that which negates it and affirms inequality. Every new category is a hypothesis of the social genius to eliminate the inequality engendered by the preceding hypothesis. In short, equality is the *primordial intention*, the *mystical tendency*, the *providential aim* that the social genius has constantly before its eyes as it whirls in the circle of economic contradictions. Thus, *Providence* is the locomotive which makes the whole of M. Proudhon’s economic baggage move better than his pure and volatized reason. He has devoted to Providence a whole chapter, which follows the one on taxes.

Providence, providential aim, this is the great word used today to explain the movement of history. In fact, this word explains nothing. It is at most a rhetorical form, one of the various ways of paraphrasing facts.

It is a fact that in Scotland landed property acquired a new value by the development of English industry. This industry opened up new outlets for wool. In order to produce wool on a large scale, arable land had to be transformed into pasturage. To effect this transformation, the estates had to be concentrated. To concentrate the estates, small holdings had first to be abolished, thousands of tenants had to be driven from their native soil and a few shepherds in charge of millions of sheep to be installed in their place. Thus, by successive transformations, landed property in Scotland has resulted in the driving out of men by sheep. Now say that the providential aim of the institution of landed property in Scotland was to have men driven out by sheep, and you will have made providential history.

Of course, the tendency towards equality belongs to our century. To say now that all former centuries, with entirely different needs, means of production, etc., worked providentially for the realization of equality is, firstly, to substitute the means and the men of our century for the men and the means of earlier centuries and to misunderstand the historical movement by which the successive generations transformed the results acquired by the generations that preceded them. Economists know very well that the very thing that was for the one a finished product was for the other but the raw material for new production.

Suppose, as M. Proudhon does, that social genius produced, or rather improvised, the feudal lords with the providential aim of transforming the *settlers* into *responsible* and *equally-placed workers*: and you will have effected a substitution of aims and of persons worthy of the Providence that instituted landed property in Scotland, in order to give itself the malicious pleasure of driving out men by sheep.

But since M. Proudhon takes such a tender interest in Providence, we refer him to the *Histoire de l'économie politique* of M. de Villeneuve-Bargemont, who likewise goes in pursuit of a providential aim. This aim, however, is not equality, but Catholicism.

Seventh and Last Observation

Economists have a singular method of procedure. There are only two kinds of institutions for them, artificial and natural. The institutions of feudalism are artificial institutions, those of the bourgeoisie are natural institutions. In

this, they resemble the theologians, who likewise establish two kinds of religion. Every religion which is not theirs is an invention of men, while their own is an emanation from God. When the economists say that present-day relations – the relations of bourgeois production – are natural, they imply that these are the relations in which wealth is created and productive forces developed in conformity with the laws of nature. These relations therefore are themselves natural laws independent of the influence of time. They are eternal laws which must always govern society. Thus, there has been history, but there is no longer any. There has been history, since there were the institutions of feudalism, and in these institutions of feudalism we find quite different relations of production from those of bourgeois society, which the economists try to pass off as natural and as such, eternal.

Feudalism also had its proletariat – serfdom, which contained all the germs of the bourgeoisie. Feudal production also had two antagonistic elements which are likewise designated by the name of the *good side* and the *bad side* of feudalism, irrespective of the fact that it is always the bad side that in the end triumphs over the good side. It is the bad side that produces the movement which makes history, by providing a struggle. If, during the epoch of the domination of feudalism, the economists, enthusiastic over the knightly virtues, the beautiful harmony between rights and duties, the patriarchal life of the towns, the prosperous condition of domestic industry in the countryside, the development of industry organized into corporations, guilds and fraternities, in short, everything that constitutes the good side of feudalism, had set themselves the problem of eliminating everything that cast a shadow on the picture – serfdom, privileges, anarchy – what would have happened? All the elements which called forth the struggle would have been destroyed, and the development of the bourgeoisie nipped in the bud. One would have set oneself the absurd problem of eliminating history.

After the triumph of the bourgeoisie, there was no longer any question of the good or the bad side of feudalism. The bourgeoisie took possession of the productive forces it had developed under feudalism. All the old economic forms, the corresponding civil relations, the political state which was the official expression of the old civil society, were smashed.

Thus, feudal production, to be judged properly, must be considered as a mode of production founded on antagonism. It must be shown how wealth was produced within this antagonism, how the productive forces were

developed at the same time as class antagonisms, how one of the classes, the bad side, the drawback of society, went on growing until the material conditions for its emancipation had attained full maturity. Is not this as good as saying that the mode of production, the relations in which productive forces are developed, are anything but eternal laws, but that they correspond to a definite development of men and of their productive forces, and that a change in men's productive forces necessarily brings about a change in their relations of production? As the main thing is not to be deprived of the fruits of civilization, of the acquired productive forces, the traditional forms in which they were produced must be smashed. From this moment, the revolutionary class becomes conservative.

The bourgeoisie begins with a proletariat which is itself a relic of the proletariat of feudal times. In the course of its historical development, the bourgeoisie necessarily develops its antagonistic character, which at first is more or less disguised, existing only in a latent state. As the bourgeoisie develops, there develops in its bosom a new proletariat, a modern proletariat; there develops a struggle between the proletarian class and the bourgeoisie class, a struggle which, before being felt, perceived, appreciated, understood, avowed, and proclaimed aloud by both sides, expresses itself, to start with, merely in partial and momentary conflicts, in subversive acts. On the other hand, if all the members of the modern bourgeoisie have the same interests inasmuch as they form a class as against another class, they have opposite, antagonistic interests inasmuch as they stand face-to-face with one another. This opposition of interests results from the economic conditions of their bourgeois life. From day to day it thus becomes clearer that the production relations in which the bourgeoisie moves have not a simple, uniform character, but a dual character; that in the selfsame relations in which wealth is produced, poverty is also produced; that in the selfsame relations in which there is a development of the productive forces, there is also a force producing repression; that these relations produce *bourgeois wealth* – i.e., the wealth of the bourgeois class – only by continually annihilating the wealth of the individual members of this class and by producing an ever-growing proletariat.

The more the antagonistic character comes to light, the more the economists, the scientific representatives of bourgeois production, find themselves in conflict with their own theory; and different schools arise.

We have the *fatalist* economists, who in their theory are as indifferent to what they call the drawbacks of bourgeois production as the bourgeois themselves are in practice to the sufferings of the proletarians who help them to acquire wealth. In this fatalist school, there are Classics and Romantics. The Classics, like Adam Smith and Ricardo, represent a bourgeoisie which, while still struggling with the relics of feudal society, works only to purge economic relations of feudal taints, to increase the productive forces and to give a new upsurge to industry and commerce. The proletariat that takes part in this struggle and is absorbed in this feverish labour experiences only passing, accidental sufferings, and itself regards them as such. Economists like Adam Smith and Ricardo, who are the historians of this epoch, have no other mission than that of showing how wealth is acquired in bourgeois production relations, of formulating these relations into categories, into laws, and of showing how superior these laws, these categories, are for the production of wealth to the laws and categories of feudal society. Poverty is in their eyes merely the pang which accompanies every childbirth, in nature as in industry.

The *romantics* belong to our own age, in which the bourgeoisie is in direct opposition to the proletariat; in which poverty is engendered in as great abundance as wealth. The economists now pose as blasé fatalists, who, from their elevated position, cast a proudly disdainful glance at the human machines who manufacture wealth. They copy all the developments given by their predecessors, and the indifference which in the latter was merely naïveté becomes in them coquetry.

Next comes the *humanitarian* school, which sympathizes with the bad side of present-day production relations. It seeks, by way of easing its conscience, to palliate even if slightly the real contrasts; it sincerely deplores the distress of the proletariat, the unbridled competition of the bourgeois among themselves; it counsels the workers to be sober, to work hard and to have few children; it advises the bourgeois to put a reasoned ardor into production. The whole theory of this school rests on interminable distinctions between theory and practice, between principles and results, between ideas and application, between form and content, between essence and reality, between right and fact, between the good side and the bad side.

The *philanthropic* school is the humanitarian school carried to perfection. It denies the necessity of antagonism; it wants to turn all men into bourgeois; it wants to realize theory in so far as it is distinguished from

practice and contains no antagonism. It goes without saying that, in theory, it is easy to make an abstraction of the contradictions that are met with at every moment in actual reality. This theory would therefore become idealized reality. The philanthropists, then, want to retain the categories which express bourgeois relations, without the antagonism which constitutes them and is inseparable from them. They think they are seriously fighting bourgeois practice, and they are more bourgeois than the others.

Just as the *economists* are the scientific representatives of the bourgeois class, so the *Socialists* and *Communists* are the theoreticians of the proletarian class. So long as the proletariat is not yet sufficiently developed to constitute itself as a class, and consequently so long as the struggle itself of the proletariat with the bourgeoisie has not yet assumed a political character, and the productive forces are not yet sufficiently developed in the bosom of the bourgeoisie itself to enable us to catch a glimpse of the material conditions necessary for the emancipation of the proletariat and for the formation of a new society, these theoreticians are merely utopians who, to meet the wants of the oppressed classes, improvise systems and go in search of a regenerating science. But in the measure that history moves forward, and with it the struggle of the proletariat assumes clearer outlines, they no longer need to seek science in their minds; they have only to take note of what is happening before their eyes and to become its mouthpiece. So long as they look for science and merely make systems, so long as they are at the beginning of the struggle, they see in poverty nothing but poverty, without seeing in it the revolutionary, subversive side, which will overthrow the old society. From this moment, science, which is a product of the historical movement, has associated itself consciously with it, has ceased to be doctrinaire and has become revolutionary.

Let us return to M. Proudhon.

Every economic relation has a good and a bad side; it is the one point on which M. Proudhon does not give himself the lie. He sees the good side expounded by the economists; the bad side he sees denounced by the Socialists. He borrows from the economists the necessity of eternal relations; he borrows from the Socialists the illusion of seeing in poverty nothing but poverty. He is in agreement with both in wanting to fall back upon the authority of science. Science for him reduces itself to the slender proportions of a scientific formula; he is the man in search of formulas. Thus it is that M. Proudhon flatters himself on having given a criticism of

both political economy and communism: he is beneath them both. Beneath the economists, since, as a philosopher who has at his elbow a magic formula, he thought he could dispense with going into purely economic details; beneath the socialists, because he has neither courage enough nor insight enough to rise, be it even speculatively, above the bourgeois horizon.

He wants to be the synthesis – he is a composite error.

He wants to soar as the man of science above the bourgeois and proletarians; he is merely the petty bourgeois, continually tossed back and forth between capital and labour, political economy and communism.

Division of labour and Machinery

The division of labour, according to M. Proudhon, opens the series of economic evolutions.

*Good
side of the
division of
labour*

“Considered in its essence, the division of labour is the manner in which *equality* of conditions and intelligence is realized.”
(Tome I, .)

*Bad side
of the
division of
labour*

“The division of labour has become for us an instrument of poverty.”
(Tome I, .)

“labour, by *dividing itself according to the law* which is peculiar to it, and which is the primary condition of its fruitfulness, ends in the negation of its aims and destroys itself.”
(Tome I, .)

Problem
to be solved To find the “recomposition which wipes out the drawbacks of the division, while retaining its useful effects.”
(Tome I, .)

The division of labour is, according to M. Proudhon, an eternal law, a simple, abstract category. Therefore the abstraction, the idea, the word must suffice for him to explain the division of labour at different historical epochs. Castes, corporations, manufacture, large-scale industry, must be explained by the single word *divide*. First study carefully the meaning of “divide”, and you will have no need to study the numerous influences which give the division of labour a definitive character in every epoch.

Certainly, things would be made much too easy if they were reduced to M. Proudhon’s categories. History does not proceed so categorically. It took three whole centuries in Germany to establish the first big division of labour, the separation of the towns from the country. In proportion, as this one relation of town and country was modified, the whole of society was modified. To take only this one aspect of the division of labour, you have the old republics, and you have Christian feudalism; you have old England with its barons and you have modern England with its cotton lords. In the 14th and 15th centuries, when there were as yet no colonies, when America did not yet exist for Europe, when Asia existed only through the intermediary of Constantinople, when the Mediterranean was the centre of commercial activity, the division of labour had a very different form, a very different aspect from that of the 17th century, when the Spanish, the Portuguese, the Dutch, the English, and the French had colonies established in all parts of the world. The extent of the market, its physiognomy, give to the division of labour at different periods a physiognomy, a character, which it would be difficult to deduce from the single word *divide*, from the idea, from the category.

“All economists since Adam Smith,” says M. Proudhon, “have pointed out the advantages and drawbacks of the law of division, but insist much more on the first than on the second, because that was more serviceable for their optimism, and none of them has ever wondered what could be the drawbacks to a law.... How does the same principle, pursued vigorously to

its consequences, lead to diametrically opposite results? Not one economist before or since A. Smith has even perceived that here was a problem to elucidate. Say goes to the length of recognizing that in the division of labour the same cause that produces the good engenders the bad.”

[Vol. I, p-96]

Adam Smith goes further than M. Proudhon thinks. He saw clearly that “the difference of natural talents in different men is, in reality, much less than we are aware of; and the very different genius which appears to distinguish men of different professions, when grown up to maturity, is not so much the *cause* as the *effect* of the division of labour.”

[Vol. I,]

In principle, a porter differs less from a philosopher than a mastiff from a greyhound. It is the division of labour which has set a gulf between them. All this does not prevent M. Proudhon from saying elsewhere that Adam Smith has not the slightest idea of the drawbacks produced by the division of labour. It is this again that makes him say that J. B. Say was the first to recognize “that in the division of labour the same cause that produces the good engenders the bad.” [Vol. I,]

But let us listen to Lemontey; *Suum cuique*.

“M. J. B. Say has done me the honour of adopting in his excellent treatise on political economy the principle that I brought to light in this fragment on the moral influence of the division of labour. The somewhat frivolous title of my book doubtless prevented him from citing me. It is only to this motive that I can attribute the silence of a writer too rich in his own stock to disavow so modest a load.”

(Lemontey, *Oeuvres completes*,
Vol. I, , Paris 1840)

Let us do him this justice: Lemontey wittily exposed the unpleasant consequences of the division of labour as it is constituted today, and M. Proudhon found nothing to add to it. But now that, through the fault of M. Proudhon, we have been drawn into this question of priority, let us say again, in passing, that long before M. Lemontey, and 17 years before Adam Smith, who was a pupil of A. Ferguson, the last-named gave a clear exposition of the subject in a chapter which deals specifically with the division of labour.

“It may even be doubted, whether the measure of national capacity increases with the advancement of arts. Many mechanical arts... succeed best under a total suppression of sentiment and reason; and ignorance is the mother of industry as well as superstition. Reflection and fancy are subject to err; but a habit of moving the hand, or the foot, is independent of either. Manufactures, accordingly, prosper most, where the mind is least consulted, and where the workshop may, without any great effort of imagination, be considered as an engine, the parts of which are men....

“The general officer may be a great proficient in the knowledge of war, while the skill of the soldier is confined to a few motions of the hand and the foot. The former may have gained what the latter has lost....

“And thinking itself, in this age of separations, may become a peculiar craft.”

(A. Ferguson, *An Essay on the History of of Civil Society*, Edinburgh 1783 [Vol. II, p, 109, 110])

To bring this literary survey to a close, we expressly deny that “all economists have insisted far more on the advantages than on the drawbacks of the division of labour.” It suffices to mention Sismondi.

Thus, as far as the advantages of the division of labour are concerned, M. Proudhon had nothing further to do than to paraphrase the general phrases known to everybody.

Let us now see how he derives from the division of labour, taken as a general law, as a category, as a thought, the drawbacks which are attached to it. How is it that this category, this law implies an unequal distribution of labour to the detriment of M. Proudhon’s equalitarian system?

“At this solemn hour of the division of labour, the storm winds begin to blow over humanity. Progress does not take place for all in an equal and uniform manner.... It begins by taking possession of a small number of the privileged.... It is this preference for person on the part of progress that has for so long kept up the belief in the natural and providential inequality of conditions, has given rise to castes, and hierarchically constituted all societies.”

(Proudhon, Vol.I, p.94)

The division of labour created castes. Now, castes are the drawbacks of the division of labour; thus, it is the division of labour that has engendered

the drawbacks. *Quod erat demonstrandum*. [Which was to be proved.] Will you go further and ask what made the division of labour create castes, hierarchical constitutions and privileged persons? M. Proudhon will tell you: Progress. And what made progress? Limitation. Limitation, for M. Proudhon, is acceptance of persons on the part of progress.

After philosophy comes history. It is no longer either descriptive history or dialectical history, it is comparative history. M. Proudhon establishes a parallel between the present-day printing worker and the printing worker of the Middle Ages; between the man of letters of today and the man of letters of the Middle Ages, and he weighs down the balance on the side of those who belong more or less to the division of labour as the Middle Ages constituted or transmitted it. He opposes the division of labour of one historical epoch. Was that what M. Proudhon had to prove? No. He should have shown us the drawbacks of the division of labour in general, of the division of labour as a category. Besides, why stress this part of M. Proudhon's work, since a little later we shall see him formally retract all these alleged developments?

"The first effect of fractional labour," continues M. Proudhon, "after the depravation of the soul, is the prolongation of the shifts, which grow in inverse ratio to the sum total of intelligence expended.... But as the length of the shifts cannot exceed 16 to 18 hours per day, the moment the compensation cannot be taken out of the time, it will be taken out of the price, and the wages will diminish.... What is certain, and the only thing for us to note, is that the universal conscience does not assess at the same rate the work of a foreman and the labour of a mechanic's assistant. It is therefore necessary to reduce the price of the day's work; so that the worker, after having been afflicted in his soul by a degrading function, cannot escape being struck in his body by the meagreness of his remuneration."

[Vol. I, p-98]

We pass over the logical value of these syllogisms, which Kant would call paralogisms which lead astray.

This is the substance of it:

The division of labour reduces the worker to a degrading function; to this degrading function corresponds a depraved soul; to the depravation of the soul is befitting an ever-increasing wage reduction. And to prove that this reduction is befitting to a depraved soul, M. Proudhon says, to relieve his

conscience, that the universal conscience wills it thus. Is M. Proudhon's soul to be reckoned as a part of the universal conscience?

Machinery is, for M. Proudhon, "the logical antithesis of the division of labour," and with the help of his dialectics, he begins by transforming machinery into the workshop.

After presupposing the modern workshop, in order to make poverty the outcome of the division of labour, M. Proudhon presupposes poverty engendered by the division of labour, in order to come to the workshop and be able to represent it as the dialectical negation of that poverty. After striking the worker morally by a degrading function, physically by the meagreness of the wage; after putting the worker under the dependence of the foreman, and debasing his work to the labour of a mechanic's assistant, he lays the blame again on the workshop and the machinery for degrading the worker "by giving him a master," and he completes his abasement by making him "sink from the rank of artisan to that of common labourer." Excellent dialectics! And if he only stopped there! But no, he has to have a new history of the division of labour, not any longer to derive the contradictions from it, but to reconstruct the workshop after his own fashion. To attain this end he finds himself compelled to forget all he has just said about division.

labour is organized, is divided differently according to the instruments it disposes over. The hand-mill presupposes a different division of labour from the steam-mill. Thus, it is slapping history in the face to want to begin by the division of labour in general, in order to get subsequently to a specific instrument of production, machinery.

Machinery is no more an economic category than the bullock that drags the plough. Machinery is merely a productive force. The modern workshop, which depends on the application of machinery, is a social production relation, an economic category.

Let us see now how things happen in M. Proudhon's brilliant imagination.

"In society, the incessant appearance of machinery is the antithesis, the inverse formula of the division of labour: it is the protest of the industrial genius against fractional and homicidal labour. What, actually, is a machine? A way of uniting different portions of labour which had been separated by the division of labour. Every machine can be defined as a summary of several operations.... Thus, through the machine there will be a

restoration of the worker.... Machinery, which in political economy places itself in contradiction to the division of labour, represents synthesis, which in the human mind is opposed to analysis.... Division merely separated the different parts of labour, letting each one devote himself to the speciality which most suited him; the workshop groups the workers according to the relation of each part to the whole.... It introduces the principle of authority in labour.... But this is not all; the machine or the workshop, after degrading the worker by giving him a master, completes his abasement by making him sink from the rank of artisan to that of common labourer.... The period we are going through at the moment, that of machinery, is distinguished by a special characteristic, the wage worker. The wage worker is subsequent to the division of labour and to exchange.”

[Vol. I, p, 136, and 161]

Just a simple remark to M. Proudhon. The separation of the different parts of labour, leaving to each one the opportunity of devoting himself to the speciality best suited to him – a separation which M. Proudhon dates from the beginning of the world – exists only in modern industry under the rule of competition.

M. Proudhon goes on to give us a most “interesting genealogy,” to show how the workshop arose from the division of labour and the wage worker from the workshop.

1) He supposes a man who “noticed that by dividing up production into its different parts and having each one performed by a separate worker,” the forces of production would be multiplied.

2) This man, “grasping the thread of this idea, tells himself that, by forming a permanent group of workers selected for the special purpose he sets himself, he will obtain a more sustained production, etc.” [Vol. I,]

3) This man makes a proposal to other men, to make them grasp his idea and the thread of his idea.

4) This man, at the beginning of industry, deals on terms of equality with his companions who later become his workmen.

5) “One realizes, in fact, that this original equality had rapidly to disappear in view of the advantageous position of the master and the dependence of the wage-earner.” [Vol. I,]

That is another example of M. Proudhon’s historical and descriptive method.

Let us now examine, from the historical and economic point of view, whether the workshop of the machine really introduced the principle of authority in society subsequently to the division of labour; whether it rehabilitated the worker on the one hand, while submitting him to authority on the other; whether the machine is the recomposition of divided labour, the synthesis of labour as opposed to its analysis.

Society as a whole has this in common with the interior of a workshop, that it too has its division of labour. If one took as a model the division of labour in a modern workshop, in order to apply it to a whole society, the society best organized for the production of wealth would undoubtedly be that which had a single chief employer, distributing tasks to different members of the community according to a previously fixed rule. But this is by no means the case. While inside the modern workshop the division of labour is meticulously regulated by the authority of the employer, modern society has no other rule, no other authority for the distribution of labour than free competition.

Under the patriarchal system, under the caste system, under the feudal and corporative system, there was division of labour in the whole of society according to fixed rules. Were these rules established by a legislator? No. Originally born of the conditions of material production, they were raised to the status of laws only much later. In this way, these different forms of the division of labour became so many bases of social organization. As for the division in the workshop, it was very little developed in all these forms of society.

It can even be laid down as a general rule that the less authority presides over the division of labour inside society, the more the division of labour develops inside the workshop, and the more it is subjected there to the authority of a single person. Thus authority in the workshop and authority in society, in relation to the division of labour, are in *inverse ratio* to each other.

The question now is what kind of workshop it is in which the occupations are very much separated, where each worker's task is reduced to a very simple operation, and where the authority, capital, groups and directs the work. How was this workshop brought into existence? In order to answer this question, we shall have to examine how manufacturing industry, properly so-called, has developed. I am speaking here of that industry which is not yet industry, with its machinery, but which is already

no longer the industry of the artisans of the Middle Ages, nor domestic industry. We shall not go into great detail: we shall merely give a few main points to show that history is not to be made with formulas.

One of the most indispensable conditions for the formation of manufacturing industry was the accumulation of capital, facilitated by the discovery of America and the import of its precious metals.

It is sufficiently proved that the increase in the means of exchange resulted in the depreciation of wages and land rents, on the one hand, and the growth of industrial profits on the other. In other words: to the extent that the propertied class and the working class, the feudal lords and the people, sank, to that extent the capitalist class, the bourgeoisie, rose.

There were yet other circumstances which contributed simultaneously to the development of manufacturing industry: the increase of commodities put into circulation from the moment that trade had penetrated to the East Indies by way of the Cape of Good Hope; the colonial system; the development of maritime trade.

Another point which has not yet been sufficiently appreciated in the history of manufacturing industry is the disbanding of the numerous retainers of feudal lords, whose subordinate ranks became vagrants before entering the workshop. The creation of the workshop was preceded by an almost universal vagrancy in the 15th and 16th centuries. The workshop found, besides, a powerful support in the many peasants who, continually driven from the country owing to the transformation of the fields into pastures and to the progress in agriculture which necessitated fewer hands for the tillage of the soil, went on congregating in the towns during whole centuries.

The growth of the market, the accumulation of capital, the modification in the social position of the classes, a large number of persons being deprived of their sources of income, all these are historical preconditions for the formation of manufacture. It was not, as M. Proudhon says, friendly agreements between equals that brought men into the workshop. It was not even in the bosom of the old guilds that manufacture was born. It was the merchant that became head of the modern workshop, and not the old guildmaster. Almost everywhere there was a desperate struggle between manufacture and crafts.

The accumulation and concentration of instruments and workers preceded the development of the division of labour inside the workshop.

Manufacture consisted much more in the bringing together of many workers and many crafts in one place, in one room under the command of one capital, than in the analysis of labour and the adaptation of a special worker to a very simple task.

The utility of a workshop consisted much less in the division of labour as such than in the circumstances that work was done on a much larger scale, that many unnecessary expenses were saved, etc. At the end of the 16th and at the beginning of the 17th century, Dutch manufacture scarcely knew any division of labour.

The development of the division of labour supposes the assemblage of workers in a workshop. There is not one single example, whether in the 16th or in the 17th century, of the different branches of one and the same craft being exploited separately to such an extent that it would have sufficed to assemble them all in one place so as to obtain a complete, ready-made workshop. But once the men and the instruments had been brought together, the division of labour, such as it had existed in the form of the guilds, was reproduced, necessarily reflected inside the workshop.

For M. Proudhon, who sees things upside down, if he sees them at all, the division of labour, in Adam Smith's sense, precedes the workshop, which is a condition of its existence.

Machinery, properly so-called, dates from the end of the 18th century. Nothing is more absurd than to see in machinery the *antithesis* of the division of labour, the *synthesis* restoring unity to divided labour.

The machine is a unification of the instruments of labour, and by no means a combination of different operations for the worker himself.

“When, by the division of labour, each particular operation has been simplified to the use of a single instrument, the linking up of all these instruments, set in motion by a single engine, constitutes – a machine.”

(Babbage, *Traite sur l'économie des machines [et des manufactures]*, Paris 1833 [p.230])

Simple tools; accumulation tools; composite tools; setting in motion of a composite tool by a single hand engine, by man; setting in motion of these instruments by natural forces, machines; system of machines having one motor; system of machines having one automatic motor – this is the progress of machinery.

The concentration of the instruments of production and the division of labour are as inseparable one from the other as are, in the political sphere,

the concentration of public authority and the division of private interests. England, with the concentration of the land, this instrument of agricultural labour, has at the same time division of agricultural labour and the application of machinery to the exploitation of the soil. France, which has the division of the instruments, the small holdings system, has, in general, neither division of agricultural labour nor application of machinery to the soil.

For M. Proudhon the concentration of the instruments of labour is the negation of the division of labour. In reality, we find again the reverse. As the concentration of instruments develops, the division develops also, and vice versa. This is why every big mechanical invention is followed by a greater division of labour, and each increase in the division of labour gives rise in turn to new mechanical inventions.

We need not recall the fact that the great progress of the division of labour began in England after the invention of machinery. Thus, the weavers and spinners were for the most part peasants like those one still meets in backward countries. The invention of machinery brought about the separation of manufacturing industry from agricultural industry. The weaver and the spinner, united but lately in a single family, were separated by the machine. Thanks to the machine, the spinner can live in England while the weaver resides in the East Indies. Before the invention of machinery, the industry of a country was carried on chiefly with raw materials that were the products of its own soil; in England – wool, in Germany – flax, in France – silks and flax, in the East Indies and the Levant – cottons, etc. Thanks to the application of machinery and of steam, the division of labour was about to assume such dimensions that large-scale industry, detached from the national soil, depends entirely on the world market, on international exchange, on an international division of labour. In short – the machine has so great an influence on the division of labour, that when, in the manufacture of some object, a means has been found to produce parts of it mechanically, the manufacture splits up immediately into two works independent of each other.

Need we speak of the philanthropic and providential aim that M. Proudhon discovers in the invention and first application of machinery?

When in England the market had become so far developed that manual labour was no longer adequate, the need for machinery was felt. Then came

the idea of the application of mechanical science, already quite developed in the 18th century.

The automatic workshop opened its career with acts which were anything but philanthropic. Children were kept at work at the whip's end; they were made an object of traffic and contracts were undertaken with the orphanages. All the laws on the apprenticeship of workers were repealed, because, to use M. Proudhon's phraseology, there was no further need for *synthetic* workers. Finally, from 1825 onwards, almost all the new inventions were the result of collisions between the worker and the employer who sought at all costs to depreciate the worker's specialized ability. After each new strike of any importance, there appeared a new machine. So little indeed did the worker see in the application of machinery a sort of rehabilitation, *restoration* – as M. Proudhon would say – that in the 18th century he stood out for a very long time against the incipient domination of the automaton.

“Wyatt,” says Doctor Ure, “invented the series of fluted rollers... (the spinning fingers usually ascribed to Arkwright)....

“The main difficulty did not, to my apprehension, lie so much in the invention of a proper self-acting mechanism... as in training human beings to renounce their desultory habits of work, and to identify themselves with the unvarying regularity of the complex automaton. But to devise and administer a successful code of factory discipline, suited to the necessities of factory diligence, was the Herculean enterprise, the noble achievement of Arkwright.”

[Vol. I, p-22, 23]

In short, by the introduction of machinery, the division of labour inside society has grown up, the task of the worker inside the workshop has been simplified, capital has been concentrated, human beings have been further dismembered.

When M. Proudhon wants to be an economist, and to abandon for a moment the “evolution of ideas in serial relation in the understanding,” then he goes and draws erudition from Adam Smith, from a time when the automatic workshop was only just coming into existence. Indeed, what a difference between the division of labour as it existed in Adam Smith's day and as we see it in the automatic workshop! In order to make this properly understood, we need only quote a few passages from Dr. Ure's *The Philosophy of Manufactures*.

“When Adam Smith wrote his immortal elements of economics, automatic machinery being hardly known, he was properly led to regard the division of labour as the grand principle of manufacturing improvement; and he showed, in the example of pin-making, how each handicraftsman, being thereby enabled to perfect himself by practice in one point, became a quicker and cheaper workman. In each branch of manufacture he saw that some parts were, on that principle, of easy execution, like the cutting of pin wires into uniform lengths, and some were comparatively difficult, like the formation and fixation of their heads; and therefore he concluded that to each a workman of appropriate value and cost was naturally assigned. This appropriation forms the very essence of the division of labour....

“But what was in Dr. Smith’s time a topic of useful illustration, cannot now be used without risk of misleading the public mind as to the right principle of manufacturing industry. In fact, the division, or rather adaptation of labour to the different talents of men, is little thought of in factory employment. On the contrary, wherever a process requires a peculiar dexterity and steadiness of hand, it is withdrawn as soon as possible from the cunning workman, who is prone to irregularities of many kinds, and it is placed in charge of a peculiar mechanism, so self-regulating, that a child may superintend it.

“The principle of the factory system then is, to substitute mechanical science for hand skill, and the partition of a process into its essential constituents, for the division or gradation of labour among artisans. On the handicraft plan, labour more or less skilled, was usually the most expensive element of production... but on the automatic plan, skilled labour gets progressively superseded, and will, eventually, be replaced by mere overlookers of machines.

“By the infirmity of human nature it happens, that the more skilful the workman, the more self-willed and intractable he is apt to become, and, of course, the less fit a component of a mechanical system, in which, by occasional irregularities, he may do great damage to the whole. The grand object therefore of the modern manufacturer is, through the union of capital and science, to reduce the task of his workpeople to the exercise of vigilance and dexterity – faculties, when concentrated to one process, speedily brought to perfection in the young.

“On the gradation system, a man must serve an apprenticeship of many years before his hand and eye become skilled enough for certain mechanical

feats; but on the system of decomposing a process into its constituents, and embodying each part in an automatic machine, a person of common care and capacity may be entrusted with any of the said elementary parts after a short probation, and may be transferred from one to another, on any emergency, at the discretion of the master. Such translations are utterly at variance with the old practice of the division of labour, which fixed one man to shaping the head of a pin, another to shaping the head of a pin, and another to sharpening its point, with the most irksome and spirit-wasting uniformity, for a whole life....

“But on the equalization plan of self-acting machines, the operative needs to call his faculties only into agreeable exercise.... As his business consists in ending the work of a well-regulated mechanism, he can learn it in a short period; and when he transfers his services, from one machine to another, he varies his task, and enlarges his views, by thinking on those general combinations which result from his and his companions’ labours. Thus, that cramping of the faculties, that narrowing of the mind, that stunting of the frame, which were ascribed, and not unjustly, by moral writers, to the division of labour, cannot, in common circumstances, occur under the equable distribution of industry....

“It is, in fact, the constant aim and tendency of every improvement in machinery to supersede human labour altogether, or to diminish its cost, by substituting the industry of women and children for that of men; of that of ordinary labourers for trained artisans.... This tendency to employ merely children with watchful eyes and nimble fingers, instead of journeymen of long experience, shows how the scholastic dogma of the division of labour into degrees of skill has been exploded by our enlightened manufacturers.”

(Andre Ure, *Philosophie des manufactures ou economie industrielle*, Vol.I, Cha [p-35])

What characterizes the division of labour inside modern society is that it engenders specialized functions, specialists, and with them craft-idiocy.

“We are struck with admiration,” says Lemontey, “when we see among the Ancients the same person distinguishing himself to a high degree as philosopher, poet, orator, historian, priest, administrator, general of an army. Our souls are appalled at the sight of so vast a domain. Each one of us plants his hedge and shuts himself up in his enclosure. I do not know whether by this parcellation the field is enlarged, but I do know that man is belittled.”

What characterizes the division of labour in the automatic workshop is that labour has there completely lost its specialized character. But the moment every special development stops, the need for universality, the tendency towards an integral development of the individual begins to be felt. The automatic workshop wipes out specialists and craft-idiocy.

M. Proudhon, not having understood even this one revolutionary side of the automatic workshop, takes a step backward and proposes to the worker that he make not only the 12th part of a pin, but successively all 12 parts of it. The worker would thus arrive at the knowledge and the consciousness of the pin. This is M. Proudhon's synthetic labour. Nobody will contest that to make a movement forward and another movement backward is to make a synthetic movement.

To sum up, M. Proudhon has not gone further than the petty-bourgeois ideal. And to realize this ideal, he can think of nothing better than to take us back to the journeyman or, at most, to the master craftsman of the Middle Ages. It is enough, he says somewhere in his book, to have created a masterpiece once in one's life, to have felt oneself just once to be a man. Is not this, in form as in content, the masterpiece demanded by the trade guild of the Middle Ages?

3. Competition and Monopoly

Good side of competition "Competition is as essential to labour as division.... It is necessary ... for the *advent of equality*." [I 186, 188]

Bad side of competition "The principle is the negation of itself. Its most certain result is to ruin those whom it drags in its train." [I 185]

General reflection "The *drawbacks* which follow in its wake, just as the good it provides... both flow logically from the principle." [I 185-86]

Problem to be "To seek the principle of *accommodation*, which must be derived from a law superior to liberty itself." [I 185]

solved “There can, therefore, be no question here of destroying competition, a thing as impossible to destroy as liberty; we have only to find its equilibrium, I would be ready to say its *police*.” [I 223]

M. Proudhon begins by defending the eternal necessity of competition against those who wish to replace it by *emulation* [Engels: The Fourierists].

There is no “purposeless emulation,” and as “the object of every passion is necessarily analogous to the passion itself – a woman for the lover, power for the ambitious, gold for the miser, a garland for the poet – the object of industrial emulation is necessarily profit. Emulation is nothing but competition itself.”

[I 187]

Competition is emulation with a view to profit. Is industrial emulation necessarily emulation with a view to profit, that is, competition?? M. Proudhon proves it by affirming it. We have seen that, for him, to affirm is to prove, just as to suppose is to deny.

If the immediate *object* of the lover is the woman, the immediate object of industrial emulation is the product and not the profit.

Competition is not industrial emulation, it is commercial emulation. In our time industrial emulation exists only in view of commerce. There are even phases in the economic life of modern nations when everybody is seized with a sort of craze for making profit without producing. This speculation craze, which recurs periodically, lays bare the true character of competition, which seeks to escape the need for industrial emulation.

If you had told an artisan of the 14th century that the privileges and the whole feudal organization of industry were going to be abrogated in favor of industrial emulation, called competition, he would have replied that the privileges of the various corporations, guilds and fraternities were organized competition. M. Proudhon does not impose upon this when he affirms that “emulation is nothing but competition itself.”

“Decree that from the first of January 1847, labor and wages shall be guaranteed to everybody: immediately an immense relaxation will succeed the high tension of industry.”

[I 189]

Instead of a supposition, an affirmation and a negation, we have now a decree that M. Proudhon issues purposely to prove the necessity of competition, its eternity as a category, etc.

If we imagine that decrees are all that is needed to get away from competition, we shall never get away from it. And if we go so far as to propose to abolish competition while retaining wages, we shall be proposing nonsense by royal decree. But nations do not proceed by royal decree. Before framing such ordinances, they must at least have changed from top to bottom the conditions of their industrial and political existence, and consequently their whole manner of being.

M. Proudhon will reply, with his imperturbable assurance, that it is the hypothesis of “a transformation of our nature without historical antecedents,” and that he would be right in “excluding is from the discussion,” we know not in virtue of which ordinance.

M. Proudhon does not know that all history is nothing but a continuous transformation of human nature.

“Let us stick to the facts. The French Revolution was made for industrial liberty as much as for political liberty; and although France, in 1789, had not perceived – let us say it openly – all the consequences of the principle whose realization it demanded, it was mistaken neither in its wishes nor in its expectations. Whoever attempts to deny this loses, in my view, the right to criticism. I will never dispute with an adversary who puts as principle the spontaneous error of 25 million men....

“Why then, if competition had not been a principle of social economy, a decree of fate, a necessity of the human soul, why, instead of abolishing corporations, guilds and brotherhoods, did nobody think rather of repairing the whole??”

[I 191, 192]

So, since the French of the 18th century abolished corporations, guilds, and fraternities instead of modifying them, the French of the 19th century must modify competition instead of abolishing it. Since competition was established in France in the 18th century as a result of historical needs, this competition must not be destroyed in the 19th century because of other historical needs. M. Proudhon, not understanding that the establishment of competition was bound up with the actual development of the men of the 18th century, makes of competition a necessity of the *human soul*, in *partibus infidelium* [literally, “territory of the infidels”; here, meaning,

“beyond the realm of reality.”] What would he have made of the great Colbert for the 17th century??

After the revolution comes the present state of affairs. M. Proudhon equally draws facts from it to show the eternity of competition, by proving that all industries in which this category is not yet sufficiently developed, as in agriculture, are in a state of inferiority and decrepitude.

To say that there are industries which have not yet reached the stage of competition, that others gains are below the level of bourgeois production, is drivel which gives not the slightest proof of the eternity of competition.

All M. Proudhon’s logic amounts to is this: competition is a social relation in which we are now developing our productive forces. To this truth, he gives no logical development, but only forms, often very well developed, when he says that competition is industrial emulation, the present-day mode of freedom, responsibility in labor, constitution of value, a condition for the advent of equality, a principle of social economy, a decree of fate, a necessity of the human soul, an inspiration of eternal justice, liberty in division, division on liberty, an economic category.

“Competition and association support each other. Far from excluding each other they are not even divergent. Whoever says competition already supposes a common aim. Competition is therefore not egoism, and the most deplorable error committed by socialism is to have regarded it as the overthrow of society.”

[I 223]

Whoever says competition says common aim, and that proves, on the one hand, that competition is association; on the other, that competition is not egoism. And whoever says *egoism*, does he not say common aim?? Every egoism operates in society and by the fact of society. Hence it presupposes society, that is to say, common aims, common needs, common means of production, etc., etc. Is it, then, be mere chance that the competition and association which the Socialists talk about are not even divergent??

Socialists know well enough that present-day society is founded on competition. How could they accuse competition of overthrowing present-day society which they want to overthrow themselves?? And how could they accuse competition of overthrowing the society to come, in which they see, on the contrary, the overthrow of competition??

M. Proudhon says, later on, that competition is the *opposite of monopoly*, and consequently cannot be the *opposite of association*.

Feudalism was, from its origins, opposed to patriarchal monarchy; it was thus not opposed to competition, which was not yet in existence. Does it follow that competition is not opposed to feudalism??

In actual fact, *society*, *association* are denominations which can be given to every society, to feudal society as well as to bourgeois society which is association founded on competition. How then can there be Socialists, who, by the single word *association*, think they can refute competition?? And how can M. Proudhon himself wish to defend competition against socialism by describing competition by the single word *association*??

All we have just said makes up the beautiful side of competition as M. Proudhon sees it. Now let us pass on to the ugly side, that is the negative side, of competition, its drawbacks, its destructive, subversive elements, its injurious qualities.

There is something dismal about the picture M. Proudhon draws of it.

Competition engenders misery, it foments civil war, it “changes natural zones,” mixes up nationalities, causes trouble in families, corrupts the public conscience, “subverts the notion of equity, of justice,” of morality, and what is worse, it destroys free, honest trade, and does not even give in exchange *synthetic value*, fixed, honest price. It disillusiones everyone, even economists. It pushes things so far as to destroy its very self.

After all the ill M. Proudhon says of it, can there be for the relations of bourgeois society, for its principles and its illusions, a more disintegrating, more destructive element than competition??

It must be carefully noted that competition always becomes the more destructive for bourgeois *relations* in proportion as it urges on a feverish creation of new productive forces, that is, of the material conditions of a new society. In this respect at least, the bad side of competition would have its good points.

“Competition as an economic position or phase, considered in its origin, is the necessary result... of the theory of the reduction of general expenses.”

[I 235]

For M. Proudhon, the circulation of the blood must be a consequence of Harvey's theory.

“Monopoly is the inevitable end of competition, which engenders it by a continual negation of itself. This generation of monopoly is in itself a

justification of it....

“Monopoly is the natural opposite of competition... but as soon as competition is necessary, it implies the idea of monopoly, since monopoly is, as it were, the seat of each competing individuality.”

[I 236, 237]

We rejoice with M. Proudhon that he can for once at least properly apply his formula to thesis and antithesis. Everyone knows that modern monopoly is engendered by competition itself.

As for the content, M. Proudhon clings to poetic images. Competition made “of every subdivision of labor a sort of sovereignty in which each individual stood with his power and his independence.” Monopoly is “the seat of every competing individuality.” The sovereignty is worth at least as much as the seat.

M. Proudhon talks of nothing but modern monopoly engendered by competition. But we all know that competition was engendered by feudal monopoly. Thus competition was originally the opposite of monopoly and not monopoly the opposite of competition. So that modern monopoly is not a simple antithesis, it is on the contrary the true synthesis.

Thesis: Feudal monopoly, before competition.

Antithesis: Competition.

Synthesis: Modern monopoly, which is the negation of feudal monopoly, in so far as it implies the system of competition, and the negation of competition in so far as it is monopoly.

Thus modern monopoly, bourgeois monopoly, is synthetic monopoly, the negation of the negation, the unity of opposites. It is monopoly in the pure, normal, rational state.

M. Proudhon is in contradiction with his own philosophy when he turns bourgeois monopoly into monopoly in the crude, primitive, contradictory, spasmodic state. M. Rossi, whom M. Proudhon quotes several times on the subject of monopoly, seems to have a better grasp of the synthetic character of bourgeois monopoly. In his *Cours d'economie politique*, he distinguishes between artificial monopolies and natural monopolies. Feudal monopolies, he says, are artificial, that is, arbitrary; bourgeois monopolies are natural, that is, rational.

Monopoly is a good thing, reasons M. Proudhon, since it is an economic category, an emanation “from the impersonal reason of humanity.” Competition, again, is a good thing since it also is an economic category.

But what is not good is the reality of monopoly and the reality of competition. What is still worse is that competition and monopoly devour each other. What is to be done?? Look for the synthesis of these two eternal thoughts, wrest it from the bosom of God, where it has been deposited from time immemorial.

In practical life we find not only competition, monopoly and the antagonism between them, but also the synthesis of the two, which is not a formula, but a movement. Monopoly produces competition, competition produces monopoly. Monopolists are made from competition; competitors become monopolists. If the monopolists restrict their mutual competition by means of partial associations, competition increases among the workers; and the more the mass of the proletarians grows as against the monopolists of one nation, the more desperate competition becomes between the monopolists of different nations. The synthesis is of such a character that monopoly can only maintain itself by continually entering into the struggle of competition.

To make the dialectical transition to the *taxes* which come after *monopoly*, M. Proudhon talks to us about the *social genius* which, after *zigzagging intrepidly onward*,

“after striding with a jaunty step, *without repenting* and without halting, *reaches the corner of monopoly*, casts backward a *melancholy* glance, and, after profound reflection, assails all the objects of production with taxes, and creates a whole administrative organization, in order that *all employments be given to the proletariat* and paid by the men of monopoly.”

[I 284, 285]

What can we say of this genius, which, while fasting, walks about in a zigzag?? And what can we say of this walking which has no other object in view than that of destroying the bourgeois by taxes, whereas taxes are the very means of giving the bourgeois the wherewithal to preserve themselves as the ruling class??

Merely to give a glimpse of the manner in which M. Proudhon treats economic details, it suffices to say that, according to him, the tax on consumption was established with a view to equality, and to relieve the proletariat.

The tax on consumption has assumed its true development only since the rise of the bourgeoisie. In the hands of industrial capital, that is, of sober and economical wealth, which maintains, reproduces, and increases itself by

the direct exploitation of labor, the tax on consumption was a means of exploiting the frivolous, gay, prodigal wealth of the fine lords who did nothing but consume, James Steuart clearly developed this original purpose of the tax on consumption in his *Recherches des principes de l'économie politique*, which he published 10 years before Adam Smith.

“Under the pure monarchy, the prince seems jealous, as it were, of growing wealth, and therefore imposes taxes upon people who are growing richer. Under the limited government they are calculated chiefly to affect those who from rich are growing poorer. Thus the monarch imposes a tax upon industry, where everyone is rated in proportion to the gain he is supposed to make by his profession. The poll-tax and *taille* are likewise proportioned to the supposed opulence of everyone libel to them.... In limited governments, impositions are more generally laid upon consumption.”

[II 190-91]

As for the *logical sequence* of taxes, of the balance of trade, of credit – in the understanding of M. Proudhon – we could only remark that the English bourgeoisie, on attaining its political constitution under William of Orange, created all at once a new system of taxes, public credit, and the system of protective duties, as soon as it was in a position freely to develop its conditions of existence.

This brief summary will suffice to give the reader a true idea of M. Proudhon's lubrications on the police or on taxes, the balance of trade, credit, communism, and population. We defy the most indulgent criticism to treat these chapters seriously.

4. Property or Ground Rent

In each historical epoch, property has developed differently and under a set of entirely different social relations. Thus to define bourgeois property is nothing else than to give an exposition of all the social relations of bourgeois production.

To try to give a definition of property as of an independent relation, a category apart, an abstract and eternal idea, can be nothing but an illusion of metaphysics or jurisprudence.

M. Proudhon, while seeming to speak of property in general, deals only with *landed property*, with *ground rent*.

“The origin of rent, as property, is, so to speak, extra- economic: it rests in psychological and moral considerations which are only very distantly connected with the production of wealth.”

(Vol. II,)

So M. Proudhon declares himself incapable of understanding the economic origin of rent and of property. He admits that this incapacity obliges him to resort to psychological and moral considerations, which, indeed, while only distantly connected with the production of wealth, have yet a very close connection with the narrowness of his historical views. M. Proudhon affirms that there is something *mystical* and *mysterious* about the origin of property. Now, to see mystery in the origin of property – that is, to make a mystery of the relation between production itself and the distribution of the instruments of production – is not this, to use M. Proudhon’s language, a renunciation of all claims to economic science?

M. Proudhon “confines himself to recalling that at the seventh epoch of economic evolution – credit – when fiction had caused reality to vanish, and human activity threatened to lose itself in empty space, it had become necessary to bind man more closely to nature. Now, rent was the price of this new contract.”

(Vol. II,)

L’homme aux quarante écus foresaw a M. Proudhon of the future:

“Mr. Creator, by your leave: everyone is master in his own world: but you will never make me believe that the one we live in is made of glass.”

In your world, where credit was a means of losing oneself in empty space, it is very possible that property became necessary in order to bind man to nature. In the world of real production, where landed property always precedes credit, M. Proudhon’s *horror vacui* [horror of a vacuum] could not exist.

The existence of rent once admitted, whatever its origin, it becomes a subject of mutually antagonistic negotiations between the farmer and the landed proprietor. What is the ultimate result of these negotiations, in other words, what is the average amount of rent? This is what M. Proudhon says:

“Ricardo’s theory answers this question. In the beginning of society, when man, new to earth, had before him nothing but huge forests, when the earth was vast and when industry was beginning to come to life, rent must have been nil. Land, as yet unformed by labour, was an object of utility; it was not an exchange value, it was common, not social. Little by little, the

multiplication of families and the progress of agriculture caused the price of land to make itself felt. Labour came to give the soil its worth; from this, rent came into being. The more fruit a field yielded with the same amount of labour, the higher it was valued; hence the tendency of proprietors was always to arrogate to themselves the whole amount of the fruits of the soil, less the wages of the farm – that is, less the costs of production. Thus property followed on the heels of labour to take from it all the product that exceeded the actual expenses. As the proprietor fulfils a mystic duty and represents the community as against the *colonus*, that farmer is, by the dispensation of Providence, no more than a responsible labourer, who must account to society for all he reaps above his legitimate wage. ...

“In essence and by destination, then, rent is an instrument of distributive justice, one of the thousand means that the genius of economy employs to attain to equality. It is an immediate land valuation which is carried out contradictorily by landowners and farmers, without any possible collusion, in a higher interest, and whose ultimate result must be to equalize the possession of the land between the exploiters of the soil and the industrialists....

“It needed no less than this magic of property to snatch from the *colonus* the surplus of his product which he cannot help regarding as his own and of which he considers himself to be exclusively the author. Rent, or rather property, has broken down agricultural egoism and created a solidarity that no power, no partition of the land could have brought into being....

“The moral effect of property having been secured, at present what remains to be done is to distribute the rent.”

[Vol. II, p-272]

All this tumult of words may be reduced firstly to this: Ricardo says that the excess of the price of agricultural products over their cost of production, including the ordinary profit and interest on the capital, gives the measure of the rent. M. Proudhon does better. He makes the landowner intervene, like a *Deus ex machina*, and snatch from the *colonus* all the surplus of his production over the cost of production. He makes use of the intervention of the landowner to explain property, of the intervention of the rent-receiver to explain rent. He answers the problem by formulating the same problem and adding an extra syllable.

Let us note also that in determining rent by the difference in fertility of the soil, M. Proudhon assigns a new origin to it, since land, before being

assessed according to different degrees of fertility, “was not,” in his view, “an exchange value, but was common.” What, then, has happened to the fiction about rent having come into being through the necessity of bringing back to the land man who was about to lose himself in the infinity of empty space?

Now let us free Ricardo’s doctrine from the providential, allegorical, and mystical phrases in which M. Proudhon has been careful to wrap it.

Rent, in the Ricardian sense, is property in land in its bourgeois state; that is, feudal property which has become subject to the conditions of bourgeois production.

We have seen that, according to the Ricardian doctrine, the price of all objects is determined ultimately by the cost of production, including the industrial profit; in other words, by the labour time employed. In manufacturing industry, the price of the product obtained by the minimum of labour regulates the price of all other commodities of the same kind, seeing that the cheapest and most productive instruments of production can be multiplied to infinity and that competition necessarily gives rise to a market price – that is, a common price for all products of the same kind.

In agricultural industry, on the contrary, it is the price of the product obtained by the greatest amount of labour which regulates the price of all products of the same kind. In the first place, one cannot, as in manufacturing industry, multiply at will the instruments of production possessing the same degree of productivity, that is, plots of land with the same degree of fertility. Then, as population increases, land of an inferior quality begins to be exploited, or new outlays of capital, proportionately less productive than before, are made upon the same plot of land. In both cases a greater amount of labour is expended to obtain a proportionately smaller product. The needs of the population having rendered necessary this increase of labour, the product of the land whose exploitation is the more costly has as certain a sale as that of a piece of land whose exploitation is cheaper. As competition levels the market price, the product of the better soil will be paid for as dearly as that of the inferior. It is the excess of the price of the products of the better soil over the cost of their production that constitutes rent. If one could always have at one’s disposal plots of land of the same degree of fertility; if one could, as in manufacturing industry, have recourse continually to cheaper and more productive machines, or if the subsequent outlays of capital produced as much as the first, then the price of

agricultural products would be determined by the price of commodities produced by the best instruments of production, as we have seen with the price of manufactured products. But, from this moment rent would have disappeared also.

For the Ricardian doctrine – “once the premises granted” – to be generally true, it is moreover essential that capital should be freely applicable to different branches of industry; that a strongly developed competition among the capitalists should have brought profits to an equal level; that the farmer should be no more than an industrial capitalist claiming for the use of his capital on the land, a profit equal to that which he would draw from his capital if it were applied in any kind of manufacture; that agricultural exploitation should be subjected to the regime of large-scale industry; and finally, that the landowner himself should aim at nothing beyond the money return.

It may happen, as in Ireland, that rent does not yet exist, although the letting of land has reached an extreme development there. Rent being the excess not only over wages, but also over industrial profit, it cannot exist where the landowner’s revenue is nothing but a mere levy on wages.

Thus, far from converting the exploiter of the land, the farmer, into a *simple labourer*, and “snatching from the cultivator the surplus of his product, which he cannot help regarding as his own,” rent confronts the landowner, not with the slave, the serf, the payer of tribute, the wage labourer, but with the industrial capitalist.

Once constituted as ground rent, ground property has in its possession only the surplus over production costs, which are determined not only by wages but also by industrial profit. It is therefore from the landowner that ground rent snatched a part of his income. Thus, there was a big lapse of time before the feudal farmer was replaced by the industrial capitalist. In Germany, for example, this transformation began only in the last third of the 18th century. It is in England alone that this relation between the industrial capitalist and the landed proprietor has been fully developed.

So long as there was only M. Proudhon’s *colonus*, there was no rent. The moment rent exists, the *colonus* is no longer the farmer, but the worker, the farmer’s *colonus*. The abasement of the labourer, reduced to the role of a simple worker, day labourer, wage-earner, working for the industrial capitalist; the invention of the industrial capitalist, exploiting the land like any other factory; the transformation of the landed proprietor from a petty

sovereign into a vulgar usurer; these are the different relations expressed by rent.

Rent, in the Ricardian sense, is patriarchal agriculture transformed into commercial industry, industrial capital applied to land, the town bourgeoisie transplanted into the country. Rent, instead of *binding man to nature*, has merely bound the exploitation of the land to competition. Once established as rent, landed property itself is the *result of competition*, since from that time onwards it depends on the market value of agricultural produce. As rent, landed property is mobilized and becomes an article of commerce. Rent is possible only from the moment when the development of urban industry, and the social organization resulting therefrom, force the landowner to aim solely at cash profits, at the monetary relation of his agricultural products – in fact to look upon his landed property only as a machine for coining money. Rent has so completely divorced the landed proprietor from the soil, from nature, that he has no need even to know his estates, as is to be seen in England. As for the farmer, the industrial capitalist and the agricultural worker, they are no more bound to the land they exploit than are the employer and the worker in the factories to the cotton and wool they manufacture; they feel an attachment only for the price of their production, the monetary product. Hence the jeremiads of the reactionary parties, who offer up all their prayers for the return of feudalism, of the good old patriarchal life, of the simple manners and the fine virtues of our forefathers. The subjection of the soil to the laws which dominate all other industries is and always will be the subject of interested condolences. Thus it may be said that rent has become the motive power which has introduced idyll into the movement of history.

Ricardo, after postulating bourgeois production as necessary for determining rent, applies the conception of rent, nevertheless, to the landed property of all ages and all countries. This is an error common to all the economists, who represent the bourgeois relations of production as eternal categories.

From the providential aim of rent – which is, for M. Proudhon, the transformation of the *colonus* into a *responsible worker*, he passes to the equalized reward of rent.

Rent, as we have just seen, is constituted by the *equal price* of the products of lands of *unequal fertility*, so that a hectolitre of corn which has

cost 10 francs is sold for 20 francs if the cost of production rises to 20 francs upon soil of inferior quality.

So long as necessity forces the purchase of all the agricultural products into the market, the market price is determined by the cost of the most expensive product. Thus it is this equalization of price, resulting from competition and not from the different fertilities of the lands, that secures to the owner of the better soil a rent of 10 francs for every hectolitre that his tenant sells.

Let us suppose for a moment that the price of corn is determined by the labour time needed to produce it, and at once the hectolitre of corn obtained from the better soil will sell at 10 francs, while the hectolitre of corn obtained on the inferior soil will cost 20 francs. This being admitted, the average market price will be 15 francs, whereas, according to the law of competition, it is 20 francs. If the average price were 15 francs, there would be no occasion for any distribution, whether equalized or otherwise, for there would be no rent. Rent exists only when one can sell for 20 francs the hectolitre of corn which has cost the producer 10 francs. M. Proudhon supposes equality of the market price, with unequal costs of production, in order to arrive at an equalized sharing out of the product of inequality.

We understand such economists as Mill, Cherbuliez, Hilditch, and others demanding that rent should be handed over to the state to serve in place of taxes. That is a frank expression of the hatred the industrial capitalist bears towards the landed proprietor, who seems to him a useless thing, an excrescence upon the general body of bourgeois production.

But first to make the price of the hectolitre of corn 20 francs in order then to make a general distribution of the 10 francs overcharge levied on the consumer, is indeed enough to make the *social genius* pursue *its zigzag course mournfully* – and knock its head against some *corner*.

Rent becomes, under M. Proudhon's pen, "an immense land valuation, which is carried out contradictorily by land-owners and farmers... in a higher interest, and whose ultimate result must be to equalize the possession of land between exploiters of the soil and the industrialists."

[Vol. II,]

For any land valuation based upon rent to be of practical value, the conditions of present society must not be departed from.

Now, we have shown that the farm rent paid by the farmer to the landlord expresses the rent with any exactitude only in the countries most

advanced in industry and commerce. And even this rent often includes interest paid to the landlord on capital incorporated in the land. The location of the land, the vicinity of towns, and many other circumstances influence the farm rent and modify the ground rent. These peremptory reasons would be enough to prove the inaccuracy of a land valuation based on rent.

Thus history, far from supplying, in rent, a ready-made land valuation, does nothing but change and turn topsy-turvy the land valuations already made.

Finally, fertility is not so natural a quality as might be thought; it is closely bound up with the social relations of the time. A piece of land may be very fertile for corn growing, and yet the market price may decide the cultivator to turn it into an artificial pastureland and thus render it infertile.

M. Proudhon has improvised his land valuation, which has not even the value of an ordinary land valuation, only to give substance to the *providentially equalitarian aim* of rent.

“Rent,” continues M. Proudhon, “is the interest paid on a capital which never perishes, namely – land. And as the capital is capable of no increase in matter, but only of an indefinite improvement in its use, it comes about that while the interest or profit on a loan (*mutuum*) tends to diminish continually through abundance of capital, rent tends always to increase through the perfecting of industry, from which results the improvement in the use of the land.... Such, in its essence, is rent.”

(Vol. II,)

This time, M. Proudhon sees in rent all the characteristics of interest, save that it is derived from capital of a specific nature. This capital is land, an eternal capital, “which is capable of no increase in matter, but only an indefinite improvement in its use.” In the progressive advance of civilization, interest has a continual tendency to fall, whilst rent continually tends to rise. Interest falls because of the abundance of capital; rent rises owing to the improvements brought about in industry, which results in an ever better utilization of land.

Such, in its essence, is the opinion of M. Proudhon.

Let us first examine how far it is true to say that rent is interest on capital.

For the landed proprietor himself, rent represents the interest on the capital that the land has cost him, or that he would draw from it if he sold it. But in buying or selling land he only buys or sells rent. The price he pays to

make himself a receiver of rent is regulated by the rate of interest in general and has nothing to do with actual nature of rent. The interest on capital invested in land is in general lower than the interest on capital invested in manufacture or commerce. Thus, for those who make no distinction between the interest that the land represents to the owner and the rent itself, the interest on land capital diminishes still more than does the interest on other capital. But it is not a question of the purchase or sale price of rent, of the marketable value of rent, of capitalized rent, it is a question of rent itself.

Farm rent can imply again, apart from rent proper, the interest on the capital incorporated in the land. In this instance the landlord receives this part of the farm rent, not as a landlord but as a capitalist; but this is not the rent proper that we are to deal with.

Land, so long as it is not exploited as a means of production, is not capital. Land as capital can be increased just as much as all the other instruments of production. Nothing is added to its matter, to use M. Proudhon's language, but the lands which serve as instruments of production are multiplied. The very fact of applying further outlays of capital to land already transformed into means of production increases land as capital without adding anything to land as matter – that is, to the extent of the land. M. Proudhon's land as matter is the Earth in its limitation. As for the eternity he attributes to land, we grant readily it has this virtue as matter. Land as capital is no more eternal than any other capital.

Gold and silver, which yield interest, are just as lasting and eternal as land. If the price of gold and silver falls, while that of land keeps rising, this is certainly not because of its more or less eternal nature.

Land as capital is fixed capital; but fixed capital gets used up just as much as circulating capital. Improvements to the land need production and upkeep; they last only for a time; and this they have in common with all other improvements used to transform matter into means of production. If land as capital were eternal, some lands would present a very different appearance from what they do today, and we should see the Roman Campagna, Sicily, Palestine, in all the splendour of their former prosperity.

There are even instances when land as capital might disappear, even though the improvements remain incorporated in the land.

In the first place, this occurs every time rent proper is wiped out by the competition of new and more fertile soils; secondly, the improvements

which might have been valuable at one time cease to be of value the moment they become universal owing to the development of agronomy.

The representative of land as capital is not the landlord, but the farmer. The proceeds yielded by land as capital are interest and industrial profit, not rent. There are lands which yield such interest and profit but still yield no rent.

Briefly, land in so far as it yields interest, is land capital, and as land capital it yields no rent, it is not landed property. Rent results from the social relations in which the exploitation of the land takes place. It cannot be a result of the more or less solid, more or less durable nature of the soil. Rent is a product of society and not of the soil.

According to M. Proudhon, “improvement in the use of the land” – a consequence “of the perfecting of industry” – causes the continual rise in rent. On the contrary, this improvement causes its periodic fall.

Wherein consists, in general, any improvement, whether in agriculture or in manufacture? In producing more with the same labour; in producing as much, or even more, with less labour. Thanks to these improvements, the farmer is spared from using a greater amount of labour for a relatively smaller product. He has no need, therefore, to resort to inferior soils, and instalments of capital applied successively to the same soil remain equally productive.

Thus, these improvements, far from continually raising rent as M. Proudhon says, become on the contrary so many temporary obstacles preventing its rise.

The English landowners of the 17th century were so well aware of this truth, that they opposed the progress of agriculture for fear of seeing their incomes diminish. (See Petty, an English economist of the time of Charles II.)

Strikes and Combinations of Workers

“Every upward movement in wages can have no other effect than a rise in the price of corn, wine, etc., that is, the effect of a dearth. For what are wages? They are the cost price of corn, etc.; they are the integrant price of everything. We may go even further: wages are the proportion of the elements composing wealth and consumed reproductively every day by the mass of the workers. Now, to double wages ... is to attribute to each one of

the producers a greater share than his product, which is contradictory, and if the rise extends only to a small number of industries, it brings a general disturbance in exchange; in a word, a dearth....

“It is impossible, I declare, for strikes followed by an increase in wages not to culminate in a general rise in prices: this is as certain as that two and two make four.”

(Proudhon, Vol. I, p and 111)

We deny all these assertions, except that two and two make four.

In the first place, there is no *general rise in prices*. If the price of everything doubles at the same time as wages, there is no change in price, the only change is in terms.

Then again, a general rise in wages can never produce a more or less general rise in the price of goods. Actually, if every industry employed the same number of workers in relation to fixed capital or to the instruments used, a general rise in wages would produce a general fall in profits and the current price of goods would undergo no alteration.

But as the relation of manual labour to fixed capital is not the same in different industries, all the industries which employ a relatively greater mass of capital and fewer workers, will be forced sooner or later to lower the price of their goods. In the opposite case, in which the price of their goods is not lowered, their profit will rise above the common rate of profits. Machines are not wage-earners. Therefore, the general rise in wages will affect less those industries, which, compared with the others, employ more machines than workers. But as competition always tends to level the rate of profits, those profits which rise above the average rate cannot but be transitory. Thus, apart from a few fluctuations, a general rise in wages will lead, not as M. Proudhon says, to a general increase in prices, but to a partial fall – that is a fall in the current price of the goods that are made chiefly with the help of machines.

The rise and fall of profits and wages expresses merely the proportion in which capitalists and workers share in the product of a day's work, without influencing in most instances the price of the product. But that “strikes followed by an increase in wages culminate in a general rise in prices, in a dearth even” – those are notions which can blossom only in the brain of a poet who has not been understood.

In England, strikes have regularly given rise to the invention and application of new machines. Machines were, it may be said, the weapon

employed by the capitalist to quell the revolt of specialized labour. The *self-acting mule*, the greatest invention of modern industry, put out of action the spinners who were in revolt. If combinations and strikes had no other effect than that of making the efforts of mechanical genius react against them, they would still exercise an immense influence on the development of industry.

“I find,” continues M. Proudhon, “in an article published by M. Leon Faucher... September 1845, that for some time the British workers have got out the habit of combination, which is assuredly a progress for which one cannot but congratulate them: but this improvement in the morale of the workers comes chiefly from their economic education. ‘It is not on the manufacturers,’ cries a spinning-mill worker at a Bolton meeting, ‘that wages depend. In periods of depression the masters are, so to speak, merely the whip with which necessity arms itself, and whether they want to or not, they have to deal blows. The regulative principle is the relation of supply and demand; and the masters have not this power’

“Well done!” cries M. Proudhon. “These are well-trained workers, model workers, etc., etc., etc. Such poverty did not exist in Britain; it will not cross the Channel.”

(Proudhon, Vol. I, p and 262)

Of all the towns in England, Bolton is the one in which the radicalism is the most developed. The Bolton workers are known to be the most revolutionary of all. At the time of the great agitation in England for the abolition of the Corn Laws, the English manufacturers thought that they could cope with the landowners only by thrusting the workers to the fore. But as the interests of the workers were no less opposed to those of the manufacturers than the interests of the manufacturers were to those of the landowners, it was natural that the manufacturers should fare badly in the workers’ meetings. What did the manufacturers do? To save appearances they organized meetings composed, to a large extent, of foremen, of the small number of workers who were devoted to them, and of the real *friends of trade*. When later on the genuine workers tried, as in Bolton and Manchester, to take part in these sham demonstrations, in order to protest against them, they were forbidden admittance on the ground that it was a *ticket meeting* – a meeting to which only persons with entrance cards were admitted. Yet the posters placarded on the walls had announced public meetings. Every time one of these meetings was held, the manufacturers’

newspapers gave a pompous and detailed account of the speeches made. It goes without saying that it was the foremen who made these speeches. The London papers reproduced them word for word. M. Proudhon has the misfortune to take foremen for ordinary workers, and enjoins them not to cross the Channel.

If in 1844 and 1845 strikes drew less attention than before, it was because 1844 and 1845 were the first two years of prosperity that British industry had had since 1837. Nevertheless none of the *trades unions* had been dissolved.

Now let us listen to the foremen of Bolton. According to them manufacturers have no command over wages because they have no command over the price of products, and they have no command over the price of products because they have no command over the world market. For this reason, they wish it to be understood that combinations should not be formed to extort an increase in wages from the masters. M. Proudhon, on the contrary, forbids combinations for fear they should be followed by a rise in wages which would bring with it a general dearth. We have no need to say that on one point there is an *entente cordiale* between the foremen and M. Proudhon: that a rise in wages is equivalent to a rise in the price of products.

But is the fear of a dearth the true cause of M. Proudhon's rancour? No. Quite simple, he is annoyed with the Bolton foremen because they determine value by *supply and demand* and hardly take any account of *constituted value*, of value which has passed into the state of constitution, of the constitution of value, including permanent exchangeability and all the other proportionalities of relations and relations of proportionality, with Providence at their side.

"A workers' strike is illegal, and it is not only the Penal Code that says so, it is the economic system, the necessity of the established order....

"That each worker individually should dispose freely over his person and his hands, this can be tolerated, but that workers should undertake by combination to do violence to monopoly, is something society cannot permit."

(Vol. I, p and 335)

M. Proudhon wants to pass off an article of the Penal Code as a necessary and general result of bourgeois relations of production.

In England, combination is authorized by an Act of Parliament, and it is the economic system which has forced Parliament to grant this legal authorization. In 1825, when, under the Minister Huskisson, Parliament had to modify the law in order to bring it more and more into line with the conditions resulting from free competition, it had of necessity to abolish all laws forbidding combinations of workers. The more modern industry and competition develop, the more elements there are which call forth and strengthen combination, and as soon as combination becomes an economic fact, daily gaining in solidity, it is bound before long to become a legal fact.

Thus the article of the Penal Code proves at the most that modern industry and competition were not yet well developed under the Constituent Assembly and under the Empire.

Economists and socialists are in agreement on one point: the condemnation of *combination*. Only they have different motives for their act of condemnation.

The economists say to workers:

Do not combine. By combination you hinder the regular progress of industry, you prevent manufacturers from carrying out their orders, you disturb trade and you precipitate the invasion of machines which, by rendering your labour in part useless, force you to accept a still lower wage. Besides, whatever you do, your wages will always be determined by the relation of hands demanded to hands supplied, and it is an effort as ridiculous as it is dangerous for you to revolt against the eternal laws of political economy.

The socialists say to the workers:

Do not combine, because what will you gain by it anyway? A rise in wages? The economists will prove to you quite clearly that the few ha'pence you may gain by it for a few moments if you succeed will be followed by a permanent fall. Skilled calculators will prove to you that it would take you years merely to recover, through the increase in your wages, the expenses incurred for the organization and upkeep of the combinations.

And we, as socialists, tell you that, apart from the money question, you will continue nonetheless to be workers, and the masters will still continue to be the masters, just as before. So no combination! No politics! For is not entering into combination engaging in politics?

The economists want the workers to remain in society as it is constituted and as it has been signed and sealed by them in their manuals.

The socialists want the workers to leave the old society alone, the better to be able to enter the new society which they have prepared for them with so much foresight.

In spite of both of them, in spite of manuals and utopias, combination has not yet ceased for an instant to go forward and grow with the development and growth of modern industry. It has now reached such a stage, that the degree to which combination has developed in any country clearly marks the rank it occupies in the hierarchy of the world market. England, whose industry has attained the highest degree of development, has the biggest and best organized combinations.

In England, they have not stopped at partial combinations which have no other objective than a passing strike, and which disappear with it. Permanent combinations have been formed, *trades unions*, which serve as ramparts for the workers in their struggles with the employers. And at the present time all these local *trades unions* find a rallying point in the *National Association of United Trades*, the central committee of which is in London, and which already numbers 80,000 members. The organization of these strikes, combinations, and *trades unions* went on simultaneously with the political struggles of the workers, who now constitute a large political party, under the name of *Chartists*.

The first attempt of workers to associate among themselves always takes place in the form of combinations.

Large-scale industry concentrates in one place a crowd of people unknown to one another. Competition divides their interests. But the maintenance of wages, this common interest which they have against their boss, unites them in a common thought of resistance – *combination*. Thus combination always has a double aim, that of stopping competition among the workers, so that they can carry on general competition with the capitalist. If the first aim of resistance was merely the maintenance of wages, combinations, at first isolated, constitute themselves into groups as the capitalists in their turn unite for the purpose of repression, and in the face of always united capital, the maintenance of the association becomes more necessary to them than that of wages. This is so true that English economists are amazed to see the workers sacrifice a good part of their wages in favor of associations, which, in the eyes of these economists, are established solely in favor of wages. In this struggle – a veritable civil war –

all the elements necessary for a coming battle unite and develop. Once it has reached this point, association takes on a political character.

Economic conditions had first transformed the mass of the people of the country into workers. The combination of capital has created for this mass a common situation, common interests. This mass is thus already a class as against capital, but not yet for itself. In the struggle, of which we have noted only a few phases, this mass becomes united, and constitutes itself as a class for itself. The interests it defends become class interests. But the struggle of class against class is a political struggle.

In the bourgeoisie we have two phases to distinguish: that in which it constituted itself as a class under the regime of feudalism and absolute monarchy, and that in which, already constituted as a class, it overthrew feudalism and monarchy to make society into a bourgeois society. The first of these phases was the longer and necessitated the greater efforts. This too began by partial combinations against the feudal lords.

Much research has been carried out to trace the different historical phases that the bourgeoisie has passed through, from the commune up to its constitution as a class.

But when it is a question of making a precise study of strikes, combinations and other forms in which the proletarians carry out before our eyes their organization as a class, some are seized with real fear and others display a *transcendental* disdain.

An oppressed class is the vital condition for every society founded on the antagonism of classes. The emancipation of the oppressed class thus implies necessarily the creation of a new society. For the oppressed class to be able to emancipate itself, it is necessary that the productive powers already acquired and the existing social relations should no longer be capable of existing side by side. Of all the instruments of production, the greatest productive power is the revolutionary class itself. The organization of revolutionary elements as a class supposes the existence of all the productive forces which could be engendered in the bosom of the old society.

Does this mean that after the fall of the old society there will be a new class domination culminating in a new political power? No.

The condition for the emancipation of the working class is the abolition of every class, just as the condition for the liberation of the third estate, of the bourgeois order, was the abolition of all estates and all orders.

The working class, in the course of its development, will substitute for the old civil society an association which will exclude classes and their antagonism, and there will be no more political power properly so-called, since political power is precisely the official expression of antagonism in civil society.

Meanwhile the antagonism between the proletariat and the bourgeoisie is a struggle of class against class, a struggle which carried to its highest expression is a total revolution. Indeed, is it at all surprising that a society founded on the *opposition* of classes should culminate in brutal *contradiction*, the shock of body against body, as its final denouement?

Do not say that social movement excludes political movement. There is never a political movement which is not at the same time social.

It is only in an order of things in which there are no more classes and class antagonisms that *social evolutions* will cease to be *political revolutions*. Till then, on the eve of every general reshuffling of society, the last word of social science will always be:

“Le combat ou la mort; la lutte sanguinaire ou le neant. C’est ainsi que la question est invinciblement posée.”

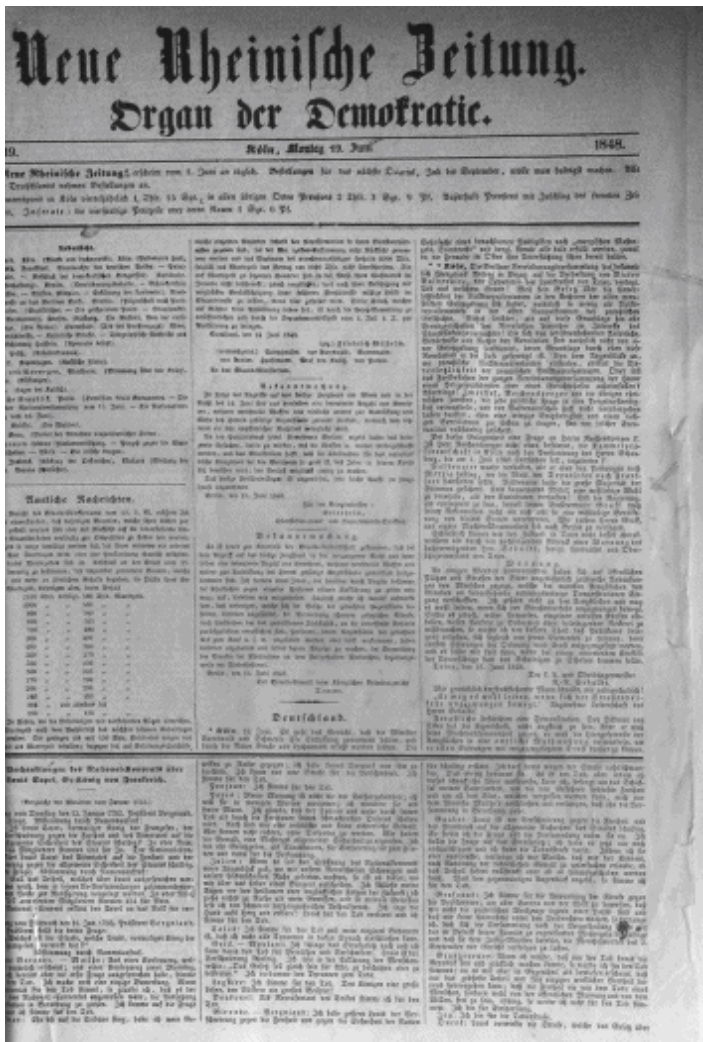

WAGE LABOUR AND CAPITAL, 1847

Translated by Harriet E. Lothrop

This essay on economics was written in 1847 and first published in articles in the *Neue Rheinische Zeitung* (New Rhenish Newspaper: Organ of Democracy) in April 1849. The German daily newspaper was printed by Marx in Cologne between 1 June 1848 and 19 May 1849. *Wage Labour And Capital* has been widely acclaimed as the precursor to Marx's important treatise *Das Kapital*. It concerns ideas of economic contemplation, putting aside some of Marx's materialist conceptions of history. It demonstrates an increased scientific rationale on ideas of "alienated labour," which in Marx's perspective would eventually lead to the proletarian revolution.

Some of the main topics examined concern labour power and labour, and how labour power becomes a commodity. It also presents the Labour Theory of Value that further develops the distinct differences between labour and labour power. The essay also examines the commodity and how the economic principles of supply and demand affect the pricing of certain commodities. Beyond that the essay explores how capital and capitalism do not service any purpose other than to gain more of it, which Marx presents as an illogical method of living one's life.

The 19 June 1848 edition of 'Neue Rheinische Zeitung'

Introduction to Karl Marx's Wage Labour and Capital by Frederick Engels

This pamphlet first appeared in the form of a series of leading articles in the *Neue Rheinische Zeitung*, beginning on April 4th, 1849. The text is made up of from lectures delivered by Marx before the German Workingmen's Club of Brussels in 1847. The series was never completed. The promise "to be continued," at the end of the editorial in Number 269 of the newspaper, remained unfulfilled in consequence of the precipitous events of that time: the invasion of Hungary by the Russians, and the uprisings in Dresden, Iserlohn, Elberfeld, the Palatinate, and in Baden, which led to the suppression of the paper on May 19th, 1849. And among the papers left by Marx no manuscript of any continuation of these articles has been found.

"Wage-labour and Capital" has appeared as an independent publication in several editions, the last of which was issued by the Swiss Co-operative Printing Association, in Hottingen-Zurich, in 1884. Hitherto, the several editions have contained the exact wording of the original articles. But since at least 10,000 copies of the present edition are to be circulated as a propaganda tract, the question necessarily forced itself upon me, would Marx himself, under these circumstance, have approved of an unaltered literal reproduction of the original?

Marx, in the '40s, had not yet completed his criticism of political economy. This was not done until toward the end of the fifties. Consequently, such of his writings as were published before the first installment of his *Critique of Political Economy* was finished, deviate in some points from those written after 1859, and contain expressions and whole sentences which, viewed from the standpoint of his later writings, appear inexact, and even incorrect. Now, it goes without saying that in ordinary editions, intended for the public in general, this earlier standpoint, as a part of the intellectual development of the author, has its place; that the author as well as the public, has an indisputable right to an unaltered reprint of these older writings. In such a case, I would not have dreamed of changing a single word in it. But it is otherwise when the edition is destined almost exclusively for the purpose of propaganda. In such a case, Marx himself would unquestionably have brought the old work, dating from

1849, into harmony with his new point of view, and I feel sure that I am acting in his spirit when I insert in this edition the few changes and additions which are necessary in order to attain this object in all essential point.

Therefore, I say to the reader at once: this pamphlet is not as Marx wrote it in 1849, but approximately as Marx would have written it in 1891. Moreover, so many copies of the original text are in circulation, that these will suffice until I can publish it again unaltered in a complete edition of Marx's works, to appear at some future time.

My alterations centre about one point. According to the original reading, the worker sells his *labour* for wages, which he receives from the capitalist; according to the present text, he sells his *labour-power*. And for this change, I must render an explanation: to the workers, in order that they may understand that we are not quibbling or word-juggling, but are dealing here with one of the most important points in the whole range of political economy; to the bourgeois, in order that they may convince themselves how greatly the uneducated workers, who can be easily made to grasp the most difficult economic analyses, excel our supercilious "cultured" folk, for whom such ticklish problems remain insoluble their whole life long.

Classical political economy borrowed from the industrial practice the current notion of the manufacturer, that he buys and pays for the labour of his employees. This conception had been quite serviceable for the business purposes of the manufacturer, his bookkeeping and price calculation. But naively carried over into political economy, it there produced truly wonderful errors and confusions.

Political economy finds it an established fact that the prices of all commodities, among them the price of the commodity which it calls "labour," continually change; that they rise and fall in consequence of the most diverse circumstances, which often have no connection whatsoever with the production of the commodities themselves, so that prices appear to be determined, as a rule, by pure chance. As soon, therefore, as political economy stepped forth as a science, it was one of its first tasks to search for the law that hid itself behind this chance, which apparently determined the prices of commodities, and which in reality controlled this very chance. Among the prices of commodities, fluctuating and oscillating, now upward, now downward, the fixed central point was searched for around which these fluctuations and oscillations were taking place. In short, starting from the

price of commodities, political economy sought for the value of commodities as the regulating law, by means of which all price fluctuations could be explained, and to which they could all be reduced in the last resort.

And so, classical political economy found that the value of a commodity was determined by the labour incorporated in it and requisite to its production. With this explanation, it was satisfied. And we, too, may, for the present, stop at this point. But, to avoid misconceptions, I will remind the reader that today this explanation has become wholly inadequate. Marx was the first to investigate thoroughly into the value-forming quality of labour and to discover that not all labour which is apparently, or even really, necessary to the production of a commodity, imparts under all circumstances to this commodity a magnitude of value corresponding to the quantity of labour used up. If, therefore, we say today in short, with economists like Ricardo, that the value of a commodity is determined by the labour necessary to its production, we always imply the reservations and restrictions made by Marx. Thus much for our present purpose; further information can be found in Marx's *Critique of Political Economy*, which appeared in 1859, and in the first volume of *Capital*.

But, as soon as the economists applied this determination of value by labour to the commodity "labour", they fell from one contradiction into another. How is the value of "labour" determined? By the necessary labour embodied in it. But how much labour is embodied in the labour of a labourer of a day a week, a month, a year. If labour is the measure of all values, we can express the "value of labour" only in labour. But we know absolutely nothing about the value of an hour's labour, if all that we know about it is that it is equal to one hour's labour. So, thereby, we have not advanced one hair's breadth nearer our goal; we are constantly turning about in a circle.

Classical economics, therefore, essayed another turn. It said: the value of a commodity is equal to its cost of production. But, what is the cost of production of "labour"? In order to answer this question, the economists are forced to strain logic just a little. Instead of investigating the cost of production of labour itself, which, unfortunately, cannot be ascertained, they now investigate the cost of production of *the labourer*. And this latter can be ascertained. It changes according to time and circumstances, but for a given condition of society, in a given locality, and in a given branch of production, it, too, is given, at least within quite narrow limits. We live

today under the regime of capitalist production, under which a large and steadily growing class of the population can live only on the condition that it works for the owners of the means of production – tools, machines, raw materials, and means of subsistence – in return for wages. On the basis of this mode of production, the labourer's cost of production consists of the sum of the means of subsistence (or their price in money) which on the average are requisite to enable him to work, to maintain in him this capacity for work, and to replace him at his departure, by reason of age, sickness, or death, with another labourer – that is to say, to propagate the working class in required numbers.

Let us assume that the money price of these means of subsistence averages 3 shillings a day. Our labourer gets, therefore, a daily wage of 3 shillings from his employer. For this, the capitalist lets him work, say, 12 hours a day. Our capitalist, moreover, calculates somewhat in the following fashion: Let us assume that our labourer (a machinist) has to make a part of a machine which he finishes in one day. The raw material (iron and brass in the necessary prepared form) costs 20 shillings. The consumption of coal by the steam-engine, the wear-and-tear of this engine itself, of the turning-lathe, and of the other tools with which our labourer works, represent, for one day and one labourer, a value of 1 shilling. The wages for one day are, according to our assumption, 3 shillings. This makes a total of 24 shillings for our piece of a machine.

But, the capitalist calculates that, on an average, he will receive for it a price of 27 shillings from his customers, or 3 shillings over and above his outlay.

Whence do they 3 shillings pocketed by the capitalist come? According to the assertion of classical political economy, commodities are in the long run sold at their values, that is, they are sold at prices which correspond to the necessary quantities of labour contained in them. The average price of our part of a machine – 27 shillings – would therefore equal its value, i.e., equal the amount of labour embodied in it. But, of these 27 shillings, 21 shillings were values already existing before the machinist began to work; 20 shillings were contained in the raw material, 1 shilling in the fuel consumed during the work and in the machines and tools used in the process and reduced in their efficiency to the value of this amount. There remains 6 shillings, which have been added to the value of the raw material. But, according to the supposition of our economists, themselves,

these 6 shillings can arise only from the labour added to the raw material by the labourer. His 12 hours' labour has created, according to this, a new value of 6 shillings. Therefore, the value of his 12 hours' labour would be equivalent to 6 shillings. So we have at last discovered what the "value of labour" is.

"Hold on there!" cries our machinist. "Six shillings? But I have received only 3 shillings! My capitalist swears high and day that the value of my 12 hours' labour is no more than 3 shillings, and if I were to demand 6, he'd laugh at me. What kind of a story is that?"

If before this we got with our value of labour into a vicious circle, we now surely have driven straight into an insoluble contradiction. We searched for the value of labour, and we found more than we can use. For the labourer, the value of the 12 hours' labour is 3 shillings; for the capitalist, it is 6 shillings, of which he pays the workingman 3 shillings as wages, and pockets the remaining 3 shilling himself. According to this, labour has not one but two values, and, moreover, two very different values!

As soon as we reduce the values, now expressed in money, to labour-time, the contradiction becomes even more absurd. By the 12 hours' labour, a new value of 6 shillings is created. Therefore, in 6 hours, the new value created equals 3 shillings – the amount which the labourer receives for 12 hours' labour. For 12 hours' labour, the workingman receives, as an equivalent, the product of 6 hours' labour. We are, thus, forced to one of two conclusions: either labour has two values, one of which is twice as large as the other, or 12 equals 6! In both cases, we get pure absurdities. Turn and twist as we may, we will not get out of this contradiction as long as we speak of the buying and selling of "labour" and of the "value of labour." And just so it happened to the political economists. The last offshoot of classical political economy – the Ricardian school – was largely wrecked on the insolubility of this contradiction. Classical political economy had run itself into a blind alley. The man who discovered the way out of this blind alley was Karl Marx.

What the economists had considered as the cost of production of "labour" was really the cost of production, not of "labour," but of the living labourer himself. And what this labourer sold to the capitalist was not his labour.

"So soon as his labour really begins," says Marx, "it ceases to belong to him, and therefore can no longer be sold by him."

At the most, he could sell his *future* labour – i.e., assume the obligation of executing a certain piece of work in a certain time. But, in this way, he does not sell labour (which would first have to be performed), but not for a stipulated payment he places his labour-power at the disposal of the capitalist for a certain time (in case of time-wages), or for the performance of a certain task (in case of piece-wages). He hires out or sells his *labour-power*. But this labour-power has grown up with his person and is inseparable from it. Its cost of production, therefore, coincides with his own cost of production; what the economist called the cost of production of labour is really the cost of production of the labourer, and therewith of his labour-power. And, thus, we can also go back from the cost of production of labour-power to the value of labour-power, and determine the quantity of social labour that is required for the production of a labour-power of a given quantity, as Marx has done in the chapter on “The Buying and Selling of labour Power.”

Now what takes place after the worker has sold his labour-power, i.e., after he has placed his labour-power at the disposal of the capitalist for stipulated-wages – whether time-wages or piece-wages? The capitalist takes the labourer into his workshop or factory, where all the articles required for the work can be found – raw materials, auxiliary materials (coal, dyestuffs, etc.), tools, and machines. Here, the worker begins to work. His daily wages are, as above, 3 shillings, and it makes no difference whether he earns them as day-wages or piece-wages. We again assume that in 12 hours the worker adds by his labour a new value of 6 shillings to the value of the raw materials consumed, which new value the capitalist realizes by the sale of the finished piece of work. Out of this new value, he pays the worker his 3 shillings, and the remaining 3 shillings he keeps for himself. If, now, the labourer creates in 12 hours a value of 6 shillings, in 6 hours he creates a value of 3 shillings. Consequently, after working 6 hours for the capitalist, the labourer has returned to him the equivalent of the 3 shillings received as wages. After 6 hours’ work, both are quits, neither one owing a penny to the other.

“Hold on there!” now cries out the capitalist. “I have hired the labourer for a whole day, for 12 hours. But 6 hours are only half-a-day. So work along lively there until the other 6 hours are at an end – only then will we be even.” And, in fact, the labourer has to submit to the conditions of the contract upon which he entered of “his own free will”, and according to

which he bound himself to work 12 whole hours for a product of labour which cost only 6 hours' labour.

Similarly with piece-wages. Let us suppose that in 12 hours our worker makes 12 commodities. Each of these costs a shilling in raw materials and wear-and-tear, and is sold for 2.5 shillings. On our former assumption, the capitalist gives the labourer .25 of a shilling for each piece, which makes a total of 3 shillings for 12 pieces. To earn this, the worker requires 12 hours. The capitalist receives 30 shillings for the 12 pieces; deducting 24 shillings for raw materials and wear-and-tear, there remains 6 shillings, of which he pays 3 shillings in wages and pockets the remaining 3. Just as before! Here, also, the worker labours 6 hours for himself – i.e., to replace his wages (half-an-hour in each of the 12 hours), and 6 hours for the capitalist.

The rock upon which the best economists were stranded, as long as they started out from the value of labour, vanishes as soon as we make our starting-point the value of *labour-power*. labour-power is, in our present-day capitalist society, a commodity like every other commodity, but yet a very peculiar commodity. It has, namely, the peculiarity of being a value-creating force, the source of value, and, moreover, when properly treated, the source of more value than it possesses itself. In the present state of production, human labour-power not only produces in a day a greater value than it itself possesses and costs; but with each new scientific discovery, with each new technical invention, there also rises the surplus of its daily production over its daily cost, while as a consequence there diminishes that part of the working-day in which the labourer produces the equivalent of his day's wages, and, on the other hand, lengthens that part of the working-day in which he must present labour gratis to the capitalist.

And this is the economic constitution of our entire modern society: the working class alone produces all values. For value is only another expression for labour, that expression, namely, by which is designated, in our capitalist society of today, the amount of socially necessary labour embodied in a particular commodity. But, these values produced by the workers do not belong to the workers. They belong to the owners of the raw materials, machines, tools, and money, which enable them to buy the labour-power of the working class. Hence, the working class gets back only a part of the entire mass of products produced by it. And, as we have just seen, the other portion, which the capitalist class retains, and which it has to share, at most, only with the landlord class, is increasing with every new

discovery and invention, while the share which falls to the working class (per capita) rises but little and very slowly, or not at all, and under certain conditions it may even fall.

But, these discoveries and inventions which supplant one another with ever-increasing speed, this productiveness of human labour which increases from day to day to unheard-of proportions, at last gives rise to a conflict, in which present capitalistic economy must go to ruin. On the one hand, immeasurable wealth and a superfluidity of products with which the buyers cannot cope. On the other hand, the great mass of society proletarianized, transformed into wage-labourers, and thereby disabled from appropriating to themselves that superfluidity of products. The splitting up of society into a small class, immoderately rich, and a large class of wage-labourers devoid of all property, brings it about that this society smothers in its own superfluidity, while the great majority of its members are scarcely, or not at all, protected from extreme want.

This condition becomes every day more absurd and more unnecessary. It *must* be gotten rid of; it can be gotten rid of. A new social order is possible, in which the class differences of today will have disappeared, and in which – perhaps after a short transition period, which, though somewhat deficient in other respects, will in any case be very useful morally – there will be the means of life, of the enjoyment of life, and of the development and activity of all bodily and mental faculties, through the systematic use and further development of the enormous productive powers of society, which exists with us even now, with equal obligation upon all to work. And that the workers are growing ever more determined to achieve this new social order will be proven on both sides of the ocean on this dawning May Day, and on Sunday, May 3rd.

FREDERICK ENGELS

London, April 30, 1891.

Preliminary

From various quarters we have been reproached for neglecting to portray the economic conditions which form the material basis of the present struggles between classes and nations. With set purpose we have hitherto touched upon these conditions only when they forced themselves upon the surface of the political conflicts.

It was necessary, beyond everything else, to follow the development of the class struggle in the history of our own day, and to prove empirically, by the actual and daily newly created historical material, that with the subjugation of the working class, accomplished in the days of February and March, 1848, the opponents of that class – the bourgeois republicans in France, and the bourgeois and peasant classes who were fighting feudal absolutism throughout the whole continent of Europe – were simultaneously conquered; that the victory of the “moderate republic” in France sounded at the same time the fall of the nations which had responded to the February revolution with heroic wars of independence; and finally that, by the victory over the revolutionary workingmen, Europe fell back into its old double slavery, into the English-Russian slavery. The June conflict in Paris, the fall of Vienna, the tragi-comedy in Berlin in November 1848, the desperate efforts of Poland, Italy, and Hungary, the starvation of Ireland into submission – these were the chief events in which the European class struggle between the bourgeoisie and the working class was summed up, and from which we proved that every revolutionary uprising, however remote from the class struggle its object might appear, must of necessity fail until the revolutionary working class shall have conquered; – that every social reform must remain a Utopia until the proletarian revolution and the feudalistic counter-revolution have been pitted against each other in a world-wide war. In our presentation, as in reality, Belgium and Switzerland were tragicomic caricaturish genre pictures in the great historic tableau; the one the model State of the bourgeois monarchy, the other the model State of the bourgeois republic; both of them, States that flatter themselves to be just as free from the class struggle as from the European revolution.

But now, after our readers have seen the class struggle of the year 1848 develop into colossal political proportions, it is time to examine more closely the economic conditions themselves upon which is founded the

existence of the capitalist class and its class rule, as well as the slavery of the workers.

We shall present the subject in three great divisions:

The Relation of Wage-labour to Capital, the Slavery of the Worker, the Rule of the Capitalist.

The Inevitable Ruin of the Middle Classes and the so-called Commons under the present system.

The Commercial Subjugation and Exploitation of the Bourgeois classes of the various European nations by the Despot of the World Market – England.

We shall seek to portray this as simply and popularly as possible, and shall not presuppose a knowledge of even the most elementary notions of political economy. We wish to be understood by the workers. And, moreover, there prevails in Germany the most remarkable ignorance and confusion of ideas in regard to the simplest economic relations, from the patented defenders of existing conditions, down to the socialist wonder-workers and the unrecognized political geniuses, in which divided Germany is even richer than in duodecimo princelings. We therefore proceed to the consideration of the first problem.

What are Wages? How are they Determined?

If several workmen were to be asked: “How much wages do you get?”, one would reply, “I get two shillings a day”, and so on. According to the different branches of industry in which they are employed, they would mention different sums of money that they receive from their respective employers for the completion of a certain task; for example, for weaving a yard of linen, or for setting a page of type. Despite the variety of their statements, they would all agree upon one point: that wages are the amount of money which the capitalist pays for a certain period of work or for a certain amount of work.

Consequently, it appears that the capitalist buys their labour with money, and that for money they sell him their labour. But this is merely an illusion. What they actually sell to the capitalist for money is their labour-power. This labour-power the capitalist buys for a day, a week, a month, etc. And after he has bought it, he uses it up by letting the worker labour during the stipulated time. With the same amount of money with which the capitalist has bought their labour-power (for example, with two shillings) he could have bought a certain amount of sugar or of any other commodity. The two shillings with which he bought 20 pounds of sugar is the price of the 20 pounds of sugar. The two shillings with which he bought 12 hours’ use of labour-power, is the price of 12 hours’ labour. Labour-power, then, is a commodity, no more, no less so than is the sugar. The first is measured by the clock, the other by the scales.

Their commodity, labour-power, the workers exchange for the commodity of the capitalist, for money, and, moreover, this exchange takes place at a certain ratio. So much money for so long a use of labour-power. For 12 hours’ weaving, two shillings. And these two shillings, do they not represent all the other commodities which I can buy for two shillings? Therefore, actually, the worker has exchanged his commodity, labour-power, for commodities of all kinds, and, moreover, at a certain ratio. By giving him two shillings, the capitalist has given him so much meat, so much clothing, so much wood, light, etc., in exchange for his day’s work. The two shillings therefore express the relation in which labour-power is exchanged for other commodities, the exchange-value of labour-power.

The exchange value of a commodity estimated in money is called its price. Wages therefore are only a special name for the price of labour-power, and are usually called the price of labour; it is the special name for the price of this peculiar commodity, which has no other repository than human flesh and blood.

Let us take any worker; for example, a weaver. The capitalist supplies him with the loom and yarn. The weaver applies himself to work, and the yarn is turned into cloth. The capitalist takes possession of the cloth and sells it for 20 shillings, for example. Now are the wages of the weaver a share of the cloth, of the 20 shillings, of the product of the work? By no means. Long before the cloth is sold, perhaps long before it is fully woven, the weaver has received his wages. The capitalist, then, does not pay his wages out of the money which he will obtain from the cloth, but out of money already on hand. Just as little as loom and yarn are the product of the weaver to whom they are supplied by the employer, just so little are the commodities which he receives in exchange for his commodity – labour-power – his product. It is possible that the employer found no purchasers at all for the cloth. It is possible that he did not get even the amount of the wages by its sale. It is possible that he sells it very profitably in proportion to the weaver's wages. But all that does not concern the weaver. With a part of his existing wealth, of his capital, the capitalist buys the labour-power of the weaver in exactly the same manner as, with another part of his wealth, he has bought the raw material – the yarn – and the instrument of labour – the loom. After he has made these purchases, and among them belongs the labour-power necessary to the production of the cloth he produces only with raw materials and instruments of labour belonging to him. For our good weaver, too, is one of the instruments of labour, and being in this respect on a par with the loom, he has no more share in the product (the cloth), or in the price of the product, than the loom itself has.

Wages, therefore, are not a share of the worker in the commodities produced by himself. Wages are that part of already existing commodities with which the capitalist buys a certain amount of productive labour-power.

Consequently, labour-power is a commodity which its possessor, the wage-worker, sells to the capitalist. Why does he sell it? It is in order to live.

But the putting of labour-power into action – i.e., the work – is the active expression of the labourer's own life. And this life activity he sells to

another person in order to secure the necessary means of life. His life-activity, therefore, is but a means of securing his own existence. He works that he may keep alive. He does not count the labour itself as a part of his life; it is rather a sacrifice of his life. It is a commodity that he has auctioned off to another. The product of his activity, therefore, is not the aim of his activity. What he produces for himself is not the silk that he weaves, not the gold that he draws up the mining shaft, not the palace that he builds. What he produces for himself is wages; and the silk, the gold, and the palace are resolved for him into a certain quantity of necessities of life, perhaps into a cotton jacket, into copper coins, and into a basement dwelling. And the labourer who for 12 hours long, weaves, spins, bores, turns, builds, shovels, breaks stone, carries hods, and so on – is this 12 hours' weaving, spinning, boring, turning, building, shovelling, stone-breaking, regarded by him as a manifestation of life, as life? Quite the contrary. Life for him begins where this activity ceases, at the table, at the tavern, in bed. The 12 hours' work, on the other hand, has no meaning for him as weaving, spinning, boring, and so on, but only as earnings, which enable him to sit down at a table, to take his seat in the tavern, and to lie down in a bed. If the silk-worm's object in spinning were to prolong its existence as caterpillar, it would be a perfect example of a wage-worker.

Labour-power was not always a commodity (merchandise). Labour was not always wage-labour, i.e., free labour. The slave did not sell his labour-power to the slave-owner, any more than the ox sells his labour to the farmer. The slave, together with his labour-power, was sold to his owner once for all. He is a commodity that can pass from the hand of one owner to that of another. He himself is a commodity, but his labour-power is not his commodity. The serf sells only a portion of his labour-power. It is not he who receives wages from the owner of the land; it is rather the owner of the land who receives a tribute from him. The serf belongs to the soil, and to the lord of the soil he brings its fruit. The free labourer, on the other hand, sells his very self, and that by fractions. He auctions off eight, 10, 12, 15 hours of his life, one day like the next, to the highest bidder, to the owner of raw materials, tools, and the means of life – i.e., to the capitalist. The labourer belongs neither to an owner nor to the soil, but eight, 10, 12, 15 hours of his daily life belong to whomsoever buys them. The worker leaves the capitalist, to whom he has sold himself, as often as he chooses, and the capitalist discharges him as often as he sees fit, as soon as he no longer gets

any use, or not the required use, out of him. But the worker, whose only source of income is the sale of his labour-power, cannot leave the whole class of buyers, i.e., the capitalist class, unless he gives up his own existence. He does not belong to this or that capitalist, but to the capitalist class; and it is for him to find his man – i.e., to find a buyer in this capitalist class.

Before entering more closely upon the relation of capital to wage-labour, we shall present briefly the most general conditions which come into consideration in the determination of wages.

Wages, as we have seen, are the price of a certain commodity, labour-power. Wages, therefore, are determined by the same laws that determine the price of every other commodity. The question then is, How is the price of a commodity determined?

By what is the price of a commodity determined?

By the competition between buyers and sellers, by the relation of the demand to the supply, of the call to the offer. The competition by which the price of a commodity is determined is threefold.

The same commodity is offered for sale by various sellers. Whoever sells commodities of the same quality most cheaply, is sure to drive the other sellers from the field and to secure the greatest market for himself. The sellers therefore fight among themselves for the sales, for the market. Each one of them wishes to sell, and to sell as much as possible, and if possible to sell alone, to the exclusion of all other sellers. Each one sells cheaper than the other. Thus there takes place a competition among the sellers which forces down the price of the commodities offered by them.

But there is also a competition among the buyers; this upon its side causes the price of the proffered commodities to rise.

Finally, there is competition between the buyers and the sellers: these wish to purchase as cheaply as possible, those to sell as dearly as possible. The result of this competition between buyers and sellers will depend upon the relations between the two above-mentioned camps of competitors – i.e., upon whether the competition in the army of sellers is stronger. Industry leads two great armies into the field against each other, and each of these again is engaged in a battle among its own troops in its own ranks. The army among whose troops there is less fighting, carries off the victory over the opposing host.

Let us suppose that there are 100 bales of cotton in the market and at the same time purchasers for 1,000 bales of cotton. In this case, the demand is 10 times greater than the supply. Competition among the buyers, then, will be very strong; each of them tries to get hold of one bale, if possible, of the whole 100 bales. This example is no arbitrary supposition. In the history of commerce we have experienced periods of scarcity of cotton, when some capitalists united together and sought to buy up not 100 bales, but the whole cotton supply of the world. In the given case, then, one buyer seeks to drive the others from the field by offering a relatively higher price for the bales of cotton. The cotton sellers, who perceive the troops of the enemy in the most

violent contention among themselves, and who therefore are fully assured of the sale of their whole 100 bales, will beware of pulling one another's hair in order to force down the price of cotton at the very moment in which their opponents race with one another to screw it up high. So, all of a sudden, peace reigns in the army of sellers. They stand opposed to the buyers like one man, fold their arms in philosophic contentment and their claims would find no limit did not the offers of even the most importunate of buyers have a very definite limit.

If, then, the supply of a commodity is less than the demand for it, competition among the sellers is very slight, or there may be none at all among them. In the same proportion in which this competition decreases, the competition among the buyers increases. Result: a more or less considerable rise in the prices of commodities.

It is well known that the opposite case, with the opposite result, happens more frequently. Great excess of supply over demand; desperate competition among the sellers, and a lack of buyers; forced sales of commodities at ridiculously low prices.

But what is a rise, and what a fall of prices? What is a high and what a low price? A grain of sand is high when examined through a microscope, and a tower is low when compared with a mountain. And if the price is determined by the relation of supply and demand, by what is the relation of supply and demand determined?

Let us turn to the first worthy citizen we meet. He will not hesitate one moment, but, like Alexander the Great, will cut this metaphysical knot with his multiplication table. He will say to us: "If the production of the commodities which I sell has cost me 100 pounds, and out of the sale of these goods I make 110 pounds – within the year, you understand – that's an honest, sound, reasonable profit. But if in the exchange I receive 120 or 130 pounds, that's a higher profit; and if I should get as much as 200 pounds, that would be an extraordinary, and enormous profit." What is it, then, that serves this citizen as the standard of his profit? The cost of the production of his commodities. If in exchange for these goods he receives a quantity of other goods whose production has cost less, he has lost. If he receives in exchange for his goods a quantity of other goods whose production has cost more, he has gained. And he reckons the falling or rising of the profit according to the degree at which the exchange value of his goods stands, whether above or below his zero – the cost of production.

We have seen how the changing relation of supply and demand causes now a rise, now a fall of prices; now high, now low prices. If the price of a commodity rises considerably owing to a failing supply or a disproportionately growing demand, then the price of some other commodity must have fallen in proportion; for of course the price of a commodity only expresses in money the proportion in which other commodities will be given in exchange for it. If, for example, the price of a yard of silk rises from two to three shillings, the price of silver has fallen in relation to the silk, and in the same way the prices of all other commodities whose prices have remained stationary have fallen in relation to the price of silk. A large quantity of them must be given in exchange in order to obtain the same amount of silk. Now, what will be the consequence of a rise in the price of a particular commodity? A mass of capital will be thrown into the prosperous branch of industry, and this immigration of capital into the provinces of the favored industry will continue until it yields no more than the customary profits, or, rather until the price of its products, owing to overproduction, sinks below the cost of production.

Conversely: if the price of a commodity falls below its cost of production, then capital will be withdrawn from the production of this commodity. Except in the case of a branch of industry which has become obsolete and is therefore doomed to disappear, the production of such a commodity (that is, its supply), will, owing to this flight of capital, continue to decrease until it corresponds to the demand, and the price of the commodity rises again to the level of its cost of production; or, rather, until the supply has fallen below the demand and its price has risen above its cost of production, for the current price of a commodity is always either above or below its cost of production.

We see how capital continually emigrates out of the province of one industry and immigrates into that of another. The high price produces an excessive immigration, and the low price an excessive emigration.

We could show, from another point of view, how not only the supply, but also the demand, is determined by the cost of production. But this would lead us too far away from our subject.

We have just seen how the fluctuation of supply and demand always bring the price of a commodity back to its cost of production. The actual price of a commodity, indeed, stands always above or below the cost of production; but the rise and fall reciprocally balance each other, so that,

within a certain period of time, if the ebbs and flows of the industry are reckoned up together, the commodities will be exchanged for one another in accordance with their cost of production. Their price is thus determined by their cost of production.

The determination of price by the cost of production is not to be understood in the sense of the bourgeois economists. The economists say that the average price of commodities equals the cost of production: that is the law. The anarchic movement, in which the rise is compensated for by a fall and the fall by a rise, they regard as an accident. We might just as well consider the fluctuations as the law, and the determination of the price by cost of production as an accident – as is, in fact, done by certain other economists. But it is precisely these fluctuations which, viewed more closely, carry the most frightful devastation in their train, and, like an earthquake, cause bourgeois society to shake to its very foundations – it is precisely these fluctuations that force the price to conform to the cost of production. In the totality of this disorderly movement is to be found its order. In the total course of this industrial anarchy, in this circular movement, competition balances, as it were, the one extravagance by the other.

We thus see that the price of a commodity is indeed determined by its cost of production, but in such a manner that the periods in which the price of these commodities rises above the costs of production are balanced by the periods in which it sinks below the cost of production, and vice versa. Of course this does not hold good for a single given product of an industry, but only for that branch of industry. So also it does not hold good for an individual manufacturer, but only for the whole class of manufacturers.

The determination of price by cost of production is tantamount to the determination of price by the labor-time requisite to the production of a commodity, for the cost of production consists, first of raw materials and wear and tear of tools, etc., i.e., of industrial products whose production has cost a certain number of work-days, which therefore represent a certain amount of labor-time, and, secondly, of direct labor, which is also measured by its duration.

By what are wages determined?

Now, the same general laws which regulate the price of commodities in general, naturally regulate wages, or the price of labour-power. Wages will now rise, now fall, according to the relation of supply and demand, according as competition shapes itself between the buyers of labour-power, the capitalists, and the sellers of labour-power, the workers. The fluctuations of wages correspond to the fluctuation in the price of commodities in general. But within the limits of these fluctuations the price of labour-power will be determined by the cost of production, by the labour-time necessary for production of this commodity: labour-power.

What, then, is the cost of production of labour-power?

It is the cost required for the maintenance of the labourer as a labourer, and for his education and training as a labourer.

Therefore, the shorter the time required for training up to a particular sort of work, the smaller is the cost of production of the worker, the lower is the price of his labour-power, his wages. In those branches of industry in which hardly any period of apprenticeship is necessary and the mere bodily existence of the worker is sufficient, the cost of his production is limited almost exclusively to the commodities necessary for keeping him in working condition. The price of his work will therefore be determined by the price of the necessary means of subsistence.

Here, however, there enters another consideration. The manufacturer who calculates his cost of production and, in accordance with it, the price of the product, takes into account the wear and tear of the instruments of labour. If a machine costs him, for example, 1,000 shillings, and this machine is used up in 10 years, he adds 100 shillings annually to the price of the commodities, in order to be able after 10 years to replace the worn-out machine with a new one. In the same manner, the cost of production of simple labour-power must include the cost of propagation, by means of which the race of workers is enabled to multiply itself, and to replace worn-out workers with new ones. The wear and tear of the worker, therefore, is calculated in the same manner as the wear and tear of the machine.

Thus, the cost of production of simple labour-power amounts to the cost of the existence and propagation of the worker. The price of this cost of

existence and propagation constitutes wages. The wages thus determined are called the minimum of wages. This minimum wage, like the determination of the price of commodities in general by cost of production, does not hold good for the single individual, but only for the race. Individual workers, indeed, millions of workers, do not receive enough to be able to exist and to propagate themselves; but the wages of the whole working class adjust themselves, within the limits of their fluctuations, to this minimum.

Now that we have come to an understanding in regard to the most general laws which govern wages, as well as the price of every other commodity, we can examine our subject more particularly.

The Nature and Growth of Capital

Capital consists of raw materials, instruments of labour, and means of subsistence of all kinds, which are employed in producing new raw materials, new instruments, and new means of subsistence. All these components of capital are created by labour, products of labour, accumulated labour. Accumulated labour that serves as a means to new production is capital.

So say the economists.

What is a Negro slave? A man of the black race. The one explanation is worthy of the other.

A Negro is a Negro. Only under certain conditions does he become a slave. A cotton-spinning machine is a machine for spinning cotton. Only under certain conditions does it become capital. Torn away from these conditions, it is as little capital as gold is itself money, or sugar is the price of sugar.

In the process of production, human beings work not only upon nature, but also upon one another. They produce only by working together in a specified manner and reciprocally exchanging their activities. In order to produce, they enter into definite connections and relations to one another, and only within these social connections and relations does their influence upon nature operate – i.e., does production take place.

These social relations between the producers, and the conditions under which they exchange their activities and share in the total act of production, will naturally vary according to the character of the means of production. With the discover of a new instrument of warfare, the firearm, the whole internal organization of the army was necessarily altered, the relations within which individuals compose an army and can work as an army were transformed, and the relation of different armies to another was likewise changed.

We thus see that the social relations within which individuals produce, the social relations of production, are altered, transformed, with the change and development of the material means of production, of the forces of production. The relations of production in their totality constitute what is called the social relations, society, and, moreover, a society at a definite

stage of historical development, a society with peculiar, distinctive characteristics. Ancient society, feudal society, bourgeois (or capitalist) society, are such totalities of relations of production, each of which denotes a particular stage of development in the history of mankind.

Capital also is a social relation of production. It is a bourgeois relation of production, a relation of production of bourgeois society. The means of subsistence, the instruments of labour, the raw materials, of which capital consists – have they not been produced and accumulated under given social conditions, within definite special relations? Are they not employed for new production, under given special conditions, within definite social relations? And does not just the definite social character stamp the products which serve for new production as capital?

Capital consists not only of means of subsistence, instruments of labour, and raw materials, not only as material products; it consists just as much of exchange values. All products of which it consists are commodities. Capital, consequently, is not only a sum of material products, it is a sum of commodities, of exchange values, of social magnitudes. Capital remains the same whether we put cotton in the place of wool, rice in the place of wheat, steamships in the place of railroads, provided only that the cotton, the rice, the steamships – the body of capital – have the same exchange value, the same price, as the wool, the wheat, the railroads, in which it was previously embodied. The bodily form of capital may transform itself continually, while capital does not suffer the least alteration.

But though every capital is a sum of commodities – i.e., of exchange values – it does not follow that every sum of commodities, of exchange values, is capital.

Every sum of exchange values is an exchange value. Each particular exchange value is a sum of exchange values. For example: a house worth 1,000 pounds is an exchange value of 1,000 pounds: a piece of paper worth one penny is a sum of exchange values of 100 1/100ths of a penny. Products which are exchangeable for others are commodities. The definite proportion in which they are exchangeable forms their exchange value, or, expressed in money, their price. The quantity of these products can have no effect on their character as commodities, as representing an exchange value, as having a certain price. Whether a tree be large or small, it remains a tree. Whether we exchange iron in pennyweights or in hundredweights, for other products, does this alter its character: its being a commodity, or exchange

value? According to the quantity, it is a commodity of greater or of lesser value, of higher or of lower price.

How then does a sum of commodities, of exchange values, become capital?

Thereby, that as an independent social power – i.e., as the power of a part of society – it preserves itself and multiplies by exchange with direct, living labour-power.

The existence of a class which possesses nothing but the ability to work is a necessary presupposition of capital.

It is only the dominion of past, accumulated, materialized labour over immediate living labour that stamps the accumulated labour with the character of capital.

Capital does not consist in the fact that accumulated labour serves living labour as a means for new production. It consists in the fact that living labour serves accumulated labour as the means of preserving and multiplying its exchange value.

Relation of Wage-Labour to Capital

What is it that takes place in the exchange between the capitalist and the wage-labourer?

The labourer receives means of subsistence in exchange for his labour-power; the capitalist receives, in exchange for his means of subsistence, labour, the productive activity of the labourer, the creative force by which the worker not only replaces what he consumes, but also gives to the accumulated labour a greater value than it previously possessed. The labourer gets from the capitalist a portion of the existing means of subsistence. For what purpose do these means of subsistence serve him? For immediate consumption. But as soon as I consume means of subsistence, they are irrevocably lost to me, unless I employ the time during which these means sustain my life in producing new means of subsistence, in creating by my labour new values in place of the values lost in consumption. But it is just this noble reproductive power that the labourer surrenders to the capitalist in exchange for means of subsistence received. Consequently, he has lost it for himself.

Let us take an example. For one shilling a labourer works all day long in the fields of a farmer, to whom he thus secures a return of two shillings. The farmer not only receives the replaced value which he has given to the day labourer, he has doubled it. Therefore, he has consumed the one shilling that he gave to the day labourer in a fruitful, productive manner. For the one shilling he has bought the labour-power of the day-labourer, which creates products of the soil of twice the value, and out of one shilling makes two. The day-labourer, on the contrary, receives in the place of his productive force, whose results he has just surrendered to the farmer, one shilling, which he exchanges for means of subsistence, which he consumes more or less quickly. The one shilling has therefore been consumed in a double manner – reproductively for the capitalist, for it has been exchanged for labour-power, which brought forth two shillings; unproductively for the worker, for it has been exchanged for means of subsistence which are lost for ever, and whose value he can obtain again only by repeating the same exchange with the farmer. Capital therefore presupposes wage-labour;

wage-labour presupposes capital. They condition each other; each brings the other into existence.

Does a worker in a cotton factory produce only cotton? No. He produces capital. He produces values which serve anew to command his work and to create by means of it new values.

Capital can multiply itself only by exchanging itself for labour-power, by calling wage-labour into life. The labour-power of the wage-labourer can exchange itself for capital only by increasing capital, by strengthening that very power whose slave it is. Increase of capital, therefore, is increase of the proletariat, i.e., of the working class.

And so, the bourgeoisie and its economists maintain that the interest of the capitalist and of the labourer is the same. And in fact, so they are! The worker perishes if capital does not keep him busy. Capital perishes if it does not exploit labour-power, which, in order to exploit, it must buy. The more quickly the capital destined for production – the productive capital – increases, the more prosperous industry is, the more the bourgeoisie enriches itself, the better business gets, so many more workers does the capitalist need, so much the dearer does the worker sell himself. The fastest possible growth of productive capital is, therefore, the indispensable condition for a tolerable life to the labourer.

But what is growth of productive capital? Growth of the power of accumulated labour over living labour; growth of the rule of the bourgeoisie over the working class. When wage-labour produces the alien wealth dominating it, the power hostile to it, capital, there flow back to it its means of employment – i.e., its means of subsistence, under the condition that it again become a part of capital, that is become again the lever whereby capital is to be forced into an accelerated expansive movement.

To say that the interests of capital and the interests of the workers are identical, signifies only this: that capital and wage-labour are two sides of one and the same relation. The one conditions the other in the same way that the usurer and the borrower condition each other.

As long as the wage-labourer remains a wage-labourer, his lot is dependent upon capital. That is what the boasted community of interests between worker and capitalists amounts to.

If capital grows, the mass of wage-labour grows, the number of wage-workers increases; in a word, the sway of capital extends over a greater mass of individuals.

Let us suppose the most favorable case: if productive capital grows, the demand for labour grows. It therefore increases the price of labour-power, wages.

A house may be large or small; as long as the neighboring houses are likewise small, it satisfies all social requirement for a residence. But let there arise next to the little house a palace, and the little house shrinks to a hut. The little house now makes it clear that its inmate has no social position at all to maintain, or but a very insignificant one; and however high it may shoot up in the course of civilization, if the neighboring palace rises in equal or even in greater measure, the occupant of the relatively little house will always find himself more uncomfortable, more dissatisfied, more cramped within his four walls.

An appreciable rise in wages presupposes a rapid growth of productive capital. Rapid growth of productive capital calls forth just as rapid a growth of wealth, of luxury, of social needs and social pleasures. Therefore, although the pleasures of the labourer have increased, the social gratification which they afford has fallen in comparison with the increased pleasures of the capitalist, which are inaccessible to the worker, in comparison with the stage of development of society in general. Our wants and pleasures have their origin in society; we therefore measure them in relation to society; we do not measure them in relation to the objects which serve for their gratification. Since they are of a social nature, they are of a relative nature.

But wages are not at all determined merely by the sum of commodities for which they may be exchanged. Other factors enter into the problem. What the workers directly receive for their labour-power is a certain sum of money. Are wages determined merely by this money price?

In the 16th century, the gold and silver circulation in Europe increased in consequence of the discovery of richer and more easily worked mines in America. The value of gold and silver, therefore, fell in relation to other commodities. The workers received the same amount of coined silver for their labour-power as before. The money price of their work remained the same, and yet their wages had fallen, for in exchange for the same amount of silver they obtained a smaller amount of other commodities. This was one of the circumstances which furthered the growth of capital, the rise of the bourgeoisie, in the 18th century.

Let us take another case. In the winter of 1847, in consequence of bad harvest, the most indispensable means of subsistence – grains, meat, butter, cheese, etc. – rose greatly in price. Let us suppose that the workers still received the same sum of money for their labour-power as before. Did not their wages fall? To be sure. For the same money they received in exchange less bread, meat, etc. Their wages fell, not because the value of silver was less, but because the value of the means of subsistence had increased.

Finally, let us suppose that the money price of labour-power remained the same, while all agricultural and manufactured commodities had fallen in price because of the employment of new machines, of favorable seasons, etc. For the same money the workers could now buy more commodities of all kinds. Their wages have therefore risen, just because their money value has not changed.

The money price of labour-power, the nominal wages, do not therefore coincide with the actual or real wages – i.e., with the amount of commodities which are actually given in exchange for the wages. If then we speak of a rise or fall of wages, we have to keep in mind not only the money price of labour-power, the nominal wages, but also the real wages.

But neither the nominal wages – i.e., the amount of money for which the labourer sells himself to the capitalist – nor the real wages – i.e., the amount of commodities which he can buy for this money – exhausts the relations which are comprehended in the term wages.

Wages are determined above all by their relations to the gain, the profit, of the capitalist. In other words, wages are a proportionate, relative quantity.

Real wages express the price of labour-power in relation to the price of commodities; relative wages, on the other hand, express the share of immediate labour in the value newly created by it, in relation to the share of it which falls to accumulated labour, to capital.

The General Law that Determines the Rise and Fall of Wages and Profits

We have said: “Wages are not a share of the worker in the commodities produced by him. Wages are that part of already existing commodities with which the capitalist buys a certain amount of productive labor-power.” But the capitalist must replace these wages out of the price for which he sells the product made by the worker; he must so replace it that, as a rule, there remains to him a surplus above the cost of production expended by him, that is, he must get a profit.

The selling price of the commodities produced by the worker is divided, from the point of view of the capitalist, into three parts:

First, the replacement of the price of the raw materials advanced by him, in addition to the replacement of the wear and tear of the tools, machines, and other instruments of labor likewise advanced by him;

Second, the replacement of the wages advanced; and

Third, the surplus leftover – i.e., the profit of the capitalist.

While the first part merely replaces previously existing values, it is evident that the replacement of the wages and the surplus (the profit of capital) are as a whole taken out of the new value, which is produced by the labor of the worker and added to the raw materials. And in this sense we can view wages as well as profit, for the purpose of comparing them with each other, as shares in the product of the worker.

Real wages may remain the same, they may even rise, nevertheless the relative wages may fall. Let us suppose, for instance, that all means of subsistence have fallen $\frac{2}{3}$ in price, while the day's wages have fallen but $\frac{1}{3}$ – for example, from three to two shillings. Although the worker can now get a greater amount of commodities with these two shillings than he formerly did with three shillings, yet his wages have decreased in proportion to the gain of the capitalist. The profit of the capitalist – the manufacturer's for instance – has increased one shilling, which means that for a smaller amount of exchange values, which he pays to the worker, the latter must produce a greater amount of exchange values than before. The share of capitals in proportion to the share of labour has risen. The distribution of social wealth between capital and labour has become still

more unequal. The capitalist commands a greater amount of labour with the same capital. The power of the capitalist class over the working class has grown, the social position of the worker has become worse, has been forced down still another degree below that of the capitalist.

What, then, is the general law that determines the rise and fall of wages and profit in their reciprocal relation?

They stand in inverse proportion to each other. The share of (profit) increases in the same proportion in which the share of labour (wages) falls, and vice versa. Profit rises in the same degree in which wages fall; it falls in the same degree in which wages rise.

It might perhaps be argued that the capitalist class can gain by an advantageous exchange of his products with other capitalists, by a rise in the demand for his commodities, whether in consequence of the opening up of new markets, or in consequence of temporarily increased demands in the old market, and so on; that the profit of the capitalist, therefore, may be multiplied by taking advantage of other capitalists, independently of the rise and fall of wages, of the exchange value of labour-power; or that the profit of the capitalist may also rise through improvements in the instruments of labour, new applications of the forces of nature, and so on.

But in the first place it must be admitted that the result remains the same, although brought about in an opposite manner. Profit, indeed, has not risen because wages have fallen, but wages have fallen because profit has risen. With the same amount of another man's labour the capitalist has bought a larger amount of exchange values without having paid more for the labour on that account – i.e., the work is paid for less in proportion to the net gain which it yields to the capitalist.

In the second place, it must be borne in mind that, despite the fluctuations in the prices of commodities, the average price of every commodity, the proportion in which it exchanges for other commodities, is determined by its cost of production. The acts of overreaching and taking advantage of one another within the capitalist ranks necessarily equalize themselves. The improvements of machinery, the new applications of the forces of nature in the service of production, make it possible to produce in a given period of time, with the same amount of labour and capital, a larger amount of products, but in no wise a larger amount of exchange values. If by the use of the spinning-machine I can furnish twice as much yarn in an hour as before its invention – for instance, 100 pounds instead of 50 pounds

– in the long run I receive back, in exchange for this 100 pounds no more commodities than I did before for 50; because the cost of production has fallen by 1/2, or because I can furnish double the product at the same cost.

Finally, in whatsoever proportion the capitalist class, whether of one country or of the entire world-market, distribute the net revenue of production among themselves, the total amount of this net revenue always consists exclusively of the amount by which accumulated labour has been increased from the proceeds of direct labour. This whole amount, therefore, grows in the same proportion in which labour augments capital – i.e., in the same proportion in which profit rises as compared with wages.

The Interests of Capital and Wage-Labour are diametrically opposed Effect of growth of productive Capital on Wages

We thus see that, even if we keep ourselves within the relation of capital and wage-labour, the interests of capitals and the interests of wage-labour are diametrically opposed to each other.

A rapid growth of capital is synonymous with a rapid growth of profits. Profits can grow rapidly only when the price of labour – the relative wages – decrease just as rapidly. Relative wages may fall, although real wages rise simultaneously with nominal wages, with the money value of labour, provided only that the real wage does not rise in the same proportion as the profit. If, for instance, in good business years wages rise 5 per cent, while profits rise 30 per cent, the proportional, the relative wage has not increased, but decreased.

If, therefore, the income of the worker increased with the rapid growth of capital, there is at the same time a widening of the social chasm that divides the worker from the capitalist, and increase in the power of capital over labour, a greater dependence of labour upon capital.

To say that “the worker has an interest in the rapid growth of capital”, means only this: that the more speedily the worker augments the wealth of the capitalist, the larger will be the crumbs which fall to him, the greater will be the number of workers than can be called into existence, the more can the mass of slaves dependent upon capital be increased.

We have thus seen that even the most favorable situation for the working class, namely, the most rapid growth of capital, however much it may improve the material life of the worker, does not abolish the antagonism between his interests and the interests of the capitalist. Profit and wages remain as before, in inverse proportion.

If capital grows rapidly, wages may rise, but the profit of capital rises disproportionately faster. The material position of the worker has improved, but at the cost of his social position. The social chasm that separates him from the capitalist has widened.

Finally, to say that “the most favorable condition for wage-labour is the fastest possible growth of productive capital”, is the same as to say: the

quicker the working class multiplies and augments the power inimical to it – the wealth of another which lords over that class – the more favorable will be the conditions under which it will be permitted to toil anew at the multiplication of bourgeois wealth, at the enlargement of the power of capital, content thus to forge for itself the golden chains by which the bourgeoisie drags it in its train.

Growth of productive capital and rise of wages, are they really so indissolubly united as the bourgeois economists maintain? We must not believe their mere words. We dare not believe them even when they claim that the fatter capital is the more will its slave be pampered. The bourgeoisie is too much enlightened, it keeps its accounts much too carefully, to share the prejudices of the feudal lord, who makes an ostentatious display of the magnificence of his retinue. The conditions of existence of the bourgeoisie compel it to attend carefully to its bookkeeping. We must therefore examine more closely into the following question:

In what manner does the growth of productive capital affect wages?

If as a whole, the productive capital of bourgeois society grows, there takes place a more many-sided accumulation of labour. The individual capitals increase in number and in magnitude. The multiplications of individual capitals increases the competition among capitalists. The increasing magnitude of increasing capitals provides the means of leading more powerful armies of workers with more gigantic instruments of war upon the industrial battlefield.

The one capitalist can drive the other from the field and carry off his capital only by selling more cheaply. In order to sell more cheaply without ruining himself, he must produce more cheaply – i.e., increase the productive forces of labour as much as possible.

But the productive forces of labour is increased above all by a greater division of labour and by a more general introduction and constant improvement of machinery. The larger the army of workers among whom the labour is subdivided, the more gigantic the scale upon which machinery is introduced, the more in proportion does the cost of production decrease, the more fruitful is the labour. And so there arises among the capitalists a universal rivalry for the increase of the division of labour and of machinery and for their exploitation upon the greatest possible scale.

If, now, by a greater division of labour, by the application and improvement of new machines, by a more advantageous exploitation of the forces of nature on a larger scale, a capitalist has found the means of producing with the same amount of labour (whether it be direct or accumulated labour) a larger amount of products of commodities than his competitors – if, for instance, he can produce a whole yard of linen in the same labour-time in which his competitors weave half-a-yard – how will this capitalist act?

He could keep on selling half-a-yard of linen at old market price; but this would not have the effect of driving his opponents from the field and enlarging his own market. But his need of a market has increased in the same measure in which his productive power has extended. The more powerful and costly means of production that he has called into existence

enable him, it is true, to sell his wares more cheaply, but they compel him at the same time to sell more wares, to get control of a very much greater market for his commodities; consequently, this capitalist will sell his half-yard of linen more cheaply than his competitors.

But the capitalist will not sell the whole yard so cheaply as his competitors sell the half-yard, although the production of the whole yard costs him no more than does that of the half-yard to the others. Otherwise, he would make no extra profit, and would get back in exchange only the cost of production. He might obtain a greater income from having set in motion a larger capital, but not from having made a greater profit on his capital than the others. Moreover, he attains the object he is aiming at if he prices his goods only a small percentage lower than his competitors. He drives them off the field, he wrests from them at least part of their market, by underselling them.

And finally, let us remember that the current price always stands either above or below the cost of production, according as the sale of a commodity takes place in the favorable or unfavorable period of the industry. According as the market price of the yard of linen stands above or below its former cost of production, will the percentage vary at which the capitalist who has made use of the new and more faithful means of production sell above his real cost of production.

But the privilege of our capitalist is not of long duration. Other competing capitalists introduce the same machines, the same division of labour, and introduce them upon the same or even upon a greater scale. And finally this introduction becomes so universal that the price of the linen is lowered not only below its old, but even below its new cost of production.

The capitalists therefore find themselves, in their mutual relations, in the same situation in which they were before the introduction of the new means of production; and if they are by these means enabled to offer double the product at the old price, they are now forced to furnish double the product for less than the old price. Having arrived at the new point, the new cost of production, the battle for supremacy in the market has to be fought out anew. Given more division of labour and more machinery, and there results a greater scale upon which division of labour and machinery are exploited. And competition again brings the same reaction against this result.

Effect of Capitalist Competition on the Capitalist Class the Middle Class and the Working Class

We thus see how the method of production and the means of production are constantly enlarged, revolutionized, how division of labour necessarily draws after it greater division of labour, the employment of machinery greater employment of machinery, work upon a large scale work upon a still greater scale. This is the law that continually throws capitalist production out of its old ruts and compels capital to strain ever more the productive forces of labour for the very reason that it has already strained them – the law that grants it no respite, and constantly shouts in its ear: March! march! This is no other law than that which, within the periodical fluctuations of commerce, necessarily adjusts the price of a commodity to its cost of production.

No matter how powerful the means of production which a capitalist may bring into the field, competition will make their adoption general; and from the moment that they have been generally adopted, the sole result of the greater productiveness of his capital will be that he must furnish at the same price, 10, 20, 100 times as much as before. But since he must find a market for, perhaps, 1,000 times as much, in order to outweigh the lower selling price by the greater quantity of the sale; since now a more extensive sale is necessary not only to gain a greater profit, but also in order to replace the cost of production (the instrument of production itself grows always more costly, as we have seen), and since this more extensive sale has become a question of life and death not only for him, but also for his rivals, the old struggle must begin again, and it is all the more violent the more powerful the means of production already invented are. The division of labour and the application of machinery will therefore take a fresh start, and upon an even greater scale.

Whatever be the power of the means of production which are employed, competition seeks to rob capital of the golden fruits of this power by reducing the price of commodities to the cost of production; in the same measure in which production is cheapened - i.e., in the same measure in which more can be produced with the same amount of labour – it compels

by a law which is irresistible a still greater cheapening of production, the sale of ever greater masses of product for smaller prices. Thus the capitalist will have gained nothing more by his efforts than the obligation to furnish a greater product in the same labour-time; in a word, more difficult conditions for the profitable employment of his capital. While competition, therefore, constantly pursues him with its law of the cost of production and turns against himself every weapon that he forges against his rivals, the capitalist continually seeks to get the best of competition by restlessly introducing further subdivision of labour and new machines, which, though more expensive, enable him to produce more cheaply, instead of waiting until the new machines shall have been rendered obsolete by competition.

If we now conceive this feverish agitation as it operates in the market of the whole world, we shall be in a position to comprehend how the growth, accumulation, and concentration of capital bring in their train an ever more detailed subdivision of labour, an ever greater improvement of old machines, and a constant application of new machine – a process which goes on uninterruptedly, with feverish haste, and upon an ever more gigantic scale.

But what effect do these conditions, which are inseparable from the growth of productive capital, have upon the determination of wages?

The greater division of labour enables one labourer to accomplish the work of five, 10, or 20 labourers; it therefore increases competition among the labourers fivefold, tenfold, or twentyfold. The labourers compete not only by selling themselves one cheaper than the other, but also by one doing the work of five, 10, or 20; and they are forced to compete in this manner by the division of labour, which is introduced and steadily improved by capital.

Furthermore, to the same degree in which the division of labour increases, is the labour simplified. The special skill of the labourer becomes worthless. He becomes transformed into a simple monotonous force of production, with neither physical nor mental elasticity. His work becomes accessible to all; therefore competitors press upon him from all sides. Moreover, it must be remembered that the more simple, the more easily learned the work is, so much the less is its cost to production, the expense of its acquisition, and so much the lower must the wages sink – for, like the price of any other commodity, they are determined by the cost of

production. Therefore, in the same manner in which labour becomes more unsatisfactory, more repulsive, do competition increase and wages decrease.

The labourer seeks to maintain the total of his wages for a given time by performing more labour, either by working a great number of hours, or by accomplishing more in the same number of hours. Thus, urged on by want, he himself multiplies the disastrous effects of division of labour. The result is: the more he works, the less wages he receives. And for this simple reason: the more he works, the more he competes against his fellow workmen, the more he compels them to compete against him, and to offer themselves on the same wretched conditions as he does; so that, in the last analysis, he competes against himself as a member of the working class.

Machinery produces the same effects, but upon a much larger scale. It supplants skilled labourers by unskilled, men by women, adults by children; where newly introduced, it throws workers upon the streets in great masses; and as it becomes more highly developed and more productive it discards them in additional though smaller numbers.

We have hastily sketched in broad outlines the industrial war of capitalists among themselves. This war has the peculiarity that the battles in it are won less by recruiting than by discharging the army of workers. The generals (the capitalists) vie with one another as to who can discharge the greatest number of industrial soldiers.

The economists tell us, to be sure, that those labourers who have been rendered superfluous by machinery find new venues of employment. They dare not assert directly that the same labourers that have been discharged find situations in new branches of labour. Facts cry out too loudly against this lie. Strictly speaking, they only maintain that new means of employment will be found for other sections of the working class; for example, for that portion of the young generation of labourers who were about to enter upon that branch of industry which had just been abolished. Of course, this is a great satisfaction to the disabled labourers. There will be no lack of fresh exploitable blood and muscle for the Messrs. Capitalists – the dead may bury their dead. This consolation seems to be intended more for the comfort of the capitalists themselves than their labourers. If the whole class of the wage-labourer were to be annihilated by machinery, how terrible that would be for capital, which, without wage-labour, ceases to be capital!

But even if we assume that all who are directly forced out of employment by machinery, as well as all of the rising generation who were waiting for a chance of employment in the same branch of industry, do actually find some new employment – are we to believe that this new employment will pay as high wages as did the one they have lost? If it did, it would be in contradiction to the laws of political economy. We have seen how modern industry always tends to the substitution of the simpler and more subordinate employments for the higher and more complex ones. How, then, could a mass of workers thrown out of one branch of industry by machinery find refuge in another branch, unless they were to be paid more poorly?

An exception to the law has been adduced, namely, the workers who are employed in the manufacture of machinery itself. As soon as there is in industry a greater demand for and a greater consumption of machinery, it is said that the number of machines must necessarily increase; consequently, also, the manufacture of machines; consequently, also, the employment of workers in machine manufacture; and the workers employed in this branch of industry are skilled, even educated, workers.

Since the year 1840 this assertion, which even before that date was only half-true, has lost all semblance of truth; for the most diverse machines are now applied to the manufacture of the machines themselves on quite as extensive a scale as in the manufacture of cotton yarn, and the labourers employed in machine factories can but play the role of very stupid machines alongside of the highly ingenious machines.

But in place of the man who has been dismissed by the machine, the factory may employ, perhaps, three children and one woman! And must not the wages of the man have previously sufficed for the three children and one woman? Must not the minimum wages have sufficed for the preservation and propagation of the race? What, then, do these beloved bourgeois phrases prove? Nothing more than that now four times as many workers' lives are used up as there were previously, in order to obtain the livelihood of one working family.

To sum up: the more productive capital grows, the more it extends the division of labour and the application of machinery; the more the division of labour and the application of machinery extend, the more does competition extend among the workers, the more do their wages shrink together.

In addition, the working class is also recruited from the higher strata of society; a mass of small business men and of people living upon the interest of their capitals is precipitated into the ranks of the working class, and they will have nothing else to do than to stretch out their arms alongside of the arms of the workers. Thus the forest of outstretched arms, begging for work, grows ever thicker, while the arms themselves grow every leaner.

It is evident that the small manufacturer cannot survive in a struggle in which the first condition of success is production upon an ever greater scale. It is evident that the small manufacturers and thereby increasing the number of candidates for the proletariat – all this requires no further elucidation.

Finally, in the same measure in which the capitalists are compelled, by the movement described above, to exploit the already existing gigantic means of production on an ever-increasing scale, and for this purpose to set in motion all the mainsprings of credit, in the same measure do they increase the industrial earthquakes, in the midst of which the commercial world can preserve itself only by sacrificing a portion of its wealth, its products, and even its forces of production, to the gods of the lower world – in short, the crises increase. They become more frequent and more violent, if for no other reason, than for this alone, that in the same measure in which the mass of products grows, and therefore the needs for extensive markets, in the same measure does the world market shrink ever more, and ever fewer markets remain to be exploited, since every previous crisis has subjected to the commerce of the world a hitherto unconquered or but superficially exploited market.

But capital not only lives upon labour. Like a master, at once distinguished and barbarous, it drags with it into its grave the corpses of its slaves, whole hecatombs of workers, who perish in the crises.

We thus see that if capital grows rapidly, competition among the workers grows with even greater rapidity – i.e., the means of employment and subsistence for the working class decrease in proportion even more rapidly; but, this notwithstanding, the rapid growth of capital is the most favorable condition for wage-labour.

MANIFESTO OF THE COMMUNIST PARTY, 1848

Translated by Samuel Moore

The *Manifesto of the Communist Party* first appeared in an 1848 political pamphlet, which was commissioned by the Communist League and published in London, just as the revolutions of 1848 began to erupt. The text is now recognised as one of the world's most influential political manuscripts, presenting an analytical approach to the class struggle and the problems of capitalism and the capitalist mode of production, rather than a prediction of communism's potential future forms. The pamphlet summarises Marx and Engels' theories about the nature of society and politics. It also briefly features their ideas for how the capitalist society of the time would eventually be replaced by socialism.

In spring 1847 Marx and Engels had joined the League of the Just, who were quickly convinced by the duo's ideas of "critical communism". At its First Congress in June, the League tasked Engels with drafting a "profession of faith", though such a document was later deemed inappropriate for an open, non-confrontational organisation. Engels wrote the "Draft of the Communist Confession of Faith", detailing the League's programme. A few months later, Engels arrived at the League's Paris branch to find that Moses Hess had written an inadequate manifesto for the group, now called the League of Communists. In Hess' absence, Engels sternly criticised the manifesto, convincing the rest of the League to entrust him with drafting a new one. This became the draft *Principles of Communism*, described as "less of a credo and more of an exam paper."

On 23 November, just before the Communist League's Second Congress, Engels wrote to Marx, expressing his desire to avoid the catechism format in favour of the manifesto, as he felt it "must contain some history." On the 28th, Marx and Engels met at Ostend in Belgium, and a few days later, gathered at the Soho, London headquarters of the German Workers' Education Association to attend the Congress. Over the next ten days, intense debate raged between League functionaries. Marx eventually

dominated the others and secured a majority for his programme. The League unanimously adopted a far more combative resolution than that at the First Congress in June. Marx and Engels were subsequently commissioned to draw up a manifesto for the League.

The text is divided into a preamble and four sections, the last forming a conclusion. The introduction begins by proclaiming “A spectre is haunting Europe — the spectre of communism. All the powers of old Europe have entered into a holy alliance to exorcise this spectre”. Pointing out that parties everywhere — including those in government and those in the opposition — have flung the “branding reproach of communism” at each other, the authors infer from this that the powers-that-be acknowledge communism to be a power in itself. Subsequently, the introduction exhorts Communists to openly publish their views and aims, to “meet this nursery tale of the spectre of communism with a manifesto of the party itself”.

The first section, “Bourgeois and Proletarians”, explores the materialist conception of history, that “the history of all hitherto existing society is the history of class struggles”. Societies have always taken the form of an oppressed majority living under the control of an oppressive minority. In capitalism, the industrial working class, or proletariat, engage in class struggle against the owners of the means of production, the bourgeoisie. As before, this struggle will end in a revolution that restructures society, or the “common ruin of the contending classes”. The bourgeoisie, through the “constant revolutionising of production and uninterrupted disturbance of all social conditions” have emerged as the supreme class in society, displacing all the old powers of feudalism. The bourgeoisie constantly exploits the proletariat for its labour power, creating profit for themselves and accumulating capital. However, in doing so, the bourgeoisie serves as “its own grave-diggers”; the proletariat inevitably will become conscious of their own potential and rise to power through revolution, overthrowing the bourgeoisie.

In late February 1848, the *Manifesto* was anonymously published by the Workers’ Educational Association at Bishopsgate in the City of London. Written in German, the 23-page pamphlet was titled *Manifest der kommunistischen Partei* and had a dark-green cover. It was reprinted three times and serialised in the *Deutsche Londoner Zeitung*, a newspaper for German émigrés. On 4 March, one day after the serialisation in the *Zeitung* began, Marx was expelled by Belgian police. Two weeks later, a thousand

copies of the *Manifesto* reached Paris and from there to Germany in early April. In May the text was corrected for printing and punctuation mistakes; Marx and Engels would use this 30-page version as the basis for future editions of the *Manifesto*.

Handwritten manuscript page, likely a draft of the Communist Manifesto, featuring dense cursive script and a prominent stamp reading "S.G. A II".

Handwritten text at the top: *Handwritten text at the top of the page, possibly a date or reference.*

Stamp: **S.G. A II**

Main body of handwritten text in cursive script, covering most of the page.

Handwritten text at the bottom: *Handwritten text at the bottom of the page, possibly a signature or date.*

Only surviving page from the first draft of the Manifesto, handwritten by Marx

The first edition

VARIOUS EXISTING OPPOSITION PARTIES.

A scene from the German March Revolution in Berlin, 1848

PREFACE.

The “Manifesto” was published as the platform of the “Communist League” a workingmen’s association, first exclusively German, later an international, and under the political conditions of the Continent before 1848, unavoidably a secret society. At a Congress of the League, held in London in November, 1847, Marx and Engels were commissioned to prepare for publication a complete theoretical and practical party-program. Drawn up in German, in January, 1848, the manuscript was sent to the printer in London a few weeks before the French revolution of February 24th. A French translation was brought out in Paris, shortly before the insurrection of June, 1848. The first English translation, by Miss Helen Macfarlane, appeared in George Julian Harney’s “Red Republican,” London, 1850. A Danish and a Polish edition had also been published.

The defeat of the Parisian insurrection of June, 1848 — the first great battle between Proletariat and Bourgeoisie — drove again into the background, for a time, the social and political aspirations of the European working class. Thenceforth, the struggle for supremacy was again, as it had been before the revolution of February, solely between different sections of the propertied class; the working class was reduced to a fight for political elbow-room, and to the position of extreme wing of the Middle-class Radicals. Wherever independent proletarian movements continued to show signs of life, they were ruthlessly hunted down. Thus the Prussian police hunted out the Central Board of the Communist League, then located in Cologne. The members were arrested, and after eighteen months’ imprisonment, they were tried in October, 1852. This celebrated “Cologne Communist trial” lasted from October 4th till November 12th; seven of the prisoners were sentenced to terms of imprisonment in a fortress, varying from three to six years. Immediately after the sentence the League was formally dissolved by the remaining members. As to the “Manifesto,” it seemed thenceforth to be doomed to oblivion.

When the European working class had recovered sufficient strength for another attack on the ruling classes, the International Working Men’s Association sprang up. But this association, formed with the express aim of welding into one body the whole militant proletariat of Europe and

America, could not at once proclaim the principles laid down in the "Manifesto." The International was bound to have a program broad enough to be acceptable to the English Trades' Unions, to the followers of Proudhon in France, Belgium, Italy and Spain and to the Lassalleans in Germany. Marx, who drew up this program to the satisfaction of all parties, entirely trusted to the intellectual development of the working-class, which was sure to result from combined action and mutual discussion. The very events and vicissitudes of the struggle against Capital, the defeats even more than the victories, could not help bringing home to men's minds the insufficiency of their various favorite nostrums, and preparing the way for a more complete insight into the true conditions of working-class emancipation. And Marx was right. The International, on its breaking up in 1874, left the workers quite different men from what it had found them in 1864. Proudhonism in France, Lasalleanism in Germany were dying out, and even the Conservative English Trades' Unions, though most of them had long since severed their connection with the International, were gradually advancing towards that point at which, last year at Swansea, their president could say in their name, "Continental Socialism has lost its terrors for us." In fact, the principles of the "Manifesto" had made considerable headway among the working men of all countries.

The Manifesto itself thus came to the front again. The German text had been, since 1850, reprinted several times in Switzerland, England and America. In 1872, it was translated into English in New York, where the translation was published in "Woodhull and Claflin's Weekly." From this English version, a French one was made in "Le Socialiste" of New York. Since then at least two more English translations, more or less mutilated, have been brought out in America, and one of them has been reprinted in England. The first Russian translation, made by Bakounine, was published at Herzen's "Kolokol" office in Geneva, about 1863; a second one, by the heroic Vera Zasulitch, also in Geneva, 1882. A new Danish edition is to be found in "Socialdemokratisk Bibliothek," Copenhagen, 1885; a fresh French translation in "Le Socialiste," Paris, 1886. From this latter a Spanish version was prepared and published in Madrid, 1886. The German reprints are not to be counted, there have been twelve altogether at the least. An Armenian translation, which was to be published in Constantinople some months ago, did not see the light, I am told, because the publisher was afraid of bringing out a book with the name of Marx on it, while the

translator declined to call it his own production. Of further translations into other languages I have heard, but have not seen them. Thus the history of the Manifesto reflects, to a great extent, the history of the modern working-class movement; at present it is undoubtedly the most widespread, the most international production of all Socialist literature, the common platform acknowledged by millions of working men from Siberia to California.

Yet, when it was written, we could not have called it a Socialist Manifesto. By Socialists, in 1847, were understood, on the one hand, the adherents of the various Utopian systems: Owenites in England, Fourierists in France, both of them already reduced to the position of mere sects, and gradually dying out; on the other hand, the most multifarious social quacks, who, by all manners of tinkering, professed to redress, without any danger to capital and profit, all sorts of social grievances, in both cases men outside the working class movement, and looking rather to the “educated” classes for support. Whatever portion of the working class had become convinced of the insufficiency of mere political revolutions, and had proclaimed the necessity of a total social change, that portion, then, called itself Communist. It was a crude, rough-hewn, purely instinctive sort of Communism; still, it touched the cardinal point and was powerful enough amongst the working class to produce the Utopian Communism, in France, of Cabet, and in Germany, of Weitling. Thus, Socialism was, in 1847, a middle-class movement, Communism a working class movement. Socialism was, on the Continent at least, “respectable”; Communism was the very opposite. And as our notion, from the very beginning, was that “the emancipation of the working class must be the act of the working class itself,” there could be no doubt as to which of the two names we must take. Moreover, we have, ever since, been far from repudiating it.

The “Manifesto” being our joint production, I consider myself bound to state that the fundamental proposition which forms its nucleus, belongs to Marx. That proposition is: that in every historical epoch, the prevailing mode of economic production and exchange, and the social organization necessarily following from it, form the basis upon which is built up, and from which alone can be explained, the political and intellectual history of that epoch; that consequently the whole history of mankind (since the dissolution of primitive tribal society, holding land in common ownership) has been a history of class struggles, contests between exploiting and exploited, ruling and oppressed classes; that the history of these class

struggles forms a series of evolution in which, now-a-days, a stage has been reached where the exploited and oppressed class — the proletariat — cannot attain its emancipation from the sway of the exploiting and ruling class — the bourgeoisie — without, at the same time, and once and for all, emancipating society at large from all exploitation, oppression, class-distinctions and class struggles.

This proposition which, in my opinion, is destined to do for history what Darwin's theory has done for biology, we, both of us, had been gradually approaching for some years before 1845. How far I had independently progressed towards it, is best shown by my "Condition of the Working Class in England." But when I again met Marx at Brussels, in spring, 1845, he had it ready worked out, and put it before me, in terms almost as clear as those in which I have stated it here.

From our joint preface to the German edition of 1872, I quote the following:

"However much the state of things may have altered during the last 25 years, the general principles laid down in this Manifesto, are, on the whole, as correct today as ever. Here and there some detail might be improved. The practical application of the principles will depend, as the manifesto itself states, everywhere and at all times, on the historical conditions for the time being existing, and, for that reason, no special stress is laid on the revolutionary measures proposed at the end of Section II. That passage would, in many respects, be very differently worded today. In view of the gigantic strides of Modern Industry since 1848, and of the accompanying improved and extended organization of the working-class, in view of the practical experience gained, first in the February revolution, and then, still more, in the Paris Commune, where the proletariat for the first time held political power for two whole months, this program has in some details become antiquated. One thing especially was proved by the Commune, viz., that "the working-class cannot simply lay hold of the ready-made State machinery, and wield it for its own purposes." (See "The Civil War in France; Address of the General Council of the International Working-men's Association," Chicago, Charles H. Kerr & Co., where this point is further developed). Further, it is self-evident, that the criticism of socialist literature is deficient in relation to the present time, because it comes down only to 1847; also, that the remarks on the relation of the Communists to the various opposition-parties (Section IV.), although in principle still correct,

yet in practice are antiquated, because the political situation has been entirely changed, and the progress of history has swept from off the earth the greater portion of the political parties there enumerated.

“But then, the Manifesto has become a historical document which we have no longer any right to alter.”

The present translation is by Mr. Samuel Moore, the translator of the greater portion of Marx’s “Capital.” We have revised it in common, and I have added a few notes explanatory of historical allusions.

Frederick Engels.

London, 30th January, 1888.

MANIFESTO OF THE COMMUNIST PARTY BY KARL MARX AND FREDERICK ENGELS

A SPECTRE is haunting Europe — the spectre of Communism. All the powers of old Europe have entered into a holy alliance to exorcise this spectre; Pope and Czar, Metternich and Guizot, French Radicals and German police-spies.

Where is the party in opposition that has not been decried as communistic by its opponents in power? Where the Opposition that has not hurled back the branding reproach of Communism, against the more advanced opposition parties, as well as against its reactionary adversaries?

Two things result from this fact.

I. Communism is already acknowledged by all European Powers to be itself a Power.

II. It is high time that Communists should openly, in the face of the whole world, publish their views, their aims, their tendencies, and meet this nursery tale of the Spectre of Communism with a Manifesto of the party itself.

To this end, Communists of various nationalities have assembled in London, and sketched the following manifesto, to be published in the English, French, German, Italian, Flemish and Danish languages.

I. BOURGEOIS AND PROLETARIANS.

The history of all hitherto existing society is the history of class struggles.

Freeman and slave, patrician and plebeian, lord and serf, guild-master and journeyman, in a word, oppressor and oppressed, stood in constant opposition to one another, carried on an uninterrupted, now hidden, now open fight, a fight that each time ended, either in a revolutionary reconstitution of society at large, or in the common ruin of the contending classes.

In the earlier epochs of history, we find almost everywhere a complicated arrangement of society into various orders, a manifold gradation of social rank. In ancient Rome we have patricians, knights, plebeians, slaves; in the middle ages, feudal lords, vassals, guild-masters, journeymen, apprentices, serfs; in almost all of these classes, again, subordinate gradations.

The modern bourgeois society that has sprouted from the ruins of feudal society, has not done away with class antagonisms. It has but established new classes, new conditions of oppression, new forms of struggle in place of the old ones.

Our epoch, the epoch of the bourgeoisie, possesses, however, this distinctive feature; it has simplified the class antagonisms. Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other: Bourgeoisie and Proletariat.

From the serfs of the middle ages sprang the chartered burghers of the earliest towns. From these burgesses the first elements of the bourgeoisie were developed.

The discovery of America, the rounding of the Cape, opened up fresh ground for the rising bourgeoisie. The East-Indian and Chinese markets, the colonization of America, trade with the colonies, the increase in the means of exchange and in commodities generally, gave to commerce, to navigation, to industry, an impulse never before known, and thereby, to the revolutionary element in the tottering feudal society, a rapid development.

The feudal system of industry, under which industrial production was monopolized by close guilds, now no longer sufficed for the growing wants of the new markets. The manufacturing system took its place. The guild-

masters were pushed on one side by the manufacturing middle-class; division of labor between the different corporate guilds vanished in the face of division of labor in each single workshop.

Meantime the markets kept ever growing, the demand, ever rising. Even manufacture no longer sufficed. Thereupon, steam and machinery revolutionized industrial production. The place of manufacture was taken by the giant, Modern Industry, the place of the industrial middle-class, by industrial millionaires, the leaders of whole industrial armies, the modern bourgeois.

Modern industry has established the world-market, for which the discovery of America paved the way. This market has given an immense development to commerce, to navigation, to communication by land. This development has, in its turn, reacted on the extension of industry; and in proportion as industry, commerce, navigation, railways extended, in the same proportion the bourgeoisie developed, increased its capital, and pushed into the background every class handed down from the Middle Ages.

We see, therefore, how the modern bourgeoisie is itself the product of a long course of development, of a series of revolutions in the modes of production and of exchange.

Each step in the development of the bourgeoisie was accompanied by a corresponding political advance of that class. An oppressed class under the sway of the feudal nobility, an armed and self-governing association in the mediaeval commune, here independent urban republic (as in Italy and Germany), there taxable “third estate” of the monarchy (as in France), afterwards, in the period of manufacture proper, serving either the semi-feudal or the absolute monarchy as a counterpoise against the nobility, and, in fact, corner stone of the great monarchies in general, the bourgeoisie has at last, since the establishment of Modern Industry and of the world-market, conquered for itself, in the modern representative State, exclusive political sway. The executive of the modern State is but a committee for managing the common affairs of the whole bourgeoisie.

The bourgeoisie, historically, has played a most revolutionary part.

The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations. It has pitilessly torn asunder the motley feudal ties that bound man to his “natural superiors,” and has left remaining no other nexus between man and man than naked self-interest, than callous

“cash payment.” It has drowned the most heavenly ecstasies of religious fervor, of chivalrous enthusiasm, of philistine sentimentalism, in the icy water of egotistical calculation. It has resolved personal worth into exchange value, and in place of the numberless indefeasible chartered freedoms, has set up that single, unconscionable freedom — Free Trade. In one word, for exploitation, veiled by religious and political illusions, it has substituted naked, shameless, direct, brutal exploitation.

The bourgeoisie has stripped of its halo every occupation hitherto honored and looked up to with reverent awe. It has converted the physician, the lawyer, the priest, the poet, the man of science, into its paid wage-laborers.

The bourgeoisie has torn away from the family its sentimental veil, and has reduced the family relation to a mere money relation.

The bourgeoisie has disclosed how it came to pass that the brutal display of vigor in the Middle Ages, which Reactionists so much admire, found its fitting complement in the most slothful indolence. It has been the first to show what man’s activity can bring about. It has accomplished wonders far surpassing Egyptian pyramids, Roman aqueducts, and Gothic cathedrals; it has conducted expeditions that put in the shade all former Exoduses of nations and crusades.

The bourgeoisie cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society. Conservation of the old modes of production in unaltered form, was, on the contrary, the first condition of existence for all earlier industrial classes. Constant revolutionizing of production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation distinguish the bourgeois epoch from all earlier ones. All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into air, all that is holy is profaned, and man is at last compelled to face with sober senses, his real conditions of life, and his relations with his kind.

The need of a constantly expanding market for its products chases the bourgeoisie over the whole surface of the globe. It must nestle everywhere, settle everywhere, establish connections everywhere.

The bourgeoisie has through its exploitation of the world-market given a cosmopolitan character to production and consumption in every country. To

the great chagrin of Reactionists, it has drawn from under the feet of industry the national ground on which it stood. All old-established national industries have been destroyed or are daily being destroyed. They are dislodged by new industries, whose introduction becomes a life and death question for all civilized nations, by industries that no longer work up indigenous raw material, but raw material drawn from the remotest zones; industries whose products are consumed, not only at home, but in every quarter of the globe. In place of the old wants, satisfied by the productions of the country, we find new wants, requiring for their satisfaction the products of distant lands and climes. In place of the old local and national seclusion and self-sufficiency, we have intercourse in every direction, universal inter-dependence of nations. And as in material, so also in intellectual production. The intellectual creations of individual nations become common property. National one-sidedness and narrow-mindedness become more and more impossible, and from the numerous national and local literatures there arises a world-literature.

The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facilitated means of communication, draws all, even the most barbarian, nations into civilization. The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese walls, with which it forces the barbarians' intensely obstinate hatred of foreigners to capitulate. It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilization into their midst, i. e., to become bourgeois themselves. In a word, it creates a world after its own image.

The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased the urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it has made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on the civilized ones, nations of peasants on nations of bourgeois, the East on the West.

The bourgeoisie keeps more and more doing away with the scattered state of the population, of the means of production, and of property. It has agglomerated population, centralized means of production, and has concentrated property in a few hands. The necessary consequence of this was political centralization. Independent, or but loosely connected

provinces, with separate interests, laws, governments and systems of taxation, became lumped together in one nation, with one government, one code of laws, one national class-interest, one frontier and one customs-tariff.

The bourgeoisie, during its rule of scarce one hundred years, has created more massive and more colossal productive forces than have all preceding generations together. Subjection of Nature's forces to man, machinery, application of chemistry to industry and agriculture, steam-navigation, railways, electric telegraphs, clearing of whole continents for cultivation, canalization of rivers, whole populations conjured out of the ground — what earlier century had even a presentiment that such productive forces slumbered in the lap of social labor?

We see then: the means of production and of exchange on whose foundation the bourgeoisie built itself up, were generated in feudal society. At a certain stage in the development of these means of production and of exchange, the conditions under which feudal society produced and exchanged, the feudal organization of agriculture and manufacturing industry, in one word, the feudal relations of property became no longer compatible with the already developed productive forces; they became so many fetters. They had to burst asunder; they were burst asunder.

Into their places stepped free competition, accompanied by a social and political constitution adapted to it, and by the economical and political sway of the bourgeois class.

A similar movement is going on before our own eyes. Modern bourgeois society with its relations of production, of exchange and of property, a society that has conjured up such gigantic means of production and of exchange, is like the sorcerer, who is no longer able to control the powers of the nether world whom he has called up by his spells. For many a decade past the history of industry and commerce is but the history of the revolt of modern productive forces against modern conditions of production, against the property relations that are the conditions for the existence of the bourgeoisie and of its rule. It is enough to mention the commercial crises that by their periodical return put on its trial, each time more threateningly, the existence of the entire bourgeois society. In these crises a great part not only of the existing products, but also of the previously created productive forces, are periodically destroyed. In these crises there breaks out an epidemic that, in all earlier epochs, would have seemed an absurdity — the

epidemic of over-production. Society suddenly finds itself put back into a state of momentary barbarism; it appears as if a famine, a universal war of devastation had cut off the supply of every means of subsistence; industry and commerce seem to be destroyed; and why? Because there is too much civilization, too much means of subsistence, too much industry, too much commerce. The productive forces at the disposal of society no longer tend to further the development of the conditions of bourgeois property; on the contrary, they have become too powerful for these conditions, by which they are fettered, and so soon as they overcome these fetters, they bring disorder into the whole of bourgeois society, endanger the existence of bourgeois property. The conditions of bourgeois society are too narrow to comprise the wealth created by them. And how does the bourgeoisie get over these crises? On the one hand by enforced destruction of a mass of productive forces; on the other, by the conquest of new markets, and by the more thorough exploitation of the old ones. That is to say, by paving the way for more extensive and more destructive crises, and by diminishing the means whereby crises are prevented.

The weapons with which the bourgeoisie felled feudalism to the ground are now turned against the bourgeoisie itself.

But not only has the bourgeoisie forged the weapons that bring death to itself; it has also called into existence the men who are to wield those weapons — the modern working-class — the proletarians.

In proportion as the bourgeoisie, i. e., capital, is developed, in the same proportion is the proletariat, the modern working-class, developed, a class of laborers, who live only so long as they find work, and who find work only so long as their labor increases capital. These laborers, who must sell themselves piecemeal, are a commodity, like every other article of commerce, and are consequently exposed to all the vicissitudes of competition, to all the fluctuations of the market.

Owing to the extensive use of machinery and to division of labor, the work of the proletarians has lost all individual character, and, consequently, all charm for the workman. He becomes an appendage of the machine, and it is only the most simple, most monotonous, and most easily acquired knack that is required of him. Hence, the cost of production of a workman is restricted, almost entirely, to the means of subsistence that he requires for his maintenance, and for the propagation of his race. But the price of a commodity, and also of labor, is equal to its cost of production. In

proportion, therefore, as the repulsiveness of the work increases, the wage decreases. Nay more, in proportion as the use of machinery and division of labor increases, in the same proportion the burden of toil also increases, whether by prolongation of the working hours, by increase of the work enacted in a given time, or by increased speed of the machinery, etc.

Modern industry has converted the little workshop of the patriarchal master into the great factory of the industrial capitalist. Masses of laborers, crowded into the factory, are organized like soldiers. As privates of the industrial army they are placed under the command of a perfect hierarchy of officers and sergeants. Not only are they the slaves of the bourgeois class, and of the bourgeois State, they are daily and hourly enslaved by the machine, by the over-looker, and, above all, by the individual bourgeois manufacturer himself. The more openly this despotism proclaims gain to be its end and aim, the more petty, the more hateful and the more embittering it is.

The less the skill and exertion or strength implied in manual labor, in other words, the more modern industry becomes developed, the more is the labor of men superseded by that of women. Differences of age and sex have no longer any distinctive social validity for the working class. All are instruments of labor, more or less expensive to use, according to their age and sex.

No sooner is the exploitation of the laborer by the manufacturer, so far at an end, that he receives his wages in cash, than he is set upon by the other portions of the bourgeoisie, the landlord, the shopkeeper, the pawnbroker, etc.

The lower strata of the Middle class — the small tradespeople, shopkeepers, and retired tradesmen generally, the handicraftsmen and peasants — all these sink gradually into the proletariat, partly because their diminutive capital does not suffice for the scale on which Modern Industry is carried on, and is swamped in the competition with the large capitalists, partly because their specialized skill is rendered worthless by new methods of production. Thus the proletariat is recruited from all classes of the population.

The proletariat goes through various stages of development. With its birth begins its struggle with the bourgeoisie. At first the contest is carried on by individual laborers, then by the workpeople of a factory, then by the operatives of one trade, in one locality, against the individual bourgeois who

directly exploits them. They direct their attacks not against the bourgeois conditions of production, but against the instruments of production themselves; they destroy imported wares that compete with their labor, they smash to pieces machinery, they set factories ablaze, they seek to restore by force the vanished status of the workman of the Middle Ages.

At this stage the laborers still form an incoherent mass scattered over the whole country, and broken up by their mutual competition. If anywhere they unite to form more compact bodies, this is not yet the consequence of their own active union, but of the union of the bourgeoisie, which class, in order to attain its own political ends, is compelled to set the whole proletariat in motion, and is moreover yet, for a time, able to do so. At this stage, therefore, the proletarians do not fight their enemies, but the enemies of their enemies, the remnants of absolute monarchy, the landowners, the non-industrial bourgeois, the petty bourgeoisie. Thus the whole historical movement is concentrated in the hands of the bourgeoisie; every victory so obtained is a victory for the bourgeoisie.

But with the development of industry the proletariat not only increases in number, it becomes concentrated in greater masses, its strength grows, and it feels that strength more. The various interests and conditions of life within the ranks of the proletariat are more and more equalized, in proportion as machinery obliterates all distinctions of labor, and nearly everywhere reduces wages to the same low level. The growing competition among the bourgeois, and the resulting commercial crises, make the wages of the workers ever more fluctuating. The unceasing improvement of machinery, ever more rapidly developing, makes their livelihood more and more precarious; the collisions between individual workmen and individual bourgeois take more and more the character of collisions between two classes. Thereupon the workers begin to form combinations (Trades' Unions) against the bourgeois; they club together in order to keep up the rate of wages; they found permanent associations in order to make provision beforehand for these occasional revolts. Here and there the contest breaks out into riots.

Now and then the workers are victorious, but only for a time. The real fruit of their battles lies, not in the immediate result, but in the ever expanding union of the workers. This union is helped on by the improved means of communication that are created by modern industry, and that place the workers of different localities in contact with one another. It was just

this contact that was needed to centralize the numerous local struggles, all of the same character, into one national struggle between classes. But every class struggle is a political struggle. And that union, to attain which the burghers of the Middle Ages, with their miserable highways, required centuries, the modern proletarians, thanks to railways, achieve in a few years.

This organization of the proletarians into a class, and consequently into a political party, is continually being upset again by the competition between the workers themselves. But it ever rises up again, stronger, firmer, mightier. It compels legislative recognition of particular interests of the workers, by taking advantage of the divisions among the bourgeoisie itself. Thus the ten-hour bill in England was carried.

Altogether collisions between the classes of the old society further, in many ways, the course of development of the proletariat. The bourgeoisie finds itself involved in a constant battle. At first with the aristocracy; later on, with those portions of the bourgeoisie itself, whose interests have become antagonistic to the progress of industry; at all times, with the bourgeoisie of foreign countries. In all these battles it sees itself compelled to appeal to the proletariat, to ask for its help, and thus, to drag it into the political arena. The bourgeoisie itself, therefore, supplies the proletariat with its own elements of political and general education, in other words, it furnishes the proletariat with weapons for fighting the bourgeoisie.

Further, as we have already seen, entire sections of the ruling classes are, by the advance of industry, precipitated into the proletariat, or are at least threatened in their conditions of existence. These also supply the proletariat with fresh elements of enlightenment and progress.

Finally, in times when the class-struggle nears the decisive hour, the process of dissolution going on within the ruling class, in fact, within the whole range of old society, assumes such a violent, glaring character, that a small section of the ruling class cuts itself adrift, and joins the revolutionary class, the class that holds the future in its hands. Just as, therefore, at an earlier period, a section of the nobility went over to the bourgeoisie, so now a portion of the bourgeoisie goes over to the proletariat, and in particular, a portion of the bourgeois ideologists, who have raised themselves to the level of comprehending theoretically the historical movements as a whole.

Of all the classes that stand face to face with the bourgeoisie today, the proletariat alone is a really revolutionary class. The other classes decay and

finally disappear in the face of modern industry; the proletariat is its special and essential product.

The lower middle-class, the small manufacturer, the shopkeeper, the artisan, the peasant, all these fight against the bourgeoisie, to save from extinction their existence as fractions of the middle class. They are, therefore, not revolutionary, but conservative. Nay more, they are reactionary, for they try to roll back the wheel of history. If by chance they are revolutionary, they are so, only in view of their impending transfer into the proletariat, they thus defend not their present, but their future interests, they desert their own standpoint to place themselves at that of the proletariat.

The “dangerous class,” the social scum, that passively rotting mass thrown off by the lowest layers of old society, may, here and there, be swept into the movement by a proletarian revolution; its conditions of life, however, prepare it far more for the part of a bribed tool of reactionary intrigue.

In the conditions of the proletariat, those of old society at large are already virtually swamped. The proletarian is without property; his relation to his wife and children has no longer anything in common with the bourgeois family-relations; modern industrial labor, modern subjection to capital, the same in England as in France, in America as in Germany, has stripped him of every trace of national character. Law, morality, religion, are to him so many bourgeois prejudices, behind which lurk in ambush just as many bourgeois interests.

All the preceding classes that got the upper hand, sought to fortify their already acquired status by subjecting society at large to their conditions of appropriation. The proletarians cannot become masters of the productive forces of society, except by abolishing their own previous mode of appropriation, and thereby also every other previous mode of appropriation. They have nothing of their own to secure and to fortify; their mission is to destroy all previous securities for, and insurances of, individual property.

All previous historical movements were movements of minorities, or in the interest of minorities. The proletarian movement is the self-conscious, independent movement of the immense majority, in the interest of the immense majority. The proletariat, the lowest stratum of our present society, cannot stir, cannot raise itself up, without the whole superincumbent strata of official society being sprung into the air.

Though not in substance, yet in form, the struggle of the proletariat with the bourgeoisie is at first a national struggle. The proletariat of each country must, of course, first of all settle matters with its own bourgeoisie.

In depicting the most general phases of the development of the proletariat, we traced the more or less veiled civil war, raging within existing society, up to the point where that war breaks out into open revolution, and where the violent overthrow of the bourgeoisie, lays the foundation for the sway of the proletariat.

Hitherto, every form of society has been based, as we have already seen, on the antagonism of oppressing and oppressed classes. But in order to oppress a class, certain conditions must be assured to it under which it can, at least, continue its slavish existence. The serf, in the period of serfdom, raised himself to membership in the commune, just as the petty bourgeois, under the yoke of feudal absolutism, managed to develop into a bourgeois. The modern laborer, on the contrary, instead of rising with the progress of industry, sinks deeper and deeper below the conditions of existence of his own class. He becomes a pauper, and pauperism develops more rapidly than population and wealth. And here it becomes evident, that the bourgeoisie is unfit any longer to be the ruling class in society, and to impose its conditions of existence upon society as an over-riding law. It is unfit to rule, because it is incompetent to assure an existence to its slave within his slavery, because it cannot help letting him sink into such a state that it has to feed him, instead of being fed by him. Society can no longer live under this bourgeoisie, in other words, its existence is no longer compatible with society.

The essential condition for the existence, and for the sway of the bourgeois class, is the formation and augmentation of capital; the condition for capital is wage-labor. Wage-labor rests exclusively on competition between the laborers. The advance of industry, whose involuntary promoter is the bourgeoisie, replaces the isolation of the laborers, due to competition, by their revolutionary combination, due to association. The development of Modern Industry, therefore, cuts from under its feet the very foundation on which the bourgeoisie produces and appropriates products. What the bourgeoisie therefore produces, above all, are its own grave-diggers. Its fall and the victory of the proletariat are equally inevitable.

II. PROLETARIANS AND COMMUNISTS.

In what relation do the Communists stand to the proletarians as a whole?

The Communists do not form a separate party opposed to other working-class parties.

They have no interests separate and apart from those of the proletariat as a whole.

They do not set up any sectarian principles of their own, by which to shape and mould the proletarian movement.

The Communists are distinguished from the other working class parties by this only: 1. In the national struggles of the proletarians of the different countries, they point out and bring to the front the common interests of the entire proletariat independently of all nationality. 2. In the various stages of development which the struggle of the working class against the bourgeoisie has to pass through, they always and everywhere represent the interests of the movement as a whole.

The Communists, therefore, are on the one hand, practically, the most advanced and resolute section of the working class parties of every country, that section which pushes forward all others; on the other hand, theoretically, they have over the great mass of the proletariat the advantage of clearly understanding the line of march, the conditions, and the ultimate general results of the proletarian movement.

The immediate aim of the Communists is the same as that of all the other proletarian parties; formation of the proletariat into a class, overthrow of the bourgeois supremacy, conquest of political power by the proletariat.

The theoretical conclusions of the Communists are in no way based on ideas or principles that have been invented, or discovered, by this or that would-be universal reformer.

They merely express, in general terms, actual relations springing from an existing class struggle, from a historical movement going on under our very eyes. The abolition of existing property relations is not at all a distinctive feature of Communism.

All property relations in the past have continually been subject to historical change consequent upon the change in historical conditions.

The French Revolution, for example, abolished feudal property in favor of bourgeois property.

The distinguishing feature of Communism is not the abolition of property generally, but the abolition of bourgeois property. But modern bourgeois private property is the final and most complete expression of the system of producing and appropriating products, that is based on class antagonism, on the exploitation of the many by the few.

In this sense, the theory of the Communists may be summed up in the single sentence: Abolition of private property.

We Communists have been reproached with the desire of abolishing the right of personally acquiring property as the fruit of a man's own labor, which property is alleged to be the ground work of all personal freedom, activity and independence.

Hard-won, self-acquired, self-earned property! Do you mean the property of the petty artisan and of the small peasant, a form of property that preceded the bourgeois form? There is no need to abolish that; the development of industry has to a great extent already destroyed it, and is still destroying it daily.

Or do you mean modern bourgeois private property?

But does wage-labor create any property for the laborer? Not a bit. It creates capital, i. e., that kind of property which exploits wage-labor, and which cannot increase except upon condition of getting a new supply of wage-labor for fresh exploitation. Property, in its present form, is based on the antagonism of capital and wage-labor. Let us examine both sides of this antagonism.

To be a capitalist, is to have not only a purely personal, but a social status in production. Capital is a collective product, and only by the united action of many members, nay, in the last resort, only by the united action of all members of society, can it be set in motion.

Capital is therefore not a personal, it is a social power.

When, therefore, capital is converted into common property, into the property of all members of society, personal property is not thereby transformed into social property. It is only the social character of the property that is changed. It loses its class-character.

Let us now take wage-labor.

The average price of wage-labor is the minimum wage, i. e., that quantum of the means of subsistence, which is absolutely requisite to keep

the laborer in bare existence as a laborer. What, therefore, the wage-laborer appropriates by means of his labor, merely suffices to prolong and reproduce a bare existence. We by no means intend to abolish this personal appropriation of the products of labor, an appropriation that is made for the maintenance and reproduction of human life, and that leaves no surplus wherewith to command the labor of others. All that we want to do away with is the miserable character of this appropriation, under which the laborer lives merely to increase capital, and is allowed to live only in so far as the interest of the ruling class requires it.

In bourgeois society, living labor is but a mean to increase accumulated labor. In Communist society, accumulated labor is but a means to widen, to enrich, to promote the existence of the laborer. In bourgeois society, therefore, the past dominates the present; in communist society, the present dominates the past. In bourgeois society capital is independent and has individuality, while the living person is dependent and has no individuality.

And the abolition of this state of things is called by the bourgeois, abolition of individuality and freedom! And rightly so. The abolition of bourgeois individuality, bourgeois independence, and bourgeois freedom is undoubtedly aimed at.

By freedom is meant, under the present bourgeois conditions of production, free trade, free selling and buying.

But if selling and buying disappears, free selling and buying disappears also. This talk about free selling and buying, and all the other “brave words” of our bourgeoisie about freedom in general, have a meaning, if any, only in contrast with restricted selling and buying, with the fettered traders of the Middle Ages, but have no meaning when opposed to the Communistic abolition of buying and selling, of the bourgeois conditions of production, and of the bourgeoisie itself.

You are horrified at our intending to do away with private property. But in your existing society, private property is already done away with for nine-tenths of the population; its existence for the few is solely due to its non-existence in the hands of those nine-tenths. You reproach us, therefore, with intending to do away with a form of property, the necessary condition for whose existence is, the non-existence of any property for the immense majority of society.

In one word, you reproach us with intending to do away with your property. Precisely so; that is just what we intend.

From the moment when labor can no longer be converted into capital, money, or rent, into a social power capable of being monopolized, i.e., from the moment when individual property can no longer be transformed into bourgeois property, into capital, from that moment, you say, individuality vanishes.

You must, therefore, confess that by “individual” you mean no other person than the bourgeois, than the middle-class owner of property. This person must, indeed, be swept out of the way, and made impossible.

Communism deprives no man of the power to appropriate the products of society: all that it does is to deprive him of the power to subjugate the labor of others by means of such appropriation.

It has been objected, that upon the abolition of private property all work will cease, and universal laziness will overtake us.

According to this, bourgeois society ought long ago to have gone to the dogs through sheer idleness; for those of its members who work, acquire nothing, and those who acquire anything, do not work. The whole of this objection is but another expression of the tautology: that there can no longer be any wage-labor when there is no longer any capital.

All objections urged against the Communistic mode of producing and appropriating material products, have, in the same way, been urged against the Communistic modes of producing and appropriating intellectual products. Just as, to the bourgeois, the disappearance of class property is the disappearance of production itself, so the disappearance of class culture is to him identical with the disappearance of all culture.

That culture, the loss of which he laments, is, for the enormous majority, a mere training to act as a machine.

But don't wrangle with us so long as you apply, to our intended abolition of bourgeois property, the standard of your bourgeois notions of freedom, culture, law, etc. Your very ideas are but the outgrowth of the conditions of your bourgeois production and bourgeois property, just as your jurisprudence is but the will of your class made into a law for all, a will, whose essential character and direction are determined by the economic conditions of existence of your class.

The selfish misconception that induces you to transform into eternal laws of nature and of reason, the social forms springing from your present mode of production and form of property — historical relations that rise and disappear in the progress of production — this misconception you share

with every ruling class that has preceded you. What you see clearly in the case of ancient property, what you admit in the case of feudal property, you are of course forbidden to admit in the case of your own bourgeois form of property.

Abolition of the family! Even the most radical flare up at this infamous proposal of the Communists.

On what foundation is the present family, the bourgeois family, based? On capital, on private gain. In its completely developed form this family exists only among the bourgeoisie. But this state of things finds its complement in the practical absence of the family among the proletarians, and in public prostitution.

The bourgeois family will vanish as a matter of course when its complement vanishes, and both will vanish with the vanishing of capital.

Do you charge us with wanting to stop the exploitation of children by their parents? To this crime we plead guilty.

But, you will say, we destroy the most hallowed of relations, when we replace home education by social.

And your education! Is not that also social, and determined by the social conditions under which you educate, by the intervention, direct or indirect, of society by means of schools, etc.? The Communists have not invented the intervention of society in education; they do but seek to alter the character of that intervention, and to rescue education from the influence of the ruling class.

The bourgeois clap-trap about the family and education, about the hallowed co-relation of parent and child, becomes all the more disgusting, the more, by the action of Modern Industry, all family ties among the proletarians are torn asunder, and their children transformed into simple articles of commerce and instruments of labor.

But you Communists would introduce community of women, screams the whole bourgeoisie in chorus.

The bourgeois sees in his wife a mere instrument of production. He hears that the instruments of production are to be exploited in common, and, naturally, can come to no other conclusion, than that the lot of being common to all will likewise fall to the women.

He has not even a suspicion that the real point aimed at is to do away with the status of women as mere instruments of production.

For the rest, nothing is more ridiculous than the virtuous indignation of our bourgeois at the community of women which, they pretend, is to be openly and officially established by the Communists. The Communists have no need to introduce community of women; it has existed almost from time immemorial.

Our bourgeois, not content with having the wives and daughters of their proletarians at their disposal, not to speak of common prostitutes, take the greatest pleasure in seducing each others' wives.

Bourgeois marriage is in reality a system of wives in common and thus, at the most, what the Communists might possibly be reproached with, is that they desire to introduce, in substitution for a hypocritically concealed, an openly legalized community of women. For the rest, it is self-evident, that the abolition of the present system of production must bring with it the abolition of the community of women springing from that system, i. e., of prostitution both public and private.

The Communists are further reproached with desiring to abolish countries and nationalities.

The working men have no country. We cannot take from them what they have not got. Since the proletariat must first of all acquire political supremacy, must rise to be the leading class of the nation, must constitute itself the nation, it is, so far, itself national, though not in the bourgeois sense of the word.

National differences, and antagonisms between peoples, are daily more and more vanishing, owing to the development of the bourgeoisie, to freedom of commerce, to the world-market, to uniformity in the mode of production and in the conditions of life corresponding thereto.

The supremacy of the proletariat will cause them to vanish still faster. United action, of the leading civilized countries at least, is one of the first conditions for the emancipation of the proletariat.

In proportion as the exploitation of one individual by another is put an end to, the exploitation of one nation by another will also be put an end to. In proportion as the antagonism between classes within the nation vanishes, the hostility of one nation to another will come to an end.

The charges against Communism made from a religious, a philosophical, and generally, from an ideological standpoint, are not deserving of serious examination.

Does it require deep intuition to comprehend that man's ideas, views, and conceptions, in one word, man's consciousness, changes with every change in the conditions of his material existence, in his social relations and in his social life?

What else does the history of ideas prove, than that intellectual production changes in character in proportion as material production is changed? The ruling ideas of each age have ever been the ideas of its ruling class.

When people speak of ideas that revolutionize society, they do but express the fact, that within the old society, the elements of a new one have been created, and that the dissolution of the old ideas keeps even pace with the dissolution of the old conditions of existence.

When the ancient world was in its last throes, the ancient religions were overcome by Christianity. When Christian ideas succumbed in the 18th century to rationalist ideas, feudal society fought its death-battle with the then revolutionary bourgeoisie. The ideas of religious liberty and freedom of conscience, merely gave expression to the sway of free competition within the domain of knowledge.

"Undoubtedly," it will be said, "religious, moral, philosophical and juridical ideas have been modified in the course of historical development. But religion, morality, philosophy, political science, and law, constantly survived this change."

"There are, besides, eternal truths, such as Freedom, Justice, etc., that are common to all states of society. But Communism abolishes eternal truths, it abolishes all religion, and all morality, instead of constituting them on a new basis; it therefore acts in contradiction to all past historical experience."

What does this accusation reduce itself to? The history of all past society has consisted in the development of class antagonisms, antagonisms that assumed different forms at different epochs.

But whatever form they may have taken, one fact is common to all past ages, viz., the exploitation of one part of society by the other. No wonder, then, that the social consciousness of past ages, despite all the multiplicity and variety it displays, moves within certain common forms, or general ideas, which cannot completely vanish except with the total disappearance of class antagonisms.

The Communist revolution is the most radical rupture with traditional property-relations; no wonder that its development involves the most radical rupture with traditional ideas.

But let us have done with the bourgeois objections to Communism.

We have seen above, that the first step in the revolution by the working class, is to raise the proletariat to the position of ruling class, to win the battle of democracy.

The proletariat will use its political supremacy, to wrest, by degrees, all capital from the bourgeoisie, to centralize all instruments of production in the hands of the State, i. e., of the proletariat organized as the ruling class; and to increase the total of productive forces as rapidly as possible.

Of course, in the beginning, this cannot be effected except by means of despotic inroads on the rights of property, and on the conditions of bourgeois production; by means of measures, therefore, which appear economically insufficient and untenable, but which, in the course of the movement, outstrip themselves, necessitate further inroads upon the old social order, and are unavoidable as a means of entirely revolutionizing the mode of production.

These measures will of course be different in different countries.

Nevertheless in the most advanced countries the following will be pretty generally applicable:

1. Abolition of property in land and application of all rents of land to public purposes.
2. A heavy progressive or graduated income tax.
3. Abolition of all right of inheritance.
4. Confiscation of the property of all emigrants and rebels.
5. Centralization of credit in the hands of the state, by means of a national bank with State capital and an exclusive monopoly.
6. Centralization of the means of communication and transport in the hands of the State.
7. Extension of factories and instruments of production owned by the State; the bringing into cultivation of waste lands, and the improvement of the soil generally in accordance with a common plan.
8. Equal liability of all to labor. Establishment of industrial armies, especially for agriculture.
9. Combination of agriculture with manufacturing industries; gradual abolition of the distinction between town and country, by a more equable

distribution of population over the country.

10. Free education for all children in public schools. Abolition of children's factory labor in its present form. Combination of education with industrial production, etc., etc.

When, in the course of development, class distinctions have disappeared, and all production has been concentrated in the hands of a vast association of the whole nation, the public power will lose its political character. Political power, properly so called, is merely the organized power of one class for oppressing another. If the proletariat during its contest with the bourgeoisie is compelled, by the force of circumstances, to organize itself as a class, if, by means of a revolution, it makes itself the ruling class, and, as such, sweeps away by force the old conditions of production, then it will, along with these conditions, have swept away the conditions for the existence of class antagonisms, and of classes generally, and will thereby have abolished its own supremacy as a class.

In place of the old bourgeois society, with its classes and class antagonisms, we shall have an association, in which the free development of each is the condition for the free development of all.

III. SOCIALIST AND COMMUNIST LITERATURE.

1. Reactionary Socialism.

a. Feudal Socialism.

Owing to their historical position, it became the vocation of the aristocracies of France and England to write pamphlets against modern bourgeois society. In the French revolution of July, 1830, and in the English reform agitation, these aristocracies again succumbed to the hateful upstart. Thenceforth, a serious political contest was altogether out of the question. A literary battle alone remained possible. But even in the domain of literature the old cries of the restoration period had become impossible.

In order to arouse sympathy, the aristocracy were obliged to lose sight, apparently, of their own interests, and to formulate their indictment against the bourgeoisie in the interest of the exploited working class alone. Thus the aristocracy took their revenge by singing lampoons on their new master, and whispering in his ears sinister prophecies of coming catastrophe.

In this way arose feudal socialism; half lamentation, half lampoon; half echo of the past, half menace of the future; at times, by its bitter, witty and incisive criticism, striking the bourgeoisie to the very hearts' core, but always ludicrous in its effect, through total incapacity to comprehend the march of modern history.

The aristocracy, in order to rally the people to them, waved the proletarian alms-bag in front for a banner. But the people, so often as it joined them, saw on their hindquarters the old feudal coats of arms, and deserted with loud and irreverent laughter.

One section of the French Legitimists, and "Young England," exhibited this spectacle.

In pointing out that their mode of exploitation was different to that of the bourgeoisie, the feudalists forget that they exploited under circumstances and conditions that were quite different, and that are now antiquated. In showing that, under their rule, the modern proletariat never existed, they forget that the modern bourgeoisie is the necessary offspring of their own form of society.

For the rest, so little do they conceal the reactionary character of their criticism, that their chief accusation against the bourgeoisie amounts to this, that under the bourgeois regime a class is being developed, which is destined to cut up root and branch the old order of society.

What they upbraid the bourgeoisie with is not so much that it creates a proletariat, as that it creates a revolutionary proletariat.

In political practice, therefore, they join in all coercive measures against the working-class; and in ordinary life, despite their high falutin phrases, they stoop to pick up the golden apples dropped from the tree of industry, and to barter truth, love, and honor for traffic in wool, beetroot-sugar and potato spirit.

As the parson has ever gone hand in hand with the landlord, so has Clerical Socialism with Feudal Socialism.

Nothing is easier than to give Christian asceticism a Socialist tinge. Has not Christianity declaimed against private property, against marriage, against the State? Has it not preached in the place of these, charity and poverty, celibacy, and mortification of the flesh, monastic life and Mother Church? Christian Socialism is but the Holy Water with which the priest consecrates the heart-burnings of the aristocrat.

b. Petty Bourgeois Socialism.

The feudal aristocracy was not the only class that was ruined by the bourgeoisie, not the only class whose conditions of existence pined and perished in the atmosphere of modern bourgeois society. The medieval burgesses and the small peasant bourgeoisie, were the precursors of the modern bourgeoisie. In those countries which are but little developed, industrially and commercially, these two classes still vegetate side by side with the rising bourgeoisie.

In countries where modern civilization has become fully developed, a new class of petty bourgeois has been formed, fluctuating between proletariat and bourgeoisie, and ever renewing itself as a supplementary part of bourgeois society. The individual members of this class, however, are being constantly hurled down into the proletariat by the action of competition, and, as modern industry develops, they even see the moment approaching when they will completely disappear as an independent section of modern society, to be replaced, in manufactures, agriculture and commerce, by overlookers, bailiffs and shopmen.

In countries like France, where the peasants constitute far more than half of the population, it was natural that writers who sided with the proletariat against the bourgeoisie, should use, in their criticism of the bourgeoisie regime, the standard of the peasant and petty bourgeois, and from the standpoint of these intermediate classes should take up the cudgels for the working-class. Thus arose petty bourgeois Socialism. Sismondi was the head of this school, not only in France, but also in England.

This school of Socialism dissected with great acuteness the contradictions in the conditions of modern production. It laid bare the hypocritical apologies of economists. It proved, incontrovertibly, the disastrous effects of machinery and division of labor; the concentration of capital and land in a few hands; overproduction and crises; it pointed out the inevitable ruin of the petty bourgeois and peasant, the misery of the proletariat, the anarchy in production, the crying inequalities in the distribution of wealth, the industrial war of extermination between nations, the dissolution of old moral bonds, of the old family relations, of the old nationalities.

In its positive aims, however, this form of Socialism aspires either to restoring the old means of production and of exchange, and with them the old property relations, and the old society, or to cramping the modern means of production and of exchange, within the frame work of the old property relations that have been, and were bound to be, exploded by those means. In either case, it is both reactionary and Utopian.

Its last words are: corporate guilds for manufacture; patriarchal relations in agriculture.

Ultimately, when stubborn historical facts had dispersed all intoxicating effects of self-deception, this form of Socialism ended in a miserable fit of the blues.

German or "True" Socialism.

The Socialist and Communist literature of France, a literature that originated under the pressure of a bourgeoisie in power, and that was the expression of the struggle against this power, was introduced into Germany at a time when the bourgeoisie, in that country, had just begun its contest with feudal absolutism.

German philosophers, would-be philosophers, and beaux esprits, eagerly seized on this literature, only forgetting, that when these writings immigrated from France into Germany, French social conditions had not

immigrated along with them. In contact with German social conditions, this French literature lost all its immediate practical significance, and assumed a purely literary aspect. Thus, to the German philosophers of the Eighteenth Century, the demands of the first French Revolution were nothing more than the demands of "Practical Reason" in general, and the utterance of the will of the revolutionary French bourgeoisie signified in their eyes the laws of pure Will, of Will as it was bound to be, of true human Will generally.

The work of the German literati consisted solely in bringing the new French ideas into harmony with their ancient philosophical conscience, or rather, in annexing the French ideas without deserting their own philosophic point of view.

This annexation took place in the same way in which a foreign language is appropriated, namely by translation.

It is well known how the monks wrote silly lives of Catholic Saints over the manuscripts on which the classical works of ancient heathendom had been written. The German literati reversed this process with the profane French literature. They wrote their philosophical nonsense beneath the French original. For instance, beneath the French criticism of the economic functions of money, they wrote "Alienation of Humanity," and beneath the French criticism of the bourgeois State they wrote, "Dethronement of the Category of the General," and so forth.

The introduction of these philosophical phrases at the back of the French historical criticisms they dubbed "Philosophy of Action," "True Socialism," "German Science of Socialism," "Philosophical Foundation of Socialism," and so on.

The French Socialist and Communist literature was thus completely emasculated. And, since it ceased in the hands of the German to express the struggle of one class with the other, he felt conscious of having overcome "French one-sidedness" and of representing, not true requirements, but the requirements of Truth, not the interests of the proletariat, but the interests of Human Nature, of Man in general, who belongs to no class, has no reality, who exists only in the misty realm or philosophical phantasy.

This German Socialism, which took its schoolboy task so seriously and solemnly, and extolled its poor stock-in-trade in such mountebank fashion, meanwhile gradually lost its pedantic innocence.

The fight of the German, and, especially, of the Prussian bourgeoisie, against feudal aristocracy and absolute monarchy, in other words, the liberal

movement, became more earnest.

By this, the long-wished-for opportunity was offered to “True Socialism” of confronting the political movement with the socialist demands, of hurling the traditional anathemas against liberalism, against representative government, against bourgeois competition, bourgeois freedom of the press, bourgeois legislation, bourgeois liberty and equality, and of preaching to the masses that they had nothing to gain, and everything to lose, by this bourgeois movement. German Socialism forgot, in the nick of time, that the French criticism, whose silly echo it was, presupposed the existence of modern bourgeois society, with its corresponding economic conditions of existence, and the political constitution adapted thereto, the very things whose attainment was the object of the pending struggle in Germany.

To the absolute governments, with their following of parsons, professors, country squires and officials, it served as a welcome scarecrow against the threatening bourgeoisie.

It was a sweet finish after the bitter pills of floggings and bullets, with which these same governments, just at that time, dosed the German working-class risings.

While this “True” Socialism thus served the governments as a weapon for fighting the German bourgeoisie, it, at the same time, directly represented a reactionary interest, the interest of the German Philistines. In Germany the petty bourgeois class, a relic of the 16th century, and since then constantly cropping up again under various forms, is the real social basis of the existing state of things.

To preserve this class, is to preserve the existing state of things in Germany. The industrial and political supremacy of the bourgeoisie threatens it with certain destruction; on the one hand, from the concentration of capital; on the other, from the rise of a revolutionary proletariat. “True” Socialism appeared to kill these two birds with one stone. It spread like an epidemic.

The robe of speculative cobwebs, embroidered with flowers of rhetoric, steeped in the dew of sickly sentiment, this transcendental robe in which the German Socialists wrapped their sorry “eternal truths” all skin and bone, served to wonderfully increase the sale of their goods amongst such a public.

And on its part, German Socialism recognized, more and more, its own calling as the bombastic representative of the petty bourgeois Philistine.

It proclaimed the German nation to be the model nation, and the German petty Philistine to be the typical man. To every villainous meanness of this model man it gave a hidden, higher, socialistic interpretation, the exact contrary of its true character. It went to the extreme length of directly opposing the “brutally destructive” tendency of Communism, and of proclaiming its supreme and impartial contempt of all class struggles. With very few exceptions, all the so-called Socialist and Communist publications that now (1847) circulate in Germany belong to the domain of this foul and enervating literature.

2. Conservative or Bourgeois Socialism.

A part of the bourgeoisie is desirous of redressing social grievances, in order to secure the continued existence of bourgeois society.

To this section belong economists, philanthropists, humanitarians, improvers of the condition of the work class, organizers of charity, members of societies for the prevention of cruelty to animals, temperance fanatics, hole and corner reformers of every imaginable kind. This form of Socialism has, moreover, been worked out into complete systems.

We may cite Proudhon’s “Philosophie de la Misère” as an example of this form.

The socialistic bourgeois want all the advantages of modern social conditions without the struggles and dangers necessarily resulting therefrom. They desire the existing state of society minus its revolutionary and disintegrating elements. They wish for a bourgeoisie without a proletariat. The bourgeoisie naturally conceives the world in which it is supreme to be the best; and bourgeois socialism develops this comfortable conception into various more or less complete systems. In requiring the proletariat to carry out such a system, and thereby to march straightway into the social New Jerusalem, it but requires in reality, that the proletariat should remain within the bounds of existing society, but should cast away all its hateful ideas concerning the bourgeoisie.

A second and more practical, but less systematic, form of this socialism sought to depreciate every revolutionary movement in the eyes of the working class, by showing that no mere political reform, but only a change in the material conditions of existence, in economical relations, could be of any advantage to them. By changes in the material conditions of existence, this form of Socialism, however, by no means understands abolition of the

bourgeois relations of production, an abolition that can be effected only by a revolution, but administrative reforms, based on the continued existence of these relations; reforms, therefore, that in no respect affect the relations between capital and labor, but, at the best, lessen the cost, and simplify the administrative work, of bourgeois government.

Bourgeois Socialism attains adequate expression, when, and only when, it becomes a mere figure of speech.

Free trade: for the benefit of the working class. Protective duties: for the benefit of the working class. Prison Reform: for the benefit of the working class. This is the last word and the only seriously meant word of bourgeois Socialism.

It is summed up in the phrase: the bourgeois is a bourgeois — for the benefit of the working class.

3. Critical-Utopian Socialism and Communism.

We do not here refer to that literature which, in every great modern revolution, has always given voice to the demands of the proletariat: such as the writings of Babeuf and others.

The first direct attempts of the proletariat to attain its own ends were made in times of universal excitement, when feudal society was being overthrown. These attempts necessarily failed, owing to the then undeveloped state of the proletariat, as well as to the absence of the economic conditions for its emancipation, conditions that had yet to be produced, and could be produced by the impending bourgeois epoch alone. The revolutionary literature that accompanied these first movements of the proletariat had necessarily a reactionary character. It inculcated universal asceticism and social leveling in its crudest form.

The Socialist and Communist systems properly so-called, those of St. Simon, Fourier, Owen and others, spring into existence in the early undeveloped period, described above, of the struggle between proletariat and bourgeoisie (see section I. Bourgeoisie and Proletariat).

The founders of these systems see, indeed, the class antagonisms, as well as the action of the decomposing elements in the prevailing form of society. But the proletariat, as yet in its infancy, offers to them the spectacle of a class without any historical initiative or any independent political movement.

Since the development of class antagonism keeps even pace with the development of industry, the economic situation, as they find it, does not as

yet offer to them the material conditions for the emancipation of the proletariat. They therefore search after a new social science, after new social laws, that are to create these conditions.

Historical action is to yield to their personal inventive action, historically created conditions of emancipation to fantastic ones, and the gradual, spontaneous class-organization of the proletariat to an organization of society specially contrived by these inventors. Future history resolves itself, in their eyes, into the propaganda and the practical carrying out of their social plans.

In the formation of their plans they are conscious of caring chiefly for the interests of the working-class, as being the most suffering class. Only from the point of view of being the most suffering class does the proletariat exist for them.

The undeveloped state of the class struggle, as well as their own surroundings, cause Socialists of this kind to consider themselves far superior to all class antagonisms. They want to improve the condition of every member of society, even that of the most favored. Hence, they habitually appeal to society at large, without distinction of class; nay, by preference, to the ruling class. For how can people, when once they understand their system, fail to see in it the best possible plan of the best possible state of society?

Hence, they reject all political, and especially all revolutionary action; they wish to attain their ends by peaceful means, and endeavor, by small experiments, necessarily doomed to failure, and by the force of example, to pave the way for the new social Gospel.

Such fantastic pictures of future society, painted at a time when the proletariat is still in a very undeveloped state, and has but a fantastic conception of its own position, correspond with the first instinctive yearnings of that class for a general reconstruction of society.

But these Socialist and Communist publications contain also a critical element. They attack every principle of existing society. Hence they are full of the most valuable materials for the enlightenment of the working class. The practical measures proposed in them, such as the abolition of the distinction between town and country, of the family, of the carrying on of industries for the account of private individuals, and of the wage system, the proclamation of social harmony, the conversion of the functions of the State into a mere superintendence of production, all these proposals point solely

to the disappearance of class-antagonisms which were, at that time, only just cropping up, and which, in these publications, are recognized under their earliest, indistinct and undefined forms only. These proposals, therefore, are of a purely Utopian character.

The significance of Critical-Utopian Socialism and Communism bears an inverse relation to historical development. In proportion as the modern class struggle develops and takes definite shape, this fantastic standing apart from the contest, these fantastic attacks on it lose all practical value and all theoretical justification. Therefore, although the originators of these systems were, in many respects, revolutionary, their disciples have, in every case, formed mere reactionary sects. They hold fast by the original views of their masters, in opposition to the progressive

IV. POSITION OF THE COMMUNISTS IN RELATION TO THE VARIOUS EXISTING OPPOSITION PARTIES.

Section II. has made clear the relations of the Communists to the existing working class parties, such as the Chartists in England and the Agrarian Reformers in America.

The Communists fight for the attainment of the immediate aims, for the enforcement of the momentary interests of the working class; but in the movement of the present, they also represent and take care of the future of that movement. In France the Communists ally themselves with the Social-Democrats, against the conservative and radical bourgeoisie, reserving, however, the right to take up a critical position in regard to phrases and illusions traditionally handed down from the great Revolution.

In Switzerland they support the Radicals, without losing sight of the fact that this party consists of antagonistic elements, partly of Democratic Socialists, in the French sense, partly of radical bourgeois.

In Poland they support the party that insists on an agrarian revolution, as the prime condition for national emancipation, that party which fomented the insurrection of Cracow in 1846.

In Germany they fight with the bourgeoisie whenever it acts in a revolutionary way, against the absolute monarchy, the feudal squirearchy, and the petty bourgeoisie.

But they never cease, for a single instant, to instill into the working class the clearest possible recognition of the hostile antagonism between bourgeoisie and proletariat, in order that the German workers may straightway use, as so many weapons against the bourgeoisie, the social and political conditions that the bourgeoisie must necessarily introduce along with its supremacy, and in order that, after the fall of the reactionary classes in Germany, the fight against the bourgeoisie itself may immediately begin.

The Communists turn their attention chiefly to Germany, because that country is on the eve of a bourgeois revolution, that is bound to be carried out under more advanced conditions of European civilization, and with a more developed proletariat, than that of England was in the seventeenth, and of France in the eighteenth century, and because the bourgeois

revolution in Germany will be but the prelude to an immediately following proletarian revolution.

In short, the Communists everywhere support every revolutionary movement against the existing social and political order of things.

In all these movements they bring to the front, as the leading question in each, the property question, no matter what its degree of development at the time.

Finally, they labor everywhere for the union and agreement of the democratic parties of all countries.

The Communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by the forcible overthrow of all existing social conditions. Let the ruling classes tremble at a Communistic revolution. The proletarians have nothing to lose but their chains. They have a world to win.

Working men of all countries, unite!

THE CLASS STRUGGLES IN FRANCE, 1850

Part I. The Defeat of June, 1848

After the July Revolution [of 1830], when the liberal banker Laffitte led his *compère*, the Duke of Orléans, in triumph to the Hôtel de Ville, he let fall the words: “*From now on the bankers will rule*”. Laffitte had betrayed the secret of the revolution.

It was not the French bourgeoisie that ruled under Louis Philippe, but one *faction* of it: bankers, stock-exchange kings, railway kings, owners of coal and iron mines and forests, a part of the landed proprietors associated with them – the so-called *financial aristocracy*. It sat on the throne, it dictated laws in the Chambers, it distributed public offices, from cabinet portfolios to tobacco bureau posts.

The *industrial bourgeoisie* proper formed part of the official opposition, that is, it was represented only as a minority in the Chambers. Its opposition was expressed all the more resolutely the more unalloyed the autocracy of the finance aristocracy became, and the more it imagined that its domination over the working class was insured after the revolts of 1832, 1834, and 1839, which had been drowned in blood. *Grandin*, a Rouen manufacturer and the most fanatical instrument of bourgeois reaction in the Constituent as well as in the Legislative National Assembly, was the most violent opponent of Guizot in the Chamber of Deputies. *Léon Faucher*, later known for his impotent efforts to climb into prominence as the Guizot of the French counterrevolution, in the last days of Louis Philippe waged a war of the pen for industry against speculation and its train bearer, the government. *Bastiat* agitated in the name of Bordeaux and the whole of wine-producing France against the ruling system.

The *petty bourgeoisie* of all gradations, and the *peasantry* also, were completely excluded from political power. Finally, in the official opposition or entirely outside the *pays légal* [electorate], there were the *ideological* representatives and spokesmen of the above classes, their savants, lawyers, doctors, etc., in a word, their so-called *men of talent*.

Owing to its financial straits, the July Monarchy was dependent from the beginning on the big bourgeoisie, and its dependence on the big bourgeoisie was the inexhaustible source of increasing financial straits. It was impossible to subordinate the administration of the state to the interests of

national production without balancing the budget, without establishing a balance between state expenditures and revenues. And how was this balance to be established without limiting state expenditures – that is, without encroaching on interests which were so many props of the ruling system – and without redistributing taxes – that is, without shifting a considerable share of the burden of taxation onto the shoulders of the big bourgeoisie itself?

On the contrary, the faction of the bourgeoisie that ruled and legislated through the Chambers had a *direct interest* in the *indebtedness of the state*. The *state deficit* was really the main object of its speculation and the chief source of its enrichment. At the end of each year a new deficit. After the lapse of four or five years a new loan. And every new loan offered new opportunities to the finance aristocracy for defrauding the state, which was kept artificially on the verge of bankruptcy – it had to negotiate with the bankers under the most unfavorable conditions. Each new loan gave a further opportunity, that of plundering the public which invested its capital in state bonds by means of stock-exchange manipulations, the secrets of which the government and the majority in the Chambers were privy to. In general, the instability of state credit and the possession of state secrets gave the bankers and their associates in the Chambers and on the throne the possibility of evoking sudden, extraordinary fluctuations in the quotations of government securities, the result of which was always bound to be the ruin of a mass of smaller capitalists and the fabulously rapid enrichment of the big gamblers. As the state deficit was in the direct interest of the ruling faction of the bourgeoisie, it is clear why the extraordinary state expenditure in the last years of Louis Philippe's reign was far more than double the *extraordinary* state expenditure under Napoleon, indeed reached a yearly sum of nearly 400,000,000 francs, whereas the whole average annual export of France seldom attained a volume amounting to 750,000,000 francs. The enormous sums which in this way flowed through the hands of the state facilitated, moreover, swindling contracts for deliveries, bribery, defalcations, and all kinds of roguery.

The defrauding of the state, practiced wholesale in connection with loans, was repeated retail in public works. What occurred in the relations between Chamber and government became multiplied in the relations between individual departments and individual entrepreneurs.

The ruling class exploited the *building of railways* in the same way it exploited state expenditures in general and state loans. The Chambers piled the main burdens on the state, and secured the golden fruits to the speculating finance aristocracy. One recalls the scandals in the Chamber of Deputies when by chance it leaked out that all the members of the majority, including a number of ministers, had been interested as shareholders in the very railway constructions which as legislators they had carried out afterward at the cost of the state.

On the other hand, the smallest financial reform was wrecked through the influence of the bankers. For example, the *postal reform*. Rothschild protested. Was it permissible for the state to curtail sources of revenue out of which interest was to be paid on its ever increasing debt?

The July Monarchy was nothing other than a joint stock company for the exploitation of France's national wealth, whose dividends were divided among ministers, Chambers, 240,000 voters, and their adherents. Louis Philippe was the director of this company – Robert Macaire on the throne. Trade, industry, agriculture, shipping, the interests of the industrial bourgeoisie, were bound to be continually endangered and prejudiced under this system. Cheap government, *gouvernement à bon marché*, was what it had inscribed on its banner in the July days.

Since the finance aristocracy made the laws, was at the head of the administration of the state, had command of all the organized public authorities, dominated public opinion through the actual state of affairs and through the press, the same prostitution, the same shameless cheating, the same mania to get rich was repeated in every sphere, from the court to the Café Borgne to get rich not by production, but by pocketing the already available wealth of others, Clashing every moment with the bourgeois laws themselves, an unbridled assertion of unhealthy and dissolute appetites manifested itself, particularly at the top of bourgeois society – lusts wherein wealth derived from gambling naturally seeks its satisfaction, where pleasure becomes *crapuleux* [debauched], where money, filth, and blood commingle. The finance aristocracy, in its mode of acquisition as well as in its pleasures, is nothing but the *rebirth of the lumpenproletariat on the heights of bourgeois society*.

And the nonruling factions of the French bourgeoisie cried: *Corruption!* The people cried: *À bas les grands voleurs! À bas les assassins!* [Down with the big thieves! Down with the assassins!] when in 1847, on the most

prominent stages of bourgeois society, the same scenes were publicly enacted that regularly lead the *lumpenproletariat* to brothels, to workhouses and lunatic asylums, to the bar of justice, to the dungeon, and to the scaffold. The industrial bourgeoisie saw its interests endangered, the petty bourgeoisie was filled with moral indignation, the imagination of the people was offended, Paris was flooded with pamphlets – “The Rothschild Dynasty,” “Usurers Kings of the Epoch,” etc. – in which the rule of the finance aristocracy was denounced and stigmatized with greater or less wit.

Rien pour la gloire! [Nothing for glory!] Glory brings no profit! *La paix partout et toujours!* [Peace everywhere and always!] War depresses the quotations of the 3 and 4 percents which the France of the Bourse jobbers had inscribed on her banner. Her foreign policy was therefore lost in a series of mortifications to French national sentiment, which reacted all the more vigorously when the rape of Poland was brought to its conclusion with the incorporation of Cracow by Austria, and when Guizot came out actively on the side of the Holy Alliance in the Swiss separatist war. The victory of the Swiss liberals in this mimic war raised the self-respect of the bourgeois opposition in France; the bloody uprising of the people in Palermo worked like an electric shock on the paralyzed masses of the people and awoke their great revolutionary memories and passions. [Annexation of Cracow by Austria in agreement with Russia and Prussia on November 11, 1846. – Swiss Sonderbund war: November 4 to 28, 1847. – Rising in Palermo: January 12, 1848; at the end of January, nine days’ bombardment of the town by the Neapolitans. Note by Engels to the edition of 1895.]

The eruption of the general discontent was finally accelerated and the mood for revolt ripened by *two economic world events*.

The *potato blight* and the *crop failures* of 1845 and 1846 increased the general ferment among the people. The famine of 1847 called forth bloody conflicts in France as well as on the rest of the Continent. As against the shameless orgies of the finance aristocracy, the struggle of the people for the prime necessities of life! At Buzançais, hunger rioters executed; in Paris, oversatiated *escrocs* [swindlers] snatched from the courts by the royal family!

The second great economic event that hastened the outbreak of the revolution was a *general commercial and industrial crisis* in England. Already heralded in the autumn of 1845 by the wholesale reverses of the speculators in railway shares, staved off during 1846 by a number of

incidents such as the impending abolition of the Corn Laws, the crisis finally burst in the autumn of 1847 with the bankruptcy of the London wholesale grocers, on the heels of which followed the insolvencies of the land banks and the closing of the factories in the English industrial districts. The after-effect of this crisis on the Continent had not yet spent itself when the February Revolution broke out.

The devastation of trade and industry caused by the economic epidemic made the autocracy of the finance aristocracy still more unbearable. Throughout the whole of France the bourgeois opposition *agitated at banquets* for an *electoral reform* which should win for it the majority in the Chambers and overthrow the Ministry of the Bourse. In Paris the industrial crisis had, moreover, the particular result of throwing a multitude of manufacturers and big traders, who under the existing circumstances could no longer do any business in the foreign market, onto the home market. They set up large establishments, the competition of which ruined the small *épiciers* [grocers] and *boutiquiers* [shopkeepers] *en masse*. Hence the innumerable bankruptcies among this section of the Paris bourgeoisie, and hence their revolutionary action in February. It is well known how Guizot and the Chambers answered the reform proposals with an unambiguous challenge, how Louis Philippe too late resolved on a ministry led by Barrot, how things went as far as hand-to-hand fighting between the people and the army, how the army was disarmed by the passive conduct of the National Guard, how the July Monarchy had to give way to a provisional government.

The *Provisional Government* which emerged from the February barricades necessarily mirrored in its composition the different parties which shared in the victory. It could not be anything but a *compromise between the different classes* which together had overturned the July throne, but whose interests were mutually antagonistic. The *great majority* of its members consisted of representatives of the bourgeoisie. The republican petty bourgeoisie was represented by Ledru-Rollin and Flocon, the republican bourgeoisie by the people from the National, the dynastic opposition by Crémieux, Dupont de l'Eure, etc. The working class had only two representatives, Louis Blanc and Albert. Finally, Lamartine in the Provisional Government; this was at first no real interest, no definite class; this was the February Revolution itself, the common uprising with its illusions, its poetry, its visionary content, and its phrases. For the rest, the

spokesman of the February Revolution, by his position and his views, belonged to the *bourgeoisie*.

If Paris, as a result of political centralization, rules France, the workers, in moments of revolutionary earthquakes, rule Paris. The first act in the life of the Provisional Government was an attempt to escape from this overpowering influence by an appeal from intoxicated Paris to sober France. Lamartine disputed the right of the barricade fighters to proclaim a republic on the ground that only the majority of Frenchmen had that right; they must await their votes, the Paris proletariat must not besmirch its victory by a usurpation. [From Lamartine's speech of 24 February] The bourgeoisie allows the proletariat only *one* usurpation – that of fighting.

Up to noon of February 25 the republic had not yet been proclaimed; on the other hand, all the ministries had already been divided among the bourgeois elements of the Provisional Government and among the generals, bankers, and lawyers of the National. But the workers were determined this time not to put up with any bamboozlement like that of July, 1830. They were ready to take up the fight anew and to get a republic by force of arms. With this message, *Raspail* betook himself to the *Hôtel de Ville*. In the name of the Paris proletariat he *commanded* the Provisional Government to proclaim a republic; if this order of the people were not fulfilled within two hours, he would return at the head of 200,000 men. The bodies of the fallen were scarcely cold, the barricades were not yet disarmed, and the only force that could be opposed to them was the National Guard. Under these circumstances the doubts born of considerations of state policy and the juristic scruples of conscience entertained by the Provisional Government suddenly vanished. The time limit of two hours had not yet expired when all the walls of Paris were resplendent with the gigantic historical words:

République français! Liberté, Egalité, Fraternité!

Even the memory of the limited aims and motives which drove the bourgeoisie into the February Revolution was extinguished by the proclamation of the republic on the basis of universal suffrage. Instead of only a few factions of the bourgeoisie, all classes of French society were suddenly hurled into the orbit of political power, forced to leave the boxes, the stalls, and the gallery and to act in person upon the revolutionary stage! With the constitutional monarchy vanished also the semblance of a state power independently confronting bourgeois society, as well as the whole series of subordinate struggles which this semblance of power called forth!

By dictating the republic to the Provisional Government, and through the Provisional Government to the whole of France, the proletariat immediately stepped into the foreground as an independent party, but at the same time challenged the whole of bourgeois France to enter the lists against it. What it won was the terrain for the fight for its revolutionary emancipation, but by no means this emancipation itself.

The first thing the February Republic had to do was, rather, to *complete the rule of the bourgeoisie* by allowing, besides the finance aristocracy, *all the propertied classes* to enter the orbit of political power. The majority of the great landowners, the Legitimists, were emancipated from the political nullity to which they had been condemned by the July Monarchy. Not for nothing had the *Gazette de France* agitated in common with the opposition papers; not for nothing had La Roche-Jaquelein taken the side of the revolution in the session of the Chamber of Deputies on February 24. The nominal proprietors, the *peasants*, who form the great majority of the French people, were put by universal suffrage in the position of arbiters of the fate of France. The February Republic finally brought the rule of the bourgeoisie clearly into view, since it struck off the crown behind which capital had kept itself concealed.

Just as the workers in the July days had fought for and won the *bourgeois monarchy*, so in the February days they fought for and won the *bourgeois republic*. Just as the July Monarchy had to proclaim itself a *monarchy surrounded by republican institutions*, so the February Republic was forced to proclaim itself a *republic surrounded by social institutions*. The Paris proletariat *compelled* this concession, too.

Marche, a worker, dictated the decree [decree on the right to work, 25 February 1848] by which the newly formed Provisional Government pledged itself to guarantee the workers a livelihood by means of labor, to provide work for all citizens, etc. And when a few days later it forgot its promises and seemed to have lost sight of the proletariat, a mass of 20,000 workers marched on the *Hôtel de Ville* with the cry: *Organize labor! Form a special Ministry of labor!* Reluctantly and after long debate, the Provisional Government nominated a permanent special commission charged with finding means of improving the lot of the working classes! This commission consisted of delegates from the corporations [guilds] of Paris artisans and was presided over by Louis Blanc and Albert. The Luxembourg Palace was assigned to it as its meeting place. In this way the

representatives of the working class were banished from the seat of the Provisional Government, the bourgeois part of which retained the real state power and the reins of administration exclusively in its hands; and *side by side* with the ministries of finance, trade, and public works, side by side with the Bank and the Bourse, there arose a *socialist synagogue* whose high priests, Louis Blanc and Albert, had the task of discovering the promised land, of preaching the new gospel, and of providing work for the Paris proletariat. Unlike any profane state power, they had no budget, no executive authority at their disposal. They were supposed to break the pillars of bourgeois society by dashing their heads against them. While the Luxembourg sought the philosopher's stone, in the *Hôtel de Ville* they minted the current coinage.

And yet the claims of the Paris proletariat, so far as they went beyond the bourgeois republic, could win no other existence than the nebulous one of the Luxembourg.

In common with the bourgeoisie the workers had made the February Revolution, and alongside the bourgeoisie they sought to secure the advancement of their interests, just as they had installed a worker in the Provisional Government itself alongside the bourgeois majority. Organize labor! But wage labor, that is the existing, the bourgeois organization of labor. Without it there is no capital, no bourgeoisie, no bourgeois society. A special Ministry of Labor! But the ministries of finance, of trade, of public works – are not these the bourgeois ministries of labor? And alongside these a proletariat Ministry of Labor had to be a ministry of impotence, a ministry of pious wishes, a Luxembourg Commission. Just as the workers thought they would be able to emancipate themselves side by side with the bourgeoisie, so they thought they would be able to consummate a proletarian revolution within the national walls of France, side by side with the remaining bourgeois nations. But French relations of production are conditioned by the foreign trade of France, by her position on the world market and the laws thereof; how was France to break them without a European revolutionary war, which would strike back at the despot of the world market, England?

As soon as it has risen up, a class in which the revolutionary interests of society are concentrated finds the content and the material for its revolutionary activity directly in its own situation: foes to be laid low, measures dictated by the needs of the struggle to be taken; the consequences

of its own deeds drive it on. It makes no theoretical inquiries into its own task. The French working class had not attained this level; it was still incapable of accomplishing its own revolution.

The development of the industrial proletariat is, in general, conditioned by the development of the industrial bourgeoisie. Only under its rule does the proletariat gain that extensive national existence which can raise its revolution to a national one, and only thus does the proletariat itself create the modern means of production, which become just so many means of its revolutionary emancipation. Only bourgeois rule tears up the material roots of feudal society and levels the ground on which alone a proletarian revolution is possible. French industry is more developed and the French bourgeoisie more revolutionary than that of the rest of the Continent. But was not the February Revolution aimed directly against the finance aristocracy? This fact proved that the industrial bourgeoisie did not rule France. The industrial bourgeoisie can rule only where modern industry shapes all property relations to suit itself, and industry can win this power only where it has conquered the world market, for national bounds are inadequate for its development. But French industry, to a great extent, maintains its command even of the national market only through a more or less modified system of prohibitive duties. While, therefore, the French proletariat, at the moment of a revolution, possesses in Paris actual power and influence which spur it on to a drive beyond its means, in the rest of France it is crowded into separate, scattered industrial centers, almost lost in the superior number of peasants and petty bourgeois. The struggle against capital in its developed, modern form – in its decisive aspect, the struggle of the industrial wage worker against the industrial bourgeois – is in France a partial phenomenon, which after the February days could so much the less supply the national content of the revolution, since the struggle against capital's secondary modes of exploitation, that of the peasant against usury and mortgages or of the petty bourgeois against the wholesale dealer, banker, and manufacturer – in a word, against bankruptcy – was still hidden in the general uprising against the finance aristocracy. Nothing is more understandable, then, than that the Paris proletariat sought to secure the advancement of its own interests side by side with those of the bourgeoisie, instead of enforcing them as the revolutionary interests of society itself, that it let the red flag be lowered to the *tricolor*. The French workers could not take a step forward, could not touch a hair of the bourgeois order, until the

course of the revolution had aroused the mass of the nation, peasants and petite bourgeois, standing between the proletariat and the bourgeoisie, against this order, against the rule of capital, and had forced it to attach itself to the proletarians as its protagonists. The workers could buy this victory only through the tremendous defeat in June.

The Luxembourg Commission, this creation of the Paris workers, must be given the credit of having disclosed, from a Europe-wide tribune, the secret of the revolution of the nineteenth century: *the emancipation of the proletariat*. The *Moniteur* blushed when it had to propagate officially the “wild ravings” which up to that time had lain buried in the apocryphal writings of the socialists and reached the ear of the bourgeoisie only from time to time as remote, half-terrifying, half-ludicrous legends. Europe awoke astonished from its bourgeois doze. Therefore, in the minds of the proletarians, who confused the finance aristocracy with the bourgeoisie in general; in the imagination of the good old republicans who denied the very existence of classes or, at most, admitted them as a result of the constitutional monarchy; in the hypocritical phrases of the factions of the bourgeoisie which up to now had been excluded from power, the *rule of the bourgeoisie* was abolished with the introduction of the republic. At that time all the royalists were transformed into republicans and all the millionaires of Paris into workers. The phrase which corresponded to this imaginary abolition of class relations was *fraternité*, universal fraternization and brotherhood. This pleasant abstraction from class antagonisms, this sentimental reconciliation of contradictory class interests, this visionary elevation above the class struggle, this fraternite, was the real catchword of the February Revolution. The classes were divided by a mere misunderstanding, and on February 24 Lamartine christened the Provisional Government “une gouvernement qui suspend *ce malentendu terrible qui existe entre les différentes classes*” [a government that removes this terrible misunderstanding which exists between the different classes, from Lamartine’s speech, 24 February 1848]. The Paris proletariat reveled in this magnanimous intoxication of fraternity.

The Provisional Government, for its part, once it was compelled to proclaim the republic, did everything to make it acceptable to the bourgeoisie and to the provinces. The bloody terror of the first French republic was disavowed by the abolition of the death penalty for political offenses; the press was opened to all opinions – the army, the courts, the

administration remained with a few exceptions in the hands of their old dignitaries; none of the July Monarchy's great offenders was brought to book. The bourgeois republicans of the National amused themselves by exchanging monarchist names and costumes for old republican ones. To them the republic was only a new ball dress for the old bourgeois society. The young republic sought its chief merit not in frightening, but rather in constantly taking fright itself, and in winning existence and disarming resistance by soft compliance and nonresistance. At home to the privileged classes, abroad to the despotic powers, it was loudly announced that the republic was of a peaceful nature. Live and let live was its professed motto. In addition to that, shortly after the February Revolution the Germans, Poles, Austrians, Hungarians, and Italians revolted, each people in accordance with its immediate situation. Russia and England – the latter itself agitated, the former cowed – were not prepared. The republic, therefore, had no national enemy to face. Consequently there were no great foreign complications which could fire the energies, hasten the revolutionary process, drive the Provisional Government forward or throw it overboard. The Paris proletariat, which looked upon the republic as its own creation, naturally acclaimed each act of the Provisional Government which facilitated the firm emplacement of the latter in bourgeois society. It willingly allowed itself to be employed on police service by Caussidière in order to protect property in Paris, just as it allowed Louis Blanc to arbitrate wage disputes between workers and masters. It made it a *point d'honneur* [point of honor] to preserve the bourgeois honor of the republic unblemished in the eyes of Europe.

The republic encountered no resistance either abroad or at home. This disarmed it. Its task was no longer the revolutionary transformation of the world, but consisted only in adapting itself to the relations of bourgeois society. As to the fanaticism with which the Provisional Government undertook this task there is no more eloquent testimony than its *financial measures*.

Public credit and *private credit* were naturally shaken. *Public credit* rests on confidence that the state will allow itself to be exploited by the wolves of finance. But the old state had vanished and the revolution was directed above all against the finance aristocracy. The vibrations of the last European commercial crisis had not yet ceased. Bankruptcy still followed bankruptcy.

Private credit was therefore paralyzed, circulation restricted, production at a standstill before the February Revolution broke out. The revolutionary crisis increased the commercial crisis. And if private credit rests on confidence that bourgeois production in the entire scope of its relations – the bourgeois order – will not be touched, will remain inviolate, what effect must a revolution have had which questioned the basis of bourgeois production, the economic slavery of the proletariat, which set up against the Bourse the sphinx of the Luxembourg? The uprising of the proletariat is the abolition of bourgeois credit, for it is the abolition of bourgeois production and its order. Public credit and private credit are the economic thermometer by which the intensity of a revolution can be measured. *The more they fall, the more the fervor and generative power of the revolution rises.*

The Provisional Government wanted to strip the republic of its antibourgeois appearance. And so it had, above all, to try to peg the exchange value of this new form of state, its *quotation* on the Bourse. Private credit necessarily rose again, together with the current Bourse quotation of the republic.

In order to allay the very *suspicion* that it would not or could not honor the obligations assumed by the monarchy, in order to build up confidence in the republic's bourgeois morality and capacity to pay, the Provisional Government took refuge in braggadocio as undignified as it was childish. In advance of the legal date of payment it paid out the interest on the 5-percent, 4 ½-percent and 4-percent bonds to the state creditors. The bourgeois aplomb, the self-assurance of the capitalists, suddenly awoke when they saw the anxious haste with which this government sought to buy their confidence.

The financial embarrassment of the Provisional Government was naturally not lessened by a theatrical stroke which robbed it of its stock of ready cash. The financial pinch could no longer be concealed and *petty bourgeois, domestic servants, and workers* had to pay for the pleasant surprise which had been prepared for the state creditors.

It was announced that no more money could be drawn on *savings bank books* for an amount of over a hundred francs. The sums deposited in the savings banks were confiscated and by decree transformed into an irredeemable state debt. This embittered the already hard-pressed *petty bourgeois* against the republic. Since he received state debt certificates in place of his savings bank books, he was forced to go to the Bourse in order

to sell them and thus deliver himself directly into the hands of the Bourse jobbers against whom he had made the February Revolution.

The finance aristocracy, which ruled under the July Monarchy, had its high church in the *Bank*. Just as the Bourse governs state credit, the Bank governs *commercial credit*.

Directly threatened not only in its rule but in its very existence by the February Revolution, the Bank tried from the outset to discredit the republic by making the lack of credit general. It suddenly stopped the credits of the bankers, the manufacturers, and the merchants. As it did not immediately call forth a counterrevolution, this maneuver necessarily reacted on the Bank itself. The capitalists drew out the money they had deposited in the vaults of the Bank. The possessors of bank notes rushed to the pay office in order to exchange them for gold and silver.

The Provisional Government could have forced the Bank into *bankruptcy* without forcible interference, in a legal manner; it would have had only to remain passive and leave the Bank to its fate. The *bankruptcy* of the Bank would have been the deluge which in an instant would have swept from French soil the finance aristocracy, the most powerful and dangerous enemy of the republic, the golden pedestal of the July Monarchy. And once the Bank was bankrupt, the bourgeoisie itself would have had to regard it as a last desperate attempt at rescue, if the government had formed a national bank and subjected national credit to the control of the nation.

The Provisional Government, on the contrary, fixed a *compulsory quotation* for the notes of the Bank. It did more. It transformed all provincial banks into branches of the Banque de France and allowed it to cast its net over the whole of France. Later it pledged the *state forests* to the Bank as a guarantee for a loan contracted from it. In this way the February Revolution directly strengthened and enlarged the bankocracy which it should have overthrown.

Meanwhile the Provisional Government was writhing under the incubus of a growing deficit. In vain it begged for patriotic sacrifices. Only the workers threw it their alms. Recourse had to be had to a heroic measure, to the imposition of a *new tax*. But who was to be taxed? The Bourse wolves, the bank kings, the state creditors, the rentiers, the industrialists? That was not the way to ingratiate the republic with the bourgeoisie. That would have meant, on the one hand, to endanger state credit and commercial credit, while on the other, attempts were made to purchase them with such great

sacrifices and humiliations. But someone had to fork over the cash. Who was sacrificed to bourgeois credit? *Jacques le bonhomme*, the *peasant*.

The Provisional Government imposed an additional tax of 45 centimes to the franc on the four direct taxes. The government press cajoled the Paris proletariat into believing that this tax would fall chiefly on the big landed proprietors, on the possessors of the milliard granted by the Restoration. But in truth it hit the *peasant class* above all, that is, the large majority of the French people. *They had to pay the costs of the February Revolution*; in them the counterrevolution gained its main material. The 45-centime tax was a question of life and death for the French peasant. He made it a life and death question for the republic. From that moment the *republic* meant to the French peasant the *45 centime tax*, and he saw in the Paris proletariat the spendthrift who did himself well at his expense.

Whereas the Revolution of 1789 began by shaking the feudal burdens off the peasants, the Revolution of 1848 announced itself to the rural population by the imposition of a new tax, in order not to endanger capital and to keep its state machine going.

There was only one means by which the Provisional Government could set aside all these inconveniences and jerk the state out of its old rut – a *declaration of state bankruptcy*. Everyone recalls how Ledru-Rollin in the National Assembly subsequently described the virtuous indignation with which he repudiated this presumptuous proposal of the Bourse Jew, Fould [from Ledru-Rollin's speech 21 April 1849], now French Finance Minister. Fould had handed him the apple from the tree of knowledge.

By honoring the bills drawn on the state by the old bourgeois society, the Provisional Government succumbed to the latter. It had become the hard-pressed debtor of bourgeois society instead of confronting it as the pressing creditor that had to collect the revolutionary debts of many years. It had to consolidate the shaky bourgeois relationships in order to fulfill obligations which are only to be fulfilled within these relationships. Credit became a condition of life for it, and the concessions to the proletariat, the promises made to it, became so many *fetters* which *had* to be struck off. The emancipation of the workers – even as a *phrase* – became an unbearable danger to the new republic, for it was a standing protest against the restoration of credit, which rests on undisturbed and untroubled recognition of the existing economic class relations. Therefore, it was necessary to *have done with the workers*.

The February Revolution had cast the army out of Paris. The National Guard, that is, the bourgeoisie in its different gradations, constituted the sole power. Alone, however, it did not feel itself a match for the proletariat. Moreover, it was forced gradually and piecemeal to open its ranks and admit armed proletarians, albeit after the most tenacious resistance and after setting up a hundred different obstacles. There consequently remained but one way out: *to play off part of the proletariat against the other*.

For this purpose the Provisional Government formed twenty-four battalions of *Mobile Guards*, each a thousand strong, composed of young men from fifteen to twenty years old. They belonged for the most part to the *lumpen proletariat*, which in all big towns forms a mass sharply differentiated from the industrial proletariat, a recruiting ground for thieves and criminals of all kinds living on the crumbs of society, people without a definite trade, vagabonds, *gens sans feu et sans aveu* [men without hearth or home], varying according to the degree of civilization of the nation to which they belong, but never renouncing their *lazzaroni* character – at the youthful age at which the Provisional Government recruited them, thoroughly malleable, as capable of the most heroic deeds and the most exalted sacrifices as of the basest banditry and the foulest corruption. The Provisional Government paid them 1 franc 50 centimes a day; that is, it bought them. It gave them their own uniform; that is, it made them outwardly distinct from the blouse-wearing workers. In part it assigned officers from the standing army as their leaders; in part they themselves elected young sons of the bourgeoisie whose rodomontades about death for the fatherland and devotion to the republic captivated them.

And so the Paris proletariat was confronted with an army, drawn from its own midst, of 24,000 young, strong, foolhardy men. It gave cheers for the Mobile Guard on its marches through Paris. It acknowledged it to be its foremost fighters on the barricades. It regarded it as the *proletarian* guard in contradistinction to the bourgeois National Guard. Its error was pardonable.

Besides the Mobile Guard, the government decided to rally around itself an army of industrial workers. A hundred thousand workers, thrown on the streets by the crisis and the revolution, were enrolled by the Minister Marie in so-called national *ateliers* [workshops]. Under this grandiose name was hidden nothing else than the employment of the workers on tedious, monotonous, unproductive earthworks at a wage of 23 sous. *English workhouses in the open* – that is what these national *ateliers* were. The

Provisional Government believed that it had formed, in them, a *second proletarian army against the workers themselves*. This time the bourgeoisie was mistaken in the national *ateliers*, just as the workers were mistaken in the Mobile Guard. It had created an *army for mutiny*.

But one purpose was achieved.

National ateliers was the name of the people's workshops which Louis Blanc preached in the Luxembourg Palace. Marie's *ateliers* [workshops], devised in direct *antagonism* to the Luxembourg, offered occasion, thanks to the common label, for a comedy of errors worthy of the Spanish servant farce. The Provisional Government itself surreptitiously spread the report that these national ateliers were the discovery of Louis Blanc, and this seemed the more plausible because Louis Blanc, the prophet of the national ateliers, was a member of the Provisional Government. And in the half-naive, half-intentional confusion of the Paris bourgeoisie, in the artificially molded opinion of France, of Europe, these workhouses were the first realization of socialism, which was put in the pillory, with them.

In their appellation, though not in their content, the *national ateliers* were the embodied protest of the proletariat against bourgeois industry, bourgeois credit, and the bourgeois republic. The whole hate of the bourgeoisie was therefore turned upon them. It had found in them, simultaneously, the point against which it could direct the attack, as soon as it was strong enough to break openly with the February illusions. All the discontent, all the ill humor of the *petty bourgeois* too was directed against these national *ateliers*, the common target. With real fury they totted up the money the proletarian loafers swallowed up while their own situation was becoming daily more unbearable. A state pension for sham labor, so that's socialism! they grumbled to themselves. They sought the reason for their misery in the national ateliers, the declamations of the Luxembourg, the processions of the workers through Paris. And no one was more fanatic about the alleged machinations of the communists than the petty bourgeoisie, who hovered hopelessly on the brink of bankruptcy.

Thus in the approaching melee between bourgeoisie and proletariat, all the advantages, all the decisive posts, all the middle strata of society were in the hands of the bourgeoisie, at the same time as the waves of the February Revolution rose high over the whole Continent, and each new post brought a new bulletin of revolution, now from Italy, now from Germany, now from the remotest parts of southeastern Europe, and maintained the general

ecstasy of the people, giving it constant testimony of a victory that it had already forfeited.

March 17 and *April 16* were the first skirmishes in the big class struggle which the bourgeois republic hid under its wing.

March 17 revealed the proletariat's ambiguous situation, which permitted no decisive act. Its demonstration originally pursued the purpose of pushing the Provisional Government back onto the path of revolution, of effecting the exclusion of its bourgeois members, according to circumstances, and of compelling the postponement of the elections for the National Assembly and the National Guard. But on March 16 the bourgeoisie represented in the National Guard staged a hostile demonstration against the Provisional Government. With the cry *À bas Ledru-Rollin* [Down with Ledru-Rollin]! it surged to the *Hôtel de Ville*. And the people were forced, on March 17, to shout: Long live Ledru-Rollin! Long live the Provisional Government! They were forced to take sides against the bourgeoisie in support of the bourgeois republic, which seemed to them to be in danger. They strengthened the Provisional Government, instead of subordinating it to themselves. March 17 went off in a melodramatic scene, and whereas the Paris proletariat on this day once more displayed its giant body, the bourgeoisie both inside and outside the Provisional Government was all the more determined to smash it.

April 16 was a *misunderstanding* engineered by the Provisional Government in alliance with the bourgeoisie. The workers had gathered in great numbers in the Champ de Mars and in the Hippodrome to choose their nominees to the general staff of the National Guard. Suddenly throughout Paris, from one end to the other, a rumor spread as quick as lightning, to the effect that the workers had met armed in the Champ de Mars, under the leadership of Louis Blanc, Blanqui, Cabet, and Raspail, in order to march thence on the *Hôtel de Ville*, overthrow the Provisional Government, and proclaim a communist government. The general alarm is sounded – Ledru-Rollin, Marrast, and Lamartine later contended for the honor of having initiated this – and in an hour 100,000 men are under arms; the *Hôtel de Ville* is occupied at all points by the National Guard; the cry Down with the Communists! Down with Louis Blanc, with Blanqui, with Raspail, with Cabet! thunders throughout Paris. Innumerable deputations pay homage to the Provisional Government, all ready to save the fatherland and society. When the workers finally appear before the *Hôtel de Ville*, in order to hand

over to the Provisional Government a patriotic collection they had made in the Champ de Mars, they learn to their amazement that bourgeois Paris has defeated their shadow in a very carefully calculated sham battle. The terrible attempt of April 16 furnished the excuse for *recalling the army to Paris* – the real purpose of the clumsily staged comedy and for the reactionary federalist demonstrations in the provinces.

On May 4 the *National Assembly* met the result of the *direct general elections*, convened. Universal suffrage did not possess the magic power which republicans of the old school had ascribed to it. They saw in the whole of France, at least in the majority of Frenchmen, *citoyens* [citizens] with the same interests, the same understanding, etc. This was their *cult of the people*. Instead of their *imaginary* people, the elections brought the *real* people to the light of day; that is, representatives of the different classes into which it falls. We have seen why peasants and petty bourgeois had to vote under the leadership of a bourgeoisie spoiling for a fight and of big landowners frantic for restoration. But if universal suffrage was not the miracle – working magic wand the republican worthies had taken it for, it possessed the incomparable higher merit of unchaining the class struggle, of letting the various middle strata of bourgeois society rapidly get over their illusions and disappointments, of tossing all the sections of the exploiting class at one throw to the apex of the state, and thus tearing from them their deceptive mask, whereas the monarchy with its property qualifications had let only certain factions of the bourgeoisie compromise themselves, allowing the others to lie hidden behind the scenes and surrounding them with the halo of a common opposition.

In the Constituent National Assembly, which met on May 4, the *bourgeois republicans*, the republicans of the *National*, had the upper hand. Even Legitimists and Orléanists at first dared to show themselves only under the mask of bourgeois republicanism. The fight against the proletariat could be undertaken only in the name of the republic.

The republic dates from May 4, not from February 25 – that is, the republic recognized by the French people; it is not the republic which the Paris proletariat thrust upon the Provisional Government, not the republic with social institutions, not the vision that hovered before the fighters on the barricades. The republic proclaimed by the National Assembly, the sole legitimate republic, is a republic which is no revolutionary weapon against the bourgeois order, but rather its political reconstitution, the political

reconsolidation of bourgeois society; in a word, a *bourgeois republic*. This contention resounded from the tribune of the National Assembly, and in the entire republican and anti-republican bourgeois press it found its echo.

And we have seen how the February Republic in reality was not and could not be other than a *bourgeois republic*; how the Provisional Government, nevertheless, was forced by the immediate pressure of the proletariat to announce it as a *republic with social institutions*; how the Paris proletariat was still incapable of going beyond the bourgeois republic otherwise than in its *fancy*, in *imagination*; how even where the republic acted in the service of the bourgeoisie when it really came to action; how the promises made to it became an unbearable danger for the new republic; how the whole life process of the Provisional Government was comprised in a continuous fight against the demands of the proletariat.

In the National Assembly all France sat in judgment upon the Paris proletariat. The Assembly broke immediately with the social illusions of the February Revolution; it roundly proclaimed the *bourgeois republic*, nothing but the bourgeois republic. It at once excluded the representatives of the proletariat, Louis Blanc and Albert, from the Executive Commission it had appointed; it threw out the proposal of a special Labor Ministry and received with acclamation the statement of Minister Trélat: “The question now is merely one of *bringing labor back to its old conditions*.” [from Trélat’s speech of 20 June 1848]

But all this was not enough. The February Republic was won by the workers with the passive support of the bourgeoisie. The proletarians rightly regarded themselves as the victors of February, and they made the arrogant claims of victors. They had to be vanquished in the streets, they had to be shown that they were worsted as soon as they did not fight *with* the bourgeoisie, but *against* the bourgeoisie. Just as the February Republic, with its socialist concessions, required a battle of the proletariat, united with the bourgeoisie, against the monarchy, so a second battle was necessary to sever the republic from socialist concessions, to officially work out the *bourgeois republic* as dominant. The bourgeoisie had to refute, arms in hand, the demands of the proletariat. And the real birthplace of the bourgeois republic is not the *February victory*; it is the *June defeat*.

The proletariat hastened the decision when, on the fifteenth of May, it pushed its way into the National Assembly sought in vain to recapture its revolutionary influence, and only delivered its energetic leaders to the

jailers of the bourgeoisie. *Il faut en finir!* This situation must end! With this cry the National Assembly gave vent to its determination to force the proletariat into a decisive struggle. The Executive Commission issued a series of provocative decrees, such as that prohibiting congregations of people, etc. The workers were directly provoked, insulted, and derided from the tribune of the Constituent National Assembly. But the real point of the attack was, as we have seen, the *national ateliers*. The Constituent Assembly imperiously pointed these out to the Executive Commission, which waited only to hear its own plan proclaimed the command of the National Assembly.

The Executive Commission began by making admission to the national *ateliers* more difficult, by turning the day wage into a piece wage, by banishing workers not born in Paris to the Sologne, ostensibly for the construction of earthworks. These earthworks were only a rhetorical formula with which to embellish their exile, as the workers, returning disillusioned, announced to their comrades. Finally, on June 21, a decree appeared in the *Moniteur* which ordered the forcible expulsion of all unmarried workers from the national *ateliers* or their enrollment in the army.

The workers were left no choice; they had to starve or let fly. They answered on June 22 with the tremendous insurrection in which the first great battle was fought between the two classes that split modern society. It was a fight for the preservation or annihilation of the *bourgeois* order. The veil that shrouded the republic was torn asunder.

It is well known how the workers, with unexampled bravery and ingenuity, without leaders, without a common plan, without means and, for the most part, lacking weapons, held in check for five days the army, the Mobile Guard, the Paris National Guard, and the National Guard that streamed in from the provinces. It is well known how the bourgeoisie compensated itself for the mortal anguish it suffered by unheard-of brutality, massacring over 3000 prisoners. The official representatives of French democracy were steeped in republican ideology to such an extent that it was only some weeks later that they began to have an inkling of the significance of the June fight. They were stupefied by the gunpowder smoke in which their fantastic republic dissolved.

The immediate impression which the news of the June defeat made on us, the reader will allow us to describe in the words of the “Neue

Rheinische Zeitung.”

“The Executive Committee, that last official vestige of the February revolution, vanished like a ghost in the face of these grave events. Lamartine’s fireworks have turned into the incendiary shells of Cavaignac.

“*Fraternité*, the brotherhood of antagonistic classes, one of which exploits the other, this fraternity which in February was proclaimed and inscribed in large letters on the facades of Paris, on every prison and every barracks – this fraternity found its true, unadulterated and prosaic expression in civil war, civil war in its most terrible aspect, the war of labor against capital. This brotherhood blazed in front of the windows of Paris on the evening of June 25, when the Paris of the bourgeoisie held illuminations while the Paris of the proletariat was burning, bleeding, groaning in the throes of death.

“This *fraternité* lasted only as long as there was a consanguinity of interests between the bourgeoisie and the proletariat. Pedants sticking to the old revolutionary tradition of 1793; socialist doctrinaires who begged alms for the people from the bourgeoisie and who were allowed to deliver lengthy sermons and compromise themselves so long as the proletarian lion had to be lulled to sleep; republicans who wanted to keep the old bourgeois order in toto, but without the crowned head; members of the Dynastic Opposition on whom chance imposed the task of bringing about the downfall of a dynasty instead of a change of government; legitimists, who did not want to cast off their livery but merely to change its style – these were the allies with whom the people had fought their February revolution. What the people instinctively hated in Louis Philip was not Louis Philip himself, but the crowned rule of a class, the capital on the throne. But magnanimous as always, the people thought they had destroyed their enemy when they had overthrown the enemy of their enemies, their common enemy.

“The February revolution was the nice revolution, the revolution of universal sympathies, because the contradictions which erupted in it against the monarchy were still undeveloped and peacefully dormant, because the social struggle which formed their background had only achieved an ephemeral existence, an existence in phrases, in words. The June revolution is the ugly revolution, the nasty revolution, because the phrases have given place to the real thing, because the republic has bared the head of the monster by knocking off the crown which shielded and concealed it.

“*Order!* was Guizot’s war-cry. *Order!* shouted Sebastiani, the Guizotist, when Warsaw became Russian. *Order!* shouts Cavaignac, the brutal echo of the French National Assembly and of the republican bourgeoisie. *Order!* thundered his grape-shot as it tore into the body of the proletariat.

“None of the numerous revolutions of the French bourgeoisie since 1789 assailed the existing order, for they retained the class rule, the slavery of the workers, the bourgeois system, even though the political form of this rule and this slavery changed frequently. The June uprising did assail this system. Woe to the June uprising!”

Woe to that June! Re-echoes Europe.

The Paris proletariat *was forced* into the June insurrection by the bourgeoisie. This sufficed to mark its doom. Its immediate, avowed needs did not drive it to engage in a fight for the forcible overthrow of the bourgeoisie, nor was it equal to this task. The *Moniteur* had to inform it officially that the time was past when the republic saw any occasion to bow and scrape to its illusions, and only its defeat convinced it of the truth that the slightest improvement in its position remains a utopia *within* the bourgeois republic, *a utopia* that becomes a crime as soon as it wants to become a reality. In place of the demands, exuberant in form but still limited and even bourgeois in content, whose concession the proletariat wanted to wring from the February Republic, there appeared the bold slogan of revolutionary struggle: *Overthrow of the bourgeoisie! Dictatorship of the Working class!*

By making its burial place the birthplace of the *bourgeois republic*, the proletariat compelled the latter to come out forthwith in its pure form as the state whose admitted object it is to perpetuate the rule of capital, the slavery of labor. Having constantly before its eyes the scarred, irreconcilable, invincible enemy – invincible because its existence is the condition of its own life – bourgeois rule, freed from all fetters, was bound to turn immediately into *bourgeois terrorism*. With the proletariat removed for the time being from the stage and bourgeois dictatorship recognized officially, the middle strata of bourgeois society, the petty bourgeoisie and the peasant class, had to adhere more and more closely to the proletariat as their position became more unbearable and their antagonism to the bourgeoisie more acute. Just as earlier they had to find the cause of their distress in its upsurge, so now in its defeat.

If the June insurrection raised the self-assurance of the bourgeoisie all over the Continent, and caused it to league itself openly with the feudal monarchy against the people, who was the first victim of this alliances The continental bourgeoisie itself. The June defeat prevented it from consolidating its rule and from bringing the people, half satisfied and half out of humor, to a standstill at the lowest stage of the bourgeois revolution.

Finally, the defeat of June divulged to the despotic powers of Europe the secret that France must maintain peace abroad at any price in order to be able to wage civil war at home. Thus the people's who had begun the fight for their national independence were abandoned to the superior power of Russia, Austria, and Prussian, but at the same time the fate of these national revolutions was made subject to the fate of the proletarian revolution, and they were robbed of their apparent autonomy, their independence of the great social revolution. The Hungarian shall not be free, nor the Pole, nor the Italian, as long as the worker remains a slave!

Finally, with the victories of the Holy Alliance, Europe has taken on a form that makes every fresh proletarian upheaval in France directly coincide with a *world war*. The new French revolution is forced to leave its national soil forthwith and *conquer the European terrain*, on which alone the social revolution of the nineteenth century can be accomplished.

Thus only the June defeat has created all the conditions under which France can seize the *initiative* of the European revolution. Only after being dipped in the blood of the *June insurgents* did the tricolor become the flag of the European revolution – the *red flag*!

And we exclaim: *The revolution is dead! Long live the revolution!*

Part II. From June 1848 to June 13, 1849

February 25, 1848, granted the *republic* to France, June 25 thrust the *revolution* upon her. And revolution, after June, meant: *overthrow of bourgeois society*, whereas before February it meant: *overthrow of the form of government*.

The June fight was led by the *republican* faction of the bourgeoisie; with victory political power necessarily fell to its share. The state of siege laid, gagged Paris, unresisting, at its feet, and in the provinces there prevailed a moral state of siege, the threatening, brutal arrogance of victorious bourgeoisie and the unleashed property fanaticism of the peasants. No danger, therefore, from *below*!

The crash of the revolutionary might of the workers was simultaneously a crash of the political influence of the *democratic republicans*; that is, of the republicans in the sense of the *petty bourgeoisie*, represented in the Executive Commission by Ledru-Rollin, in the Constituent National Assembly by the part of the Montagne and in the press by the “Réforme.” Together with the bourgeois republicans, they had conspired on April 16 against the proletariat, together with them they had warred against it in the June days. Thus they themselves blasted the background against which their party stood out as a power, for the petty bourgeoisie can preserve a revolutionary attitude toward the bourgeoisie only as long as the proletariat stands behind it. The proletarians were dismissed. The sham alliance which the bourgeois republicans, reluctantly and with reservations, concluded with them during the epoch of the Provisional Government and the Executive Commission was openly broken by the bourgeois republicans. Spurned and repulsed as allies, they sank down to subordinate henchmen of the tricolor men, from whom they could not wring any concessions but whose domination they had to support whenever it, and with it the republic, seemed to be put in jeopardy by the anti-republican bourgeois factions. Lastly, these factions, the Orléanists and the Legitimists, were from the very beginning in a minority in the Constituent National Assembly. Before the June days they dared to react only under the mask of bourgeois republicanism – the June victory allowed for a moment the whole of bourgeois France to greet its savior in Cavaignac; and when, shortly after

the June days, the anti-republican party regained independence, the military dictatorship and the state of siege in Paris permitted it to put out its antennae only very timidly and cautiously.

Since 1830 the *bourgeois republican* faction, in the person of its writers, its spokesmen, its men of talent and ambition, its deputies, generals, bankers, and lawyers, had grouped itself around a Parisian journal, the *National*. In the provinces this journal had its branch newspapers. The coterie of the *National* was the *dynasty of the tricolor republic*. It immediately took possession of all state offices – of the ministries, the prefecture of police, the post-office directorship, the prefectures, the higher army officer posts – which had now become vacant. At the head of the executive power stood its general, *Cavaignac*; its editor in chief, Marrast, became permanent president of the Constituent National Assembly. As master of ceremonies he at the same time did the honors, in his salons, of the respectable republic.

Even revolutionary French writers, awed, as it were, by the republican tradition, have strengthened the mistaken belief that the royalists dominated the Constituent National Assembly. On the contrary, after the June days, the Constituent Assembly remained the *exclusive representative of bourgeois republicanism*, and it emphasized this aspect all the more resolutely, the more the influence of the tricolor republicans collapsed outside the Assembly. If the question was one of maintaining the *form* of the bourgeois republic, then the Assembly had the votes of the democratic republicans at its disposal; if one of maintaining the *content*, then even its mode of speech no longer separated it from the royalist bourgeois factions, for it is the interests of the bourgeoisie, the material conditions of its class rule and class exploitation, that form the content of the bourgeois republic.

Thus it was not royalism but bourgeois republicanism that was realized in the life and work of this Constituent Assembly, which in the end did not die, nor was killed, but decayed.

For the entire duration of its rule, for as long as it gave its grand performance of state on the proscenium, an unbroken sacrificial feast was being staged in the background – the continual sentencing by courts-martial of the captured June insurgents or their deportation without trial. The Constituent Assembly had the tact to admit that in the June insurgents it was not judging criminals but wiping out enemies.

The first act of the Constituent National Assembly was to set up a *commission of inquiry* into the events of June and of May 15, and into the part played by the socialist and democratic party leaders during these days. The inquiry was directly aimed at Louis Blanc, Ledru-Rollin, and Caussidière. The bourgeois republicans burned with impatience to rid themselves of these rivals. They could have entrusted the venting of their spleen to no more suitable object than M. Odilon Barrot, the former chief of the dynastic opposition, the incarnation of liberalism, the *nullité grave* [self-important non-entity], the thoroughly shallow person who not only had a dynasty to revenge, but even had to settle accounts with the revolutionists for thwarting his premiership. A sure guarantee of his relentlessness. This Barrot was therefore appointed chairman of the commission of inquiry, and he constructed a complete legal process against the February Revolution which may be summarized thus: March 17, *demonstration*; April 16, *conspiracy*; May 15, *attempt*; June 23, *civil war*! Why did he not stretch his erudite criminologist's researches as far back as February 24? The *Journal des Débats* inquired – that is, to the *foundation of Rome*. The origin of states gets lost in a myth that one may believe but may not discuss. Louis Blanc and Caussidière were handed over to the courts. The National Assembly completed the work of purging itself which it had begun on May 15.

The plan formed by the Provisional Government, and again taken up by Goudchaux, of taxing capital – in the form of a mortgage tax was rejected by the Constituent Assembly; the law that limited the working day to ten hours was repealed; imprisonment for debt was once more introduced; the large section of the French population that can neither read nor write was excluded from jury service. Why not from the franchise also? Journals again had to deposit caution money. The right of association was restricted.

No one had fought more fanatically in the June days for the salvation of property and the restoration of credit than the Parisian petty bourgeois – keepers of cafes and restaurants, marchands de vins [wine merchants], small traders, shopkeepers, handicraftsman, etc. The shopkeeper had pulled himself together and marched against the barricades in order to restore the traffic which leads from the streets into the shop. But behind the barricade stood the customers and the debtors; before it the creditors of the shop. And when the barricades were thrown down and the workers were crushed and the shopkeepers, drunk with victory, rushed back to their shops, they found the entrance barred by a savior of property, an official agent of credit, who

presented them with threatening notices: Overdue promissory note! Overdue house rent! Overdue bond! Doomed shop! Doomed shopkeeper!

Salvation of property! But the house they lived in was not their property; the shop they kept was not their property; the commodities they dealt in were not their property. Neither their business, nor the plate they ate from, nor the bed they slept on belonged to them any longer. It was precisely from them that *this property had to be saved* – for the house-owner who let the house, for the banker who discounted the promissory note, for the capitalist who made the advances in cash, for the manufacturer who entrusted the sale of his commodities to these retailers, for the wholesale dealer who had credited the raw materials to these handicraftsman. *Restoration of credit!* But credit, having regained strength, proved itself a vigorous and jealous god; it turned the debtor who could not pay out of his four walls, together with wife and child, surrendered his sham property to capital, and threw the man himself into the debtors' prison, which had once more reared its head threateningly over the corpses of the June insurgents.

The petty bourgeois saw with horror that by striking down the workers they had delivered themselves without resistance into the hands of their creditors. Their bankruptcy, which since February had been dragging on in chronic fashion and had apparently been ignored, was openly declared after June.

Their *nominal property* had been left unassailed as long as it was of consequence to drive them to the battlefield in the name of property. Now that the great issue with the proletariat had been settled, the small matter of the *épiciers* could in turn be settled. In Paris the mass of overdue paper amounted to over 21,000,000 francs; in the provinces to over 1,000,000. The proprietors of more than 7,000 Paris firms had not paid their rent since February.

While the National Assembly had instituted an inquiry into *political guilt*, going as far back as the end of February, the petty bourgeois on their part now demanded an inquiry into *civil debts* up to February 24. They assembled en masse in the Bourse hall and threateningly demanded, on behalf of every businessman who could prove that his insolvency was due solely to the stagnation caused by the revolution and that his business had been in good condition on February 24, an extension of the term of payment by order of a commerce court and the compulsory liquidation of creditors claims in consideration of a moderate percentage payment. As a legislative

proposal, this question was dealt with in the National Assembly in the form of *concordats à l'amiable* [amicable agreements]. The Assembly vacillated; then it suddenly learned that at the same time, at the Porte St. Denis, thousands of wives and children of the insurgents had prepared an amnesty petition.

In the presence of the resurrected specter of June, the petty bourgeoisie trembled and the National Assembly retrieved its implacability. The *concordats à l'amiable*, the amicable settlements between debtor and creditor, were rejected in their most essential points.

Thus long after the democratic representatives of the petty bourgeois had been repulsed within the National Assembly by the republican representatives of the bourgeoisie, this parliamentary breach received its civil, its real economic meaning by the petty bourgeois as debtors being handed over to the bourgeois as creditors. A large part of the former were completely ruined and the remainder were allowed to continue their businesses only under conditions which made them absolute serfs of capital. On August 22, 1848, the National Assembly rejected the *concordats à l'amiable*; on September 19, 1848, in the midst of the state of siege, Prince Louis Bonaparte and the prisoner of Vincennes, the Communist Raspail, were elected representatives of Paris. The bourgeoisie, however, elected the usurious moneychanger and Orléanist Fould. From all sides at once, therefore, open declaration of war against the Constituent National Assembly, against bourgeois republicanism, against Cavaignac.

It needs no argument to show how the mass bankruptcy of the Paris petty bourgeois was bound to produce aftereffects far transcending the circle of its immediate victims, and to convulse bourgeois commerce once more, while the state deficit was swollen anew by the costs of the June insurrection, and state revenues sank continuously through the hold-up of production, the restricted consumption, and the decreasing imports. Cavaignac and the National Assembly could have recourse to no other expedient than a new loan, which forced them still further under the yoke of the finance aristocracy.

While the petty bourgeois had harvested bankruptcy and liquidation by order of court as the fruit of the June victory, Cavaignac's Janisseries, the *Mobile Guards*, found their reward in the soft arms of the courtesans, and as "the youthful saviors of society" they received all kinds of homage in the salons of Marrast, the knight of the tricolor, who served simultaneously as

the *Amphitryon* and the troubadour of the respectable republic. Meantime, this social favoritism and the disproportionately higher pay of the Mobile Guard embittered the *army*, while all those national illusions with which bourgeois republicanism, through its journal, the *National*, had been able to attach to itself a part of the army and peasant class under Louis Philippe vanished at the same time. The role of mediator which Cavaignac and the National Assembly played in *North Italy* in order, together with England, to betray it to Austria – this one day of rule destroyed eighteen years of opposition on the part of the *National*. No government was less national than that of the *National*, none more dependent on England, and, under Louis Philippe, the *National* lived by paraphrasing daily Cato's dictum: *Carthaginem esse delendam* [Carthage must be destroyed], none was more servile toward the Holy Alliance, and from a Guizot the *National* had demanded the tearing up of the Treaties of Vienna. The irony of history made Bastide, the ex-editor for foreign affairs of the *National*, Minister of Foreign Affairs of France, so that he might refute every one of his articles in every one of his dispatches.

For a moment, the army and the peasant class had believed that, simultaneously with the military dictatorship, war abroad and gloire had been placed on the order of the day in France. But Cavaignac was not the dictatorship of the saber over bourgeois society; he was the dictatorship of the bourgeoisie by the saber. And of the soldier they now required only the gendarme. Under the stern features of antique-republican resignation Cavaignac concealed humdrum submission to the humiliating conditions of his bourgeois office. *L'argent n'a pas de maître!* Money has no master! He, as well as the Constituent Assembly in general, idealized this old election cry of the Third Estate by translating it into political speech: The bourgeoisie has no king; the true form of its rule is the republic.

And the "great organic work" of the Constituent National Assembly consisted in working out this *form*, in producing a republican *constitution*. The rechristening of the Christian calendar as a republican one, of the saintly Bartholomew as the saintly Robespierre, made no more change in the wind and weather than this constitution made or was supposed to make in bourgeois society. Where it went beyond a *change of costume*, it put on record the *existing* facts. Thus it solemnly registered the fact of the republic, the fact of universal suffrage, the fact of a single sovereign National Assembly in place of two limited constitutional chambers. Thus it

registered and regulated the fact of the dictatorship of Cavaignac by replacing the stationary, irresponsible hereditary monarchy with an ambulatory, responsible, elective monarchy, with a quadrennial presidency. Thus it elevated no less to an organic law the fact of the extraordinary powers with which the National Assembly, after the horrors of May 15 and June 25, had prudently invested its president in the interest of its own security. The remainder of the constitution was a work of terminology. The royalist labels were torn off the mechanism of the old monarchy and republican labels stuck on. Marrast, former editor in chief of the *National*, now editor in chief of the constitution, acquitted himself of this academic task not without talent.

The Constituent Assembly resembled the Chilean official who wanted to regulate property relations in land more firmly by a cadastral survey just at the moment when subterranean rumblings announced the volcanic eruption that was to hurl away the land from under his very feet. While in theory it accurately marked off the forms in which the rule of the bourgeoisie found republican expression, in reality it held its own only by the abolition of all formulas, by force *sans phrase* [without any exceptions], by the *state of siege*. Two days before it began its work on the constitution, it proclaimed an extension of the state of siege. Formerly constitutions had been made and adopted as soon as the social process of revolution had reached a point of rest, the newly formed class relationships had established themselves, and the contending factions of the ruling class had had recourse to a compromise which allowed them to continue the struggle among themselves and at the same time to keep the exhausted masses of the people out of it. This constitution, on the contrary, did not sanction any social revolution – it sanctioned the momentary victory of the old society over the revolution.

The first draft of the constitution, made before the June days, still contained the *droit au travail*, the right to work, the first clumsy formula wherein the revolutionary demands of the proletariat are summarized. It was transformed into the *droit à l'assistance*, the right to public relief, and what modern state does not feed its paupers in some form or other? The right to work is, in the bourgeois sense, an absurdity, a miserable, pious wish. But behind the right to work stands the power over capital; behind the power over capital, the appropriation of the means of production, their subjection to the associated working class, and therefore the abolition of

wage labor, of capital, and of their mutual relations. Behind the “*right to work*” stood the June insurrection. The Constituent Assembly, which in fact put the revolutionary proletariat hors la loi, outside the law, had on principle to throw the *proletariat’s* formula out of the constitution, the law of laws; had to pronounce its anathema upon the “right to work.” But it did not stop there. As Plato banned the poets from his republic, so it banished forever from its republic the *progressive tax*. And the progressive tax is not only a bourgeois measure, which can be carried out within the existing relations of production to a greater or less degree, it was the only means of binding the middle strata of bourgeois society to the “respectable” republic, of reducing the state debt, of holding the anti-republican majority of the bourgeoisie in check.

In the matter of the *concordats à l’amiable*, the tricolor republicans had actually sacrificed the petty bourgeoisie to the big bourgeoisie. They elevated this isolated fact to a principle by the legal prohibition of a progressive tax. They put bourgeois reform on the same level as proletarian revolution. But what class then remained as the mainstay of their republic? The big bourgeoisie. And its mass was anti-republican. While it exploited the republicans of the National in order to consolidate again the old relations of economic life, it thought, on the other hand, of exploiting the once more consolidated social relations in order to restore the political forms that corresponded to them. As early as the beginning of October, Cavaignac felt compelled to make Dufaure and Vivien, previously ministers of Louis Philippe, ministers of the republic, however much the brainless puritans of his own party growled and blustered.

While the tricolor constitution rejected every compromise with the petty bourgeoisie and was unable to win the attachment of any new social element to the new form of government, it hastened, on the other hand, to restore its traditional inviolability to a body that constituted the most hard-bitten and fanatical defender of the old state. It raised the *irremovability of judges*, which had been questioned by the Provisional Government, to an organic law. The *one* king whom it had removed rose again, by the score, in these irremovable inquisitors of legality.

The French press has analyzed from numerous aspects the contradictions of M. Marrast’s constitution, for example, the coexistence of two sovereigns, the National Assembly and the President, etc., etc.

The comprehensive contradiction of this constitution, however, consists in the following: The classes whose social slavery the constitution is to perpetuate – proletariat, peasantry, petty bourgeoisie – it puts in possession of political power through universal suffrage. And from the class whose old social power it sanctions, the bourgeoisie, it withdraws the political guarantees of this power. It forces the political rule of the bourgeoisie into democratic conditions, which at every moment help the hostile classes to victory and jeopardize the very foundations of bourgeois society. From the first group it demands that they should not go forward from political to social emancipation; from the others that they should not go back from social to political restoration.

These contradictions perturbed the bourgeois republicans little. To the extent that they ceased to be *indispensable* – and they were indispensable only as the protagonists of the old society against the revolutionary proletariat – they fell, a few weeks after their victory, from the position of a *party* to that of a *coterie*. And they treated the constitution as a big *intrigue*. What was to be constituted in it was, above all, the rule of the *coterie*. The President was to be a protracted Cavaignac; the Legislative Assembly a protracted Constituent Assembly. They hoped to reduce the political power of the masses of the people to a semblance of power, and to be able to make sufficient play with this sham power itself to keep continually hanging over the majority of the bourgeoisie the dilemma of the June days: *realm of the National* or *realm of anarchy*.

The work on the constitution, which was begun on September 4, was finished on October 23. On September 2 the Constituent Assembly had decided not to dissolve until the organic laws supplementing the constitution were enacted. Nonetheless, it now decided to bring to life the creation that was most peculiarly its own, the President, on December 4, long before the circle of its own activity was closed. So sure was it of hailing, in the homunculus of the constitution, the son of his mother. As a precaution it was provided that if none of the candidates received two million votes, the election should pass over from the nation to the Constituent Assembly.

Futile provisions! The first day of the realization of the constitution was the last day of the rule of the Constituent Assembly. In the abyss of the ballot box lay its sentence of death. It sought the “son of his mother” and found the “nephew of his uncle”. Saul Cavaignac slew one million votes,

but David Napoleon slew six million. Saul Cavaignac was beaten six times over.

December 10, 1848, was the day of the *peasant insurrection*. Only from this day does the February of the French peasants date. The symbol that expressed their entry into the revolutionary movement, clumsily cunning, knavishly naive, doltishly sublime, a calculated superstition, a pathetic burlesque, a cleverly stupid anachronism, a world-historic piece of buffoonery and an indecipherable hieroglyphic for the understanding of the civilized – this symbol bore the unmistakable physiognomy of the class that represents barbarism within civilization. The republic had announced itself to this class with the *tax collector*; it announced itself to the republic with the *emperor*. Napoleon was the only man who had exhaustively represented the interests and the imagination of the peasant class, newly created in 1789. By writing his name on the frontispiece of the republic, it declared war abroad and the enforcing of its class interests at home. Napoleon was to the peasants not a person but a program. With banners, with beat of drums and blare of trumpets, they marched to the polling booths shouting: *Plus d'impôts, à bas les riches, à bas la république, vive l'Empereur!* No more taxes, down with the rich, down with the republic, long live the emperor! Behind the emperor was hidden the peasant war. The republic that they voted down was the *republic of the rich*.

December 10 was the coup d'état of the peasants, which overthrew the existing government. And from that day on, when they had taken a government from France and given a government to her, their eyes were fixed steadily on Paris. For a moment active heroes of the revolutionary drama, they could no longer be forced back into the inactive and spineless role of the chorus.

The other classes helped to complete the election victory of the peasants. To the *proletariat*, the election of Napoleon meant the deposition of Cavaignac, the overthrow of the Constituent Assembly, the dismissal of bourgeois republicanism, the cessation of the June victory. To the *petty bourgeoisie*, Napoleon meant the rule of the debtor over the creditor. For the majority of the *big bourgeoisie*, the election of Napoleon meant an open breach with the faction of which it had had to make use, for a moment, against the revolution, but which became intolerable to it as soon as this faction sought to consolidate the position of the moment into a constitutional position. Napoleon in place of Cavaignac meant to this

majority the monarch, in place of the republic, the beginning of the royalist restoration, a sly hint at Orléans, the fleur-de-lis hidden beneath the violets. Lastly, the *army* voted for Napoleon against the Mobile Guard, against the peace idyll, for war.

Thus it happened, as the *Neue Rheinische Zeitung* stated, that the most simple-minded man in France acquired the most multifarious significance. Just because he was nothing, he could signify everything save himself. Meanwhile, different as the meaning of the name Napoleon might be in the mouths of the different classes, with this name each wrote on his ballot: Down with the party of the *National*, down with Cavaignac, down with the Constituent Assembly, down with the bourgeois republic. Minister Dufaure publicly declared in the Constituent Assembly: December 10 is a second February 24.

Petty bourgeoisie and proletariat had voted en bloc *for* Napoleon, in order to vote *against* Cavaignac and, by pooling their votes, to wrest the final decision from the Constituent Assembly. The more advanced sections of the two classes, however, put forward their own candidates. Napoleon was the *collective name* of all parties in coalition against the bourgeois republic; *Ledru-Rollin* and *Raspail* were the *proper names*, the former of the democratic petty bourgeoisie, the latter of the revolutionary proletariat. The votes for Raspail – the proletarians and their socialist spokesmen declared it loudly – were to be merely a demonstration, so many protests against any presidency, that is, against the constitution itself, so many votes against Ledru-Rollin, the first act by which the proletariat, as an independent political party, declared its separation from the democratic party. This party, on the other hand – the democratic petty bourgeoisie and its parliamentary representative, the Montagne – treated the candidature of Ledru-Rollin with all the seriousness with which it is in the habit of solemnly duping itself. For the rest, this was its last attempt to set itself up as an independent party, as against the proletariat. Not only the republican bourgeois party, but also the democratic petty bourgeoisie and its Montagne were beaten on December 10.

France now possessed a *Napoleon* side by side with a *Montagne*, proof that both were only the lifeless caricatures of the great realities whose names they bore. Louis Napoleon, with the emperor's hat and the eagle, parodied the old Napoleon no more miserably than the Montagne, with its phrases borrowed from 1793 and its demagogic poses, parodied the old

Montagne. Thus the traditional 1793 superstition was stripped off at the same time as the traditional Napoleon superstition. The revolution had come into its own only when it had won its *own*, its *original* name, and it could do that only when the modern revolutionary class, the industrial proletariat, came dominatingly into its foreground. One can say that December 10 dumbfounded the Montagne and caused it to grow confused in its own mind, if for no other reason than because that day laughingly cut short with a contemptuous peasant jest the classical analogy to the old revolution.

On December 20 Cavaignac laid down his office and the Constituent Assembly proclaimed Louis Napoleon President of the Republic, On December 19, the last day of its sole rule, it rejected the proposal for amnesty for the June insurgents. Would revoking the decree of June 27, under which it had condemned 15,000 insurgents to deportation without judicial sentence, not have meant revoking the June battle itself.

Odilon Barrot, the last minister of Louis Philippe, became the first minister of Louis Napoleon. Just as Louis Napoleon dated his rule, not from December 10, but from a decree of the Senate of 1804, so he found a prime minister who did not date his ministry from December 20, but from a royal decree of February 24. As the legitimate heir of Louis Philippe, Louis Napoleon mollified the change of government by retaining the old ministry, which, moreover, had not had time to be worn out, since it had not found time to embark upon life.

The leaders of the royalist bourgeois factions advised him in this choice. The head of the old dynastic opposition, who had unconsciously constituted the transition to the republicans of the National, was still more fitted to constitute with full consciousness the transition from the bourgeois republic to the monarchy.

Odilon Barrot was the leader of the one old opposition party which, always fruitlessly struggling for ministerial portfolios, had not yet been used up. In rapid succession the revolution hurled all the old opposition parties to the top of the state, so that they would have to deny, to repudiate their old phrases not only in deeds but even in words, and might finally be flung all together, combined in a repulsive commixture, on the dung heap of history by the people. And no apostasy was spared this Barrot, this incarnation of bourgeois liberalism, who for eighteen years had hidden the rascally vacuity of his mind behind the serious demeanor of his body. If at

certain moments the far too striking contrast between the thistles of the present and the laurels of the past startled the man himself, one glance in the mirror gave him back his ministerial composure and human self-admiration. What beamed at him from the mirror was Guizot, whom he had always envied, who had always mastered him, Guizot himself, but Guizot with the Olympian forehead of Odilon. What he overlooked were the ears of Midas.

The Barrot of February 24 first became manifest in the Barrot of December 20. Associated with him, the Orléanist and Voltairean, was the Legitimist and Jesuit Falloux, as Minister of Public Worship.

A few days later, the Ministry of Home Affairs was given to Léon Faucher, the Malthusian. Law, religion, and political economy! The ministry of Barrot contained all this and, in addition, a combination of Legitimists and Orléanists. Only the Bonapartist was lacking. Bonaparte still hid his longing to signify Napoleon, for *Soulouque* did not yet play Toussaint Louverture.

The party of the *National* was immediately relieved of all the higher posts, where it had entrenched itself. The prefecture of police, the post-office directorship, the procuratorship general, the mairie [mayor's office] of Paris were all filled with old creatures of the monarchy. Changarnier, the Legitimist, received the unified supreme command of the National Guard of the Department of the Seine, of the Mobile Guard and the troops of the line of the first military division; Bugeaud, the Orléanist, was appointed commander in chief of the Alpine Army. This change of officials continued uninterrupted under the Barrot government. The first act of his ministry was the restoration of the old royalist administration. The official scene was at once transformed – scenery, costumes, speech, actors, supers, mutes, prompters, the position of the parties, the theme of the drama, the content of the conflict, the whole situation. Only the premundane Constituent Assembly remained in its place. But from the hour when the National Assembly had installed Bonaparte, Bonaparte Barrot, and Barrot Changarnier, France stepped out of the period of republican constitution into the period of the constituted republic. And what place was there for a Constituent Assembly in a constituted republic? After the earth had been created, there was nothing else for its creator to do but flee to heaven. The Constituent Assembly was determined not to follow his example; the National Assembly was the last asylum of the party of the bourgeois

republicans. If all levers of executive power had been wrested from it, was there not left to it constituent omnipotence? Its first thought was to hold under all circumstances the position of sovereignty it occupied, and thence to reconquer the lost ground. Once the Barrot Ministry was displaced by a ministry of the *National*, the royalist personnel would have to vacate the palaces of the administration forthwith and the tricolor personnel would triumphantly move in again. The National Assembly resolved on the overthrow of the ministry and the ministry itself offered an opportunity for the attack, a better one than the Constituent Assembly itself could have invented.

It will be remembered that for the peasants Louis Bonaparte signified: No more taxes! Six days he sat in the President's chair, and on the seventh, on December 27, his ministry proposed the *retention of the salt tax*, whose abolition the Provisional Government had decreed. The salt tax shares with the wine tax the privilege of being the scapegoat of the old French financial system, particularly in the eyes of the country folk. The Barrot Ministry could not have put into the mouth of the peasants' choice a more mordant epigram on his electors than the words: *Restoration of the salt tax!* With the salt tax, Bonaparte lost his revolutionary salt – the Napoleon of the peasant insurrection dissolved like an apparition, and nothing remained but the great unknown of royalist bourgeois intrigue. And not without intention did the Barrot Ministry make this act of tactlessly rude disillusionment the first governmental act of the President.

The Constituent Assembly, for its part, eagerly seized the double opportunity of overthrowing the ministry and, as against the elected choice of the peasantry, setting itself up as the representative of peasant interests. It rejected the proposal of the finance minister, reduced the salt tax to a third of its former amount, thus increasing by sixty millions a state deficit of five hundred and sixty millions, and, after this *vote of no confidence*, calmly awaited the resignation of the ministry. So little did it comprehend the new world that surrounded it and its own changed position. Behind the ministry stood the President and behind the President stood six millions who had placed in the ballot box as many votes of no confidence in the Constituent Assembly. The Constituent Assembly gave the nation back its no-confidence vote. Absurd exchange! It forgot that its votes were no longer legal tender. The rejection of the salt tax only matured the decision of Bonaparte and his ministry to finish the Constituent Assembly. There began

that long duel which lasted the entire latter half of the life of the Constituent Assembly. *January 29*, March 31, and May 8 are the journées, the great days of this crisis, just so many forerunners of *June 13*.

Frenchmen, for example Louis Blanc, have construed January 29 as the date of the emergence of a constitutional contradiction, the contradiction between a sovereign, indissoluble National Assembly born of universal suffrage and a President who, to go by the wording, was responsible to the Assembly, but who, to go by reality, was not only similarly sanctioned by universal suffrage and in addition united in his own person all the votes that were split up a hundred times and distributed among the individual members of the National Assembly, but who was also in full possession of the whole executive power, above which the National Assembly hovered as a merely moral force. This interpretation of January 29 confuses the language of the struggle on the platform, through the press, and in the clubs with its real content. Louis Bonaparte as against the Constituent National Assembly – that was not one unilateral constitutional power as against another; that was not the executive power as against the legislative. That was the constituted bourgeois republic itself as against the intrigues and ideological demands of the revolutionary faction of the bourgeoisie that had founded it and was now amazed to find that its constituted republic looked like a restored monarchy, and now desired forcibly to prolong the constituent period with its conditions, its illusions, its language, and its personages and to prevent the mature bourgeois republic from emerging in its complete and peculiar form. As the Constituent National Assembly represented Cavaignac, who had fallen back into its midst, so Bonaparte represented the Legislative National Assembly that had not yet been divorced from him, that is, the National Assembly of the constituted bourgeois republic.

The election of Bonaparte could become explicable only, by putting in the place of the one name its manifold meanings, by repeating itself in the election of the new National Assembly. The mandate of the old was annulled by December 10. Thus on January 29 it was not the President and the National Assembly of the *same* republic that were face to face; it was the National Assembly of the republic that was coming into being and the President of the republic that had come into being, two powers that embodied quite different periods in the life process of the republic; the one, the small republican faction of the bourgeoisie that alone could proclaim the

republic, wrest it from the revolutionary proletariat by street fighting and a reign of terror, and draft its ideal basic features in the constitution; and the other, the whole royalist mass of the bourgeoisie that alone could rule in this constituted bourgeois republic, strip the constitution of its ideological trimmings, and realize by its legislation and administration the indispensable conditions for the subjugation of the proletariat.

The storm which broke on January 29 gathered its elements during the whole month of January. The Constituent Assembly wanted to drive the Barrot Ministry to resign by its no-confidence vote. The Barrot Ministry, on the other hand, proposed to the Constituent Assembly that it should give itself a definitive no-confidence vote, decide on suicide, and decree *its own dissolution*. On January 6, Rateau, one of the most obscure deputies, at the order of the ministry brought this motion before the Constituent Assembly that in August had determined not to dissolve until it had enacted a whole series of organic laws supplementing the constitution. Fould, the ministerialist, bluntly declared to it that its dissolution was necessary “*for the restoration of the deranged credit.*” And did it not derange credit when it prolonged the provisional stage and, with Barrot, again called Bonaparte in question, and, with Bonaparte, the constituted republic Barrot the Olympian became a raving Roland at the prospect of seeing the premiership he had finally pocketed, which the republicans had already withheld from him for ten months, again torn from him after scarcely two weeks’ enjoyment of it. Barrot, confronting this wretched Assembly, out-tyrannized the tyrant. His mildest words were, “No future is possible with it.” And actually it did represent only the past. “It is incapable,” he added ironically, “of providing the republic with the institutions which are necessary for its consolidation.” Incapable indeed! Its bourgeois energy was broken simultaneously with its exceptional antagonism to the proletariat, and with its antagonism to the royalists its republican exuberance lived anew. Thus it was doubly incapable of consolidating the bourgeois republic, which it no longer comprehended, by means of the corresponding institutions.

Simultaneously with Rateau’s motion the ministry evoked a *storm of petitions* throughout the land, and from all corners of France came flying daily at the head of the Constituent Assembly bundles of *billets-doux* [love-letters] in which it was more or less categorically requested to *dissolve* and make its will. The Constituent Assembly, on its side, called forth counter-

petitions in which it caused itself to be requested to remain alive. The election struggle between Bonaparte and Cavaignac was renewed as a petition struggle for and against the dissolution of the National Assembly; the petitions were to be belated commentaries on December 10. This agitation continued during the whole of January.

In the conflict between the Constituent Assembly and the President, the former could not refer back to the general election as its origin, for the appeal was from the Assembly to universal suffrage. It could base itself on no regularly constituted power, for the issue was the struggle against the legal power. It could not overthrow the ministry by no-confidence votes, as it again essayed to do on January 6 and 26, for the ministry did not ask for its confidence. Only one possibility was left to it, that of *insurrection*. The fighting forces of the insurrection were the *republican part of the National Guard*, the *Mobile Guard*, and the centers of the revolutionary proletariat, the *clubs*. The Mobile Guard, those heroes of the June days, in December formed the organized fighting force of the republican faction of the bourgeoisie, just as before June the *national ateliers* had formed the organized fighting force of the revolutionary proletariat. As the Executive Commission of the Constituent Assembly directed its brutal attack on the *national ateliers*, when it had to put an end to the now unbearable pretensions of the proletariat, so the ministry of Bonaparte directed its attack on the Mobile Guard, when it had to put an end to the now unbearable pretensions of the republican faction of the bourgeoisie. It ordered the *disbanding of the Mobile Guard*. One half of it was dismissed and thrown on the street, the other was organized on monarchist instead of democratic lines, and its pay was reduced to the usual pay of troops of the line. The Mobile Guard found itself in the position of the June insurgents and every day the press carried *public confessions* in which it admitted its blame for June and implored the proletariat to forgive it.

And the *clubs*? From the moment when the Constituent Assembly in the person of Barrot called in question the President, and in the person of the President the constituted bourgeois republic, and in the person of the constituted bourgeois republic the bourgeois republic in general, all the constituent elements of the February Republic necessarily ranged themselves around it – all the parties that wished to overthrow the existing republic and by a violent retrograde process to transform it into a republic of their class interests and principles. The scrambled eggs were

unscrambled, the crystallisations of the revolutionary movement had again become fluid, the republic that was being fought for was again the indefinite republic of the February days, the defining of which each party reserved to itself. For a moment the parties again took up their old February positions, without sharing the illusions of February. The tricolor republicans on the *National* again leaned on the democratic republicans of the *Réforme* and pushed them as protagonists into the foreground of the parliamentary struggle. The democratic republicans again leaned on the socialist republicans – on January 27 a public manifesto announced their reconciliation and union – and prepared their insurrectional background in the clubs. The ministerial press rightly treated the tricolor republicans of the *National* as the resurrected insurgents of June. In order to maintain themselves at the head of the bourgeois republic, they called in question the bourgeois republic itself. On January 26 Minister Faucher proposed a law on the right of association, the first paragraph of which read: “*Clubs are forbidden.*” He moved that this bill immediately be discussed as urgent. The Constituent Assembly rejected the motion of urgency, and on January 27 Ledru-Rollin put forward a proposition, with 230 signatures appended to it, to impeach the ministry for violation of the constitution. The impeachment of the ministry at times when such an act was a tactless disclosure of the impotence of the judge, to wit, the majority of the Chamber, or an impotent protest of the accuser against this majority itself – that was the great revolutionary trump that the latter-day Montagne played from now on at each high spot of the crisis. Poor Montagne! crushed by the weight of its own name!

On May 15 Blanqui, Barbès, Raspall, etc., had attempted to break up the Constituent Assembly by forcing an entrance into its hall at the head of the Paris proletariat. Barrot prepared a moral May 15 for the same Assembly when he wanted to dictate its self-dissolution and close the hall. The same Assembly had commissioned Barrot to make the inquiry against the May accused, and now, at the moment when he appeared before it like a royalist Blanqui, when it sought for allies against him in the clubs, among the revolutionary proletarians, in the party of Blanqui – at this moment the relentless Barrot tormented it with the proposal to withdraw the May prisoners from the Court of Assizes with its jury and hand them over to the High Court, the haute cour devised by the party of the *National*. Remarkable how wild fear for a ministerial portfolio could pound out of the

head of a Barrot points worthy of a Beaumarchais! After much vacillation the National Assembly accepted his proposal. As against the makers of the May attempt, it reverted to its normal character.

If the Constituent Assembly, as against the President and the ministers, was driven to *insurrection*, the President and the ministers, as against the Constituent Assembly, were driven to a coup d'état, for they had no legal means of dissolving it. But the Constituent Assembly was the mother of the constitution and the constitution was the mother of the President. With the coup d'état the President tore up the constitution and extinguished his republican legal title. He was then forced to pull out his imperial legal title, but the imperial legal title woke up the Orléanist legal title and both paled before the Legitimist legal title. The downfall of the legal republic could shoot to the top only its extreme antipode, the Legitimist monarchy, at a moment when the Orléanist party was still only the vanquished of February and Bonaparte was still only the victor of December 10, when both could oppose to republican usurpation only their likewise usurped monarchist titles. The Legitimists were aware of the propitiousness of the moment; they conspired openly. They could hope to find their *Monk* in General Changarnier. The imminence of the *white monarchy* was as openly announced in their clubs as was that of the *red republic* in the proletarian clubs.

The ministry would have escaped all difficulties by a happily suppressed rising. "Legality is the death of us," cried Odilon Barrot. A rising would have allowed it, under the pretext of salut public [public safety], to dissolve the Constituent Assembly, to violate the constitution in the interests of the constitution itself. The brutal behavior of Odilon Barrot in the National Assembly, the motion for the dissolution of the clubs, the tumultuous removal of fifty tricolor prefects and their replacement by royalists, the dissolution of the Mobile Guard, the ill treatment of their chiefs by Changarnier, the reinstatement of Lerminier, the professor who was impossible even under Guizot, the toleration of the Legitimist braggadocio – all these were just so many provocations to mutiny. But the mutiny remained mute. It expected its signal from the Constituent Assembly and not from the ministry.

Finally came January 29, the day the decision was to be taken on the motion of Mathieu (de la Drôme) for unconditional rejection of Râteau's motion. Legitimists, Orléanists, Bonapartists, Mobile Guard, Montagne,

clubs – all conspired on this day, each just as much against the ostensible enemy as against the ostensible ally. Bonaparte, on horseback, mustered a part of the troops on the Place de la Concorde; Changarnier play-acted with a display of strategic maneuvers; the Constituent Assembly found its building occupied by the military. This Assembly, the center of all the conflicting hopes, fears, expectations, ferments, tensions, and conspiracies, this lionhearted Assembly did not falter for a moment when it came nearer to the *Weltgeist* [world spirit] than ever. It was like the fighter who not only feared to make use of his own weapons but also felt himself obliged to maintain the weapons of his opponent unimpaired. Scorning death, it signed its own death warrant and rejected the unconditional rejection of the Râteau motion. Itself in a state of siege, it set limits to a constituent activity whose necessary frame had been the state of siege of Paris. It revenged itself worthily when on the following day it instituted an inquiry into the fright that the ministry had given it on January 29. In this great comedy of intrigues the Montagne showed its lack of revolutionary energy and political understanding by allowing itself to be used by the party of the *National* as the crier in the contest. The party of the National had made its last attempt to continue to maintain, in the constituted republic, the monopoly of rule it had possessed during the inchoate period of the bourgeois republic. It was shipwrecked.

While in the January crisis it was a question of the existence of the Constituent Assembly, in the crisis of March 21 it was a question of the existence of the constitution – there of the personnel of the *National* party, here of its ideal. There is no need to point out that the respectable republicans surrendered the exaltation of their ideology more cheaply than the worldly enjoyment of governmental power.

On March 21 Faucher's bill against the right of association: the *suppression of the clubs* was on the order of the day in the National Assembly. Article 8 of the constitution guarantees to all Frenchmen the right to associate. The prohibition of the clubs was therefore an unequivocal violation of the constitution, and the Constituent Assembly itself was to canonize the profanation of its holy of holies. But the clubs – these were the gathering points, the conspiratorial seats of the revolutionary proletariat. The National Assembly had itself forbidden the coalition of the workers against its bourgeois. And the clubs – what were they but a coalition of the whole working class against the whole bourgeois class, the formation of a

workers' state against the bourgeois state? Were they not just so many constituent assemblies of the proletariat and just so many military detachments of revolt in fighting trim – what the constitution was to constitute above all else was the rule of the bourgeoisie. By the right of association the constitution, therefore, could manifestly mean only associations that harmonized with the rule of the bourgeoisie, that is, with bourgeois order. If for reasons of theoretical propriety it expressed itself in general terms, were not the government and the National Assembly there to interpret and apply it in a special case? And if in the primeval epoch of the republic the clubs actually were forbidden by the state of siege, had they not to be forbidden in the ordered, constituted republic by the law? The tri-color republicans had nothing to oppose to this prosaic interpretation of the constitution but the high-flown phraseology of the constitution. A section of them, Pagnerre, Duclerc, etc., voted for the ministry and thereby gave it a majority. The others, with the archangel Cavaignac and the father of the church Marrast at their head, retired, after the article on the prohibition of the clubs had gone through, to a special committee room, jointly with Ledru-Rollin and the Montagne – “and held a council.” The National Assembly was paralyzed; it no longer had a quorum. At the right time, M. Crémieux remembered in the committee room that the way from here led directly to the street and that it was no longer February, 1848, but March, 1849. The party of the National, suddenly enlightened, returned to the National Assembly's hall of session, behind it the Montagne, duped once more. The latter, constantly tormented by revolutionary longings, just as constantly clutched at constitutional possibilities, and still felt itself more in place behind the bourgeois republicans than in front of the revolutionary proletariat. Thus the comedy was played. And the Constituent Assembly itself had decreed that the violation of the letter of the constitution was the only appropriate realization of its spirit.

There was only one point left to settle, the relation of the constituted republic to the European revolution, *its foreign policy*. On May 8, 1849, unwonted excitement prevailed in the Constituent Assembly, whose term of life was due to end in a few days. The attack of the French army on Rome, its repulse by the Romans, its political infamy and military disgrace, the foul assassination of the Roman republic by the French republic – the first Italian campaign of the second Bonaparte – was on the order of the day. The Montagne had once more played its great trump; Ledru-Rollin had laid on

the President's table the inevitable bill of impeachment against the ministry, and this time also against Bonaparte, for violation of the constitution.

The motive of May 8 was repeated later as the motive of June 13. Let us get clear about the expedition to Rome.

As early as the middle of November, 1848, Cavaignac had sent a battle fleet to Civita Vecchia in order to protect the Pope, to take him on board and ship him over to France. The Pope was to consecrate the respectable republic, and to insure the election of Cavaignac as President. With the Pope, Cavaignac wanted to angle for the priests, with the priests for the peasants, and with the peasants for the presidency. The expedition of Cavaignac, an election advertisement in its immediate purpose, was at the same time a protest and a threat against the Roman revolution. It contained in embryo France's intervention in favor of the Pope.

This intervention on behalf of the Pope, in association with Austria and Naples against the Roman republic, was decided at the first meeting of Bonaparte's ministerial council, on December 23. Falloux in the ministry – that meant the Pope in Rome – and in the Rome of the Pope. Bonaparte no longer needed the Pope in order to become the President of the peasants; but he needed the conservation of the Pope in order to conserve the peasants of the President. Their credulity had made him President. With faith they would lose credulity, and with the Pope, faith. And the Orléanists and Legitimists in coalition, who ruled in Bonaparte's name! Before the king was restored, the power that consecrates kings had to be restored. Apart from their royalism: without the old Rome, subject to his temporal rule, no Pope; without the Pope, no Catholicism; without Catholicism, no French religion, and without religion, what would become of the old French society? The mortgage the peasant has on heavenly possessions guarantees the mortgage the bourgeois has on peasant possessions. The Roman revolution was therefore an attack on property, on the bourgeois order, dreadful as the June Revolution. Reestablished bourgeois rule in France required the restoration of papal rule in Rome. Finally, to smite the Roman revolutionists was to smite the allies of the French revolutionists; the alliance of the counterrevolutionary classes in the constituted French republic was necessarily supplemented by the alliance of the French republic with the Holy Alliance, with Naples and Austria.

The decision of the ministerial council on December 23 was no secret to the Constituent Assembly. On January 8 Ledru-Rollin had interpellated the

ministry about it; the ministry had denied it and the National Assembly had proceeded to the order of the day. Did it trust the word of the ministry? We know it spent the whole month of January giving the ministry no-confidence votes. But if it was part of the ministry's role to lie, it was part of the National Assembly's role to feign belief in its lie and thereby save republican *dehors* [face].

Meanwhile Piedmont was beaten, Charles-Albert had abdicated, and the Austrian army knocked at the gates of France. Ledru-Rollin vehemently interpellated. The ministry proved that it had only continued in North Italy the policy of Cavaignac and Cavaignac only the policy of the Provisional Government, that is, of Ledru-Rollin. This time it even reaped a vote of confidence from the National Assembly and was authorized to occupy temporarily a suitable point in Upper Italy to give support to peaceful negotiations with Austria concerning the integrity of Sardinian territory and the question of Rome. It is known that the fate of Italy is decided on the battlefields of North Italy. Hence Rome would fall with Lombardy and Piedmont, or France would have to declare war on Austria and thereby on the European counterrevolution. Did the National Assembly suddenly take the Barrot Ministry for the old Committee of Public Safety? Or itself for the Convention? Why, then, the military occupation of a point in Upper Italy? This transparent veil covered the expedition against Rome.

On April 14, 14,000 men sailed under Oudinot for Civita Vecchia; on April 16 the National Assembly voted the ministry a credit Of 1,200,000 francs for the maintenance of a fleet of intervention in the Mediterranean Sea for three months. Thus it gave the ministry every means of intervening against Rome, while it adopted the pose of letting it intervene against Austria. It did not see what the ministry did; it only heard what it said. Such faith was not found in Israel; the Constituent Assembly had fallen into the position of not daring to know what the constituted republic had to do.

Finally, on May 8, the last scene of the comedy was played; the Constituent Assembly urged the ministry to take swift measures to bring the Italian expedition back to the aim set for it. Bonaparte that same evening inserted a letter in the *Moniteur* in which he lavished the greatest appreciation on Oudinot. On May 11 the National Assembly rejected the bill of impeachment against this same Bonaparte and his ministry. And the Montagne, which instead of tearing this web of deceit to pieces took the parliamentary comedy tragically in order to play in it the role of Fouquier-

Tinville, did not betray its natural petty bourgeois calf's hide under the borrowed lion's skin of the Convention!

The latter half of the life of the Constituent Assembly is summarized thus: on January 29 it admits that the royalist bourgeois factions are the natural superiors of the republic constituted by it; on March 21, that the violation of the constitution is its realization; and on May 11, that the bombastically proclaimed passive alliance of the French republic with the struggling peoples means its active alliance with the European counterrevolution.

This miserable Assembly left the stage after it had given itself the satisfaction, two days before its first birthday, May 4, of rejecting the motion of amnesty for the June insurgents. Its power shattered, held in deadly hatred by the people, repulsed, maltreated, contemptuously thrown aside by the bourgeoisie, whose tool it was, forced in the second half of its life to disavow the first, robbed of its republican illusions, without having created anything great in the past, without hope in the future, and with its living body dying bit by bit, it was able to galvanize its own corpse into life only by continually recalling and living through the June victory over and over again, affirming itself by constantly repeated damnation of the damned. A vampire living on the blood of the June insurgents!

It left behind a state deficit increased by the costs of the June insurrection, by the loss of the salt tax, by the compensation it paid the plantation owners for abolishing Negro slavery, by the costs of the Roman expedition, by the loss of the wine tax, whose abolition it resolved upon when already at its last gasp – a malicious old man, happy to impose on his laughing heir a compromising debt of honor.

With the beginning of March the agitation for the election of the *Legislative National Assembly* had commenced. Two main groups opposed each other, the *party of Order* and the *democratic socialist, or Red, party*; between the two stood the *Friends of the Constitution*, under which name the tricolor republicans of the National sought to put forward a party. *The party of Order* was formed directly after the June days; only after December 10 had allowed it to cast off the coterie of the *National*, of the bourgeois republicans, was the secret of its existence, the *coalition of Orléanists and Legitimists into one party*, disclosed. The bourgeois class fell apart into two big factions which alternately – the *big landed proprietors* under the *restored monarchy* and the *finance aristocracy* and the *industrial*

bourgeoisie under the *July Monarchy* – had maintained a monopoly of power. *Bourbon* was the royal name for the predominant influence of the interests of the one faction, *Orléans* the royal name for the predominant influence of the interests of the other faction – the *nameless realm of the republic* was the only one in which both factions could maintain with equal power the common class interest without giving up their mutual rivalry. If the bourgeois republic could not be anything but the perfected and clearly expressed rule of the whole bourgeois class, could it be anything but the rule of the Orléanists supplemented by the Legitimists, and of the Legitimists supplemented by the Orléanists, the *synthesis of the Restoration and the July Monarchy*. The bourgeois republicans of the *National* did not represent any large faction of their class resting on economic foundations. They possessed only the importance and the historical claim of having asserted, under the monarchy, as against the two bourgeois factions that understood only their particular regime, the general regime of the bourgeois class, the *nameless realm of the republic*, which they idealized and embellished with antique arabesques, but in which above all they hailed the rule of their coterie. If the party of the National grew confused in its own mind when it desecrated the royalists in coalition at the top of the republic founded by it, these royalists deceived themselves no less concerning the fact of their united rule. They did not comprehend that if each of their factions, regarded separately, by itself, was royalist, the product of their chemical combination had necessarily to be *republican*, that the white and the blue monarchy had to neutralize each other in the tricolor republic. Forced by antagonism to the revolutionary proletariat and the transition classes thronging more and more around it as their center to summon their united strength and to conserve the organization of this united strength, each faction of the party of Order had to assert, as against the desire for restoration and the overweening presumption of the other, their joint rule, that is, the *republican form* of bourgeois rule. Thus we find these royalists in the beginning believing in an immediate restoration, later preserving the republican form with foaming rage and deadly invective against it on their lips, and finally confessing that they can endure each other only in the republic and postponing the restoration indefinitely. The enjoyment of the united rule itself strengthened each of the two factions, and made each of them still more unable and unwilling to subordinate itself to the other, that is, to restore the monarchy.

The *party of Order* directly proclaimed in its election program the rule of the bourgeois class, that is, the preservation of the life conditions of its rule: *property, family, religion, order!* Naturally it represented its class rule and the conditions of its class rule as the rule of civilization and as the necessary conditions of material production as well as of the relations of social intercourse arising from it. The party of Order had enormous money and resources at its command; it organized its branches throughout France – it had all the ideologists of the old society in its pay – it had the influence of the existing governmental power at its disposal; it possessed an army of unpaid vassals in the whole mass of petty bourgeois and peasants, who, still removed from the revolutionary movement, found in the high dignitaries of property the natural representatives of their petty prejudices. This party, represented throughout the country by countless petty kings, could punish the rejection of their candidates as insurrection, dismiss the rebellious workers, the recalcitrant farm hands, domestic servants, clerks, railway officials, copyists, all the functionaries civilly subordinate to it. Finally, here and there it could maintain the delusion that the republican Constituent Assembly had prevented the Bonaparte of December 10 from manifesting his wonderworking powers. We have not mentioned the Bonapartists in connection with the party of Order. They were not a serious faction of the bourgeois class, but a collection of old, superstitious invalids and young, unbelieving soldiers of fortune. The party of Order was victorious in the elections; it sent a large majority to the Legislative Assembly.

As against the coalesced counterrevolutionary bourgeois class, the sections of the petty bourgeoisie and peasant class already revolutionized naturally had to ally themselves with the high dignitary of revolutionary interests, the revolutionary proletariat. We have seen how the democratic spokesmen of the petty bourgeoisie in parliament, that is, the Montagne, were driven by parliamentary defeats to the socialist spokesmen of the proletariat, and how the actual petty bourgeoisie, outside of parliament, was driven by the *concordats à l'amiable* [friendly agreements], by the brutal enforcement of bourgeois interests, and by bankruptcy to the actual proletarians. On January 27 Montagne and the socialists had celebrated their reconciliation; at the great banquet of February, 1849, they repeated their act of union. The social and the democratic party, the party of the workers and that of the petty bourgeois, united to form the Social-Democratic party, that is, the Red party.

Paralyzed for a moment by the agony that followed the June days, the French republic had lived through a continuous series of feverish excitements since the raising of the state of siege, since October 14. First the struggle for the presidency, then the struggle between the President and the Constituent Assembly; the struggle for the clubs; the trial of Bourges which, in contrast with the petty figures of the President, the coalesced royalists, the respectable republicans, the democratic Montagne, and the socialist doctrines of the proletariat, caused the proletariat's real revolutionists to appear as primordial monsters such as only a deluge leaves behind on the surface of society, or such as could only precede a social deluge; the election agitation; the execution of the Bréa murderers; the continual proceedings against the press; the violent interference of the government with the banquets by police action; the insolent royalist provocations; the exhibition of the portraits of Louis Blanc and Caussidière on the pillory; the unbroken struggle between the constituted republic and the Constituent Assembly, which each moment drove the revolution back to its starting point, which each moment made the victors the vanquished and the vanquished the victors and in an instant changed around the positions of the parties and the classes, their separations and connections; the rapid march of the European counterrevolution; the glorious Hungarian fight; the armed uprisings in Germany; the Roman expedition; the ignominious defeat of the French army before Rome – in this vortex of the movement, in this torment of historical unrest, in this dramatic ebb and flow of revolutionary passions, hopes, and disappointments, the different classes of French society had to count their epochs of development in weeks when they had previously counted them in half-centuries. A considerable part of the peasants and of the provinces was revolutionized. Not only were they disappointed in Napoleon, but the Red party offered them, instead of the name, the content, instead of illusory freedom from taxation, repayment of the milliard paid to the Legitimists, the adjustment of mortgages, and the abolition of usury.

The army itself was infected with the revolutionary fever. In voting for Bonaparte it had voted for victory, and he gave it defeat. In him it had voted for the Little Corporal [Napoleon] behind whom the great revolutionary general is concealed, and he once more gave it the great generals behind whom the pipe-clay corporal shelters himself. There was no doubt that the Red party, that is, the coalesced democratic party, was bound to celebrate, if

not victory, still, great triumphs; that Paris, the army, and a great part of the provinces would vote for it. *Ledru-Rollin*, the leader of the Montagne, was elected by five departments; no leader of the party of Order carried off such a victory, no candidate belonging to the proletarian party proper. This election reveals to us the secret of the democratic-socialist party. If, on the one hand, the Montagne, the parliamentary champion of the democratic petty bourgeoisie, was forced to unite with the socialist doctrinaires of the proletariat – the proletariat, forced by the terrible material defeat of June to raise itself up again through intellectual victories and not yet enabled through the development of the remaining classes to seize the revolutionary dictatorship, had to throw itself into the arms of the doctrinaires of its emancipation, the founders of socialist sects – the revolutionary peasants, the army, and the provinces, on the other hand, ranged themselves behind the Montagne, which thus became lord and master in the revolutionary army camp and through the understanding with the socialists eliminated every antagonism in the revolutionary party. In the latter half of the life of the Constituent Assembly it represented the Assembly's republican fervor and caused to be buried in oblivion its sins during the Provisional Government, during the Executive Commission, during the June days. In the same measure as the party of the National, in accordance with its half-and-half nature, had allowed itself to be put down by the royalist ministry, the party of the Mountain, which had been brushed aside during the omnipotence of the *National*, rose and asserted itself as the parliamentary representative of the revolution. In fact, the party of the National had nothing to oppose to the other, royalist factions but ambitious personalities and idealistic humbug. The party of the Mountain, on the contrary, represented a mass hovering between the bourgeoisie and the proletariat, a mass whose material interests demanded democratic institutions. In comparison with the Cavaignacs and the Marrasts, *Ledru-Rollin* and the Montagne, therefore, represented the true revolution, and from the consciousness of this important situation they drew the greater courage the more the expression of revolutionary energy limited itself to parliamentary attacks, bringing in bills of impeachment, threats, raised voices, thundering speeches, and extremes which were pushed only as far as phrases. The peasants were in about the same position as the petty bourgeoisie; they had more or less the same social demands to put forward. All the middle strata of society, so far as they were driven into the revolutionary movement, were

therefore bound to find their hero in Ledru-Rollin. Ledru-Rollin was the personage of the democratic petty bourgeoisie. As against the party of Order, the half-conservative, half-revolutionary, and wholly utopian reformers of this order had first to be pushed to the forefront.

The party of the *National*, “the Friends of the Constitution *quand même* [as is],” the *républicains purs et simples* [republicans pure and simple], were completely defeated in the elections. A tiny minority of them was sent into the Legislative Chamber; their most noted leaders vanished from the stage, even Marrast, the editor in chief and the Orpheus of the respectable republic.

On May 28 the Legislative Assembly convened; on June 11 the collision of May 8 was renewed and, in the name of the Montagne, Ledru-Rollin brought in a bill of impeachment against the President and the ministry for violation of the constitution, for the bombardment of Rome. On June 12 the Legislative Assembly rejected the bill of impeachment, just as the Constituent Assembly had rejected it on May 11, but the proletariat this time drove the Montagne onto the streets – not to a street battle, however, but only to a street procession. It is enough to say that the Montagne was at the head of this movement to know that the movement was defeated, and that June, 1849, was a caricature, as ridiculous as it was vile, of June, 1848. The great retreat of June 13 was eclipsed only by the still greater battle report of Changarnier, the great man that the party of Order improvised. Every social epoch needs its great men, and when it does not find them, it invents them, as Helvétius says.

On December 20 only one half of the constituted bourgeois republic was in existence: the *President*; on May 28 it was completed by the other half, the *Legislative Assembly*. In June, 1848, the constituent bourgeois republic, by an unspeakable battle against the proletariat, and in June, 1849, the constituted bourgeois republic, by an unutterable comedy with the petty bourgeoisie, engraved their names in the birth register of history. June, 1849, was the nemesis of June, 1848. In June, 1849, it was not the workers that were vanquished; it was the petty bourgeois, who stood between them and the revolution, that were felled. June, 1849, was not a bloody tragedy between wage labor and capital, but a prison-filling and lamentable play of debtors and creditors. The party of Order had won, it was all-powerful; it had now to show what it was.

Part III. Consequences of June 13, 1849

On December 20 the Janus head of the *constitutional republic* had still shown only *one* face, the executive face with the indistinct, plain features of L. Bonaparte; on May 28, 1849, it showed its second face, the legislative, pitted with the scars that the orgies of the Restoration and the July Monarchy had left behind. With the *Legislative* National Assembly the phenomenon of the *constitutional republic* was completed, that is, the republican form of government in which the rule of the bourgeois class is constituted, the common rule, therefore, of the two great royalist factions that form the French bourgeoisie, the coalesced Legitimists and Orléanists, the *party of Order*. While the French republic thus became the property of the coalition of the royalist parties, the European coalition of the counterrevolutionary powers embarked simultaneously upon a general crusade against the last places of refuge of the March revolutions. Russia invaded Hungary, Prussia marched against the army defending the Reich constitution and Oudinot bombarded Rome. The European crisis was evidently approaching a decisive turning point; the eyes of all Europe were turned on Paris, and the eyes of all Paris on the *Legislative Assembly*.

On June 11 Ledru-Rollin mounted its tribune. He made no speech; he formulated an indictment of the ministers, naked, unadorned, factual, concentrated, forceful.

The attack on Rome is an attack on the constitution; the attack on the Roman republic is an attack on the French republic. Article 5 of the constitution reads: "The French republic never employs its forces against the liberty of any people whatsoever" – and the President employs the French army against Roman liberty. Article 54 Of the constitution forbids the executive power to declare any war whatsoever without the consent of the National Assembly. The Constituent Assembly's resolution of May 8 expressly commands the ministers to make the Rome expedition conform with the utmost speed to its original mission; it therefore just as expressly prohibits war on Rome – and Oudinot bombards Rome. Thus Ledru-Rollin called the constitution itself as a witness for the prosecution against Bonaparte and his ministers. At the royalist majority of the National Assembly, he, the tribune of the constitution, hurled the threatening

declaration: “The republicans will know how to command respect for the constitution by every means, be it even by force of arms!” “*By force of arms!*” came the hundredfold echo of the Montagne. The majority answered with a terrible tumult; the President of the National Assembly called Ledru-Rollin to order – Ledru-Rollin repeated the challenge, and finally laid on the President’s table a motion for the impeachment of Bonaparte and his ministers. By 361 votes to 203, the National Assembly resolved to pass on from the bombardment of Rome to the next item on the agenda.

Did Ledru-Rollin believe he could beat the National Assembly by means of the constitution, and the President by means of the National Assembly?

To be sure, the constitution forbade any attack on the liberty of foreign peoples, but what the French army attacked in Rome was, according to the ministry, not “liberty” but the “despotism of anarchy.” Had the Montagne still not comprehended, all experiences in the Constituent Assembly notwithstanding, that the interpretation of the constitution did not belong to those who had made it, but only to those who had accepted it? That its wording must be construed in its viable meaning and that the bourgeois meaning was its only viable meaning That Bonaparte and the royalist majority of the National Assembly were the authentic interpreters of the constitution, as the priest is the authentic interpreter of the Bible, and the judge the authentic interpreter of the laws Should the National Assembly, freshly emerged from the general elections, feel itself bound by the testamentary provisions of the dead Constituent Assembly, whose will an Odilon Barrot had broken while it was alive? When Ledru-Rollin cited the Constituent Assembly’s resolution of May 8, had he forgotten that the same Constituent Assembly on May 11 had rejected his first motion for the impeachment of Bonaparte and the ministers; that it had acquitted the President and the ministers; that it had thus sanctioned the attack on Rome as “constitutional”; that he only lodged an appeal against a judgment already delivered – that he, lastly, appealed from the republican Constituent Assembly to the royalist Legislative Assembly? The constitution itself calls insurrection to its aid by summoning, in a special article, every citizen to protect it. Ledru-Rollin based himself on this article. But at the same time, are not the public authorities organized for the defense of the constitution, and does not the violation of the constitution begin only from the moment when one of the constitutional public authorities rebels against the other?

And the President of the republic, the ministers of the republic, and the National Assembly of the republic were in the most harmonious agreement.

What the Montagne attempted on June 11 was “*an insurrection within the limits of pure reason*,” that is, a purely *parliamentary insurrection*. The majority of the Assembly, intimidated by the prospect of an armed rising of the popular masses, was, in Bonaparte and the ministers, to destroy its own power and the significance of its own election. Had not the Constituent Assembly similarly attempted to annul the election of Bonaparte, when it insisted so obstinately on the dismissal of the Barrot-Falloux Ministry?

Neither were there lacking from the time of the Convention models for parliamentary insurrections which had suddenly transformed completely the relation between the majority and the minority – and should the young Montagne not succeed where the old had succeeded? – nor did relations at the moment seem unfavorable for such an undertaking. Popular unrest in Paris had reached an alarmingly high point – the army, according to its vote at the election, did not seem favorably inclined toward the government; the legislative majority itself was still too young to have become consolidated, and in addition it consisted of old gentlemen. If the Montagne were successful in a parliamentary insurrection, the helm of state would fall directly into its hands. The democratic petty bourgeoisie, for its part, wished, as always, for nothing more fervently than to see the battle fought out in the clouds over its head between the departed spirits of parliament. Finally, both of them, the democratic petty bourgeoisie and its representatives, the Montagne, would, through a parliamentary insurrection, achieve their great purpose, that of breaking the power of the bourgeoisie without unleashing the proletariat or letting it appear otherwise than in perspective; the proletariat would have been used without becoming dangerous.

After the vote of the National Assembly on June 11, a conference took place between some members of the Montagne and delegates of the secret workers’ societies. The latter urged that the attack be started the same evening. The Montagne decisively rejected this plan. On no account did it want to let the leadership slip out of its hands; its allies were as suspect to it as its antagonists, and rightly so. The memory of June, 1848, surged through the ranks of the Paris proletariat more vigorously than ever. Nevertheless it was chained to the alliance with the Montagne. The latter represented the largest part of the departments – it had increased its

influence in the army; it had at its disposal the democratic section of the National Guard; it had the moral power of the shopkeepers behind it. To begin the revolution at this moment against the will of the Montagne would have meant for the proletariat, decimated moreover by cholera and driven out of Paris in considerable numbers by unemployment, to repeat uselessly the June days of 1848, without the situation which had forced this desperate struggle. The proletarian delegates did the only rational thing. They obligated the Montagne to compromise itself, that is, to come out beyond the confines of the parliamentary struggle, in the event that its bill of impeachment was rejected. During the whole of June 13 the proletariat maintained this same skeptically watchful attitude, and awaited a seriously engaged irrevocable melee between the democratic National Guard and the army, in order then to plunge into the fight and push the revolution forward beyond the petty bourgeois aim set for it. In the event of victory a proletarian commune was already formed which would take its place beside the official government. The Parisian workers had learned in the bloody school of June, 1848.

On June 12 Minister Lacrosse himself brought forward in the Legislative Assembly the motion to proceed at once to the discussion of the bill of impeachment. During the night the government had made every provision for defense and attack; the majority of the National Assembly was determined to drive the rebellious minority out into the streets; the minority itself could no longer retreat; the die was cast; the bill of impeachment was rejected by 377 votes to 8. The "Mountain," which had abstained from voting, rushed resentfully into the propaganda halls of the "pacific democracy," the newspaper offices of the *Démocratie Pacifique*.

Its withdrawal from the parliament building broke its strength as withdrawal from the earth broke the strength of Antaeus, her giant son. Samsons in the precincts of the Legislative Assembly, the Montagnards were only Philistines in the precincts of the "pacific democracy." A long, noisy, rambling debate ensued. The Montagne was determined to compel respect for the constitution by every means, "*only not by force of arms.*" In this decision it was supported by a manifesto and by a deputation of "Friends of the Constitution." "Friends of the Constitution" was what the wreckage of the coterie of the *National*, the bourgeois-republican party, called itself. While six of its remaining parliamentary representatives had voted *against*, the others in a body voting *for*, the rejection of the bill of

impeachment, while *Cavaignac* placed his saber at the disposal of the party of Order, the larger, extra-parliamentary part of the coterie greedily seized the opportunity to emerge from its position of a political pariah and to press into the ranks of the democratic party. Did they not appear as the natural shield bearers of this party, which hid itself behind their shield, behind their *principles*, behind the *constitution*?

Till break of day the “Mountain” was in labor. It gave birth to “*a proclamation to the people*,” which on the morning of June occupied a more or less shamefaced place in two socialist journals. It declared the President, the ministers, and the majority of the Legislative Assembly “*outside the constitution*” and summoned the National Guard, the army, and finally also the people “to arise.” “*Long live the Constitution!*” was the slogan it put forward, a slogan that signified nothing other than “*Down with the revolution!*”

In conformity with the constitutional proclamation of the Mountain, there was a so-called *peaceful demonstration* of the petty bourgeois on June 13, that is, a street procession from the Chateau d’Eau through the Boulevards, 30,000 strong, mainly National Guardsmen, unarmed, with an admixture of members of the secret workers’ sections, moving along with the cry: “*Long live the Constitution!*” which was uttered mechanically, icily, and with a bad conscience by the members of the procession itself, and thrown back ironically by the echo of the people that surged along the sidewalks, instead of swelling up like thunder. From the many-voiced song the chest notes were missing. And when the procession swung by the meeting hall of the “Friends of the Constitution” and a hired herald of the constitution appeared on the housetop, violently cleaving the air with his claqueur hat and from tremendous lungs letting the catch – cry “*Long live the Constitution!*” fall like hail on the heads of the pilgrims, they themselves seemed overcome for a moment by the comedy of the situation. It is known how the procession, having arrived at the termination of the Rue de la Paix, was received in the Boulevards by the dragoons and chasseurs of Changarnier in an altogether unparliamentary way, how in a trice it scattered in all directions, and how it threw behind it a few shouts of “To arms” only in order that the parliamentary call to arms of June 11 might be fulfilled.

The majority of the Montagne assembled in the Rue du Hasard scattered when this violent dispersion of the peaceful procession, the muffled rumors

of murder of unarmed citizens on the Boulevards, and the growing tumult in the streets seemed to herald the approach of a rising. *Ledru-Rollin* at the head of a small band of deputies saved the honor of the Mountain. Under the protection of the Paris Artillery, which had assembled in the Palais National, they betook themselves to the *Conservatoire des Arts et Métiers* [Museum of arts and trades, an educational institution in Paris], where the fifth and sixth legions of the National Guard were to arrive. But the Montagnards waited in vain for the fifth and sixth legions; these discreet National Guards left their representatives in the lurch; the Paris Artillery itself prevented the people from throwing up barricades; chaotic disorder made any decision impossible; the troops of the line advanced with fixed bayonets; some of the representatives were taken prisoner, while others escaped. Thus ended June 13.

If June 23, 1848, was the insurrection of the revolutionary proletariat, June 13, 1849, was the insurrection of the democratic petty bourgeois, each of these two insurrections being the *classically pure* expression of the class which had been its vehicle.

Only in Lyons did it come to an obstinate, bloody conflict. Here, where the industrial bourgeoisie and the industrial proletariat stand directly opposed to one another, where the workers' movement is not, as in Paris, included in and determined by the general movement, June 13, in its repercussion, lost its original character. Wherever else it broke out in the provinces it did not kindle fire – *a cold lightning flash*.

June 13 closes the first *period in the life of the constitutional republic*, which had attained its normal existence on May 28, 1849, with the meeting of the Legislative Assembly. The whole period of this prologue is filled with vociferous struggle between the party of Order and the Montagne, between the big bourgeoisie and the petty bourgeoisie, which strove in vain against the consolidation of the bourgeois republic, for which it had itself continuously conspired in the Provisional Government and in the Executive Commission, and for which, during the June days, it had fought fanatically against the proletariat. The thirteenth of June breaks its resistance and makes the *legislative dictatorship* of the united royalists a *fait accompli*. From this moment the National Assembly is only a *Committee of Public Safety of the party of Order*.

Paris had put the President, the ministers, and the majority of the National Assembly in a “*state of impeachment*”; they put Paris in a “*state of*

siege.” The Mountain had declared the majority of the Legislative Assembly “*outside the constitution*”; for violation of the constitution the majority handed over the Mountain to the haute cour and proscribed everything in it that still had vital force. It was decimated to a rump without head or heart. The minority had gone so far as to attempt *aparliamentary insurrection* – the majority elevated its *parliamentary despotism* to law. It decreed new “*standing orders*,” which annihilate the freedom of the tribune and authorize the president of the National Assembly to punish representatives for violation of the standing orders with censure, with fines, with stoppage of their salaries, with suspension of membership, with incarceration. Over the rump of the Montagne it hung the rod instead of the sword. The remainder of the deputies of the Montagne owed it to their honor to make a mass exit. By such an act the dissolution of the party of Order would have been hastened. It would have had to break up into its original component parts the moment not even the semblance of an opposition would hold it together any longer.

Simultaneously with their *parliamentary* power, the democratic petty bourgeois were robbed of their *armed* power through the dissolution of the Paris Artillery and the eighth, ninth, and twelfth legions of the National Guard. On the other hand, the legion of high finance, which on June 13 had raided the print shops of Boule and Roux, demolished the presses, played havoc with the offices of the republican journals, and arbitrarily arrested editors, compositors, printers, shipping clerks, and errand boys, received encouraging approval from the tribune of the National Assembly. All over France the disbanding of National Guards suspected of republicanism was repeated.

A new *press law*, a new *law of association*, a new *law on the state of siege*, the prisons of Paris overflowing, the political refugees driven out, all the journals that go beyond the limits of the *National* suspended, Lyons and the five departments surrounding it abandoned to the brutal persecution of military despotism, the courts ubiquitous, and the army of officials, so often purged, purged once more – these were the inevitable, the constantly *recurring commonplaces* of victorious reaction, worth mentioning after the massacres and the deportations of June only because this time they were directed not only against Paris but also against the departments, not only against the proletariat but, above all, against the middle classes.

The repressive laws by which the declaration of a state of siege was left to the discretion of the government, the press still more firmly muzzled, and the right of association annihilated, absorbed the whole of the legislative activity of the National Assembly during the months of June, July, and August.

However, this epoch is characterized not by the exploitation of victory *in fact*, but *in principle*; not by the resolutions of the National Assembly, but by the grounds advanced for these resolutions; not by the thing but by the phrase; not by the phrase but by the accent and the gesture which enliven the phrase. The brazen, unreserved expression of *royalist sentiments*, the contemptuously aristocratic insults to the republic, the coquettishly frivolous babbling of restoration aims in a word, the boastful violation of *republican decorum* – give its peculiar tone and color to this period. Long live the Constitution! was the battle cry of the *vanquished* of June 13. The *victors* were therefore absolved from the hypocrisy of constitutional, that is, republican, speech. The counterrevolution subjugated Hungary, Italy, and Germany, and they believed that the restoration was already at the gates of France. Among the masters of ceremonies of the factions of Order there ensued a real competition to document their royalism in the *Moniteur*, and to confess, repent, and crave pardon before God and man for liberal sins perchance committed by them under the monarchy. No day passed without the February Revolution being declared a national calamity from the tribune of the National Assembly, without some Legitimist provincial cabbage-junker solemnly stating that he had never recognized the republic, without one of the cowardly deserters of and traitors to the July Monarchy relating the belated deeds of heroism in the performance of which only the philanthropy of Louis Philippe or other misunderstandings had hindered him. What was admirable in the February days was not the magnanimity of the victorious people, but the self-sacrifice and moderation of the royalists, who had allowed it to be victorious. One Representative of the People proposed to divert part of the money destined for the relief of those wounded in February to the *Municipal Guards*, who alone in those days had deserved well of the fatherland. Another wanted to have an equestrian statue decreed to the Duke of Orléans in the Place du Carrousel. Thiers called the constitution a dirty piece of paper. There appeared in succession on the tribune Orléanists, to repent of their conspiracy against the legitimate monarchy by Legitimists, who reproached themselves with having hastened

the overthrow of monarchy in general by resisting the illegitimate monarchy; Thiers, who repented of having intrigued against Molé; Molé, who repented of having intrigued against Guizot; Barrot, who repented of having intrigued against all three. The cry “Long live the Social-Democratic Republic!” was declared unconstitutional; the cry “Long live the Republic!” was prosecuted as social-democratic. On the anniversary of the Battle of Waterloo, a representative declared: “I fear an invasion of the Prussians less than the entry of the revolutionary refugees into France.” To the complaints about the terrorism organized in Lyons and the neighboring departments, Baraguay d’Hilliers answered: “I prefer the white terror to the red terror.” And the Assembly applauded frantically every time an epigram against the republic, against the revolution, against the constitution, for the monarchy, or for the Holy Alliance fell from the lips of its orators. Every infringement of the minutest republican formality – for example, that of addressing the representatives as *citoyens* – filled the knights of order with enthusiasm.

The by-elections in Paris on July 8, held under the influence of the state of siege and of the abstention of a great part of the proletariat from the ballot box, the taking of Rome by the French army, the entry into Rome of the red eminences and, in their train, of inquisition and monkish terrorism, added fresh victories to the victory of June and increased the intoxication of the party of Order.

Finally, in the middle of August, half with the intention of attending the Department Councils just assembled, half through exhaustion from the tendentious orgy of many months, the royalists decreed a two – month recess of the National Assembly. With transparent irony they left behind a commission of twenty-five representatives, the cream of the Legitimists and the Orléanists, a Molé and a Changarnier, as proxies for the National Assembly and as *guardians of the republic*. The irony was more profound than they suspected. They, condemned by history to help to overthrow the monarchy they loved, were destined by it to conserve the republic they hated.

The *second period in the life of the constitutional republic, its royalist period of sowing wild oats*, closes with the *recess* of the Legislative Assembly.

The state of siege in Paris had again been raised, the activities of the press had again begun. During the suspension of the Social-Democratic papers, during the period of repressive legislation and royalist bluster, the

Siècle, the old literary representative of the *monarchist-constitutional petty bourgeois*, *republicanized itself*; the *Presse*, the old literary exponent of the *bourgeois reformers*, *democratized itself*; while the *National*, the old classic organ of the *republican bourgeois*, socialized itself.

The *secret societies* grew in extent and intensity in the same degree that the *public clubs* became impossible. The *workers' industrial cooperatives*, tolerated as purely commercial societies, while of no account economically, became politically so many means of cementing the proletariat. June 13 had struck off the official heads of the various semirevolutionary parties; the masses that remained won a head of their own. The knights of order had practiced intimidation by prophecies of the terror of the red republic; the base excesses, the hyperborean atrocities of the victorious counterrevolution in Hungary, in Baden, and in Rome washed the "*red republic*" white. And the malcontent intermediate classes of French society began to prefer the promises of the red republic with its problematic terrors to the terrors of the red monarchy with its actual hopelessness. No socialist in France spread more revolutionary propaganda than *Haynau*. *A chaque capacité selon ses oeuvres!* [To each man of talent according to his work!]

In the meantime Louis Bonaparte exploited the recess of the National Assembly to make princely tours of the provinces, the most hot-blooded Legitimists made pilgrimages to Ems, to the grandchild of the saintly Louis, and the mass of the popular representatives on the side of order intrigued in the Department Councils, which had just met. It was necessary to make them pronounce what the majority of the National Assembly did not yet dare pronounce, an *urgent motion for immediate revision of the constitution*. According to the constitution, it could not be revised before 1852, and then only by a National Assembly called together expressly for this purpose. If, however, the majority of the Department Councils expressed themselves to this effect, was not the National Assembly bound to sacrifice the virginity of the constitution to the voice of France? The National Assembly entertained the same hopes in regard to these provincial assemblies as the nuns in Voltaire's *Henriade* entertained in regard to the pandours. But, some exceptions apart, the Potiphars of the National Assembly had to deal with just so many Josephs of the provinces. The vast majority did not want to understand the importunate insinuation. The revision of the constitution was frustrated by the very instruments which were to have called it into being,

by the votes of the Department Councils. The voice of France, and indeed of bourgeois France, had spoken and had spoken against revision.

At the beginning of October the Legislative National Assembly met once more – *tantum mutatus ab illo*. Its physiognomy was completely changed. The unexpected rejection of revision on the part of the Department Councils had put it back within the limits of the constitution and indicated the limits of its term of life. The Orléanists had become mistrustful because of the pilgrimages of the Legitimists to Ems; the Legitimists had grown suspicious because of the Orléanists' negotiations with London; the journals of the two factions had fanned the fire and weighed the reciprocal claims of their pretenders. Orléanists and Legitimists grumbled in unison at the machinations of the Bonapartists, which showed themselves in the princely tours, in the more or less transparent emancipatory attempts of the President, in the presumptuous language of the Bonapartist newspapers; Louis Bonaparte grumbled at a National Assembly which found only the Legitimist-Orléanist conspiracy legitimate, at a ministry which betrayed him continually to this National Assembly. Finally the ministry was itself divided on the Roman policy and on the *income tax* proposed by Minister Passy, decried as socialistic by the conservatives.

One of the first bills of the Barrot Ministry in the reassembled Legislative Assembly was a demand for a credit of 300,000 francs for the payment of a widow's pension to the *Duchess of Orléans*! The National Assembly granted it and added to the list of debts of the French nation a sum of seven million francs. Thus while Louis Philippe continued to play successfully the role of the *pauvre honteux*, the shamefaced beggar, the ministry dared not move an increase of salary for Bonaparte nor did the Assembly appear inclined to grant it. And Louis Bonaparte, as ever, vacillated in the dilemma: *Aut Caesar aut Clichy*!

The minister's second demand for a credit, one of nine million francs for the *costs of the Rome expedition*, increased the tension between Bonaparte on the one hand and the ministers and the National Assembly on the other. Louis Bonaparte had inserted a letter to his military aide, Edgar Ney, in the *Moniteur*, in which he bound the papal government to constitutional guarantees. The Pope, on his part, had published an address, *motu proprio*, in which he rejected any limitation of his restored rule. Bonaparte's letter, with studied indiscretion, raised the curtain on his cabinet in order to expose himself to the eyes of the gallery as a benevolent genius who was, however,

misunderstood and shackled in his own house. It was not the first time that he had coquetted with the “furtive flights of a free soul.” *Thiers*, the reporter of the commission, completely ignored Bonaparte’s flight and contented himself with translating the papal allocution into French. It was not the ministry but *Victor Hugo* who sought to save the President through an order of the day in which the National Assembly was to express its agreement with Napoleon’s letter. *Allons donc! Allons donc!* [Let’s go then!] With this disrespectful, frivolous interjection the majority buried Hugo’s motion. The policy of the President? The letter of the President? The President himself? *Allons donc! Allons donc!* Who the devil takes Monsieur Bonaparte seriously? Do you believe, Monsieur Victor Hugo, that we believe you that you believe in the president? *Allons donc! Allons donc!*

Finally, the breach between Bonaparte and the National Assembly was hastened by the discussion on the *recall of the Orléans and the Bourbons*. In default of the ministry, the President’s cousin [Joseph Bonaparte], son of the ex-king of Westphalia, had put forward this motion, which had no other purpose than to push the Legitimist and the Orléanist pretenders down to the same level, or rather a lower level than the Bonapartist pretender, who at least stood in fact at the pinnacle of the state.

Napoleon Bonaparte was disrespectful enough to make the *recall of the expelled royal families* and the *amnesty of the June insurgents* parts of one and the same motion. The indignation of the majority compelled him to apologize immediately for this sacrilegious concatenation of the holy and the impious, of the royal races and the proletarian brood, of the fixed stars of society and of its swamp lights, and to assign each of the two motions to its proper place. The majority energetically rejected the recall of the royal family, and *Berryer*, the Demosthenes of the Legitimists, left no doubt about the meaning of the vote. The civic degradation of the pretenders, that is what is intended! It is desired to rob them of their halo, of the last majesty that is left to them, the *majesty of exile*! What, cried *Berryer*, would the pretenders think of the President, who, forgetting his august origin, came here to live as a simple private individual? It could not have been more clearly intimated to Louis Bonaparte that he had not gained the day by his presence, that whereas the royalists in coalition needed him here in France as a “*neutral man*” in the presidential chair, the serious pretenders to the throne had to be kept out of profane sight by the fog of exile.

On November 1, Louis Bonaparte answered the Legislative Assembly with a message which in quite brusque words announced the dismissal of the Barrot Ministry and the formation of a new ministry. The Barrot-Falloux Ministry was the ministry of the royalist coalition, the Hautpoul Ministry was the ministry of Bonaparte, the organ of the President as against the Legislative Assembly, the *ministry of the clerks*.

Bonaparte was no longer the merely *neutral man* of December 10, 1848. His possession of the executive power had grouped a number of interests around him, the struggle with anarchy forced the party of Order itself to increase his influence, and if he was *no longer* popular, the party of Order was *unpopular*. Could he not hope to compel the Orléanists and the Legitimists, through their rivalry as well as through the necessity of some sort of monarchist restoration, to recognize the *neutral pretender*?

From November 1, 1849, dates the third period in the life of the constitutional republic, a period which closes with March 10, 1850. The regular game, so much admired by Guizot, of the constitutional institutions, the wrangling between executive and legislative power, now begins. More, as against the hankering for restoration on the part of the united Orléanists and Legitimists, Bonaparte defends his title to his actual power, the republic; as against the hankering for restoration on the part of Bonaparte, the party of Order defends its title to its common rule, the republic; as against the Orléanists, the Legitimists, and as against the Legitimists, the Orléanists, defend the status quo, the republic. All these factions of the party of Order, each of which has its own king and its own restoration *in petto* [secretly], mutually enforce, as against their rivals' hankering for usurpation and revolt, the common rule of the bourgeoisie, the form in which the special claims remain neutralized and reserved the *republic*.

Just as Kant makes the republic, so these royalists make the *monarchy* the only rational form of state, a postulate of practical reason whose realization is never attained, but whose attainment must always be striven for and mentally adhered to as the goal.

Thus the constitutional republic had gone forth from the hands of the bourgeois republicans as a hollow ideological formula to become a form full of content and life in the hands of the royalists in coalition. And Thiers spoke more truly than he suspects when he said: "We, the royalists, are the true pillars of the constitutional republic."

The overthrow of the ministry of the coalition and the appearance of the ministry of the clerks has a second significance. Its Finance Minister was *Fould*. Fould as Finance Minister signifies the official surrender of France's national wealth to the Bourse, the management of the state's property by the Bourse and in the interests of the Bourse. With the nomination of Fould, the finance aristocracy announced its restoration in the *Moniteur*. This restoration necessarily supplemented the other restorations, which form just so many links in the chain of the constitutional republic.

Louis Philippe had never dared to make a genuine *loup-cervier* [stock-exchange wolf] finance minister. Just as his monarchy was the ideal name for the rule of the big bourgeoisie, so in his ministries the privileged interests had to bear ideologically disinterested names. The bourgeois republic every where pushed into the forefront what the different monarchies, Legitimist as well as Orléanist, had kept concealed in the background. It made earthly what they had made heavenly. In place of the names of the saints it put the bourgeois proper names of the dominant class interests.

Our whole exposition has shown how the republic, from the first day of its existence, did not overthrow but consolidated the finance aristocracy. But the concessions made to it were a fate to which submission was made without the desire to bring it about. With Fould, the initiative in the government returned to the finance aristocracy.

The question will be asked how the coalesced bourgeoisie could bear and suffer the rule of finance, which under Louis Philippe depended on the exclusion or subordination of the remaining bourgeois factions.

The answer is simple.

First of all, the finance aristocracy itself forms a weighty, authoritative part of the royalist coalition, whose common governmental power is denominated republic. Are not the spokesmen and leading lights among the Orléanists the old confederates and accomplices of the finance aristocracy? Is it not itself the golden phalanx of Orleanism? As far as the Legitimists are concerned, under Louis Philippe they had already participated in practice in all the orgies of the Bourse, mine, and railway speculations. In general, the combination of large landed property with high finance is a *normal fact*. Proof: *England*; proof: even *Austria*.

In a country like France, where the volume of national production stands at a disproportionately lower level than the amount of the national debt,

where government bonds form the most important subject of speculation and the Bourse the chief market for the investment of capital that wants to turn itself to account in an unproductive way – in such a country a countless number of people from all bourgeois or semi-bourgeois classes must have an interest in the state debt, in the Bourse gamblings, in finance. Do not all these interested subalterns find their natural mainstays and commanders in the faction which represents this interest in its vastest outlines, which represents it as a whole?

What conditions the accrual of state property to high finance? The constantly growing indebtedness of the state. And the indebtedness of the state? The constant excess of its expenditure over its income, a disproportion which is simultaneously the cause and effect of the system of state loans.

In order to escape from this indebtedness, the state must either restrict its expenditure, that is, simplify and curtail the government organism, govern as little as possible, employ as few personnel as possible, enter as little as possible into relations with bourgeois society. This path was impossible for the party of Order, whose means of repression, official interference in the name of the state, and ubiquity through organs of state were bound to increase in the same measure as the number of quarters increased from which its rule and the conditions for the existence of its class were threatened. The gendarmerie cannot be reduced in the same measure as attacks on persons and property increase.

Or the state must seek to evade the debts and produce an immediate but transitory balance in its budget by putting *extraordinary taxes* on the shoulders of the wealthiest classes. But was the party of Order to sacrifice its own wealth on the altar of the fatherland to stop the national wealth from being exploited by the Bourse? *Pas si bête!* [Not so stupid!]

Therefore, without a complete revolution in the French state, no revolution in the French state budget. Along with this state budget necessarily goes the lordship of the trade in state debts, of the state creditors, the bankers, the money dealers, and the wolves of the Bourse. Only one faction of the party of Order was directly concerned in the overthrow of the finance aristocracy – the *manufacturers*. We are not speaking of the middle, of the smaller people engaged in industry; we are speaking of the reigning princes of the manufacturing interests, who had formed the broad basis of the dynastic opposition under Louis Philippe.

Their interest is indubitably reduction of the costs of production and hence reduction of the taxes, which enter into production, and hence reduction of the state debts, the interest on which enters into the taxes, hence the overthrow of the finance aristocracy.

In England – and the largest French manufacturers are petty bourgeois compared with their English rivals actually find the manufacturers, a Cobden, a Bright, at the head of the crusade against the bank and the stock-exchange aristocracy. Why not in France? In England industry predominates – in France, agriculture. In England industry requires free trade; in France, protective tariffs, national monopoly alongside the other monopolies. French industry does not dominate French production; the French industrialists, therefore, do not dominate the French bourgeoisie. In order to secure the advancement of their interests as against the remaining factions of the bourgeoisie, they cannot, like the English, take the lead of the movement and simultaneously push their class interests to the fore; they must follow in the train of the revolution, and serve interests which are opposed to the collective interests of their class. In February they had misunderstood their position; February sharpened their wits. And who is more directly threatened by the workers than the employer, the industrial capitalists? The manufacturer, therefore, of necessity became in France the most fanatical member of the party of Order. The reduction of his *profit* by finance, what is that compared with the *abolition of profit by the proletariat*?

In France, the petty bourgeois does what normally the industrial bourgeois would have to do; the worker does what normally would be the task of the petty bourgeois; and the task of the worker, who accomplishes that? No one. In France it is not accomplished; in France it is proclaimed. It is not accomplished anywhere within the national boundaries. The class war within French society turns into a world war, in which the nations confront one another. Accomplishment begins only at the moment when, through the world war, the proletariat is pushed to the fore of the people that dominates the world market, to the forefront in England. The revolution, which finds here not its end, but its organizational beginning, is no short-lived revolution. The present generation is like the Jews whom Moses led through the wilderness. It not only has a new world to conquer, it must go under in order to make room for the men who are able to cope with a new world.

Let us return to Fould.

On November 14, 1849, Fould mounted the tribune of the National Assembly and expounded his system of finance: an apology for the old system of taxes! Retention of the wine tax! Abandonment of Passy's income tax!

Passy, too, was no revolutionist; he was an old minister of Louis Philippe's. He belonged to the Puritans of the Dufaure brand and to the most intimate confidants of Teste, the scapegoat of the July Monarchy. Passy, too, had praised the old tax system and recommended the retention of the wine tax, but he had at the same time torn the veil from the state deficit. He had declared the necessity for a new tax, the income tax, if the bankruptcy of the state was to be avoided. Fould, who had recommended state bankruptcy to Ledru-Rollin, recommended the state deficit to the Legislative Assembly. He promised economies, the secret of which later revealed itself in that, for example, expenditures diminished by sixty millions while the floating debt increased by two hundred millions – conjurers' tricks in the grouping of figures, in the drawing up of accounts, which all finally amounted to new loans.

Alongside the other jealous bourgeois factions, the finance aristocracy naturally did not act in so shamelessly corrupt a manner under Fould as under Louis Philippe. But once it existed, the system remained the same: constant increase in the debts, masking of the deficit. And in time the old Bourse swindling came out more openly. Proof: the law concerning the Avignon Railway; the mysterious fluctuations in government securities, for a brief time the topic of the day throughout Paris; finally, the ill-starred speculations of Fould and Bonaparte on the elections of March 10.

With the official restoration of the finance aristocracy, the French people soon had to stand again before a February 24.

The Constituent Assembly, in an attack of misanthropy against its heir, had abolished the wine tax for the year of our Lord 1850. New debts could not be paid with the abolition of old taxes. *Creton*, a cretin of the party of Order, had moved the retention of the wine tax even before the Legislative Assembly recessed. Fould took up this motion in the name of the Bonapartist ministry and on December 20, 1849, the anniversary of the day Bonaparte was proclaimed President, the National Assembly decreed the *restoration of the wine tax*.

The sponsor of this restoration was not a financier; it was the Jesuit chief *Montalembert*. His argument was strikingly simple: Taxation is the maternal

breast on which the government is suckled. The government is the instruments of repression; it is the organs of authority; it is the army; it is the police; it is the officials, the judges, the ministers; it is the *priests*. An attack on taxation is an attack by the anarchists on the sentinels of order, who safeguard the material and spiritual production of bourgeois society from the inroads of the proletarian vandals. Taxation is the fifth god, side by side with property, the family, order, and religion. And the wine tax is incontestably taxation and, moreover, not ordinary, but traditional, monarchically disposed, respectable taxation. *Vive l'impôt des boissons!* [Long live the tax on drinks!] Three cheers and one cheer more!

When the French peasant paints the devil he paints him in the guise of a tax collector. From the moment when Montalembert elevated taxation to a god, the peasant became godless, atheist, and threw himself into the arms of the devil, of socialism. The religion of order had forfeited him; the Jesuits had forfeited him; Bonaparte had forfeited him. December 20, 1849, had irrevocably compromised December 20, 1848. The “nephew of his uncle” was not the first of his family whom the wine tax defeated, this tax which, in Montalembert’s phrase, heralds the revolutionary storm. The real, the great Napoleon declared on St. Helena that the reintroduction of the wine tax had contributed more to his downfall than all else, since it had alienated from him the peasants of Southern France. As far back as under Louis XIV the favorite object of the hatred of the people (see the writings of Boisguillebert and Vauban), abolished by the first revolution, it was reintroduced by Napoleon in a modified form in 1808. When the Restoration entered France, there trotted before it not only the Cossacks,, but also the promises to abolish the wine tax. The *gentilhommerie* [gentry] naturally did not need to keep its word to the *gens taillables à merci et miséricorde* [people taxed pitilessly]. The year 1830 promised the abolition of the wine tax. It was not its way to do what it said or say what it did. The year 1848 promised the abolition of the wine tax, just as it promised everything. Finally, the Constituent Assembly, which promised nothing, made, as already mentioned, a testamentary provision whereby the wine tax was to disappear on January 1, 1850. And just ten days before January 1, 1850, the Legislative Assembly introduced it once more, so that the French people perpetually pursued it, and when they had thrown it out the door saw it come in again through the window.

The popular hatred of the wine tax is explained by the fact that it unites in itself all the odiousness of the French system of taxation. The mode of its collection is odious, the mode of its distribution aristocratic, for the rates of taxation are the same for the commonest as for the costliest wines; it increases, therefore, in geometrical progression as the wealth of the consumers decreases, an inverted progressive tax. It accordingly directly provokes the poisoning of the laboring classes by putting a premium on adulterated and imitation wines. It lessens consumption, since it sets up *octrois* [toll houses] before the gates of all towns of over four thousand inhabitants and transforms each such town into a foreign country with a protective tariff against French wine. The big wine merchants, but still more the small ones, the *marchands de vins*, whose livelihood directly depends on the consumption of wine, are so many avowed enemies of the wine tax. And finally, by lessening consumption the wine tax curtails the producers' market. While it renders the urban workers incapable of paying for wine, it renders the wine growers incapable of selling it. And France has a wine-growing population of about twelve million. One can therefore understand the hatred of the people in general; one can in particular understand the fanaticism of the peasants against the wine tax. And in addition they saw in its restoration no isolated, more or less accidental event. The peasants have a kind of historical tradition of their own, which is handed down from father to son, and in this historical school it is muttered that whenever any government wants to dupe the peasants, it promises the abolition of the wine tax, and as soon as it has duped the peasants, it retains or reintroduces the wine tax. In the wine tax the peasant tests the bouquet of the government, its tendency. The restoration of the wine tax on December 20 meant: *Louis Bonaparte is like the rest*. But he was not like the rest; he was a *peasant discovery*, and in the petitions carrying millions of signatures against the wine tax they took back the votes that they had given a year before to the "nephew of his uncle."

The country folk – over two-thirds of the total French population – consist for the most part of so-called free *landowners*. The first generation, gratuitously freed by the Revolution of 1789 from its feudal burdens, had paid no price for the soil. But the following generations paid, under the form of the *price of land*, what their semi-serf forefathers had paid in the form of rent, tithes, corvee, etc. The more, on the one hand, the population grew and the more, on the other hand, the partition of the soil increased, the

higher became the price of the parcels, for the demand for them increased with their smallness. But in proportion as the price the peasant paid for his parcel rose, whether he bought it directly or whether he had it accounted as capital by his co-heirs, necessarily the *indebtedness of the peasant*, that is, the *mortgage*, also rose. The claim to a debt encumbering the land is termed a mortgage, a pawn ticket in respect of the land. Just as *privileges* accumulated on the medieval estate, *mortgages* accumulate on the modern small allotment. On the other hand, under the system of parcelisation the soil is purely an *instrument of production* for its proprietor. Now the fruitfulness of land diminishes in the same measure as land is divided. The application of machinery to the land, the division of labor, major soil – improvement measures, such as cutting drainage and irrigation canals and the like, become more and more impossible, while the *unproductive costs* of cultivation increase in the same proportion as the division of the instrument of production itself. All this, regardless of whether the possessor of the small allotment possesses capital or not. But the more the division increases, the more does the parcel of land with its utterly wretched inventory form the entire capital of the small allotment peasant, the more does investment of capital in the land diminish, the more does the peasant lack land, money, and education for making use of the progress in agronomy, and the more does the cultivation of the soil retrogress. Finally, the *net proceeds* diminish in the same proportion as the *gross consumption* increases, as the whole family of the peasant is kept back from other occupations through its holding and yet is not enabled to live by it.

In the measure, therefore, that the population and, with it, the division of the land increases, does the *instrument of production*, the soil, become more expensive and its *fertility decrease*, does *agriculture decline and the peasant become loaded with debt*. And what was the effect becomes, in its turn, the cause. Each generation leaves behind another more deeply in debt – each new generation begins under more unfavorable and more aggravating conditions; mortgaging begets mortgaging, and when it becomes impossible for the peasant to offer his small holding as security for new debts, that is, to encumber it with new mortgages, he falls a direct victim to usury, and usurious interest rates become so much the more exorbitant.

Thus it came about that the French peasant cedes to the capitalist, in the form of *interest* on the *mortgages* encumbering the soil and in the form of

interest on the advances made by the usurer without mortgages, not only ground rent, not only the industrial profit – in a word, not only the whole net profit – but even a part of the wages, and that therefore he has sunk to the level of the Irish tenant farmer – all under the pretense of being a private proprietor.

This process was accelerated in France by the ever growing *burden* of *taxes*, by *court costs* called forth in part directly by the formalities with which French legislation encumbers the ownership of land, in part by the innumerable conflicts over parcels everywhere bounding and crossing each other, and in part by the litigiousness of the peasants, whose enjoyment of property is limited to the fanatical assertion of their title to their fancied property, their *property rights*.

According to a statistical statement of 1840, the gross production of French agriculture amounted to 5,237,178,000 francs. Of this the costs of cultivation came to 3,552,000,000 francs, including consumption by the persons working. There remained a net product of 1,685,178,000 francs, from which 550,000,000 had to be deducted for interest on mortgages, 100,000,000 for law officials, 350,000,000 for taxes, and 107,000,000 for registration money, stamp duty, mortgage fees, etc. There was left one-third of the net product or 538,000,000; when distributed over the population, not 25 francs per head net product. Naturally, neither usury outside of mortgage nor lawyers' fees, etc., are included in this calculation.

The condition of the French peasants, when the republic had added new burdens to their old ones, is comprehensible. It can be seen that their exploitation differs only in *form* from the exploitation of the industrial proletariat. The exploiter is the same: *capital*. The individual capitalists exploit the individual peasants through *mortgages* and *usury*, the capitalist class exploits the peasant class through the *state taxes*. The peasant's title to property is the talisman by which capital held him hitherto under its spell, the pretext under which it set him against the industrial proletariat. Only the fall of capital can raise the peasant; only an anti-capitalist, a proletarian government can break his economic misery, his social degradation. The *constitutional republic* is the dictatorship of his united exploiters; the *social-democratic*, the *red republic*, is the dictatorship of his allies. And the scale rises or falls according to the votes the peasant casts into the ballot box. He himself has to decide his fate. So spoke the socialists in pamphlets,

almanacs, calendars, and leaflets of all kinds. This language became more understandable to him through the counter-writings of the party of Order, which for its part turned to him, and which by gross exaggeration, by its brutal conception and representation of the intentions and ideas of the socialists, struck the true peasant note and overstimulated his lust after forbidden fruit. But most understandable was the language of the actual experience that the peasant class had gained from the use of the suffrage, were the disillusionments overwhelming him, blow upon blow, with revolutionary speed. *Revolutions are the locomotives of history.*

The gradual revolutionizing of the peasants was manifested by various symptoms. It early revealed itself in the elections to the Legislative Assembly – it was revealed in the state of siege in the five departments bordering Lyons; it was revealed a few months after June 13 in the election of a Montagnard in place of the former president of the *Chambre introuvable* by the Department of the Gironde; it was revealed on December 20, 1849, in the election of a red in place of a deceased Legitimist deputy in the Department *du Gard*, that promised land of the Legitimists, the scene of the most frightful infamies committed against the republicans in 1794 and 1795 and the center of the white terror in 1815, when liberals and Protestants were publicly murdered. This revolutionizing of the most stationary class is most clearly evident since the reintroduction of the wine tax. The governmental measures and the laws of January and February, 1850, are directed almost exclusively against the *departments* and the *peasants*. The most striking proof of their progress.

The Hautpoul circular, by which the gendarme was appointed inquisitor of the prefect, of the subprefect, and, above all, of the mayor, and by which espionage was organized even in the hidden corners of the remotest village community; the *law against the schoolteachers*, by which they (the men of talent, the spokesmen, the educators and interpreters of the peasant class) were subjected to the arbitrary power of the prefect – they, the proletarians of the learned class, were chased like hunted beasts from one community to another; the *bill against the mayors*, by which the Damocles sword of dismissal was hung over their heads, and they, the presidents of the peasant communities, were every moment set in opposition to the President of the Republic and the party of Order; the *ordinance* which transformed the seventeen military districts of France into four pashaliks and forced the barracks and the bivouac on the French as their national salon; the

education law, by which the party of Order proclaimed unconsciousness and the forcible stupefaction of France as the condition of its life under the regime of universal suffrage what were all these laws and measures? Desperate attempts to reconquer the departments and the peasants of the departments for the party of Order.

Regarded as *repression*, they were wretched methods that wrung the neck of their own purpose. The big measures, like the retention of the wine tax, of the 45-centime tax, the scornful rejection of peasant petitions for the repayment of the milliard, etc., all these legislative thunderbolts struck the peasant class all at once, wholesale, from the center; the laws and measures cited made attack and resistance *general*, the topic of the day in every hut; they inoculated every village with revolution; *they localized and peasantized the revolution*.

On the other hand, do not these proposals of Bonaparte and their acceptance by the National Assembly prove the unity of the two powers of the constitutional republic, so far as it is a question of repression of anarchy – that is, of all the classes that rise against the bourgeois dictatorship? Did not *Soulouque* [Louis Bonaparte], directly after his brusque message, assure the Legislative Assembly of his *dévouement* [devotion] to order, through the immediately following message of *Carlier*, that dirty, mean caricature of Fouché, as Louis Bonaparte himself was the shallow caricature of Napoleon?

The *education law* shows us the alliance of the young Catholics with the old Voltaireans. Could the rule of the united bourgeois be anything else but the coalesced despotism of the pro-Jesuit Restoration and the make-believe free-thinking July Monarchy? Had not the weapons that the one bourgeois faction had distributed among the people against the other faction, in their mutual struggle for supremacy, again been torn from it, the people, since the latter was confronting their united dictatorship? Nothing has aroused the Paris shopkeeper more than this coquettish *étalage* [display] of *Jesuitism*, not even the rejection of the *concordats à l'amiable* [friendly agreements].

Meanwhile the collisions between the different factions of the party of Order, as well as between the National Assembly and Bonaparte, continued. The National Assembly was far from pleased that Bonaparte, immediately after his *coup d'état*, after appointing his own, Bonapartist ministry, summoned before him the invalids of the monarchy, newly appointed prefects, and made their unconstitutional agitation for his reelection as

President the condition of their appointment; that Carlier celebrated his inauguration with the closing of a Legitimist club, or that Bonaparte founded a journal of his own, *Le Napoleon*, which betrayed the secret longings of the President to the public, while his ministers had to deny them from the tribune of the Legislative Assembly. The latter was far from pleased by the defiant retention of the ministry, notwithstanding its various votes of no confidence; far from pleased by the attempt to win the favor of the noncommissioned officers by an extra pay of four sous a day and the favor of the proletariat by a plagiarisation of Eugène Sue's *Mysteries* by an honor loan bank; far from pleased, finally, by the effrontery with which the ministers were made to move the deportation of the remaining June insurgents to Algiers, in order to heap unpopularity on the Legislative Assembly *en gros*, while the President reserved popularity for himself *en detail*, by individual grants of pardon. *Thiers* let fall threatening words about *coups d'état* and *coups de tête* [rash acts], and the Legislative Assembly revenged itself on Bonaparte by rejecting every proposed law that he put forward for his own benefit, and by inquiring with noisy mistrust, in every instance when he made a proposal in the common interest, whether he did not aspire, through increase of the executive power, to augment the personal power of Bonaparte. In a word, *it revenged itself by a conspiracy of contempt*.

The Legitimist party, on its part, saw with vexation the more capable Orléanists once more occupying almost all posts and *centralization* increasing, while it sought its salvation principally in *decentralization*. And so it was. The counterrevolution *centralized forcibly*, that is, it prepared the mechanism of the revolution. It even *centralized* the gold and silver of France in the Paris Bank through the compulsory quotation of bank notes, and so created the *ready war chest of the revolution*.

Lastly, the Orléanists saw with vexation the emergent principle of legitimacy contrasted with their bastard principle, and themselves every moment snubbed and maltreated as the bourgeois misalliance of a noble spouse.

Little by little we have seen peasants, petty bourgeois, the middle classes in general, stepping alongside the proletariat, driven into open antagonism to the official republic and treated by it as antagonists. *Revolt against bourgeois dictatorship, need of a change of society, adherence to*

democratic-republican institutions as organs of their movement, grouping around the proletariat as the decisive revolutionary power – these are the common characteristics of the *so-called party of social democracy, the party of the red republic*. This *party of anarchy*, as its opponents christened it, is no less a coalition of different interests than the *party of Order*. From the smallest reform of the old social disorder to the overthrow of the old social order, from bourgeois liberalism to revolutionary terrorism – as far apart as this lie the extremes that form the starting point and the finishing point of the party of “anarchy.”

Abolition of the protective tariff – socialism! For it strikes at the monopoly of the *industrial* faction of the party of Order. Regulation of the state budget – socialism! For it strikes at the monopoly of the *financial* faction of the party of Order. Free admission of foreign meat and corn – socialism! For it strikes at the monopoly of the third faction of the party of Order, *large landed property*. The demands of the free-trade party, that is, of the most advanced English bourgeois party, appear in France as so many socialist demands. Voltaireanism socialism! For it strikes at a fourth faction of the party of Order, the *Catholic*. Freedom of the press, right of association, universal public education – socialism, socialism! They strike at the general monopoly of the party of Order.

So swiftly had the march of the revolution ripened conditions that the friends of reform of all shades, the most moderate claims of the middle classes, were compelled to group themselves around the banner of the most extreme party of revolution, around the *red flag*.

Yet manifold as the *socialism* of the different large sections of the party of anarchy was, according to the economic conditions and the total revolutionary requirements of the class or fraction of a class arising out of these, in *one* point it is in harmony: in proclaiming itself the *means of emancipating the proletariat* and the emancipation of the latter as its *object*. Deliberate deception on the part of some; self-deception on the part of the others, who promote the world transformed according to their own needs as the best world for all, as the realization of all revolutionary claims and the elimination of all revolutionary collisions.

Behind the *general* socialist phrases of the “*party of anarchy*,” which sound rather alike, there is concealed the *socialism* of the *National*, of the *Presse*, and of the *Siècle*, which more or less consistently wants to

overthrow the rule of the finance aristocracy and to free industry and trade from their hitherto existing fetters. This is the socialism of industry, of trade, and of agriculture, whose bosses in the party of Order deny these interests, insofar as they no longer coincide with their private monopolies. *Petty bourgeois socialism*, socialism par excellence, is distinct from this *bourgeois socialism*, to which, as to every variety of socialism, sections of the workers and petty bourgeois naturally rally. Capital hounds this class chiefly as its *creditor*, so it demands *credit institutions*; capital crushes it by *competition*, so it demands *associations* supported by the state; capital overwhelms it by *concentration*, so it demands *progressive taxes*, limitations on inheritance, taking over of large construction projects by the state, and other measures that *forcibly stem the growth of capital*. Since it dreams of the peaceful achievement of its socialism – allowing, perhaps, for a second February Revolution lasting a brief day or so the coming historical process naturally appears to it as an *application of systems* which the thinkers of society, whether in companies or as individual inventors, devise or have devised. Thus they become the eclectics or adepts of the existing socialist *systems*, of *doctrinaire socialism*, which was the theoretical expression of the proletariat only as long as it had not yet developed further into a free historical movement of its own.

While this *utopian doctrinaire socialism*, which subordinates the total movement to one of its stages, which puts in place of common social production the brainwork of individual pedants and, above all, in fantasy does away with the revolutionary struggle of the classes and its requirements by small conjurers' tricks or great sentimentality, while this doctrinaire socialism, which at bottom only idealizes present society, takes a picture of it without shadows, and wants to achieve its ideal athwart the realities of present society; while the proletariat surrenders this socialism to the petty bourgeoisie; while the struggle of the different socialist leaders among themselves sets forth each of the so-called systems as a pretentious adherence to one of the transit points of the social revolution as against another – the *proletariat* rallies more and more around *revolutionary socialism*, around *communism*, for which the bourgeoisie has itself invented the name of *Blanqui*. This socialism is the *declaration of the permanence of the revolution*, the *class dictatorship* of the proletariat as the necessary transit point to the *abolition of class distinctions generally*, to the abolition

of all the relations of production on which they rest, to the abolition of all the social relations that correspond to these relations of production, to the revolutionizing of all the ideas that result from these social relations.

The scope of this exposition does not permit of developing the subject further.

We have seen that just as in the party of *Order* the *finance aristocracy* necessarily took the lead, so in the party of “*anarchy*” the *proletariat*. While the different classes, united in a revolutionary league, grouped themselves around the proletariat, while the departments became ever more unsafe and the Legislative Assembly itself ever more morose toward the pretensions of the French Soulouque, the long deferred and delayed by-election of substitutes for the Montagnards, proscribed after June 13, drew near.

The government, scorned by its foes, maltreated and daily humiliated by its alleged friends, saw only *one* mean of emerging from this repugnant and untenable position – *revolt*. A revolt in Paris would have permitted the proclamation of a state of siege in Paris and the departments and thus the control of the elections. On the other hand, the friends of order, in face of a government that had gained victory over anarchy, were constrained to make concessions, if they did not want to appear as anarchists themselves.

The government set to work. At the beginning of February, 1850, provocation of the people by chopping down the trees of liberty. In vain. If the trees of liberty lost their place, the government itself lost its head and fell back, frightened by its own provocation. The National Assembly, however, received this clumsy attempt at emancipation on the part of Bonaparte with ice-cold mistrust. The removal of the wreaths of immortelles from the July column was no more successful. It gave part of the army an opportunity for revolutionary demonstrations and the National Assembly the occasion for a more or less veiled vote of no confidence in the ministry. In vain the government press threatened the abolition of universal suffrage and the invasion of the Cossacks. In vain was Hautpoul's direct challenge, issued to the Left in the Legislative Assembly itself, to betake itself to the streets, and his declaration that the government was ready to receive it. Hautpoul received nothing but a call to order from the President, and the party of Order, with silent, malicious joy, allowed a deputy of the Left to mock Bonaparte's usurpatory longings. In vain, finally, was the prophecy of a revolution on February 24. The government caused February 24 to be ignored by the people.

The proletariat did not allow itself to be provoked to *revolt*, because it was on the point of making a *revolution*.

Unhindered by the provocations of the government, which only heightened the general exasperation at the existing situation, the election committee, wholly under the influence of the workers, put forward three candidates for Paris: *Deflotte, Vidal, and Carnot*. *Deflotte* was a June deportee, amnestied through one of Bonaparte's popularity-seeking ideas; he was a friend of Blanqui and had taken part in the attempt of May 15. *Vidal*, known as a communist writer through his book *Concerning the Distribution of Wealth*, was formerly secretary to Louis Blanc in the Luxembourg Commission. *Carnot*, son of the man of the Convention who had organized the victory, the least compromised member of the National party, Minister of Education in the Provisional Government and the Executive Commission, was through his democratic public education bill a living protest against the education law of the Jesuits. These three candidates represented the three allied classes: at the head, the June insurgent, the representative of the revolutionary proletariat; next to him the doctrinaire socialist, the representative of the socialist petty bourgeoisie; finally, the third, the representative of the republican bourgeois party whose democratic formulas had gained a socialist significance vis-a-vis the party of Order and had long lost their own significance. This was a *general coalition against the bourgeoisie and the government, as in February*. But this time the *proletariat* was at the *head of the revolutionary league*.

In spite of all efforts the socialist candidates won. The army itself voted for the June insurgent against its own War Minister La Hitte. The party of Order was thunderstruck. The elections in the departments did not solace them; the departments gave a majority to the Montagnards.

The election of March 10, 1850! It was the revocation of June, 1848: the butchers and deportees of the June insurgents returned to the National Assembly but returned, bowed down, in the train of the deported, and with their principles on their lips. *It was the revocation of June 13, 1849:* the Montagne, proscribed by the National Assembly, returned to the National Assembly, but as advance trumpeters of the revolution, no longer as its commanders. *It was the revocation of December 10:* Napoleon had lost out with his Minister La Hitte. The parliamentary history of France knows only one analogy: the rejection of d'Haussez, minister of Charles X, in 1830. Finally, the election of March 10, 1850, was the cancellation of the election

of May 13, which had given the party of Order a majority. The election of March 10 protested against the majority of May 13. March 10 was a revolution. Behind the ballots lie the paving stones.

“The vote of March 10 means war,” shouted Ségur d’Aguesseau, one of the most advanced members of the party of Order.

With March 10, 1850, the constitutional republic entered a new phase, *the phase of its dissolution*. The different factions of the majority are again united among themselves and with Bonaparte; they are again the saviors of order – he is again their neutral man. If they remember that they are royalists, it happens only from despair of the possibility of a bourgeois republic; if he remembers that he is a pretender, it happens only because he despairs of remaining President.

At the command of the party of Order, Bonaparte answers the election of *Deflotte*, the June insurgent, by appointing *Baroche* Minister of Internal Affairs, Baroche, the accuser of Blanqui and Barbès, of Ledru-Rollin and Guinard. The Legislative Assembly answers the election of *Carnot* by adopting the education law, the election of *Vidal* by suppressing the socialist press. The party of Order seeks to blare away its own fears by the trumpet blasts of its press. “The sword is holy,” cries one of its organs; “the defenders of order must take the offensive against the Red party,” cries another; “between socialism and society there is a duel to the death, a war without surcease or mercy; in this duel of desperation one or the other must go under; if society does not annihilate socialism, socialism will annihilate society,” crows a third cock of Order. Throw up the barricades of order, the barricades of religion, the barricades of the family! An end must be made of the 127,000 voters of Paris! A Bartholomew’s Night for the socialists! And the party of Order believes for a moment in its own certainty of victory.

Their organs hold forth most fanatically of all against the “*boutiquiers* [tradesmen] *of Paris*.” The June insurgent of Paris elected by the shopkeepers of Paris as their representative! This means that a second June, 1848, is impossible; this means that a second June 13, 1849, is impossible; this means that the moral influence of capital is broken; this means that the bourgeois assembly now represents only the bourgeoisie; this means that big property is lost, because its vassal, small property, seeks its salvation in the camp of the propertyless.

The party of Order naturally returns to its inevitable *commonplace*. “*More repression*,” it cries, “*tenfold repression!*” But its power of

repression has diminished tenfold, while resistance has increased a hundredfold. Must not the chief instrument of repression, the army, itself be repressed? And the party of Order speaks its last word: "The iron ring of suffocating legality must be broken. *The constitutional republic is impossible.* We must fight with our true weapons; since February, 1848, we have fought the revolution with its weapons and on its terrain – , we have accepted its institutions; the constitution is a fortress which safeguards only the besiegers, not the besieged! By smuggling ourselves into holy Ilion in the belly of the Trojan horse, we have, unlike our forefathers, the *Grecks*, not conquered the hostile town, but made prisoners of ourselves.

The foundation of the constitution, however, is *universal suffrage*. *Annihilation of universal suffrage* – such is the last word of the party of Order, of the bourgeois dictatorship.

On May 4, 1848, on December 20, 1848, on May 13, 1849, and on July 8, 1849, universal suffrage admitted that they were right. On March 10, 1850, universal suffrage admitted that it had itself been wrong. Bourgeois rule as the outcome and result of universal suffrage, as the express act of the sovereign will of the people – that is the meaning of the bourgeois constitution. But has the constitution any further meaning from the moment that the content of this suffrage, of this sovereign will, is no longer bourgeois rule? Is it not the duty of the bourgeoisie so to regulate the suffrage that it wills the reasonable, its rule? By ever and anon putting an end to the existing state power and creating it anew out of itself, does not universal suffrage put an end to all stability, does it not every moment question all the powers that be, does it not annihilate authority, does it not threaten to elevate anarchy itself to the position of authority? After March 10, 1850, who would still doubt it?

By repudiating universal suffrage, with which it hitherto draped itself and from which it sucked its omnipotence, the bourgeoisie openly confesses, "*Our dictatorship has hitherto existed by the will of the people; it must now be consolidated against the will of the people.*" And, consistently, it seeks its props no longer within *France*, but without, in foreign countries, in *invasion*.

With the invasion, this second Coblenz, its seat established in France itself, rouses all the national passions against itself. With the attack on universal suffrage it provides a *general pretext* for the new revolution, and the revolution requires such a pretext. Every *special* pretext would divide

the factions of the revolutionary league, and give prominence to their differences. The *general* pretext stuns the semi-revolutionary classes; it permits them to deceive themselves concerning the *definite character* of the coming revolution, concerning the consequences of their own act. Every revolution requires a question for discussion at banquets. Universal suffrage is the banquet question of the new revolution.

The bourgeois factions in *coalition*, however, are already condemned, since they take flight from the only possible form of their united power, from the most potent and complete form of their *class rule*, the *constitutional republic*, back to the subordinate, incomplete, weaker form of *monarchy*. They resemble the old man who in order to regain his youthful strength fetched out his boyhood garments and suffered torment trying to get his withered limbs into them. Their republic had the *sole* merit of *being the hothouse of the revolution*.

March 10, 1850, bears the inscription:

Après moi le déluge! After me the deluge!

Part IV. The Abolition of Universal Suffrage in 1850

The same symptoms have shown themselves in *France* since 1849, and particularly since the beginning of 1850. The Parisian industries are abundantly employed and the cotton factories of Rouen and Mulhouse are also doing pretty well, although here, as in England, the high prices of the raw material have exercised a retarding influence. The development of prosperity in France was, in addition, especially promoted by the comprehensive tariff reform in Spain and by the reduction of the duties on various luxury articles in Mexico; the export of French commodities to both markets has considerably increased. The growth of capital in France led to a series of speculations, for which the exploitation of the California gold mines on a large scale served as a pretext. A swarm of companies have sprung up; the low denomination of their shares and their socialist-colored prospectuses appeal directly to the purses of the petty bourgeois and the workers, but all and sundry result in that sheer swindling which is characteristic of the French and Chinese alone. One of these companies is even patronized directly by the government. The import duties in France during the first nine months of 1848 amounted to 63,000,000 francs, of 1849 to 95,000,000 francs, and of 1850 to 93,000,000 francs. Moreover, in the month of September, 1850, they again rose by more than a million compared with the same month of 1849. Exports also rose in 1849, and still more in 1850.

The most striking proof of restored prosperity is the Bank's reintroduction of specie payment by the law of August 6, 1850. On March 15, 1848, the Bank had been authorized to suspend specie payment. Its note circulation, including that of the provincial banks, amounted at that time to 373,000,000 francs (14,920,000 pounds). On November 2, 1849, this circulation amounted to 482,000,000 francs, or 19,280,000, an increase of 4,360,000 pounds, and on September 2, 1850, to 496,000,000 francs, or 19,840,000 pounds, an increase of about 5,000,000 pounds. This was not accompanied by any depreciation of the notes; on the contrary, the increased circulation of the notes was accompanied by the steadily increasing accumulation of gold and silver in the vaults of the Bank, so that

in the summer of 1850 its metallic reserve amounted to about 141,000,000 pounds, an unprecedented sum in France. That the Bank was thus placed in a position to increase its circulation and therewith its active capital by 123,000,000 francs, or 5,000,000 pounds, is striking proof of the correctness of our assertion in an earlier issue that the finance aristocracy has not only not been overthrown by the revolution, but has even been strengthened. This result becomes still more evident from the following survey of French bank legislation during the last few years. On June 10, 1847, the Bank was authorized to issue notes of 200 francs; hitherto the smallest denomination had been 500 francs. A decree of March 15, 1848, declared the notes of the Bank of France legal tender and relieved it of the obligation of redeeming them in specie. Its note issue was limited to 350,000,000 francs. It was simultaneously authorized to issue notes of 100 francs. A decree of April 27 prescribed the merging of the departmental banks in the Bank of France; another decree, of May 2, 1848, increased the latter's note issue to 442,000,000 francs. A decree of December 22, 1849, raised the maximum of the note issue to 525,000,000 francs. Finally, the law of August 6, 1850, reestablished the exchangeability of notes for specie. These facts, the continual increase in the circulation, the concentration of the whole of French credit in the hands of the Bank, and the accumulation of all French gold and silver in the Bank's vaults led M. Proudhon to the conclusion that the Bank must now shed its old snakeskin and metamorphose itself into a Proudhonist people's bank. He did not even need to know the history of the English bank restriction from 1797 to 1819; he only needed to direct his glance across the Channel to see that this fact, for him unprecedented in the history of bourgeois society, was nothing more than a very normal bourgeois event, which only now occurred in France for the first time. One sees that the allegedly revolutionary theoreticians who, after the Provisional Government, talked big in Paris were just as ignorant of the nature and the results of the measures taken as the gentlemen of the Provisional Government themselves.

In spite of the industrial and commercial prosperity that France momentarily enjoys, the mass of the people, the twenty-five million peasants, suffer from a great depression. The good harvests of the past few years have forced the prices of corn much lower even than in England, and the position of the peasants under such circumstances, in debt, sucked dry by usury and crushed by taxes, must be anything but splendid. The history

of the past three years has, however, provided sufficient proof that this class of the population is absolutely incapable of any revolutionary initiative.

Just as the period of crisis began later on the Continent than in England, so also did prosperity. The process originated in England, which is the demiurge of the bourgeois cosmos. On the Continent the various phases of the cycle repeatedly experienced by bourgeois society assume a secondary and tertiary form. First, the Continent exports to England disproportionately more than to any other country. This export to England, however, depends on the latter's position, especially in regard to the overseas market. England exports disproportionately more to overseas countries than to the whole Continent, so that the quantity of continental exports to those countries is always dependent on England's foreign trade. Hence when crises on the Continent produce revolutions there first, the bases for them are always laid in England. Violent outbreaks naturally erupt sooner at the extremities of the bourgeois body than in its heart, because in the latter the possibilities of accommodation are greater than in the former. On the other hand, the degree to which continental revolutions affect England is at the same time the thermometer that indicates to what extent these revolutions really put into question bourgeois life conditions, and to what extent they touch only their political formations.

Given this general prosperity, wherein the productive forces of bourgeois society are developing as luxuriantly as it is possible for them to do within bourgeois relationships, a real revolution is out of the question. Such a revolution is possible only in periods when *both* of these *factors* — the *modern forces* of production and the *bourgeois forms of production* — come *into opposition* with each other. The various bickerings in which representatives of the individual factions of the continental party of Order presently engage and compromise each other, far from providing an occasion for revolution, are, on the contrary, possible only because the bases of relationships are momentarily so secure and — what the reactionaries do not know — so *bourgeois*. On this all the reactionary attempts to hold back bourgeois development will rebound just as much as will all the ethical indignation and all the enraptured proclamations of the democrats. *A new revolution is only a consequence of a new crisis. The one, however, is as sure to come as the other.*

Let us now turn to *France*.

The victory that the people, in conjunction with the petty bourgeois, had won in the elections of March 10 was annulled by the people itself when it provoked the new election of April 28. Vidal was elected not only in Paris, but also in the Lower Rhine. The Paris Committee, in which the Montagne and the petty bourgeoisie were strongly represented, induced him to accept for the Lower Rhine. The victory of March 10 ceased to be a decisive one; the date of the decision was once more postponed; the tension of the people was relaxed; it became accustomed to legal triumphs instead of revolutionary ones. The revolutionary meaning of March 10, the rehabilitation of the June insurrection, was finally completely annihilated by the candidature of Eugene Sue, the sentimental petty-bourgeois social-fantast, which the proletariat could at best accept as a joke to please the grisettes. As against this well-meaning candidature, the party of Order, emboldened by the vacillating policy of its opponents, put up a candidate who was to represent the June victory. This comic candidate was the Spartan paterfamilias Leclerc, from whose person, however, the heroic armor was torn piece by piece by the press, and who experienced a brilliant defeat in the election. The new election victory on April 28 put the Montagne and the petty bourgeoisie in high feather. They already exulted in the thought of being able to arrive at the goal of their wishes in a purely legal way and without again pushing the proletariat into the foreground through a new revolution; they reckoned positively on bringing Ledru-Rollin into the presidential chair and a majority of Montagnards into the Assembly through universal suffrage in the new elections of 1852. The party of Order, rendered perfectly certain by the prospective elections, by Sue's candidature, and by the mood of the Montagne and the petty bourgeoisie, that the latter were resolved to remain quiet no matter what happened, answered the two election victories with an election law which abolished universal suffrage.

The government took good care not to make this legislative proposal on its own responsibility. It made an apparent concession to the majority by entrusting the working out of the bill to the high dignitaries of this majority, the seventeen burgraves. Thus it was not the government that proposed the repeal of universal suffrage to the Assembly; the majority of the Assembly proposed it to itself.

On May 8 the project was brought into the Chamber. The entire Social-Democratic press rose as one man in order to preach to the people dignified

bearing, calme majestueux, passivity, and trust in its representatives. Every article of these journals was a confession that a revolution would, above all, annihilate the so-called revolutionary press, and that therefore it was now a question of its self-preservation. The allegedly revolutionary press betrayed its whole secret. It signed its own death warrant.

On May 21 the Montagne put the preliminary question to debate and moved the rejection of the whole project on the ground that it violated the constitution. The party of Order answered that the constitution would be violated if it were necessary; there was, however, no need for this at present, because the constitution was capable of every interpretation, and because the majority alone was competent to decide on the correct interpretation. To the unbridled, savage attacks of Thiers and Montalembert the Montagne opposed a decorous and refined humanism. It took its stand on the ground of law; the party of Order referred it to the ground on which the law grows, to bourgeois property. The Montagne whimpered: Did they really want, then, to conjure up revolutions by main force? The party of Order replied: One would await them.

On May 22 the preliminary question was settled by 462 votes to 227. The same men who had proved with such solemn profundity that the National Assembly and every individual deputy would be renouncing his mandate if he renounced the people, his mandatory, now stuck to their seats and suddenly sought to let the country act, through petitions at that, instead of acting themselves, and still sat there unmoved when, on May 31, the law went through in splendid fashion. They sought to revenge themselves by a protest in which they recorded their innocence of the rape of the constitution, a protest which they did not even submit openly, but smuggled into the President's pocket from the rear.

An army of 150,000 men in Paris, the long deferment of the decision, the appeasing attitude of the press, the pusillanimity of the Montagne and of the newly elected representatives, the majestic calm of the petty bourgeois, but above all, the commercial and industrial prosperity, prevented any attempt at revolution on the part of the proletariat.

Universal suffrage had fulfilled its mission. The majority of the people had passed through the school of development, which is all that universal suffrage can serve for in a revolutionary period. It had to be set aside by a revolution or by the reaction.

The Montagne developed a still greater display of energy on an occasion that arose soon afterward. From the tribune War Minister Hautpoul had termed the February Revolution a baneful catastrophe. The orators of the Montagne, who, as always, distinguished themselves by their morally indignant bluster, were not allowed by the President, Dupin, to speak. Girardin proposed to the Montagne that it should walk out at once en masse. Result: The Montagne remained seated, but Girardin was cast out from its midst as unworthy.

The election law still needed one thing to complete it, a new *press law*. This was not long in coming. A proposal of the government, made many times more drastic by amendments of the party of Order, increased the caution money, put an extra stamp on feuilleton fiction (answer to the election of Eugène Sue), taxed all publications appearing weekly or monthly up to a certain number of sheets, and finally provided that every article of a journal must bear the signature of the author. The provisions concerning the caution money killed the so-called revolutionary press; the people regarded its extinction as satisfaction for the abolition of universal suffrage. However, neither the tendency nor the effect of the new law extended only to this section of the press. As long as the newspaper press was anonymous, it appeared as the organ of a numberless and nameless public opinion; it was the third power in the state. Through the signature of every article, a newspaper became a mere collection of literary contributions from more or less known individuals. Every article sank to the level of an advertisement. Hitherto the newspapers had circulated as the paper money of public opinion; now they were resolved into more or less bad solo bills, whose worth and circulation depended on the credit not only of the drawer but also of the endorser. The press of the party of Order had incited not only for the repeal of universal suffrage but also for the most extreme measures against the bad press. However, in its sinister anonymity even the good press was irksome to the party of Order and still more to its individual provincial representatives. As for itself, it demanded only the paid writer, with name, address, and description. In vain the good press bemoaned the ingratitude with which its services were rewarded. The law went through; the provision about the giving of names hit it hardest of all. The names of republican journalists were rather well known; but the respectable firms of the “Journal des Débats”, the “Assemblée Nationale”, the “Constitutionnel”, etc., etc., cut a sorry figure in their high protestations

of state wisdom when the mysterious company all at once disintegrated into purchasable penny-a-liners of long practice, who had defended all possible causes for cash, like Granier de Cassagnac, or into old milksops who called themselves statesmen, like Capefigue, or into coquettish fops, like M. Lemoigne of the *Débats*.

In the debate on the press law the Montagne had already sunk to such a level of moral degeneracy that it had to confine itself to applauding the brilliant tirades of an old notable of Louis Philippe's time, M. Victor Hugo.

With the election law and the press law the revolutionary and democratic party exits from the official stage. Before their departure home, shortly after the end of the session, the two factions of the Montagne, the socialist democrats and the democratic socialists, issued two manifestoes, two *testimonia paupertatis* [certificates of pauperism] in which they proved that while power and success were never on their side, they nonetheless had ever been on the side of eternal justice and all the other eternal truths.

Let us now consider the party of Order. The "Neue Rheinische Zeitung" had said: "As against the hankering for restoration on the part of the united Orléanists and Legitimists, Bonaparte defends his title to his actual power, the republic; as against the hankering for restoration on the part of Bonaparte, the party of Order defends its title to its common rule, the republic; as against the Orléanists, the Legitimists, and as against the Legitimists, the Orléanists, defend the status quo, the republic. All these factions of the party of Order, each of which has its own king and its own restoration in petto, mutually enforce, as against their rivals' hankering for usurpation and revolt, the common rule of the bourgeoisie, the form in which the special claims remain neutralized and reserved — the republic.... And Thiers spoke more truly than he suspects when he said: 'We, the royalists, are the true pillars of the constitutional republic'."

This comedy of the *républicains malgré eux* [republicans in spite of themselves], the antipathy to the status quo and the constant consolidation of it; the incessant friction between Bonaparte and the National Assembly; the ever renewed threat of the party of Order to split into its separate component parts, and the ever repeated conjugation of its factions; the attempt of each faction to transform each victory over the common foe into a defeat for its temporary allies; the mutual petty jealousy, chicanery, harassment, the tireless drawing of swords that ever and again ends with a

baiser Lamourette — this whole unedifying comedy of errors never developed more classically than during the past six months.

The party of Order regarded the election law at the same time as a victory over Bonaparte. Had not the government abdicated when it handed over the editing of and responsibility for its own proposal to the Commission of Seventeen? And did not the chief strength of Bonaparte as against the Assembly lie in the fact that he was the chosen of six millions? Bonaparte, on his part, treated the election law as a concession to the Assembly, with which he claimed to have purchased harmony between the legislative and executive powers. As reward, the vulgar adventurer demanded an increase of three millions in his civil list. Dared the National Assembly enter into a conflict with the executive at a moment when it had excommunicated the great majority of Frenchmen? It was roused to anger; it appeared to want to go to extremes; its commission rejected the motion; the Bonapartist press threatened, and referred to the disinherited people, deprived of its franchise; numerous noisy attempts at an arrangement took place, and the Assembly finally gave way in fact, but at the same time revenged itself in principle. Instead of increasing the civil list in principle by three millions per annum, it granted Bonaparte an accommodation of 2,160,000 francs. Not satisfied with this, it made even this concession only after it had been supported by Changarnier, the general of the party of Order and the protector thrust upon Bonaparte. Therefore it really granted the two millions not to Bonaparte, but to Changarnier.

This sop, thrown to him *de mauvaise grâce* [with bad grace], was accepted by Bonaparte quite in the spirit of the donor. The Bonapartist press blustered anew against the National Assembly. When in the debate on the press law the amendment was made on the signing of names — which, in turn, was directed especially against the less important papers — the representatives of the private interests of Bonaparte, the principal Bonapartist paper, the *Pouvoir*, published an open and vehement attack on the National Assembly. The ministers had to disavow the paper before the Assembly; the *girant* [manager] of the *Pouvoir* was summoned before the bar of the National Assembly and sentenced to pay the highest fine, 5,000 francs. Next day the *Pouvoir* published a still more insolent article against the Assembly, and as the revenge of the government, the public prosecutor promptly prosecuted a number of Legitimist journals for violating the constitution.

Finally there came the question of proroguing the Assembly. Bonaparte desired this in order to be able to operate unhindered by the Assembly. The party of Order desired it partly for the purpose of carrying on its factional intrigues, partly for the pursuit of the private interests of the individual deputies. Both needed it in order to consolidate and push further the victories of reaction in the provinces. The Assembly therefore adjourned from August 11 until November 11. Since, however, Bonaparte in no way concealed that his only concern was to get rid of the irksome surveillance of the National Assembly, the Assembly imprinted on the vote of confidence itself the stamp of lack of confidence in the President. All Bonapartists were kept off the permanent commission of twenty-eight members who stayed on during the recess as guardians of the virtue of the republic. In their stead, even some republicans of the *Siècle* and the *National* were elected to it, in order to prove to the President the attachment of the majority to the constitutional republic.

Shortly before, and especially immediately after the recess, the two big factions of the party of Order, the Orléanists and the Legitimists, appeared to want to be reconciled, and this by a fusion of the two royal houses under whose flags they were fighting. The papers were full of reconciliation proposals that were said to have been discussed at the sickbed of Louis Philippe at St. Leonards, when the death of Louis Philippe suddenly simplified the situation. Louis Philippe was the usurper, Henry V the dispossessed; the Count of Paris, on the other hand, owing to the childlessness of Henry V, was his lawful heir to the throne. Every pretext for objecting to a fusion of the two dynastic interests was now removed. But precisely now the two factions of the bourgeoisie first discovered that it was not zeal for a definite royal house that divided them, but that it was rather their divided class interests that kept the two dynasties apart. The Legitimists, who had made a pilgrimage to the residence of Henry V at Wiesbaden just as their competitors had to St. Leonards, received there the news of Louis Philippe's death. Forthwith they formed a ministry in *partibus infidelium*, which consisted mostly of members of that commission of guardians of the virtue of the republic and which on the occasion of a squabble in the bosom of the party came out with the most outspoken proclamation of right by the grace of God. The Orléanists rejoiced over the compromising scandal that this manifesto called forth in the press, and did not conceal for a moment their open enmity to the Legitimists.

During the adjournment of the National Assembly, the Councils of the departments met. The majority of them declared for a more or less qualified revision of the constitution; that is, they declared for a not definitely specified monarchist restoration, for a "*solution*", and confessed at the same time that they were too incompetent and too cowardly to find this solution. The Bonapartist faction at once construed this desire for revision in the sense of a prolongation of Bonaparte's presidency.

The constitutional solution, the retirement of Bonaparte in May, 1852, the simultaneous election of a new President by all the electors of the land, the revision of the constitution by a Chamber of Revision during the first months of the new presidency, is utterly inadmissible for the ruling class. The day of the new presidential election would be the day of rendezvous for all the hostile parties, the Legitimists, the Orléanists, the bourgeois republicans, the revolutionists. It would have to come to a violent decision between the different factions. Even if the party of Order should succeed in uniting around the candidature of a neutral person outside the dynastic families, he would still be opposed by Bonaparte. In its struggle with the people, the party of Order is compelled constantly to increase the power of the executive. Every increase of the executive's power increases the power of its bearer, Bonaparte. In the same measure, therefore, as the party of Order strengthens its joint might, it strengthens the fighting resources of Bonaparte's dynastic pretensions, it strengthens his chance of frustrating a constitutional solution by force on the day of the decision. He will then have, as against the party of Order, no more scruples about the one pillar of the constitution than that party had, as against the people, about the other pillar in the matter of the election law. He would, seemingly even against the Assembly, appeal to universal suffrage. In a word, the constitutional solution questions the entire political status quo and behind the jeopardizing of the status quo the bourgeois sees chaos, anarchy, civil war. He sees his purchases and sales, his promissory notes, his marriages, his agreements duly acknowledged before a notary, his mortgages, his ground rents, house rents, profits, all his contracts and sources of income called in question on the first Sunday in May, 1852, and he cannot expose himself to this risk. Behind the jeopardizing of the political status quo lurks the danger of the collapse of the entire bourgeois society. The only possible solution in the framework of the bourgeoisie is the postponement of the solution. It can save the constitutional republic only by a violation of the constitution, by

the prolongation of the power of the President. This is also the last word of the press of Order, after the protracted and profound debates on the “solutions” in which it indulged after the session of the general councils. The high and mighty party of Order thus finds itself, to its shame, compelled to take seriously the ridiculous, commonplace, and, to it, odious person of the pseudo Bonaparte.

This dirty figure likewise deceived himself about the causes that clothed him more and more with the character of the indispensable man. While his party had sufficient insight to ascribe the growing importance of Bonaparte to circumstances, he believed that he owed it solely to the magic power of his name and his continual caricaturing of Napoleon. He became more enterprising every day. To offset the pilgrimages to St. Leonards and Wiesbaden, he made his round trips through France. The Bonapartists had so little faith in the magic effect of his personality that they sent with him everywhere as claquers people from the Society of December 10, that organization of the Paris lumpen proletariat, packed en masse into railway trains and post chaises. They put speeches into the mouth of their marionette which, according to the reception in the different towns, proclaimed republican resignation or perennial tenacity as the keynote of the President’s policy. In spite of all maneuvers these journeys were anything but triumphal processions.

When Bonaparte believed he had thus made the people enthusiastic, he set out to win the army. He caused great reviews to be held on the plain of Satory, near Versailles, at which he sought to buy the soldiers with garlic sausages, champagne, and cigars. Whereas the genuine Napoleon, amid the hardships of his campaigns of conquest, knew how to cheer up his weary soldiers with outbursts of patriarchal familiarity, the pseudo Napoleon believed it was in gratitude that the troops shouted: *Vive Napoleon, vive le saucisson!* [Long live Napoleon, long live the sausage!] that is, Hurrah for the *Wurst* [sausage], hurrah for the *Hanswurst* [buffoon]!

These reviews led to the outbreak of the long suppressed dissension between Bonaparte and his War Minister Hautpoul, on the one hand, and Changarnier, on the other. In Changarnier the party of Order had found its real neutral man, in whose case there could be no question of his own dynastic claims. It had designated him Bonaparte’s successor. In addition, Changarnier had become the great general of the party of Order through his conduct on January 29 and June 13, 1849, the modern Alexander whose

brutal intervention had, in the eyes of the timid bourgeois, cut the Gordian knot of the revolution. At bottom just as ridiculous as Bonaparte, he had thus become a power in the very cheapest manner and was set up by the National Assembly to watch the President. He himself coquetted, for example, in the matter of the salary grant, with the protection that he gave Bonaparte, and rose up ever more overpoweringly against him and the ministers. When, on the occasion of the election law, an insurrection was expected, he forbade his officers to take any orders whatever from the War Minister or the President. The press was also instrumental in magnifying the figure of Changarnier. With the complete absence of great personalities, the party of Order naturally found itself compelled to endow a single individual with the strength lacking in its class as a whole and so puff up this individual to a prodigy. Thus arose the myth of Changarnier, the “*bulwark of society*.” The arrogant charlatanry, the secretive air of importance with which Changarnier condescended to carry the world on his shoulders, forms the most ridiculous contrast to the events during and after the [last] Satory review, which irrefutably proved that it needed only a stroke of the pen by Bonaparte, the infinitely little, to bring this fantastic offspring of bourgeois fear, the colossus Changarnier, back to the dimensions of mediocrity and transform him, society’s heroic savior, into a pensioned general.

Bonaparte had for some time been revenging himself on Changarnier by provoking the War Minister to disputes in matters of discipline with the irksome protector. The last review at Satory finally brought the old animosity to a climax. The constitutional indignation of Changarnier knew no bounds when he saw the cavalry regiments file past with the unconstitutional cry: *Vive l’Empereur!* [Long live the Emperor!] In order to forestall any unpleasant debate on this cry in the coming session of the Chamber, Bonaparte removed War Minister Hautpoul by appointing him governor of Algiers. In his place he put a reliable old general of the time of the Empire, one who was fully a match for Changarnier in brutality. But so that the dismissal of Hautpoul might not appear as a concession to Changarnier, he simultaneously transferred General Neumayer, the right hand of the great savior of society, from Paris to Nantes. It was Neumayer who at the last review had induced the whole of the infantry to file past the successor of Napoleon in icy silence. Changarnier, himself attacked in the person of Neumayer, protested and threatened. To no purpose. After two days’ negotiations, the decree transferring Neumayer appeared in the

Moniteur, and there was nothing left for the hero of Order but to submit to discipline or resign.

Bonaparte's struggle with Changarnier is the continuation of his struggle with the party of Order. The reopening of the National Assembly on November 11 will therefore take place under threatening auspices. It will be a storm in a teacup. In essence the old game must go on. Meanwhile the majority of the party of Order will, despite the clamor of the sticklers for principle in its different factions, be compelled to prolong the power of the President. Similarly, Bonaparte, already humbled by lack of money, will, despite all preliminary protestations, accept this prolongation of power from the hands of the National Assembly as simply delegated to him. Thus the solution is postponed; the status quo continued; one faction of the party of Order compromised, weakened, made unworkable by the other; the repression of the common enemy, the mass of the nation, extended and exhausted — until the economic relations themselves have again reached the point of development where a new explosion blows into the air all these squabbling parties with their constitutional republic.

For the peace of mind of the bourgeois it must be said, however, that the scandal between Bonaparte and the party of Order has the result of ruining a multitude of small capitalists on the Bourse and putting their assets into the pockets of the big wolves of the Bourse.

ADDRESS OF THE CENTRAL COMMITTEE TO THE COMMUNIST LEAGUE

Anonymous translation

LONDON, MARCH 1850

Brothers!

In the two revolutionary years of 1848-49 the League proved itself in two ways. First, its members everywhere involved themselves energetically in the movement and stood in the front ranks of the only decisively revolutionary class, the proletariat, in the press, on the barricades and on the battlefields. The League further proved itself in that its understanding of the movement, as expressed in the circulars issued by the Congresses and the Central Committee of 1847 and in the Manifesto of the Communist Party, has been shown to be the only correct one, and the expectations expressed in these documents have been completely fulfilled. This previously only propagated by the League in secret, is now on everyone's lips and is preached openly in the market place. At the same time, however, the formerly strong organization of the League has been considerably weakened. A large number of members who were directly involved in the movement thought that the time for secret societies was over and that public action alone was sufficient. The individual districts and communes allowed their connections with the Central Committee to weaken and gradually become dormant. So, while the democratic party, the party of the petty bourgeoisie, has become more and more organized in Germany, the workers' party has lost its only firm foothold, remaining organized at best in individual localities for local purposes; within the general movement it has consequently come under the complete domination and leadership of the petty-bourgeois democrats. This situation cannot be allowed to continue; the independence of the workers must be restored. The Central Committee recognized this necessity and it therefore sent an emissary, Joseph Moll, to Germany in the winter of 1848-9 to reorganize the League. Moll's mission, however, failed to produce any lasting effect, partly because the German

workers at that time had not enough experience and partly because it was interrupted by the insurrection last May. Moll himself took up arms, joined the Baden-Palatinate army and fell on 29 June in the battle of the River Murg. The League lost in him one of the oldest, most active and most reliable members, who had been involved in all the Congresses and Central Committees and had earlier conducted a series of missions with great success. Since the defeat of the German and French revolutionary parties in July 1849, almost all the members of the Central Committee have reassembled in London: they have replenished their numbers with new revolutionary forces and set about reorganizing the League with renewed zeal.

This reorganization can only be achieved by an emissary, and the Central Committee considers it most important to dispatch the emissary at this very moment, when a new revolution is imminent, that is, when the workers' party must go into battle with the maximum degree of organization, unity and independence, so that it is not exploited and taken in tow by the bourgeoisie as in 1848.

We told you already in 1848, brothers, that the German liberal bourgeoisie would soon come to power and would immediately turn its newly won power against the workers. You have seen how this forecast came true. It was indeed the bourgeoisie which took possession of the state authority in the wake of the March movement of 1848 and used this power to drive the workers, its allies in the struggle, back into their former oppressed position. Although the bourgeoisie could accomplish this only by entering into an alliance with the feudal party, which had been defeated in March, and eventually even had to surrender power once more to this feudal absolutist party, it has nevertheless secured favourable conditions for itself. In view of the government's financial difficulties, these conditions would ensure that power would in the long run fall into its hands again and that all its interests would be secured, if it were possible for the revolutionary movement to assume from now on a so-called peaceful course of development. In order to guarantee its power the bourgeoisie would not even need to arouse hatred by taking violent measures against the people, as all of these violent measures have already been carried out by the feudal counter-revolution. But events will not take this peaceful course. On the contrary, the revolution which will accelerate the course of events, is imminent, whether it is initiated by an independent rising of the French

proletariat or by an invasion of the revolutionary Babel by the Holy Alliance.

The treacherous role that the German liberal bourgeoisie played against the people in 1848 will be assumed in the coming revolution by the democratic petty bourgeoisie, which now occupies the same position in the opposition as the liberal bourgeoisie did before 1848. This democratic party, which is far more dangerous for the workers than were the liberals earlier, is composed of three elements: 1) The most progressive elements of the big bourgeoisie, who pursue the goal of the immediate and complete overthrow of feudalism and absolutism. This fraction is represented by the former Berlin Vereinbarer, the tax resisters; 2) The constitutional-democratic petty bourgeois, whose main aim during the previous movement was the formation of a more or less democratic federal state; this is what their representative, the Left in the Frankfurt Assembly and later the Stuttgart parliament, worked for, as they themselves did in the Reich Constitution Campaign; 3) The republican petty bourgeois, whose ideal is a German federal republic similar to that in Switzerland and who now call themselves 'red' and 'social-democratic' because they cherish the pious wish to abolish the pressure exerted by big capital on small capital, by the big bourgeoisie on the petty bourgeoisie. The representatives of this fraction were the members of the democratic congresses and committees, the leaders of the democratic associations and the editors of the democratic newspapers.

After their defeat all these fractions claim to be 'republicans' or 'reds', just as at the present time members of the republican petty bourgeoisie in France call themselves 'socialists'. Where, as in Wurtemberg, Bavaria, etc., they still find a chance to pursue their ends by constitutional means, they seize the opportunity to retain their old phrases and prove by their actions that they have not changed in the least. Furthermore, it goes without saying that the changed name of this party does not alter in the least its relationship to the workers but merely proves that it is now obliged to form a front against the bourgeoisie, which has united with absolutism, and to seek the support of the proletariat.

The petty-bourgeois democratic party in Germany is very powerful. It not only embraces the great majority of the urban middle class, the small industrial merchants and master craftsmen; it also includes among its followers the peasants and rural proletariat in so far as the latter has not yet found support among the independent proletariat of the towns.

The relationship of the revolutionary workers' party to the petty-bourgeois democrats is this: it cooperates with them against the party which they aim to overthrow; it opposes them wherever they wish to secure their own position.

The democratic petty bourgeois, far from wanting to transform the whole society in the interests of the revolutionary proletarians, only aspire to a change in social conditions which will make the existing society as tolerable and comfortable for themselves as possible. They therefore demand above all else a reduction in government spending through a restriction of the bureaucracy and the transference of the major tax burden into the large landowners and bourgeoisie. They further demand the removal of the pressure exerted by big capital on small capital through the establishment of public credit institutions and the passing of laws against usury, whereby it would be possible for themselves and the peasants to receive advances on favourable terms from the state instead of from capitalists; also, the introduction of bourgeois property relationships on land through the complete abolition of feudalism. In order to achieve all this they require a democratic form of government, either constitutional or republican, which would give them and their peasant allies the majority; they also require a democratic system of local government to give them direct control over municipal property and over a series of political offices at present in the hands of the bureaucrats.

The rule of capital and its rapid accumulation is to be further counteracted, partly by a curtailment of the right of inheritance, and partly by the transference of as much employment as possible to the state. As far as the workers are concerned one thing, above all, is definite: they are to remain wage labourers as before. However, the democratic petty bourgeois want better wages and security for the workers, and hope to achieve this by an extension of state employment and by welfare measures; in short, they hope to bribe the workers with a more or less disguised form of alms and to break their revolutionary strength by temporarily rendering their situation tolerable. The demands of petty-bourgeois democracy summarized here are not expressed by all sections of it at once, and in their totality they are the explicit goal of only a very few of its followers. The further particular individuals or fractions of the petty bourgeoisie advance, the more of these demands they will explicitly adopt, and the few who recognize their own programme in what has been mentioned above might well believe they have

put forward the maximum that can be demanded from the revolution. But these demands can in no way satisfy the party of the proletariat. While the democratic petty bourgeois want to bring the revolution to an end as quickly as possible, achieving at most the aims already mentioned, it is our interest and our task to make the revolution permanent until all the more or less propertied classes have been driven from their ruling positions, until the proletariat has conquered state power and until the association of the proletarians has progressed sufficiently far – not only in one country but in all the leading countries of the world – that competition between the proletarians of these countries ceases and at least the decisive forces of production are concentrated in the hands of the workers. Our concern cannot simply be to modify private property, but to abolish it, not to hush up class antagonisms but to abolish classes, not to improve the existing society but to found a new one. There is no doubt that during the further course of the revolution in Germany, the petty-bourgeois democrats will for the moment acquire a predominant influence. The question is, therefore, what is to be the attitude of the proletariat, and in particular of the League towards them:

- 1) While present conditions continue, in which the petty-bourgeois democrats are also oppressed;
- 2) In the coming revolutionary struggle, which will put them in a dominant position;
- 3) After this struggle, during the period of petty-bourgeois predominance over the classes which have been overthrown and over the proletariat.

1. At the moment, while the democratic petty bourgeois are everywhere oppressed, they preach to the proletariat general unity and reconciliation; they extend the hand of friendship, and seek to found a great opposition party which will embrace all shades of democratic opinion; that is, they seek to ensnare the workers in a party organization in which general social-democratic phrases prevail while their particular interests are kept hidden behind, and in which, for the sake of preserving the peace, the specific

demands of the proletariat may not be presented. Such a unity would be to their advantage alone and to the complete disadvantage of the proletariat. The proletariat would lose all its hard-won independent position and be reduced once more to a mere appendage of official bourgeois democracy. This unity must therefore be resisted in the most decisive manner. Instead of lowering themselves to the level of an applauding chorus, the workers, and above all the League, must work for the creation of an independent organization of the workers' party, both secret and open, and alongside the official democrats, and the League must aim to make every one of its communes a center and nucleus of workers' associations in which the position and interests of the proletariat can be discussed free from bourgeois influence. How serious the bourgeois democrats are about an alliance in which the proletariat has equal power and equal rights is demonstrated by the Breslau democrats, who are conducting a furious campaign in their organ, the *Neue Oder Zeitung*, against independently organized workers, whom they call 'socialists'. In the event of a struggle against a common enemy a special alliance is unnecessary. As soon as such an enemy has to be fought directly, the interests of both parties will coincide for the moment and an association of momentary expedience will arise spontaneously in the future, as it has in the past. It goes without saying that in the bloody conflicts to come, as in all others, it will be the workers, with their courage, resolution and self-sacrifice, who will be chiefly responsible for achieving victory. As in the past, so in the coming struggle also, the petty bourgeoisie, to a man, will hesitate as long as possible and remain fearful, irresolute and inactive; but when victory is certain it will claim it for itself and will call upon the workers to behave in an orderly fashion, to return to work and to prevent so-called excesses, and it will exclude the proletariat from the fruits of victory. It does not lie within the power of the workers to prevent the petty-bourgeois democrats from doing this; but it does lie within their power to make it as difficult as possible for the petty bourgeoisie to use its power against the armed proletariat, and to dictate such conditions to them that the rule of the bourgeois democrats, from the very first, will carry within it the seeds of its own destruction, and its subsequent displacement by the proletariat will be made considerably easier. Above all, during and immediately after the struggle the workers, as far as it is at all possible, must oppose bourgeois attempts at pacification and force the democrats to carry out their terroristic phrases. They must work to ensure that the

immediate revolutionary excitement is not suddenly suppressed after the victory. On the contrary, it must be sustained as long as possible. Far from opposing the so-called excesses – instances of popular vengeance against hated individuals or against public buildings with which hateful memories are associated – the workers' party must not only tolerate these actions but must even give them direction. During and after the struggle the workers must at every opportunity put forward their own demands against those of the bourgeois democrats. They must demand guarantees for the workers as soon as the democratic bourgeoisie sets about taking over the government. They must achieve these guarantees by force if necessary, and generally make sure that the new rulers commit themselves to all possible concessions and promises – the surest means of compromising them. They must check in every way and as far as is possible the victory euphoria and enthusiasm for the new situation which follow every successful street battle, with a cool and cold-blooded analysis of the situation and with undisguised mistrust of the new government. Alongside the new official governments they must simultaneously establish their own revolutionary workers' governments, either in the form of local executive committees and councils or through workers' clubs or committees, so that the bourgeois-democratic governments not only immediately lost the support of the workers but find themselves from the very beginning supervised and threatened by authorities behind which stand the whole mass of the workers. In a word, from the very moment of victory the workers' suspicion must be directed no longer against the defeated reactionary party but against their former ally, against the party which intends to exploit the common victory for itself.

2. To be able forcefully and threateningly to oppose this party, whose betrayal of the workers will begin with the very first hour of victory, the workers must be armed and organized. The whole proletariat must be armed at once with muskets, rifles, cannon and ammunition, and the revival of the old-style citizens' militia, directed against the workers, must be opposed. Where the formation of this militia cannot be prevented, the workers must try to organize themselves independently as a proletarian guard, with elected leaders and with their own elected general staff; they must try to place themselves not under the orders of the state authority but of the revolutionary local councils set up by the workers. Where the workers are employed by the state, they must arm and organize themselves into special

corps with elected leaders, or as a part of the proletarian guard. Under no pretext should arms and ammunition be surrendered; any attempt to disarm the workers must be frustrated, by force if necessary. The destruction of the bourgeois democrats' influence over the workers, and the enforcement of conditions which will compromise the rule of bourgeois democracy, which is for the moment inevitable, and make it as difficult as possible – these are the main points which the proletariat and therefore the League must keep in mind during and after the approaching uprising.

3. As soon as the new governments have established themselves, their struggle against the workers will begin. If the workers are to be able to forcibly oppose the democratic petty bourgeois it is essential above all for them to be independently organized and centralized in clubs. At the soonest possible moment after the overthrow of the present governments, the Central Committee will come to Germany and will immediately convene a Congress, submitting to it the necessary proposals for the centralization of the workers' clubs under a directorate established at the movement's center of operations. The speedy organization of at least provincial connections between the workers' clubs is one of the prime requirements for the strengthening and development of the workers' party; the immediate result of the overthrow of the existing governments will be the election of a national representative body. Here the proletariat must take care: 1) that by sharp practices local authorities and government commissioners do not, under any pretext whatsoever, exclude any section of workers; 2) that workers' candidates are nominated everywhere in opposition to bourgeois-democratic candidates. As far as possible they should be League members and their election should be pursued by all possible means. Even where there is no prospect of achieving their election the workers must put up their own candidates to preserve their independence, to gauge their own strength and to bring their revolutionary position and party standpoint to public attention. They must not be led astray by the empty phrases of the democrats, who will maintain that the workers' candidates will split the democratic party and offer the forces of reaction the chance of victory. All such talk means, in the final analysis, that the proletariat is to be swindled. The progress which the proletarian party will make by operating independently in this way is infinitely more important than the disadvantages resulting from the presence of a few reactionaries in the

representative body. If the forces of democracy take decisive, terroristic action against the reaction from the very beginning, the reactionary influence in the election will already have been destroyed.

The first point over which the bourgeois democrats will come into conflict with the workers will be the abolition of feudalism as in the first French revolution, the petty bourgeoisie will want to give the feudal lands to the peasants as free property; that is, they will try to perpetrate the existence of the rural proletariat, and to form a petty-bourgeois peasant class which will be subject to the same cycle of impoverishment and debt which still afflicts the French peasant. The workers must oppose this plan both in the interest of the rural proletariat and in their own interest. They must demand that the confiscated feudal property remain state property and be used for workers' colonies, cultivated collectively by the rural proletariat with all the advantages of large-scale farming and where the principle of common property will immediately achieve a sound basis in the midst of the shaky system of bourgeois property relations. Just as the democrats ally themselves with the peasants, the workers must ally themselves with the rural proletariat.

The democrats will either work directly towards a federated republic, or at least, if they cannot avoid the one and indivisible republic they will attempt to paralyze the central government by granting the municipalities and provinces the greatest possible autonomy and independence. In opposition to this plan the workers must not only strive for one and indivisible German republic, but also, within this republic, for the most decisive centralization of power in the hands of the state authority. They should not let themselves be led astray by empty democratic talk about the freedom of the municipalities, self-government, etc. In a country like Germany, where so many remnants of the Middle Ages are still to be abolished, where so much local and provincial obstinacy has to be broken down, it cannot under any circumstances be tolerated that each village, each town and each province may put up new obstacles in the way of revolutionary activity, which can only be developed with full efficiency from a central point. A renewal of the present situation, in which the Germans have to wage a separate struggle in each town and province for the same degree of progress, can also not be tolerated. Least of all can a so-called free system of local government be allowed to perpetuate a form of property which is more backward than modern private property and which

is everywhere and inevitably being transformed into private property; namely communal property, with its consequent disputes between poor and rich communities. Nor can this so-called free system of local government be allowed to perpetuate, side by side with the state civil law, the existence of communal civil law with its sharp practices directed against the workers. As in France in 1793, it is the task of the genuinely revolutionary party in Germany to carry through the strictest centralization. [It must be recalled today that this passage is based on a misunderstanding. At that time – thanks to the Bonapartist and liberal falsifiers of history – it was considered as established that the French centralised machine of administration had been introduced by the Great Revolution and in particular that it had been used by the Convention as an indispensable and decisive weapon for defeating the royalist and federalist reaction and the external enemy. It is now, however, a well-known fact that throughout the revolution up to the eighteenth Brumaire the whole administration of the *départements*, *arrondissements* and *communes* consisted of authorities elected by the respective constituents themselves, and that these authorities acted with complete freedom within the general state laws; that precisely this provincial and local self-government, similar to the American, became the most powerful lever of the revolution and indeed to such an extent that Napoleon, immediately after his coup d'état of the eighteenth Brumaire, hastened to replace it by the still existing administration by prefects, which, therefore, was a pure instrument of reaction from the beginning. But no more than local and provincial self-government is in contradiction to political, national centralisation, is it necessarily bound up with that narrow-minded cantonal or communal self-seeking which strikes us as so repulsive in Switzerland, and which all the South German federal republicans wanted to make the rule in Germany in 1849. – Note by Engels to the 1885 edition.]

We have seen how the next upsurge will bring the democrats to power and how they will be forced to propose more or less socialistic measures. it will be asked what measures the workers are to propose in reply. At the beginning, of course, the workers cannot propose any directly communist measures. But the following courses of action are possible:

1. They can force the democrats to make inroads into as many areas of the existing social order as possible, so as to disturb its regular functioning and so that the petty-bourgeois democrats compromise themselves; furthermore, the workers can force the concentration of as many productive

forces as possible – means of transport, factories, railways, etc. – in the hands of the state.

2. They must drive the proposals of the democrats to their logical extreme (the democrats will in any case act in a reformist and not a revolutionary manner) and transform these proposals into direct attacks on private property. If, for instance, the petty bourgeoisie propose the purchase of the railways and factories, the workers must demand that these railways and factories simply be confiscated by the state without compensation as the property of reactionaries. If the democrats propose a proportional tax, then the workers must demand a progressive tax; if the democrats themselves propose a moderate progressive tax, then the workers must insist on a tax whose rates rise so steeply that big capital is ruined by it; if the democrats demand the regulation of the state debt, then the workers must demand national bankruptcy. The demands of the workers will thus have to be adjusted according to the measures and concessions of the democrats.

Although the German workers cannot come to power and achieve the realization of their class interests without passing through a protracted revolutionary development, this time they can at least be certain that the first act of the approaching revolutionary drama will coincide with the direct victory of their own class in France and will thereby be accelerated. But they themselves must contribute most to their final victory, by informing themselves of their own class interests, by taking up their independent political position as soon as possible, by not allowing themselves to be misled by the hypocritical phrases of the democratic petty bourgeoisie into doubting for one minute the necessity of an independently organized party of the proletariat. Their battle-cry must be: *The Permanent Revolution*.

THE EIGHTEENTH BRUMAIRE OF LOUIS NAPOLEON, 1852

Anonymous translation

The Eighteenth Brumaire of Louis Napoleon, an essay written by Marx between December 1851 and March 1852, was originally published in *Die Revolution*, a German monthly magazine established by Joseph Weydemeyer in New York. The text discusses the French coup of 1851 in which Louis-Napoléon Bonaparte assumed dictatorial powers. Marx presents himself as a social and political historian, treating actual historical events from the viewpoint of his materialist conception of history. Along with Marx's contemporary writings on English politics, the essay is a principal source for understanding Marx's theory of the capitalist state. It also shows more criticism of the proletariat than might be associated with his other work, referring to the bureaucracy as a "giant parasitic body" and describing widespread perceptions of the proletariat as a "party of anarchy, socialism, and communism," a party paradoxically established on precepts of an oppositional "party of order."

In the preface to the second edition, Marx explained it was the intention of the work to "demonstrate how the class struggle in France created circumstances and relationships that made it possible for a grotesque mediocrity to play a hero's part." The text contains the most famous formulation of Marx's view of the role of the individual in history, often translated as: "Men make their own history, but they do not make it as they please; they do not make it under self-selected circumstances, but under circumstances existing already, given and transmitted from the past."

[TRANSLATOR'S PREFACE](#)

[THE EIGHTEENTH BRUMAIRE OF LOUIS BONAPARTE](#)

Louis-Napoléon Bonaparte (1808-1873) was the only President (1848–52) of the French Second Republic and, as Napoleon III, the Emperor (1852–70) of the Second French Empire.

TRANSLATOR'S PREFACE

“The Eighteenth Brumaire of Louis Bonaparte” is one of Karl Marx’ most profound and most brilliant monographs. It may be considered the best work extant on the philosophy of history, with an eye especially upon the history of the Movement of the Proletariat, together with the bourgeois and other manifestations that accompany the same, and the tactics that such conditions dictate.

The recent populist uprising; the more recent “Debs Movement”; the thousand and one utopian and chimerical notions that are flaring up; the capitalist maneuvers; the hopeless, helpless grasping after straws, that characterize the conduct of the bulk of the working class; all of these, together with the empty-headed, ominous figures that are springing into notoriety for a time and have their day, mark the present period of the Labor Movement in the nation a critical one. The best information acquirable, the best mental training obtainable are requisite to steer through the existing chaos that the death-tainted social system of today creates all around us. To aid in this needed information and mental training, this instructive work is now made accessible to English readers, and is commended to the serious study of the serious.

The teachings contained in this work are hung on an episode in recent French history. With some this fact may detract of its value. A pedantic, supercilious notion is extensively abroad among us that we are an “Anglo Saxon” nation; and an equally pedantic, supercilious habit causes many to look to England for inspiration, as from a racial birthplace Nevertheless, for weal or for woe, there is no such thing extant as “Anglo-Saxon” — of all nations, said to be “Anglo-Saxon,” in the United States least. What we still have from England, much as appearances may seem to point the other way, is not of our bone-and-marrow, so to speak, but rather partakes of the nature of “importations.” We are no more English on account of them than we are Chinese because we all drink tea.

Of all European nations, France is the one to which we come nearest. Besides its republican form of government — the directness of its history, the unity of its actions, the sharpness that marks its internal development, are all characteristics that find their parallel her best, and vice versa. In all

essentials the study of modern French history, particularly when sketched by such a master hand as Marx', is the most valuable one for the acquisition of that historic, social and biologic insight that our country stands particularly in need of, and that will be inestimable during the approaching critical days.

For the assistance of those who, unfamiliar with the history of France, may be confused by some of the terms used by Marx, the following explanations may prove aidful:

On the 18th Brumaire (Nov. 9th), the post-revolutionary development of affairs in France enabled the first Napoleon to take a step that led with inevitable certainty to the imperial throne. The circumstance that fifty and odd years later similar events aided his nephew, Louis Bonaparte, to take a similar step with a similar result, gives the name to this work— "The Eighteenth Brumaire of Louis Bonaparte."

As to the other terms and allusions that occur, the following sketch will suffice:

Upon the overthrow of the first Napoleon came the restoration of the Bourbon throne (Louis XVIII, succeeded by Charles X). In July, 1830, an uprising of the upper tier of the bourgeoisie, or capitalist class — the aristocracy of finance — overthrew the Bourbon throne, or landed aristocracy, and set up the throne of Orleans, a younger branch of the house of Bourbon, with Louis Philippe as king. From the month in which this revolution occurred, Louis Philippe's monarchy is called the "July Monarchy." In February, 1848, a revolt of a lower tier of the capitalist class — the industrial bourgeoisie — against the aristocracy of finance, in turn dethroned Louis Philippe. The affair, also named from the month in which it took place, is the "February Revolution". "The Eighteenth Brumaire" starts with that event.

Despite the inapplicableness to our affairs of the political names and political leadership herein described, both these names and leaderships are to such an extent the products of an economic-social development that has here too taken place with even greater sharpens, and they have their present or threatened counterparts here so completely, that, by the light of this work of Marx', we are best enabled to understand our own history, to know whence we came, and whither we are going and how to conduct ourselves.

D.D.L. New York, Sept. 12, 1897

THE EIGHTEENTH BRUMAIRE OF LOUIS BONAPARTE

I

Hegel says somewhere that that great historic facts and personages recur twice. He forgot to add: "Once as tragedy, and again as farce." Caussidiere for Danton, Louis Blanc for Robespierre, the "Mountain" of 1848-51 for the "Mountain" of 1793-05, the Nephew for the Uncle. The identical caricature marks also the conditions under which the second edition of the eighteenth Brumaire is issued.

Man makes his own history, but he does not make it out of the whole cloth; he does not make it out of conditions chosen by himself, but out of such as he finds close at hand. The tradition of all past generations weighs like an alp upon the brain of the living. At the very time when men appear engaged in revolutionizing things and themselves, in bringing about what never was before, at such very epochs of revolutionary crisis do they anxiously conjure up into their service the spirits of the past, assume their names, their battle cries, their costumes to enact a new historic scene in such time-honored disguise and with such borrowed language. Thus did Luther masquerade as the Apostle Paul; thus did the revolution of 1789-1814 drape itself alternately as Roman Republic and as Roman Empire; nor did the revolution of 1818 know what better to do than to parody at one time the year 1789, at another the revolutionary traditions of 1793-95. Thus does the beginner, who has acquired a new language, keep on translating it back into his own mother tongue; only then has he grasped the spirit of the new language and is able freely to express himself therewith when he moves in it without recollections of the old, and has forgotten in its use his own hereditary tongue.

When these historic configurations of the dead past are closely observed a striking difference is forthwith noticeable. Camille Desmoulins, Danton, Robespierre, St. Juste, Napoleon, the heroes as well as the parties and the masses of the old French revolution, achieved in Roman costumes and with Roman phrases the task of their time: the emancipation and the establishment of modern bourgeois society. One set knocked to pieces the

old feudal groundwork and mowed down the feudal heads that had grown upon it; Napoleon brought about, within France, the conditions under which alone free competition could develop, the partitioned lands be exploited the nation's unshackled powers of industrial production be utilized; while, beyond the French frontier, he swept away everywhere the establishments of feudality, so far as requisite, to furnish the bourgeois social system of France with fit surroundings of the European continent, and such as were in keeping with the times. Once the new social establishment was set on foot, the antediluvian giants vanished, and, along with them, the resuscitated Roman world — the Brutuses, Gracchi, Publicolas, the Tribunes, the Senators, and Caesar himself. In its sober reality, bourgeois society had produced its own true interpretation in the Says, Cousins, Royer-Collards, Benjamin Constants and Guizots; its real generals sat behind the office desks; and the mutton-head of Louis XVIII was its political lead. Wholly absorbed in the production of wealth and in the peaceful fight of competition, this society could no longer understand that the ghosts of the days of Rome had watched over its cradle. And yet, lacking in heroism as bourgeois society is, it nevertheless had stood in need of heroism, of self-sacrifice, of terror, of civil war, and of bloody battle fields to bring it into the world. Its gladiators found in the stern classic traditions of the Roman republic the ideals and the form, the self-deceptions, that they needed in order to conceal from themselves the narrow bourgeois substance of their own struggles, and to keep their passion up to the height of a great historic tragedy. Thus, at another stage of development a century before, did Cromwell and the English people draw from the Old Testament the language, passions and illusions for their own bourgeois revolution. When the real goal was reached, when the remodeling of English society was accomplished, Locke supplanted Habakuk.

Accordingly, the reviving of the dead in those revolutions served the purpose of glorifying the new struggles, not of parodying the old; it served the purpose of exaggerating to the imagination the given task, not to recoil before its practical solution; it served the purpose of rekindling the revolutionary spirit, not to trot out its ghost.

In 1848-51 only the ghost of the old revolution wandered about, from Marrast the “*Republicain en gaunts jaunes*,” [#1 Silk-stockings republican] who disguised himself in old Bailly, down to the adventurer, who hid his repulsively trivial features under the iron death mask of Napoleon. A whole

people, that imagines it has imparted to itself accelerated powers of motion through a revolution, suddenly finds itself transferred back to a dead epoch, and, lest there be any mistake possible on this head, the old dates turn up again; the old calendars; the old names; the old edicts, which long since had sunk to the level of the antiquarian's learning; even the old bailiffs, who had long seemed mouldering with decay. The nation takes on the appearance of that crazy Englishman in Bedlam, who imagines he is living in the days of the Pharaohs, and daily laments the hard work that he must do in the Ethiopian mines as gold digger, immured in a subterranean prison, with a dim lamp fastened on his head, behind him the slave overseer with a long whip, and, at the mouths of the mine a mob of barbarous camp servants who understand neither the convicts in the mines nor one another, because they do not speak a common language. "And all this," cries the crazy Englishman, "is demanded of me, the free-born Englishman, in order to make gold for old Pharaoh." "In order to pay off the debts of the Bonaparte family" — sobs the French nation. The Englishman, so long as he was in his senses, could not rid himself of the rooted thought making gold. The Frenchmen, so long as they were busy with a revolution, could not rid themselves of the Napoleonic memory, as the election of December 10th proved. They longed to escape from the dangers of revolution back to the flesh pots of Egypt; the 2d of December, 1851 was the answer. They have not merely the character of the old Napoleon, but the old Napoleon himself-caricatured as he needs must appear in the middle of the nineteenth century.

The social revolution of the nineteenth century can not draw its poetry from the past, it can draw that only from the future. It cannot start upon its work before it has stricken off all superstition concerning the past. Former revolutions require historic reminiscences in order to intoxicate themselves with their own issues. The revolution of the nineteenth century must let the dead bury their dead in order to reach its issue. With the former, the phrase surpasses the substance; with this one, the substance surpasses the phrase.

The February revolution was a surprisal; old society was taken unawares; and the people proclaimed this political stroke a great historic act whereby the new era was opened. On the 2d of December, the February revolution is jockeyed by the trick of a false player, and what is seen to be overthrown is no longer the monarchy, but the liberal concessions which had been wrung from it by centuries of struggles. Instead of society itself having conquered a new point, only the State appears to have returned to its

oldest form, to the simply brazen rule of the sword and the club. Thus, upon the “coup de main” of February, 1848, comes the response of the “coup de tete” December, 1851. So won, so lost. Meanwhile, the interval did not go by unutilized. During the years 1848-1851, French society retrieved in abbreviated, because revolutionary, method the lessons and teachings, which — if it was to be more than a disturbance of the surface-should have preceded the February revolution, had it developed in regular order, by rule, so to say. Now French society seems to have receded behind its point of departure; in fact, however, it was compelled to first produce its own revolutionary point of departure, the situation, circumstances, conditions, under which alone the modern revolution is in earnest.

Bourgeois revolutions, like those of the eighteenth century, rush onward rapidly from success to success, their stage effects outbid one another, men and things seem to be set in flaming brilliants, ecstasy is the prevailing spirit; but they are short-lived, they reach their climax speedily, then society relapses into a long fit of nervous reaction before it learns how to appropriate the fruits of its period of feverish excitement. Proletarian revolutions, on the contrary, such as those of the nineteenth century, criticize themselves constantly; constantly interrupt themselves in their own course; come back to what seems to have been accomplished, in order to start over anew; scorn with cruel thoroughness the half measures, weaknesses and meannesses of their first attempts; seem to throw down their adversary only in order to enable him to draw fresh strength from the earth, and again, to rise up against them in more gigantic stature; constantly recoil in fear before the undefined monster magnitude of their own objects — until finally that situation is created which renders all retreat impossible, and the conditions themselves cry out:

“Hic Rhodus, hic salta!” [#2 Here is Rhodes, leap here! An allusion to Aesop’s Fables.]

Every observer of average intelligence; even if he failed to follow step by step the course of French development, must have anticipated that an unheard of fiasco was in store for the revolution. It was enough to hear the self-satisfied yelpings of victory wherewith the Messieurs Democrats mutually congratulated one another upon the pardons of May 2d, 1852. Indeed, May 2d had become a fixed idea in their heads; it had become a dogma with them — something like the day on which Christ was to reappear and the Millennium to begin had formed in the heads of the

Chiliasts. Weakness had, as it ever does, taken refuge in the wonderful; it believed the enemy was overcome if, in its imagination, it hocus-pocused him away; and it lost all sense of the present in the imaginary apotheosis of the future, that was at hand, and of the deeds, that it had “in petto,” but which it did not yet want to bring to the scratch. The heroes, who ever seek to refute their established incompetence by mutually bestowing their sympathy upon one another and by pulling together, had packed their satchels, taken their laurels in advance payments and were just engaged in the work of getting discounted “in partibus,” on the stock exchange, the republics for which, in the silence of their unassuming dispositions, they had carefully organized the government personnel. The 2d of December struck them like a bolt from a clear sky; and the ‘peoples, who, in periods of timid despondency, gladly allow their hidden fears to be drowned by the loudest screamers, will perhaps have become convinced that the days are gone by when the cackling of geese could save the Capitol.

The constitution, the national assembly, the dynastic parties, the blue and the red republicans, the heroes from Africa, the thunder from the tribune, the flash-lightnings from the daily press, the whole literature, the political names and the intellectual celebrities, the civil and the criminal law, the “liberte’, egalite’, fraternite’,” together with the 2d of May 1852 — all vanished like a phantasmagoria before the ban of one man, whom his enemies themselves do not pronounce an adept at witchcraft. Universal suffrage seems to have survived only for a moment, to the end that, before the eyes of the whole world, it should make its own testament with its own hands, and, in the name of the people, declare: “All that exists deserves to perish.”

It is not enough to say, as the Frenchmen do, that their nation was taken by surprise. A nation, no more than a woman, is excused for the unguarded hour when the first adventurer who comes along can do violence to her. The riddle is not solved by such shifts, it is only formulated in other words. There remains to be explained how a nation of thirty-six millions can be surprised by three swindlers, and taken to prison without resistance.

Let us recapitulate in general outlines the phases which the French revolution of February 24th, 1848, to December, 1851, ran through.

Three main periods are unmistakable:

First — The February period;

Second — The period of constituting the republic, or of the constitutive national assembly (May 4, 1848, to May 29th, 1849);

Third — The period of the constitutional republic, or of the legislative national assembly (May 29, 1849, to December 2, 1851).

The first period, from February 24, or the downfall of Louis Philippe, to May 4, 1848, the date of the assembling of the constitutive assembly — the February period proper — may be designated as the prologue of the revolution. It officially expressed its own character in this, that the government which it improvised declared itself “provisional;” and, like the government, everything that was broached, attempted, or uttered, pronounced itself provisional. Nobody and nothing dared to assume the right of permanent existence and of an actual fact. All the elements that had prepared or determined the revolution — dynastic opposition, republican bourgeoisie, democratic-republican small traders’ class, social-democratic labor element—all found “provisionally” their place in the February government.

It could not be otherwise. The February days contemplated originally a reform of the suffrage laws, whereby the area of the politically privileged among the property-holding class was to be extended, while the exclusive rule of the aristocracy of finance was to be overthrown. When however, it came to a real conflict, when the people mounted the barricades, when the National Guard stood passive, when the army offered no serious resistance, and the kingdom ran away, then the republic seemed self-understood. Each party interpreted it in its own sense. Won, arms in hand, by the proletariat, they put upon it the stamp of their own class, and proclaimed the social republic. Thus the general purpose of modern revolutions was indicated, a purpose, however, that stood in most singular contradiction to every thing that, with the material at hand, with the stage of enlightenment that the masses had reached, and under existing circumstances and conditions, could be immediately used. On the other hand, the claims of all the other elements, that had cooperated in the revolution of February, were recognized by the lion’s share that they received in the government. Hence, in no period do we find a more motley mixture of high-sounding phrases together with actual doubt and helplessness; of more enthusiastic reform aspirations, together with a more slavish adherence to the old routine; more seeming harmony permeating the whole of society together with a deeper alienation of its several elements. While the Parisian proletariat was still

gloating over the sight of the great perspective that had disclosed itself to their view, and was indulging in seriously meant discussions over the social problems, the old powers of society had groomed themselves, had gathered together, had deliberated and found an unexpected support in the mass of the nation — the peasants and small traders — all of whom threw themselves on a sudden upon the political stage, after the barriers of the July monarchy had fallen down.

The second period, from May 4, 1848, to the end of May, 1849, is the period of the constitution, of the founding of the bourgeois republic immediately after the February days, not only was the dynastic opposition surprised by the republicans, and the republicans by the Socialists, but all France was surprised by Paris. The national assembly, that met on May 4, 1848, to frame a constitution, was the outcome of the national elections; it represented the nation. It was a living protest against the assumption of the February days, and it was intended to bring the results of the revolution back to the bourgeois measure. In vain did the proletariat of Paris, which forthwith understood the character of this national assembly, endeavor, a few days after its meeting; on May 15, to deny its existence by force, to dissolve it, to disperse the organic apparition, in which the reacting spirit of the nation was threatening them, and thus reduce it back to its separate component parts. As is known, the 15th of May had no other result than that of removing Blanqui and his associates, i.e. the real leaders of the proletarian party, from the public scene for the whole period of the cycle which we are here considering.

Upon the bourgeois monarchy of Louis Philippe, only the bourgeois republic could follow; that is to say, a limited portion of the bourgeoisie having ruled under the name of the king, now the whole bourgeoisie was to rule under the name of the people. The demands of the Parisian proletariat are utopian tom-fooleries that have to be done away with. To this declaration of the constitutional national assembly, the Paris proletariat answers with the June insurrection, the most colossal event in the history of European civil wars. The bourgeois republic won. On its side stood the aristocracy of finance, the industrial bourgeoisie; the middle class; the small traders' class; the army; the slums, organized as *Garde Mobile*; the intellectual celebrities, the parsons' class, and the rural population. On the side of the Parisian proletariat stood none but itself. Over 3,000 insurgents were massacred, after the victory 15,000 were transported without trial.

With this defeat, the proletariat steps to the background on the revolutionary stage. It always seeks to crowd forward, so soon as the movement seems to acquire new impetus, but with ever weaker effort and ever smaller results; So soon as any of the above lying layers of society gets into revolutionary fermentation, it enters into alliance therewith and thus shares all the defeats which the several parties successively suffer. But these succeeding blows become ever weaker the more generally they are distributed over the whole surface of society. The more important leaders of the Proletariat, in its councils, and the press, fall one after another victims of the courts, and ever more questionable figures step to the front. It partly throws itself it upon doctrinaire experiments, “co-operative banking” and “labor exchange” schemes; in other words, movements, in which it goes into movements in which it gives up the task of revolutionizing the old world with its own large collective weapons and on the contrary, seeks to bring about its emancipation, behind the back of society, in private ways, within the narrow bounds of its own class conditions, and, consequently, inevitably fails. The proletariat seems to be able neither to find again the revolutionary magnitude within itself nor to draw new energy from the newly formed alliances until all the classes, with whom it contended in June, shall lie prostrate along with itself. But in all these defeats, the proletariat succumbs at least with the honor that attaches to great historic struggles; not France alone, all Europe trembles before the June earthquake, while the successive defeats inflicted upon the higher classes are bought so easily that they need the brazen exaggeration of the victorious party itself to be at all able to pass muster as an event; and these defeats become more disgraceful the further removed the defeated party stands from the proletariat.

True enough, the defeat of the June insurgents prepared, leveled the ground, upon which the bourgeois republic could be founded and erected; but it, at the same time, showed that there are in Europe other issues besides that of “Republic or Monarchy.” It revealed the fact that here the Bourgeois Republic meant the unbridled despotism of one class over another. It proved that, with nations enjoying an older civilization, having developed class distinctions, modern conditions of production, an intellectual consciousness, wherein all traditions of old have been dissolved through the work of centuries, that with such countries the republic means only the political revolutionary form of bourgeois society, not its conservative form of existence, as is the case in the United States of America, where, true

enough, the classes already exist, but have not yet acquired permanent character, are in constant flux and reflux, constantly changing their elements and yielding them up to one another where the modern means of production, instead of coinciding with a stagnant population, rather compensate for the relative scarcity of heads and hands; and, finally, where the feverishly youthful life of material production, which has to appropriate a new world to itself, has so far left neither time nor opportunity to abolish the illusions of old. [#3 This was written at the beginning of 1852.]

All classes and parties joined hands in the June days in a “Party of Order” against the class of the proletariat, which was designated as the “Party of Anarchy,” of Socialism, of Communism. They claimed to have “saved” society against the “enemies of society.” They gave out the slogans of the old social order— “Property, Family, Religion, Order” — as the passwords for their army, and cried out to the counter-revolutionary crusaders: “In this sign thou wilt conquer!” From that moment on, so soon as any of the numerous parties, which had marshaled themselves under this sign against the June insurgents, tries, in turn, to take the revolutionary field in the interest of its own class, it goes down in its turn before the cry: “Property, Family, Religion, Order.” Thus it happens that “society is saved” as often as the circle of its ruling class is narrowed, as often as a more exclusive interest asserts itself over the general. Every demand for the most simple bourgeois financial reform, for the most ordinary liberalism, for the most commonplace republicanism, for the flattest democracy, is forthwith punished as an “assault upon society,” and is branded as “Socialism.” Finally the High Priests of “Religion and Order” themselves are kicked off their tripods; are fetched out of their beds in the dark; hurried into patrol wagons, thrust into jail or sent into exile; their temple is razed to the ground, their mouths are sealed, their pen is broken, their law torn to pieces in the name of Religion, of Family, of Property, and of Order. Bourgeois, fanatic on the point of “Order,” are shot down on their own balconies by drunken soldiers, forfeit their family property, and their houses are bombarded for pastime — all in the name of Property, of Family, of Religion, and of Order. Finally, the refuse of bourgeois society constitutes the “holy phalanx of Order,” and the hero Crapulinsky makes his entry into the Tuileries as the “Savior of Society.”

Let us resume the thread of events.

The history of the Constitutional National Assembly from the June days on, is the history of the supremacy and dissolution of the republican bourgeois party, the party which is known under several names of "Tricolor Republican," "True Republican," "Political Republican," "Formal Republican," etc., etc. Under the bourgeois monarchy of Louis Philippe, this party had constituted the Official Republican Opposition, and consequently had been a recognized element in the then political world. It had its representatives in the Chambers, and commanded considerable influence in the press. Its Parisian organ, the "National," passed, in its way, for as respectable a paper as the "Journal des Debats." This position in the constitutional monarchy corresponded to its character. The party was not a fraction of the bourgeoisie, held together by great and common interests, and marked by special business requirements. It was a coterie of bourgeois with republican ideas-writers, lawyers, officers and civil employees, whose influence rested upon the personal antipathies of the country for Louis Philippe, upon reminiscences of the old Republic, upon the republican faith of a number of enthusiasts, and, above all, upon the spirit of French patriotism, whose hatred of the treaties of Vienna and of the alliance with England kept them perpetually on the alert. The "National" owed a large portion of its following under Louis Philippe to this covert imperialism, that, later under the republic, could stand up against it as a deadly competitor in the person of Louis Bonaparte. The fought the aristocracy of finance just the same as did the rest of the bourgeois opposition. The polemic against the budget, which in France, was closely connected with the opposition to the aristocracy of finance, furnished too cheap a popularity and too rich a material for Puritanical leading articles, not to be exploited. The industrial bourgeoisie was thankful to it for its servile defense of the French tariff system, which, however, the paper had taken up, more out of patriotic than economic reasons the whole bourgeois class was thankful to it for its vicious denunciations of Communism and Socialism For the rest, the party of the "National" was purely republican, i.e. it demanded a republican instead of a monarchic form of bourgeois government; above all, it demanded for the bourgeoisie the lion's share of the government. As to how this transformation was to be accomplished, the party was far from being clear. What, however, was clear as day to it and was openly declared at the reform banquets during the last days of Louis Philippe's reign, was its

unpopularity with the democratic middle class, especially with the revolutionary proletariat. These pure republicans, as pure republicans go, were at first on the very point of contenting themselves with the regency of the Duchess of Orleans, when the February revolution broke out, and when it gave their best known representatives a place in the provisional government. Of course, they enjoyed from the start the confidence of the bourgeoisie and of the majority of the Constitutional National Assembly. The Socialist elements of the Provisional Government were promptly excluded from the Executive Committee which the Assembly had elected upon its convening, and the party of the "National" subsequently utilized the outbreak of the June insurrection to dismiss this Executive Committee also, and thus rid itself of its nearest rivals — the small traders' class or democratic republicans (Ledru-Rollin, etc.). Cavaignac, the General of the bourgeois republican party, who commanded at the battle of June, stepped into the place of the Executive Committee with a sort of dictatorial power. Marrast, former editor-in-chief of the "National", became permanent President of the Constitutional National Assembly, and the Secretaryship of State, together with all the other important posts, devolved upon the pure republicans.

The republican bourgeois party, which since long had looked upon itself as the legitimate heir of the July monarchy, thus found itself surpassed in its own ideal; but it came to power, not as it had dreamed under Louis Philippe, through a liberal revolt of the bourgeoisie against the throne, but through a grape-shot-and-canistered mutiny of the proletariat against Capital. That which it imagined to be the most revolutionary, came about as the most counter-revolutionary event. The fruit fell into its lap, but it fell from the Tree of Knowledge, not from the Tree of life.

The exclusive power of the bourgeois republic lasted only from June 24 to the 10th of December, 1848. It is summed up in the framing of a republican constitution and in the state of siege of Paris.

The new Constitution was in substance only a republicanized edition of the constitutional charter of 1830. The limited suffrage of the July monarchy, which excluded even a large portion of the bourgeoisie from political power, was irreconcilable with the existence of the bourgeois republic. The February revolution had forthwith proclaimed direct and universal suffrage in place of the old law. The bourgeois republic could not annul this act. They had to content themselves with tacking to it the

limitation a six months' residence. The old organization of the administrative law, of municipal government, of court procedures of the army, etc., remained untouched, or, where the constitution did change them, the change affected their index, not their subject; their name, not their substance.

The inevitable "General Staff" of the "freedoms" of 1848 — personal freedom, freedom of the press, of speech, of association and of assemblage, freedom of instruction, of religion, etc. — received a constitutional uniform that rendered them invulnerable. Each of these freedoms is proclaimed the absolute right of the French citizen, but always with the gloss that it is unlimited in so far only as it be not curtailed by the "equal rights of others," and by the "public safety," or by the "laws," which are intended to effect this harmony. For instance:

"Citizens have the right of association, of peaceful and unarmed assemblage, of petitioning, and of expressing their opinions through the press or otherwise. The enjoyment of these rights has no limitation other than the equal rights of others and the public safety." (Chap. II. of the French Constitution, Section 8.)

"Education is free. The freedom of education shall be enjoyed under the conditions provided by law, and under the supervision of the State." (Section 9.)

"The domicile of the citizen is inviolable, except under the forms prescribed by law." (Chap. I., Section 3), etc., etc.

The Constitution, it will be noticed, constantly alludes to future organic laws, that are to carry out the glosses, and are intended to regulate the enjoyment of these unabridged freedoms, to the end that they collide neither with one another nor with the public safety. Later on, the organic laws are called into existence by the "Friends of Order," and all the above named freedoms are so regulated that, in their enjoyment, the bourgeoisie encounter no opposition from the like rights of the other classes. Wherever the bourgeoisie wholly interdicted these rights to "others," or allowed them their enjoyment under conditions that were but so many police snares, it was always done only in the interest of the "public safety," i. e., of the bourgeoisie, as required by the Constitution.

Hence it comes that both sides—the "Friends of Order," who abolished all those freedoms, as, well as the democrats, who had demanded them all — appeal with full right to the Constitution: Each paragraph of the

Constitution contains its own antithesis, its own Upper and Lower House—freedom as a generalization, the abolition of freedom as a specification. Accordingly, so long as the name of freedom was respected, and only its real enforcement was prevented in a legal way, of course the constitutional existence of freedom remained uninjured, untouched, however completely its common existence might be extinguished.

This Constitution, so ingeniously made invulnerable, was, however, like Achilles, vulnerable at one point: not in its heel, but in its head, or rather, in the two heads into which it ran out—the Legislative Assembly, on the one hand, and the President on the other. Run through the Constitution and it will be found that only those paragraphs wherein the relation of the President to the Legislative Assembly is defined, are absolute, positive, uncontradictory, undistortable.

Here the bourgeois republicans were concerned in securing their own position. Articles 45-70 of the Constitution are so framed that the National Assembly can constitutionally remove the President, but the President can set aside the National Assembly only unconstitutionally, he can set it aside only by setting aside the Constitution itself. Accordingly, by these provisions, the National Assembly challenges its own violent destruction. It not only consecrates, like the character of 1830, the division of powers, but it extends this feature to an unbearably contradictory extreme. The “play of constitutional powers,” as Guizot styled the clapper-clawings between the legislative and the executive powers, plays permanent “vabanque” in the Constitution of 1848. On the one side, 750 representatives of the people, elected and qualified for re-election by universal suffrage, who constitute an uncontrollable, indissoluble, indivisible National Assembly, a National Assembly that enjoys legislative omnipotence, that decides in the last instance over war, peace and commercial treaties, that alone has the power to grant amnesties, and that, through its perpetuity, continually maintains the foreground on the stage; on the other, a President, clad with all the attributes of royalty, with the right to appoint and remove his ministers independently from the national assembly, holding in his hands all the means of executive power, the dispenser of all posts, and thereby the arbiter of at least one and a half million existences in France, so many being dependent upon the 500,000 civil employees and upon the officers of all grades. He has the whole armed power behind him. He enjoys the privilege of granting pardons to individual criminals; suspending the National

Guards; of removing with the consent of the Council of State the general, cantonal and municipal Councilmen, elected by the citizens themselves. The initiative and direction of all negotiations with foreign countries are reserved to him. While the Assembly itself is constantly acting upon the stage, and is exposed to the critically vulgar light of day, he leads a hidden life in the Elysian fields, only with Article 45 of the Constitution before his eyes and in his heart daily calling out to him, “Frere, il faut mourir!” [#1 Brother, you must die!] Your power expires on the second Sunday of the beautiful month of May, in the fourth year after your election! The glory is then at an end; the play is not performed twice; and, if you have any debts, see to it betimes that you pay them off with the 600,000 francs that the Constitution has set aside for you, unless, perchance, you should prefer traveling to Clichy [#2 The debtors’ prison.] on the second Monday of the beautiful month of May.

While the Constitution thus clothes the President with actual power, it seeks to secure the moral power to the National Assembly. Apart from the circumstance that it is impossible to create a moral power through legislative paragraphs, the Constitution again neutralizes itself in that it causes the President to be chosen by all the Frenchmen through direct suffrage. While the votes of France are splintered to pieces upon the 750 members of the National Assembly they are here, on the contrary, concentrated upon one individual. While each separate Representative represents only this or that party, this or that city, this or that dunghill, or possibly only the necessity of electing some one Seven-hundred-and-fiftieth or other, with whom neither the issue nor the man is closely considered, that one, the President, on the contrary, is the elect of the nation, and the act of his election is the trump card, that, the sovereign people plays out once every four years. The elected National Assembly stands in a metaphysical, but the elected President in a personal, relation to the nation. True enough, the National Assembly presents in its several Representatives the various sides of the national spirit, but, in the President, this spirit is incarnated. As against the National Assembly, the President possesses a sort of divine right, he is by the grace of the people.

Thetis, the sea-goddess, had prophesied to Achilles that he would die in the bloom of youth. The Constitution, which had its weak spot, like Achilles, had also, like Achilles, the presentiment that it would depart by premature death. It was enough for the pure republicans, engaged at the

work of framing a constitution, to cast a glance from the misty heights of their ideal republic down upon the profane world in order to realize how the arrogance of the royalists, of the Bonapartists, of the democrats, of the Communists, rose daily, together with their own discredit, and in the same measure as they approached the completion of their legislative work of art, without Thetis having for this purpose to leave the sea and impart the secret to them. They ought to outwit fate by means of constitutional artifice, through Section 111 of the Constitution, according to which every motion to revise the Constitution had to be discussed three successive times between each of which a full month was to elapse and required at least a three-fourths majority, with the additional proviso that not less than 500 members of the National Assembly voted. They thereby only made the impotent attempt, still to exercise as a parliamentary minority, to which in their mind's eye they prophetically saw themselves reduced, a power, that, at this very time, when they still disposed over the parliamentary majority and over all the machinery of government, was daily slipping from their weak hands.

Finally, the Constitution entrusts itself for safe keeping, in a melodramatic paragraph, "to the watchfulness and patriotism of the whole French people, and of each individual Frenchman," after having just before, in another paragraph entrusted the "watchful" and the "patriotic" themselves to the tender, inquisitorial attention of the High Court, instituted by itself.

That was the Constitution of 1848, which on, the 2d of December, 1851, was not overthrown by one head, but tumbled down at the touch of a mere hat; though, true enough, that hat was a three-cornered Napoleon hat.

While the bourgeois' republicans were engaged in the Assembly with the work of splicing this Constitution, of discussing and voting, Cavaignac, on the outside, maintained the state of siege of Paris. The state of siege of Paris was the midwife of the constitutional assembly, during its republican pains of travail. When the Constitution is later on swept off the earth by the bayonet, it should not be forgotten that it was by the bayonet, likewise — and the bayonet turned against the people, at that — that it had to be protected in its mother's womb, and that by the bayonet it had to be planted on earth. The ancestors of these "honest republicans" had caused their symbol, the tricolor, to make the tour of Europe. These, in their turn also made a discovery, which all of itself, found its way over the whole

continent, but, with ever renewed love, came back to France, until, by this time, if had acquired the right of citizenship in one-half of her Departments — the state of siege. A wondrous discovery this was, periodically applied at each succeeding crisis in the course of the French revolution. But the barrack and the bivouac, thus periodically laid on the head of French society, to compress her brain and reduce her to quiet; the sabre and the musket, periodically made to perform the functions of judges and of administrators, of guardians and of censors, of police officers and of watchmen; the military moustache and the soldier's jacket, periodically heralded as the highest wisdom and guiding stars of society; — were not all of these, the barrack and the bivouac, the sabre and the musket, the moustache and the soldier's jacket bound, in the end, to hit upon the idea that they might as well save, society once for all, by proclaiming their own regime as supreme, and relieve bourgeois society wholly of the care of ruling itself? The barrack and the bivouac, the sabre and the musket, the moustache and the soldier's jacket were all the more bound to hit upon this idea, seeing that they could then also expect better cash payment for their increased deserts, while at the merely periodic states of siege and the transitory savings of society at the behest of this or that bourgeois faction, very little solid matter fell to them except some dead and wounded, besides some friendly bourgeois grimaces. Should not the military, finally, in and for its own interest, play the game of "state of siege," and simultaneously besiege the bourgeois exchanges? Moreover, it must not be forgotten, and be it observed in passing, that Col. Bernard, the same President of the Military Committee, who, under Cavaignac, helped to deport 15,000 insurgents without trial, moves at this period again at the head of the Military Committees now active in Paris.

Although the honest, the pure republicans built with the state of siege the nursery in which the Praetorian guards of December 2, 1851, were to be reared, they, on the other hand, deserve praise in that, instead of exaggerating the feeling of patriotism, as under Louis Philippe, now; they themselves are in command of the national power, they crawl before foreign powers; instead of making Italy free, they allow her to be reconquered by Austrians and Neapolitans. The election of Louis Bonaparte for President on December 10, 1848, put an end to the dictatorship of Cavaignac and to the constitutional assembly.

In Article 44 of the Constitution it is said "The President of the French Republic must never have lost his status as a French citizen." The first President of the French Republic, L. N. Bonaparte, had not only lost his status as a French citizen, had not only been an English special constable, but was even a naturalized Swiss citizen.

In the previous chapter I have explained the meaning of the election of December 10. I shall not here return to it. Suffice it here to say that it was a reaction of the farmers' class, who had been expected to pay the costs of the February revolution, against the other classes of the nation: it was a reaction of the country against the city. It met with great favor among the soldiers, to whom the republicans of the "National" had brought neither fame nor funds; among the great bourgeoisie, who hailed Bonaparte as a bridge to the monarchy; and among the proletarians and small traders, who hailed him as a scourge to Cavaignac. I shall later have occasion to enter closer into the relation of the farmers to the French revolution.

The epoch between December 20, 1848, and the dissolution of the constitutional assembly in May, 1849, embraces the history of the downfall of the bourgeois republicans. After they had founded a republic for the bourgeoisie, had driven the revolutionary proletariat from the field and had meanwhile silenced the democratic middle class, they are themselves shoved aside by the mass of the bourgeoisie who justly appropriate this republic as their property. This bourgeois mass was Royalist, however. A part thereof, the large landed proprietors, had ruled under the restoration, hence, was Legitimist; the other part, the aristocrats of finance and the large industrial capitalists, had ruled under the July monarchy, hence, was Orleanist. The high functionaries of the Army, of the University, of the Church, in the civil service, of the Academy and of the press, divided themselves on both sides, although in unequal parts. Here, in the bourgeois republic, that bore neither the name of Bourbon, nor of Orleans, but the name of Capital, they had found the form of government under which they could all rule in common. Already the June insurrection had united them all into a "Party of Order." The next thing to do was to remove the bourgeois republicans who still held the seats in the National Assembly. As brutally as these pure republicans had abused their own physical power against the people, so cowardly, low-spirited, disheartened, broken, powerless did they yield, now when the issue was the maintenance of their own republicanism and their own legislative rights against the Executive power and the

royalists I need not here narrate the shameful history of their dissolution. It was not a downfall, it was extinction. Their history is at an end for all time. In the period that follows, they figure, whether within or without the Assembly, only as memories — memories that seem again to come to life so soon as the question is again only the word “Republic,” and as often as the revolutionary conflict threatens to sink down to the lowest level. In passing, I might observe that the journal which gave to this party its name, the “National,” goes over to Socialism during the following period.

Before we close this period, we must look back upon the two powers, one of destroys the other on December 2, 1851, while, from December 20, 1848, down to the departure of the constitutional assembly, they live marital relations. We mean Louis Bonaparte, on the one hand, on the other, the party of the allied royalists; of Order, and of the large bourgeoisie.

At the inauguration of his presidency, Bonaparte forthwith framed a ministry out of the party of Order, at whose head he placed Odillon Barrot, be it noted, the old leader of the liberal wing of the parliamentary bourgeoisie. Mr. Barrot had finally hunted down a seat in the ministry, the spook of which had been pursuing him since 1830; and what is more, he had the chairmanship in this ministry, although not, as he had imagined under Louis Philippe, the promoted leader of the parliamentary opposition, but with the commission to kill a parliament, and, moreover, as an ally of all his arch enemies, the Jesuits and the Legitimists. Finally he leads the bride home, but only after she has been prostituted. As to Bonaparte, he seemed to eclipse himself completely. The party of Order acted for him.

Immediately at the first session of the ministry the expedition to Rome was decided upon, which it was there agreed, was to be carried out behind I the back of the National Assembly, and the funds for which, it was equally agreed, were to be wrung from the Assembly under false pretences. Thus the start was made with a swindle on the National Assembly, together with a secret conspiracy with the absolute foreign powers against the revolutionary Roman republic. In the same way, and with a similar maneuver, did Bonaparte prepare his stroke of December 2 against the royalist legislature and its constitutional republic. Let it not be forgotten that the same party, which, on December 20, 1848, constituted Bonaparte’s ministry, constituted also, on December 2, 1851, the majority of the legislative National Assembly.

In August the constitutive assembly decided not to dissolve until it had prepared and promulgated a whole series of organic laws, intended to supplement the Constitution. The party of Order proposed to the assembly, through Representative Râteau, on January 6, 1849, to let the Organic laws go, and rather to order its own dissolution. Not the ministry alone, with Mr. Odillon Barrot at its head, but all the royalist members of the National Assembly were also at this time hectoring to it that its dissolution was necessary for the restoration of the public credit, for the consolidation of order, to put an end to the existing uncertain and provisional, and establish a definite state of things; they claimed that its continued existence hindered the effectiveness of the new Government, that it sought to prolong its life out of pure malice, and that the country was tired of it. Bonaparte took notice of all these invectives hurled at the legislative power, he learned them by heart, and, on December 21, 1851, he showed the parliamentary royalists that he had learned from them. He repeated their own slogans against themselves.

The Barrot ministry and the party of Order went further. They called all over France for petitions to the National Assembly in which that body was politely requested to disappear. Thus they led the people's unorganic masses to the fray against the National Assembly, i.e., the constitutionally organized expression of people itself. They taught Bonaparte, to appeal from the parliamentary body to the people. Finally, on January 29, 1849, the day arrived when the constitutional assembly was to decide about its own dissolution. On that day the body found its building occupied by the military; Changarnier, the General of the party of Order, in whose hands was joined the supreme command of both the National Guards and the regulars, held that day a great military review, as though a battle were imminent; and the coalized royalists declared threateningly to the constitutional assembly that force would be applied if it did not act willingly. It was willing, and chattered only for a very short respite. What else was the 29th of January, 1849, than the "coup d'état" of December 2, 1851, only executed by the royalists with Napoleon's aid against the republican National Assembly? These gentlemen did not notice, or did not want to notice, that Napoleon utilized the 29th of January, 1849, to cause a part of the troops to file before him in front of the Tuileries, and that he seized with avidity this very first open exercise of the military against the

parliamentary power in order to hint at Caligula. The allied royalists saw only their own Changarnier.

Another reason that particularly moved the party of Order forcibly to shorten the term of the constitutional assembly were the organic laws, the laws that were to supplement the Constitution, as, for instance, the laws on education, on religion, etc. The allied royalists had every interest in framing these laws themselves, and not allowing them to be framed by the already suspicious republicans. Among these organic laws, there was, however, one on the responsibility of the President of the republic. In 1851 the Legislature was just engaged in framing such a law when Bonaparte forestalled that political stroke by his own of December 2. What all would not the coalized royalists have given in their winter parliamentary campaign of 1851, had they but found this "Responsibility law" ready made, and framed at that, by the suspicious, the vicious republican Assembly!

After, on January 29, 1849, the constitutive assembly had itself broken its last weapon, the Barrot ministry and the "Friends of Order" harassed it to death, left nothing undone to humiliate it, and wrung from its weakness, despairing of itself, laws that cost it the last vestige of respect with the public. Bonaparte, occupied with his own fixed Napoleonic idea, was audacious enough openly to exploit this degradation of the parliamentary power: When the National Assembly, on May 8, 1849, passed a vote of censure upon the Ministry on account of the occupation of Civita-Vecchia by Oudinot, and ordered that the Roman expedition be brought back to its alleged purpose, Bonaparte published that same evening in the "Moniteur" a letter to Oudinot, in which he congratulated him on his heroic feats, and already, in contrast with the quill-pushing parliamentarians, posed as the generous protector of the Army. The royalists smiled at this. They took him simply for their dupe. Finally, as Marrast, the President of the constitutional assembly, believed on a certain occasion the safety of the body to be in danger, and, resting on the Constitution, made a requisition upon a Colonel, together with his regiment, the Colonel refused obedience, took refuge behind the "discipline," and referred Marrast to Changarnier, who scornfully sent him off with the remark that he did not like "bayonettes intelligentes." [#1 Intelligent bayonets] In November, 1851, as the coalized royalists wanted to begin the decisive struggle with Bonaparte, they sought, by means of their notorious "Questors Bill," to enforce the principle of the right of the President of the National Assembly to issue direct requisitions

for troops. One of their Generals, Leflo, supported the motion. In vain did Changarnier vote for it, or did Thiers render homage to the cautious wisdom of the late constitutional assembly. The Minister of War, St. Arnaud, answered him as Changarnier had answered Marrast — and he did so amidst the plaudits of the Mountain.

Thus did the party of Order itself, when as yet it was not the National Assembly, when as yet it was only a Ministry, brand the parliamentary regime. And yet this party objects vociferously when the 2d of December, 1851, banishes that regime from France!

We wish it a happy journey.

III

On May 29, 1849, the legislative National Assembly convened. On December 2, 1851, it was broken up. This period embraces the term of the Constitutional or Parliamentary public.

In the first French revolution, upon the reign of the Constitutionalists succeeds that of the Girondins; and upon the reign of the Girondins follows that of the Jacobins. Each of these parties in succession rests upon its more advanced element. So soon as it has carried the revolution far enough not to be able to keep pace with, much less march ahead of it, it is shoved aside by its more daring allies, who stand behind it, and it is sent to the guillotine. Thus the revolution moves along an upward line.

Just the reverse in 1848. The proletarian party appears as an appendage to the small traders' or democratic party; it is betrayed by the latter and allowed to fall on April 16, May 15, and in the June days. In its turn, the democratic party leans upon the shoulders of the bourgeois republicans; barely do the bourgeois republicans believe themselves firmly in power, than they shake off these troublesome associates for the purpose of themselves leaning upon the shoulders of the party of Order. The party of Order draws in its shoulders, lets the bourgeois republicans tumble down heels over head, and throws itself upon the shoulders of the armed power. Finally, still of the mind that it is sustained by the shoulders of the armed power, the party of Order notices one fine morning that these shoulders have turned into bayonets. Each party kicks backward at those that are pushing forward, and leans forward upon those that are crowding backward; no wonder that, in this ludicrous posture, each loses its balance, and, after

having cut the unavoidable grimaces, breaks down amid singular somersaults. Accordingly, the revolution moves along a downward line. It finds itself in this retreating motion before the last February-barricade is cleared away, and the first governmental authority of the revolution has been constituted.

The period we now have before us embraces the motliest jumble of crying contradictions: constitutionalists, who openly conspire against the Constitution; revolutionists, who admittedly are constitutional; a National Assembly that wishes to be omnipotent yet remains parliamentary; a Mountain, that finds its occupation in submission, that parries its present defeats with prophecies of future victories; royalists, who constitute the “patres conscripti” of the republic, and are compelled by the situation to uphold abroad the hostile monarchic houses, whose adherents they are, while in France they support the republic that they hate; an Executive power that finds its strength in its very weakness, and its dignity in the contempt that it inspires; a republic, that is nothing else than the combined infamy of two monarchies — the Restoration and the July Monarchy — with an imperial label; unions, whose first clause is disunion; struggles, whose first law is in-decision; in the name of peace, barren and hollow agitation; in the name of the revolution, solemn sermonizings on peace; passions without truth; truths without passion; heroes without heroism; history without events; development, whose only moving force seems to be the calendar, and tiresome by the constant reiteration of the same tensions and relaxes; contrasts, that seem to intensify themselves periodically, only in order to wear themselves off and collapse without a solution; pretentious efforts made for show, and bourgeois frights at the danger of the destruction of the world, simultaneous with the carrying on of the pettiest intrigues and the performance of court comedies by the world’s saviours, who, in their “laissez aller,” recall the Day of Judgment not so much as the days of the Fronde; the official collective genius of France brought to shame by the artful stupidity of a single individual; the collective will of the nation, as often as it speaks through the general suffrage, seeking its true expression in the prescriptive enemies of the public interests until it finally finds it in the arbitrary will of a filibuster. If ever a slice from history is drawn black upon black, it is this. Men and events appear as reversed “Schlemihls,” [1 The hero In Chamisso’s “Peter Schiemihl,” who loses his own shadow.] as shadows, the bodies of which have been lost. The revolution itself paralyzes

its own apostles, and equips only its adversaries with passionate violence. When the “Red Spectre,” constantly conjured up and exorcised by the counter-revolutionists finally does appear, it does not appear with the Anarchist Phrygian cap on its head, but in the uniform of Order, in the Red Breeches of the French Soldier.

We saw that the Ministry, which Bonaparte installed on December 20, 1849, the day of his “Ascension,” was a ministry of the party of Order, of the Legitimist and Orleanist coalition. The Barrot-Falloux ministry had weathered the republican constitutive convention, whose term of life it had shortened with more or less violence, and found itself still at the helm. Changamier, the General of the allied royalists continued to unite in his person the command-in-chief of the First Military Division and of the Parisian National Guard. Finally, the general elections had secured the large majority in the National Assembly to the party of Order. Here the Deputies and Peers of Louis Phillipe met a saintly crowd of Legitimists, for whose benefit numerous ballots of the nation had been converted into admission tickets to the political stage. The Bonapartist representatives were too thinly sowed to be able to build an independent parliamentary party. They appeared only as “mauvaise queue” [#2 Practical joke] played upon the party of Order. Thus the party of Order was in possession of the Government, of the Army, and of the legislative body, in short, of the total power of the State, morally strengthened by the general elections, that caused their sovereignty to appear as the will of the people, and by the simultaneous victory of the counter-revolution on the whole continent of Europe.

Never did party open its campaign with larger means at its disposal and under more favorable auspices.

The shipwrecked pure republicans found themselves in the legislative National Assembly melted down to a clique of fifty men, with the African Generals Cavaignac, Lamorciere and Bedeau at its head. The great Opposition party was, however, formed by the Mountain. This parliamentary baptismal name was given to itself by the Social Democratic party. It disposed of more than two hundred votes out of the seven hundred and fifty in the National Assembly, and, hence, was at least just as powerful as any one of the three factions of the party of Order. Its relative minority to the total royalist coalition seemed counterbalanced by special circumstances. Not only did the Departmental election returns show that it

had gained a considerable following among the rural population, but, furthermore, it numbered almost all the Paris Deputies in its camp; the Army had, by the election of three under-officers, made a confession of democratic faith; and the leader of the Mountain, Ledru-Rollin had in contrast to all the representatives of the party of Order, been raised to the rank of the “parliamentary nobility” by five Departments, who combined their suffrages upon him. Accordingly, in view of the inevitable collisions of the royalists among themselves, on the one hand, and of the whole party of Order with Bonaparte, on the other, the Mountain seemed on May 29, 1849, to have before it all the elements of success. A fortnight later, it had lost everything, its honor included.

Before we follow this parliamentary history any further, a few observations are necessary, in order to avoid certain common deceptions concerning the whole character of the epoch that lies before us. According to the view of the democrats, the issue, during the period of the legislative National Assembly, was, the same as during the period of the constitutive assembly, simply the struggle between republicans and royalists; the movement itself was summed up by them in the catch-word Reaction — night, in which all cats are grey, and allows them to drawl out their drowsy commonplaces. Indeed, at first sight, the party of Order presents the appearance of a tangle of royalist factions, that, not only intrigue against each other, each aiming to raise its own Pretender to the throne, and exclude the Pretender of the Opposite party, but also are all united in a common hatred for and common attacks against the “Republic.” On its side, the Mountain appears, in counter-distinction to the royalist conspiracy, as the representative of the “Republic.” The party of Order seems constantly engaged in a “Reaction,” which, neither more nor less than in Prussia, is directed against the press, the right of association and the like, and is enforced by brutal police interventions on the part of the bureaucracy, the police and the public prosecutor — just as in Prussia; the Mountain on the contrary, is engaged with equal assiduity in parrying these attacks, and thus in defending the “eternal rights of man” — as every so-called people’s party has more or less done for the last hundred and fifty years. At a closer inspection, however, of the situation and of the parties, this superficial appearance, which veils the Class Struggle, together with the peculiar physiognomy of this period, vanishes wholly.

Legitimists and Orleanists constituted, as said before, the two large factions of the party of Order. What held these two factions to their respective Pretenders, and inversely kept them apart from each other, what else was it but the lily and the tricolor, the House of Bourbon and the house of Orleans, different shades of royalty? Under the Bourbons, Large Landed Property ruled together with its parsons and lackeys; under the Orleanist, it was the high finance, large industry, large commerce, i.e., Capital, with its retinue of lawyers, professors and orators. The Legitimate kingdom was but the political expression for the hereditary rule of the landlords, as the July monarchy was but the political expression for the usurped rule of the bourgeois upstarts. What, accordingly, kept these two factions apart was no so-called set of principles, it was their material conditions for life — two different sorts of property — ; it was the old antagonism of the City and the Country, the rivalry between Capital and Landed property. That simultaneously old recollections; personal animosities, fears and hopes; prejudices and illusions; sympathies and antipathies; convictions, faith and principles bound these factions to one House or the other, who denies it? Upon the several forms of property, upon the social conditions of existence, a whole superstructure is reared of various and peculiarly shaped feelings, illusions, habits of thought and conceptions of life. The whole class produces and shapes these out of its material foundation and out of the corresponding social conditions. The individual unit to whom they flow through tradition and education, may fancy that they constitute the true reasons for and premises of his conduct. Although Orleanists and Legitimists, each of these factions, sought to make itself and the other believe that what kept the two apart was the attachment of each to its respective royal House; nevertheless, facts proved later that it rather was their divided interest that forbade the union of the two royal Houses. As, in private life, the distinction is made between what a man thinks of himself and says, and that which he really is and does, so, all the more, must the phrases and notions of parties in historic struggles be distinguished from the real organism, and their real interests, their notions and their reality. Orleanists and Legitimists found themselves in the republic beside each other with equal claims. Each side wishing, in opposition to the other, to carry out the restoration of its own royal House, meant nothing else than that each of the two great Interests into which the bourgeoisie is divided — Land and Capital — sought to restore its own supremacy and the

subordinacy of the other. We speak of two bourgeois interests because large landed property, despite its feudal coquetry and pride of race, has become completely bourgeois through the development of modern society. Thus did the Tories of England long fancy that they were enthusiastic for the Kingdom, the Church and the beauties of the old English Constitution, until the day of danger wrung from them the admission that their enthusiasm was only for Ground Rent.

The coalized royalists carried on their intrigues against each other in the press, in Ems, in Clarmont — outside of the parliament. Behind the scenes, they don again their old Orleanist and Legitimist liveries, and conduct their old tourneys; on the public stage, however, in their public acts, as a great parliamentary party, they dispose of their respective royal houses with mere courtesies, adjourn “in infinitum” the restoration of the monarchy. Their real business is transacted as Party of Order, i. e., under a Social, not a Political title; as representatives of the bourgeois social system; not as knights of traveling princesses, but as the bourgeois class against the other classes; not as royalists against republicans. Indeed, as party of Order they exercised a more unlimited and harder dominion over the other classes of society than ever before either under the restoration or the July monarchy—a thing possible only under the form of a parliamentary republic, because under this form alone could the two large divisions of the French bourgeoisie be united; in other words, only under this form could they place on the order of business the sovereignty of their class, in lieu of the regime of a privileged faction of the same. If, this notwithstanding, they are seen as the party of Order to insult the republic and express their antipathy for it, it happened not out of royalist traditions only: Instinct taught them that while, indeed, the republic completes their authority, it at the same time undermined their social foundation, in that, without intermediary, without the mask of the crown, without being able to turn aside the national interest by means of its subordinate struggles among its own conflicting elements and with the crown, the republic is compelled to stand up sharp against the subjugated classes, and wrestle with them. It was a sense of weakness that caused them to recoil before the unqualified demands of their own class rule, and to retreat to the less complete, less developed, and, for that very reason, less dangerous forms of the same. As often, on the contrary, as the allied royalists come into conflict with the Pretender who stands before them — with Bonaparte — , as often as they believe their parliamentary

omnipotence to be endangered by the Executive, in other words, as often as they must trot out the political title of their authority, they step up as Republicans, not as Royalists — and this is done from the Orleanist Thiers, who warns the National Assembly that the republic divides them least, down to Legitimist Berryer, who, on December 2, 1851, the scarf of the tricolor around him, harangues the people assembled before the Mayor's building of the Tenth Arrondissement, as a tribune in the name of the Republic; the echo, however, derisively answering back to him: "Henry V.! Henry V!" [#3 The candidate of the Bourbons, or Legitimists, for the throne.]

However, against the allied bourgeois, a coalition was made between the small traders and the workingmen — the so-called Social Democratic party. The small traders found themselves ill rewarded after the June days of 1848; they saw their material interests endangered, and the democratic guarantees, that were to uphold their interests, made doubtful. Hence, they drew closer to the workingmen. On the other hand, their parliamentary representatives — the Mountain — , after being shoved aside during the dictatorship of the bourgeois republicans, had, during the last half of the term of the constitutive convention, regained their lost popularity through the struggle with Bonaparte and the royalist ministers. They had made an alliance with the Socialist leaders. During February, 1849, reconciliation banquets were held. A common program was drafted, joint election committees were empanelled, and fusion candidates were set up. The revolutionary point was thereby broken off from the social demands of the proletariat and a democratic turn given to them; while, from the democratic claims of the small traders' class, the mere political form was rubbed off and the Socialist point was pushed forward. Thus came the Social Democracy about. The new Mountain, the result of this combination, contained, with the exception of some figures from the working class and some Socialist sectarians, the identical elements of the old Mountain, only numerically stronger. In the course of events it had, however, changed, together with the class that it represented. The peculiar character of the Social Democracy is summed up in this that democratic-republican institutions are demanded as the means, not to remove the two extremes — Capital and Wage-slavery — , but in order to weaken their antagonism and transform them into a harmonious whole. However different the methods may be that are proposed for the accomplishment of this object, however

much the object itself may be festooned with more or less revolutionary fancies, the substance remains the same. This substance is the transformation of society upon democratic lines, but a transformation within the boundaries of the small traders' class. No one must run away with the narrow notion that the small traders' class means on principle to enforce a selfish class interest. It believes rather that the special conditions for its own emancipation are the general conditions under which alone modern society can be saved and the class struggle avoided. Likewise must we avoid running away with the notion that the Democratic Representatives are all "shopkeepers," or enthuse for these. They may — by education and individual standing — be as distant from them as heaven is from earth. That which makes them representatives of the small traders' class is that they do not intellectually leap the bounds which that class itself does not leap in practical life; that, consequently, they are theoretically driven to the same problems and solutions, to which material interests and social standing practically drive the latter. Such, in fact, is at all times the relation of the "political" and the "literary" representatives of a class to the class they represent.

After the foregoing explanations, it goes with-out saying that, while the Mountain is constantly wrestling for the republic and the so-called "rights of man," neither the republic nor the "rights of man" is its real goal, as little as an army, whose weapons it is sought to deprive it of and that defends itself, steps on the field of battle simply in order to remain in possession of implements of warfare.

The party of Order provoked the Mountain immediately upon the convening of the assembly. The bourgeoisie now felt the necessity of disposing of the democratic small traders' class, just as a year before it had understood the necessity of putting an end to the revolutionary proletariat.

But the position of the foe had changed. The strength of the proletarian party was on the streets; that of the small traders' class was in the National Assembly itself. The point was, accordingly, to wheedle them out of the National Assembly into the street, and to have them break their parliamentary power themselves, before time and opportunity could consolidate them. The Mountain jumped with loose reins into the trap.

The bombardment of Rome by the French troops was the bait thrown at the Mountain. It violated Article V. of the Constitution, which forbade the French republic to use its forces against the liberties of other nations;

besides, Article IV. forbade all declaration of war by the Executive without the consent of the National Assembly; furthermore, the constitutive assembly had censured the Roman expedition by its resolution of May 8. Upon these grounds, Ledru-Rollin submitted on June 11, 1849, a motion impeaching Bonaparte and his Ministers. Instigated by the wasp-stings of Thiers, he even allowed himself to be carried away to the point of threatening to defend the Constitution by all means, even arms in hand. The Mountain rose as one man, and repeated the challenge. On June 12, the National Assembly rejected the notion to impeach, and the Mountain left the parliament. The events of June 13 are known: the proclamation by a part of the Mountain pronouncing Napoleon and his Ministers "outside the pale of the Constitution"; the street parades of the democratic National Guards, who, unarmed as they were, flew apart at contact with the troops of Changarnier; etc., etc. Part of the Mountain fled abroad, another part was assigned to the High Court of Bourges, and a parliamentary regulation placed the rest under the school-master supervision of the President of the National Assembly. Paris was again put under a state of siege; and the democratic portion of the National Guards was disbanded. Thus the influence of the Mountain in parliament was broken, together with the power; of the small traders' class in Paris.

Lyons, where the 13th of June had given the signal to a bloody labor uprising, was, together with the five surrounding Departments, likewise pronounced in state of siege, a condition that continues down to this moment. [#4 January, 1852]

The bulk of the Mountain had left its vanguard in the lurch by refusing their signatures to the proclamation; the press had deserted: only two papers dared to publish the pronunciamiento; the small traders had betrayed their Representatives: the National Guards stayed away, or, where they did turn up, hindered the raising of barricades; the Representatives had duped the small traders: nowhere were the alleged affiliated members from the Army to be seen; finally, instead of gathering strength from them, the democratic party had infected the proletariat with its own weakness, and, as usual with democratic feats, the leaders had the satisfaction of charging "their people" with desertion, and the people had the satisfaction of charging their leaders with fraud.

Seldom was an act announced with greater noise than the campaign contemplated by the Mountain; seldom was an event trumpeted ahead with

more certainty and longer beforehand than the “inevitable victory of the democracy.” This is evident: the democrats believe in the trombones before whose blasts the walls of Jericho fall together; as often as they stand before the walls of despotism, they seek to imitate the miracle. If the Mountain wished to win in parliament, it should not appeal to arms; if it called to arms in parliament, it should not conduct itself parliamentarily on the street; if the friendly demonstration was meant seriously, it was silly not to foresee that it would meet with a warlike reception; if it was intended for actual war, it was rather original to lay aside the weapons with which war had to be conducted. But the revolutionary threats of the middle class and of their democratic representatives are mere attempts to frighten an adversary; when they have run themselves into a blind alley, when they have sufficiently compromised themselves and are compelled to execute their threats, the thing is done in a hesitating manner that avoids nothing so much as the means to the end, and catches at pretexts to succumb. The bray of the overture, that announces the fray, is lost in a timid growl so soon as this is to start; the actors cease to take themselves seriously, and the performance falls flat like an inflated balloon that is pricked with a needle.

No party exaggerates to itself the means at its disposal more than the democratic, none deceives itself with greater heedlessness on the situation. A part of the Army voted for it, thereupon the Mountain is of the opinion that the Army would revolt in its favor. And by what occasion? By an occasion, that, from the standpoint of the troops, meant nothing else than that the revolutionary soldiers should take the part of the soldiers of Rome against French soldiers. On the other hand, the memory of June, 1848, was still too fresh not to keep alive a deep aversion on the part of the proletariat towards the National Guard, and a strong feeling of mistrust on the part of the leaders of the secret societies for the democratic leaders. In order to balance these differences, great common interests at stake were needed. The violation of an abstract constitutional paragraph could not supply such interests. Had not the constitution been repeatedly violated, according to the assurances of the democrats themselves? Had not the most popular papers branded them as a counter-revolutionary artifice? But the democrat — by reason of his representing the middle class, that is to say, a Transition Class, in which the interests of two other classes are mutually dulled —, imagines himself above all class contrast. The democrats grant that opposed to them stands a privileged class, but they, together with the whole remaining mass

of the nation, constitute the “PEOPLE.” What they represent is the “people’s rights”; their interests are the “people’s interests.” Hence, they do not consider that, at an impending struggle, they need to examine the interests and attitude of the different classes. They need not too seriously weigh their own means. All they have to do is to give the signal in order to have the “people” fall upon the “oppressors” with all its inexhaustible resources. If, thereupon, in the execution, their interests turn out to be uninteresting, and their power to be impotence, it is ascribed either to depraved sophists, who split up the “undivisible people” into several hostile camps; or to the army being too far brutalized and blinded to appreciate the pure aims of the democracy as its own best; or to some detail in the execution that wrecks the whole plan; or, finally, to an unforeseen accident that spoiled the game this time. At all events, the democrat comes out of the disgraceful defeat as immaculate as he went innocently into it, and with the refreshed conviction that he must win; not that he himself and his party must give up their old standpoint, but that, on the contrary, conditions must come to his aid.

For all this, one must not picture to himself the decimated, broken, and, by the new parliamentary regulation, humbled Mountain altogether too unhappy. If June 13 removed its leaders, it, on the other hand, made room for new ones of inferior capacity, who are flattered by their new position. If their impotence in parliament could no longer be doubted, they were now justified to limit their activity to outbursts of moral indignation. If the party of Order pretended to see in them, as the last official representatives of the revolution, all the horrors of anarchy incarnated, they were free to appear all the more flat and modest in reality. Over June 13 they consoled themselves with the profound expression: “If they but dare to assail universal suffrage . . . then . . . then we will show who we are!” *Nous verrons.* [#5 We shall see.]

As to the “Mountaineers,” who had fled abroad, it suffices here to say that Ledru-Rollin — he having accomplished the feat of hopelessly ruining, in barely a fortnight, the powerful party at whose head he stood — , found himself called upon to build up a French government “in partibus;” that his figure, at a distance, removed from the field of action, seemed to gain in size in the measure that the level of the revolution sank and the official prominences of official France became more and more dwarfish; that he could figure as republican Pretender for 1852, and periodically issued to the

Wallachians and other peoples circulars in which “despot of the continent” is threatened with the feats that he and his allies had in contemplation. Was Proudhon wholly wrong when he cried out to these gentlemen: “Vous n’etes que des blaqueurs”? [#6 You are nothing but fakirs.]

The party of Order had, on June 13, not only broken up the Mountain, it had also established the Subordination of the Constitution to the Majority Decisions of the National Assembly. So, indeed, did the republic understand it, to — wit, that the bourgeois ruled here in parliamentary form, without, as in the monarchy, finding a check in the veto of the Executive power, or the liability of parliament to dissolution. It was a “parliamentary republic,” as Thiers styled it. But if, on June 13, the bourgeoisie secured its omnipotence within the parliament building, did it not also strike the parliament itself, as against the Executive and the people, with incurable weakness by excluding its most popular part? By giving up numerous Deputies, without further ceremony to the mercies of the public prosecutor, it abolished its own parliamentary inviolability. The humiliating regulation, that it subjected the Mountain to, raised the President of the republic in the same measure that it lowered the individual Representatives of the people. By branding an insurrection in defense of the Constitution as anarchy, and as a deed looking to the overthrow of society, it interdicted to itself all appeal to insurrection whenever the Executive should violate the Constitution against it. And, indeed, the irony of history wills it that the very General, who by order of Bonaparte bombarded Rome, and thus gave the immediate occasion to the constitutional riot of June 13, that Oudinot, on December 22, 1851, is the one imploringly and vainly to be offered to the people by the party of Order as the General of the Constitution. Another hero of June 13, Vieyra, who earned praise from the tribune of the National Assembly for the brutalities that he had committed in the democratic newspaper offices at the head of a gang of National Guards in the hire of the high finance — this identical Vieyra was initiated in the conspiracy of Bonaparte, and contributed materially in cutting off all protection that could come to the National Assembly, in the hour of its agony, from the side of the National Guard.

June 13 had still another meaning. The Mountain had wanted to place Bonaparte under charges. Their defeat was, accordingly, a direct victory of Bonaparte; it was his personal triumph over his democratic enemies. The party of Order fought for the victory, Bonaparte needed only to pocket it. He did so. On June 14, a proclamation was to be read on the walls of Paris

wherein the President, as it were, without his connivance, against his will, driven by the mere force of circumstances, steps forward from his cloisterly seclusion like misjudged virtue, complains of the calumnies of his antagonists, and, while seeming to identify his own person with the cause of order, rather identifies the cause of order with his own person. Besides this, the National Assembly had subsequently approved the expedition against Rome; Bonaparte, however, had taken the initiative in the affair. After he had led the High Priest Samuel back into the Vatican, he could hope as King David to occupy the Tuileries. He had won the parson-interests over to himself.

The riot of June 13 limited itself, as we have seen, to a peaceful street procession. There were, consequently, no laurels to be won from it. Nevertheless, in these days, poor in heroes and events, the party of Order converted this bloodless battle into a second Austerlitz. Tribune and press lauded the army as the power of order against the popular multitude, and the impotence of anarchy; and Changarnier as the “bulwark of society” — a mystification that he finally believed in himself. Underhand, however, the corps that seemed doubtful were removed from Paris; the regiments whose suffrage had turned out most democratic were banished from France to Algiers the restless heads among the troops were consigned to penal quarters; finally, the shutting out of the press from the barracks, and of the barracks from contact with the citizens was systematically carried out.

We stand here at the critical turning point in the history of the French National Guard. In 1830, it had decided the downfall of the restoration. Under Louis Philippe, every riot failed, at which the National Guard stood on the side of the troops. When, in the February days of 1848, it showed itself passive against the uprising and doubtful toward Louis Philippe himself, he gave himself up for lost. Thus the conviction cast root that a revolution could not win without, nor the Army against the National Guard. This was the superstitious faith of the Army in bourgeois omnipotence. The June days of 1848, when the whole National Guard, jointly with the regular troops, threw down the insurrection, had confirmed the superstition. After the inauguration of Bonaparte's administration, the position of the National Guard sank somewhat through the unconstitutional joining of their command with the command of the First Military Division in the person of Changarnier.

As the command of the National Guard appeared here merely an attribute of the military commander-in-chief, so did the Guard itself appear only as an appendage of the regular troops. Finally, on June 13, the National Guard was broken up, not through its partial dissolution only, that from that date forward was periodically repeated at all points of France, leaving only wrecks of its former self behind. The demonstration of June 13 was, above all, a demonstration of the National Guards. True, they had not carried their arms, but they had carried their uniforms against the Army — and the talisman lay just in these uniforms. The Army then learned that this uniform was but a woolen rag, like any other. The spell was broken. In the June days of 1848, bourgeoisie and small traders were united as National Guard with the Army against the proletariat; on June 13, 1849, the bourgeoisie had the small traders' National Guard broken up; on December 2, 1851, the National Guard of the bourgeoisie itself vanished, and Bonaparte attested the fact when he subsequently signed the decree for its disbandment. Thus the bourgeoisie had itself broken its last weapon against the army, from the moment when the small traders' class no longer stood as a vassal behind, but as a rebel before it; indeed, it was bound to do so, as it was bound to destroy with its own hand all its means of defence against absolutism, so soon as itself was absolute.

In the meantime, the party of Order celebrated the recovery of a power that seemed lost in 1848 only in order that, freed from its trammels in 1849, it be found again through invectives against the republic and the Constitution; through the malediction of all future, present and past revolutions, that one included which its own leaders had made; and, finally, in laws by which the press was gagged, the right of association destroyed, and the stage of siege regulated as an organic institution. The National Assembly then adjourned from the middle of August to the middle of October, after it had appointed a Permanent Committee for the period of its absence. During these vacations, the Legitimists intrigued with Ems; the Orleanists with Claremont; Bonaparte through princely excursions; the Departmental Councilmen in conferences over the revision of the Constitution; — occurrences, all of which recurred regularly at the periodical vacations of the National Assembly, and upon which I shall not enter until they have matured into events. Be it here only observed that the National Assembly was impolitic in vanishing from the stage for long intervals, and leaving in view, at the head of the republic, only one,

however sorry, figure — Louis Bonaparte's — , while, to the public scandal, the party of Order broke up into its own royalist component parts, that pursued their conflicting aspirations after the restoration. As often as, during these vacations the confusing noise of the parliament was hushed, and its body was dissolved in the nation, it was unmistakably shown that only one thing was still wanting to complete the true figure of the republic: to make the vacation of the National Assembly permanent, and substitute its inscription— “Liberty, Equality, Fraternity” — by the unequivocal words, “Infantry, Cavalry, Artillery”.

IV

The National Assembly reconvened in the middle of October. On November 1, Bonaparte surprised it with a message, in which he announced the dismissal of the Barrot-Falloux Ministry, and the framing of a new. Never have lackeys been chased from service with less ceremony than Bonaparte did his ministers. The kicks, that were eventually destined for the National Assembly, Barrot & Company received in the meantime.

The Barrot Ministry was, as we have seen, composed of Legitimists and Orleanists; it was a Ministry of the party of Order. Bonaparte needed that Ministry in order to dissolve the republican constituent assembly, to effect the expedition against Rome, and to break up the democratic party. He had seemingly eclipsed himself behind this Ministry, yielded the reins to the hands of the party of Order, and assumed the modest mask, which, under Louis Philippe, had been worn by the responsible overseer of the newspapers — the mask of “homme de paille.” [#1 Man of straw] Now he threw off the mask, it being no longer the light curtain behind which he could conceal, but the Iron Mask, which prevented him from revealing his own physiognomy. He had instituted the Barrot Ministry in order to break up the republican National Assembly in the name of the party of Order; he now dismissed it in order to declare his own name independent of the parliament of the party of Order.

There was no want of plausible pretexts for this dismissal. The Barrot Ministry had neglected even the forms of decency that would have allowed the president of the republic to appear as a power along with the National Assembly. For instance, during the vacation of the National Assembly, Bonaparte published a letter to Edgar Ney, in which he seemed to

disapprove the liberal attitude of the Pope, just as, in opposition to the constitutive assembly, he had published a letter, in which he praised Oudinot for his attack upon the Roman republic; when the National Assembly came to vote on the budget for the Roman expedition, Victor Hugo, out of pretended liberalism, brought up that letter for discussion; the party of Order drowned this notion of Bonaparte's under exclamations of contempt and incredulity as though notions of Bonaparte could not possibly have any political weight; — and none of the Ministers took up the gauntlet for him. On another occasion, Barrot, with his well-known hollow pathos, dropped, from the speakers' tribune in the Assembly, words of indignation upon the “abominable machinations,” which, according to him, went on in the immediate vicinity of the President. Finally, while the Ministry obtained from the National Assembly a widow's pension for the Duchess of Orleans, it denied every motion to raise the Presidential civil list; — and, in Bonaparte, be it always remembered, the Imperial Pretender was so closely blended with the impecunious adventurer, that the great idea of his being destined to restore the Empire was ever supplemented by that other, to-wit, that the French people was destined to pay his debts.

The Barrot-Falloux Ministry was the first and last parliamentary Ministry that Bonaparte called into life. Its dismissal marks, accordingly, a decisive period. With the Ministry, the party of Order lost, never to regain, an indispensable post to the maintenance of the parliamentary regime, — the handle to the Executive power. It is readily understood that, in a country like France, where the Executive disposes over an army of more than half a million office-holders, and, consequently, keeps permanently a large mass of interests and existences in the completest dependence upon itself; where the Government surrounds, controls, regulates, supervises and guards society, from its mightiest acts of national life, down to its most insignificant motions; from its common life, down to the private life of each individual; where, due to such extraordinary centralization, this body of parasites acquires a ubiquity and omniscience, a quickened capacity for motion and rapidity that finds an analogue only in the helpless lack of self-reliance, in the unstrung weakness of the body social itself; — that in such a country the National Assembly lost, with the control of the ministerial posts, all real influence; unless it simultaneously simplified the administration; if possible, reduced the army of office-holders; and, finally, allowed society and public opinion to establish its own organs, independent

of government censorship. But the Material Interest of the French bourgeoisie is most intimately bound up in maintenance of just such a large and extensively ramified governmental machine. There the bourgeoisie provides for its own superfluous membership; and supplies, in the shape of government salaries, what it can not pocket in the form of profit, interest, rent and fees. On the other hand, its Political Interests daily compel it to increase the power of repression, i.e., the means and the personnel of the government; it is at the same time forced to conduct an uninterrupted warfare against public opinion, and, full of suspicion, to hamstring and lame the independent organs of society — whenever it does not succeed in amputating them wholly. Thus the bourgeoisie of France was forced by its own class attitude, on the one hand, to destroy the conditions for all parliamentary power, its own included, and, on the other, to render irresistible the Executive power that stood hostile to it.

The new Ministry was called the d'Hautpoul Ministry. Not that General d'Hautpoul had gained the rank of Ministerial President. Along with Barrot, Bonaparte abolished this dignity, which, it must be granted, condemned the President of the republic to the legal nothingness of a constitutional kind, of a constitutional king at that, without throne and crown, without sceptre and without sword, without irresponsibility, without the imperishable possession of the highest dignity in the State, and, what was most untoward of all — without a civil list. The d'Hautpoul Ministry numbered only one man of parliamentary reputation, the Jew Fould, one of the most notorious members of the high finance. To him fell the portfolio of finance. Turn to the Paris stock quotations, and it will be found that from November 1, 1849, French stocks fall and rise with the falling and rising of the Bonapartist shares. While Bonaparte had thus found his ally in the Bourse, he at the same time took possession of the Police through the appointment of Carlier as Prefect of Police.

But the consequences of the change of Ministry could reveal themselves only in the course of events. So far, Bonaparte had taken only one step forward, to be all the more glaringly driven back. Upon his harsh message, followed the most servile declarations of submissiveness to the National Assembly. As often as the Ministers made timid attempts to introduce his own personal hobbies as bills, they themselves seemed unwilling and compelled only by their position to run the comic errands, of whose futility they were convinced in advance. As often as Bonaparte blabbed out his

plans behind the backs of his Ministers, and sported his “idees napoleoniennes,” [#2 Napoleonic ideas.] his own Ministers disavowed him from the speakers’ tribune in the National Assembly. His aspirations after usurpation seemed to become audible only to the end that the ironical laughter of his adversaries should not die out. He deported himself like an unappreciated genius, whom the world takes for a simpleton. Never did he enjoy in fuller measure the contempt of all classes than at this period. Never did the bourgeoisie rule more absolutely; never did it more boastfully display the insignia of sovereignty.

It is not here my purpose to write the history of its legislative activity, which is summed up in two laws passed during this period: the law reestablishing the duty on wine, and the laws on education, to suppress infidelity. While the drinking of wine was made difficult to the Frenchmen, all the more bounteously was the water of pure life poured out to them. Although in the law on the duty on wine the bourgeoisie declares the old hated French tariff system to be inviolable, it sought, by means of the laws on education, to secure the old good will of the masses that made the former bearable. One wonders to see the Orleanists, the liberal bourgeois, these old apostles of Voltarianism and of eclectic philosophy, entrusting the supervision of the French intellect to their hereditary enemies, the Jesuits. But, while Orleanists and Legitimists could part company on the question of the Pretender to the crown, they understood full well that their joint reign dictated the joining of the means of oppression of two distinct epochs; that the means of subjugation of the July monarchy had to be supplemented with and strengthened by the means of subjugation of the restoration.

The farmers, deceived in all their expectations, more than ever ground down by the law scale of the price of corn, on the one hand, and, on the other, by the growing load of taxation and mortgages, began to stir in the Departments. They were answered by the systematic baiting of the school masters, whom the Government subjected to the clergy; by the systematic baiting of the Mayors, whom it subjected to the Prefects; and by a system of espionage to which all were subjected. In Paris and the large towns, the reaction itself carries the physiognomy of its own epoch; it irritates more than it crows; in the country, it becomes low, moan, petty, tiresome, vexatious, — in a word, it becomes “gensdarme.” It is easily understood how three years of the gensdarme regime, sanctified by the regime of the clergyman, was bound to demoralize unripe masses.

Whatever the mass of passion and declamation, that the party of Order expended from the speakers' tribune in the National Assembly against the minority, its speech remained monosyllabic, like that of the Christian, whose speech was to be "Aye, aye; nay, nay." It was monosyllabic, whether from the tribune or the press; dull as a conundrum, whose solution is known beforehand. Whether the question was the right of petition or the duty on wine, the liberty of the press or free trade, clubs or municipal laws, protection of individual freedom or the regulation of national economy, the slogan returns ever again, the theme is monotonously the same, the verdict is ever ready and unchanged: Socialism! Even bourgeois liberalism is pronounced socialistic; socialistic, alike, is pronounced popular education; and, likewise, socialistic national financial reform. It was socialistic to build a railroad where already a canal was; and it was socialistic to defend oneself with a stick when attacked with a sword.

This was not a mere form of speech, a fashion, nor yet party tactics. The bourgeoisie perceives correctly that all the weapons, which it forged against feudalism, turn their edges against itself; that all the means of education, which it brought forth, rebel against its own civilization; that all the gods, which it made, have fallen away from it. It understands that all its so-called citizens' rights and progressive organs assail and menace its class rule, both in its social foundation and its political superstructure — consequently, have become "socialistic." It justly scents in this menace and assault the secret of Socialism, whose meaning and tendency it estimates more correctly than the spurious, so-called Socialism, is capable of estimating itself, and which, consequently, is unable to understand how it is that the bourgeoisie obdurately shuts up its ears to it, alike whether it sentimentally whines about the sufferings of humanity; or announces in Christian style the millennium and universal brotherhood; or twaddles humanistically about the soul, culture and freedom; or doctrinally matches out a system of harmony and wellbeing for all classes. What, however, the bourgeoisie does not understand is the consequence that its own parliamentary regime, its own political reign, is also of necessity bound to fall under the general ban of "socialistic." So long as the rule of the bourgeoisie is not fully organized, has not acquired its purely political character, the contrast with the other classes cannot come into view in all its sharpness; and, where it does come into view, it cannot take that dangerous turn that converts every conflict with the Government into a conflict with Capital. When, however, the

French bourgeoisie began to realize in every pulsation of society a menace to “peace,” how could it, at the head of society, pretend to uphold the regime of unrest, its own regime, the parliamentary regime, which, according to the expression of one of its own orators, lives in struggle, and through struggle? The parliamentary regime lives on discussion, — how can it forbid discussion? Every single interest, every single social institution is there converted into general thoughts, is treated as a thought, — how could any interest or institution claim to be above thought, and impose itself as an article of faith? The orators’ conflict in the tribune calls forth the conflict of the rowdies in the press the debating club in parliament is necessarily supplemented by debating clubs in the salons and the barrooms; the representatives, who are constantly appealing to popular opinion, justify popular opinion in expressing its real opinion in petitions. The parliamentary regime leaves everything to the decision of majorities, — how can the large majorities beyond parliament be expected not to wish to decide? If, from above, they hear the fiddle screeching, what else is to be expected than that those below should dance?

Accordingly, by now persecuting as Socialist what formerly it had celebrated as Liberal, the bourgeoisie admits that its own interest orders it to raise itself above the danger of self government; that, in order to restore rest to the land, its own bourgeois parliament must, before all, be brought to rest; that, in order to preserve its social power unhurt, its political power must be broken; that the private bourgeois can continue to exploit the other classes and rejoice in “property,” “family,” “religion” and “order” only under the condition that his own class be condemned to the same political nullity of the other classes, that, in order to save their purse, the crown must be knocked off their heads, and the sword that was to shield them, must at the same time be hung over their heads as a sword of Damocles.

In the domain of general bourgeois interests, the National Assembly proved itself so barren, that, for instance, the discussion over the Paris-Avignon railroad, opened in the winter of 1850, was not yet ripe for a vote on December 2, 1851. Wherever it did not oppress or was reactionary, the bourgeoisie was smitten with incurable barrenness.

While Bonaparte’s Ministry either sought to take the initiative of laws in the spirit of the party of Order, or even exaggerated their severity in their enforcement and administration, he, on his part, sought to win popularity by means of childishly silly propositions, to exhibit the contrast between

himself and the National Assembly, and to hint at a secret plan, held in reserve and only through circumstances temporarily prevented from disclosing its hidden treasures to the French people. Of this nature was the proposition to decree a daily extra pay of four sous to the under-officers; so, likewise, the proposition for a “word of honor” loan bank for working-men. To have money given and money borrowed — that was the perspective that he hoped to cajole the masses with. Presents and loans — to that was limited the financial wisdom of the slums, the high as well as the low; to that were limited the springs which Bonaparte knew how to set in motion. Never did Pretender speculate more dully upon the dullness of the masses.

Again and again did the National Assembly fly into a passion at these unmistakable attempts to win popularity at its expense, and at the growing danger that this adventurer, lashed on by debts and unrestrained by reputation, might venture upon some desperate act. The strained relations between the party of Order and the President had taken on a threatening aspect, when an unforeseen event threw him back, rueful into its arms. We mean the supplementary elections of March, 1850. These elections took place to fill the vacancies created in the National Assembly, after June 13, by imprisonment and exile. Paris elected only Social-Democratic candidates; it even united the largest vote upon one of the insurgents of June, 1848, — Deflotte. In this way the small traders’ world of Paris, now allied with the proletariat, revenged itself for the defeat of June 13, 1849. It seemed to have disappeared from the field of battle at the hour of danger only to step on it again at a more favorable opportunity, with increased forces for the fray, and with a bolder war cry. A circumstance seemed to heighten the danger of this electoral victory. The Army voted in Paris for a June insurgent against Lahitte, a Minister of Bonaparte’s, and, in the Departments, mostly for the candidates of the Mountain, who, there also, although not as decisively as in Paris, maintained the upper hand over their adversaries.

Bonaparte suddenly saw himself again face to face with the revolution. As on January 29, 1849, as on June 13, 1849, on May 10, 1850, he vanished again behind the party of Order. He bent low; he timidly apologized; he offered to appoint any Ministry whatever at the behest of the parliamentary majority; he even implored the Orleanist and Legitimist party leaders — the Thiers, Berryers, Broglies, Moles, in short, the so-called burgraves — to take hold of the helm of State in person. The party of Order did not know

how to utilize this opportunity, that was never to return. Instead of boldly taking possession of the proffered power, it did not even force Bonaparte to restore the Ministry dismissed on November 1; it contented itself with humiliating him with its pardon, and with affiliating Mr. Baroche to the d'Hautpoul Ministry. This Baroche had, as Public Prosecutor, stormed before the High Court at Bourges, once against the revolutionists of May 15, another time against the Democrats of June 13, both times on the charge of "attentats" against the National Assembly. None of Bonaparte's Ministers contributed later more towards the degradation of the National Assembly; and, after December 2, 1851, we meet him again as the comfortably stalled and dearly paid Vice-President of the Senate. He had spat into the soup of the revolutionists for Bonaparte to eat it.

On its part, the Social Democratic party seemed only to look for pretexts in order to make its own victory doubtful, and to dull its edge. Vidal, one of the newly elected Paris representatives, was returned for Strassburg also. He was induced to decline the seat for Paris and accept the one for Strassburg. Thus, instead of giving a definite character to their victory at the hustings, and thereby compelling the party of Order forthwith to contest it in parliament; instead of thus driving the foe to battle at the season of popular enthusiasm and of a favorable temper in the Army, the democratic party tired out Paris with a new campaign during the months of March and April; it allowed the excited popular passions to wear themselves out in this second provisional electoral play it allowed the revolutionary vigor to satiate itself with constitutional successes, and lose its breath in petty intrigues, hollow declamation and sham moves; it gave the bourgeoisie time to collect itself and make its preparations finally, it allowed the significance of the March elections to find a sentimentally weakening commentary at the subsequent April election in the victory of Eugene Sue. In one word, it turned the 10th of March into an April Fool.

The parliamentary majority perceived the weakness of its adversary. Its seventeen burgraves — Bonaparte had left to it the direction of and responsibility for the attack —, framed a new election law, the moving of which was entrusted to Mr. Faucher, who had applied for the honor. On May 8, he introduced the new law whereby universal suffrage was abolished; a three years residence in the election district imposed as a condition for voting; and, finally, the proof of this residence made dependent, for the working-man, upon the testimony of his employer.

As revolutionarily as the democrats had agitated and stormed during the constitutional struggles, so constitutionally did they, now, when it was imperative to attest, arms in hand, the earnestness of their late electoral victories, preach order, “majestic calmness,” lawful conduct, i. e., blind submission to the will of the counter-revolution, which revealed itself as law. During the debate, the Mountain put the party of Order to shame by maintaining the passionless attitude of the law-abiding burger, who upholds the principle of law against revolutionary passions; and by twitting the party of Order with the fearful reproach of proceeding in a revolutionary manner. Even the newly elected deputies took pains to prove by their decent and thoughtful deportment what an act of misjudgment it was to decry them as anarchists, or explain their election as a victory of the revolution. The new election law was passed on May 31. The Mountain contented itself with smuggling a protest into the pockets of the President of the Assembly. To the election law followed a new press law, whereby the revolutionary press was completely done away with. It had deserved its fate. The “National” and the “Presse,” two bourgeois organs, remained after this deluge the extreme outposts of the revolution.

We have seen how, during March and April, the democratic leaders did everything to involve the people of Paris in a sham battle, and how, after May 8, they did everything to keep it away from a real battle. We may not here forget that the year 1850 was one of the most brilliant years of industrial and commercial prosperity; consequently, that the Parisian proletariat was completely employed. But the election law of May 31, 1850 excluded them from all participation in political power; it cut the field of battle itself from under them; it threw the workingmen back into the state of pariahs, which they had occupied before the February revolution. In allowing themselves, in sight of such an occurrence, to be led by the democrats, and in forgetting the revolutionary interests of their class through temporary comfort, the workingmen abdicated the honor of being a conquering power; they submitted to their fate; they proved that the defeat of June, 1848, had incapacitated them from resistance for many a year to come finally, that the historic process must again, for the time being, proceed over their heads. As to the small traders’ democracy, which, on June 13, had cried out: “If they but dare to assail universal suffrage . . . then . . . then we will show who we are!” — they now consoled themselves with the thought that the counter-revolutionary blow, which had struck them, was

no blow at all, and that the law of May 31 was no law. On May 2, 1852, according to them, every Frenchman would appear at the hustings, in one hand the ballot, in the other the sword. With this prophecy they set their hearts at ease. Finally, the Army was punished by its superiors for the elections of May and April, 1850, as it was punished for the election of May 29, 1849. This time, however, it said to itself determinately: "The revolution shall not cheat us a third time."

The law of May 31, 1850, was the "coup d'etat" of the bourgeoisie. All its previous conquests over the revolution had only a temporary character: they became uncertain the moment the National Assembly stepped off the stage; they depended upon the accident of general elections, and the history of the elections since 1848 proved irrefutably that, in the same measure as the actual reign of the bourgeoisie gathered strength, its moral reign over the masses wore off. Universal suffrage pronounced itself on May 10 pointedly against the reign of the bourgeoisie; the bourgeoisie answered with the banishment of universal suffrage. The law of May 31 was, accordingly, one of the necessities of the class struggle. On the other hand, the constitution required a minimum of two million votes for the valid ejection of the President of the republic. If none of the Presidential candidates polled this minimum, then the National Assembly was to elect the President out of the three candidates polling the highest votes. At the time that the constitutive body made this law, ten million voters were registered on the election rolls. In its opinion, accordingly, one-fifth of the qualified voters sufficed to make a choice for President valid. The law of May 31 struck at least three million voters off the rolls, reduced the number of qualified voters to seven millions, and yet, notwithstanding, it kept the lawful minimum at two millions for the election of a President. Accordingly, it raised the lawful minimum from a fifth to almost a third of the qualified voters, i.e., it did all it could to smuggle the Presidential election out of the hands of the people into those of the National Assembly. Thus, by the election law of May 31, the party of Order seemed to have doubly secured its empire, in that it placed the election of both the National Assembly and the President of the republic in the keeping of the stable portion of society.

The strife immediately broke out again between the National Assembly and Bonaparte, so soon as the revolutionary crisis was weathered, and universal suffrage was abolished.

The Constitution had fixed the salary of Bonaparte at 600,000 francs. Barely half a year after his installation, he succeeded in raising this sum to its double: Odillon Barrot had wrung from the constitutive assembly a yearly allowance of 600,000 francs for so-called representation expenses. After June 13, Bonaparte hinted at similar solicitations, to which, however, Barrot then turned a deaf ear. Now, after May 31, he forthwith utilized the favorable moment, and caused his ministers to move a civil list of three millions in the National Assembly. A long adventurous, vagabond career had gifted him with the best developed antennae for feeling out the weak moments when he could venture upon squeezing money from his bourgeois. He carried on regular blackmail. The National Assembly had maimed the sovereignty of the people with his aid and his knowledge: he now threatened to denounce its crime to the tribunal of the people, if it did not pull out its purse and buy his silence with three millions annually. It had robbed three million Frenchmen of the suffrage: for every Frenchman thrown "out of circulation," he demanded a franc "in circulation." He, the elect of six million, demanded indemnity for the votes he had been subsequently cheated of. The Committee of the National Assembly turned the importunate fellow away. The Bonapartist press threatened: Could the National Assembly break with the President of the republic at a time when it had broken definitely and on principle with the mass of the nation? It rejected the annual civil list, but granted, for this once, an allowance of 2,160,000 francs. Thus it made itself guilty of the double weakness of granting the money, and, at the same time, showing by its anger that it did so only unwillingly. We shall presently see to what use Bonaparte put the money. After this aggravating after-play, that followed upon the heels of the abolition of universal suffrage, and in which Bonaparte exchanged his humble attitude of the days of the crisis of March and April for one of defiant impudence towards the usurping parliament, the National Assembly adjourned for three months, from August 11, to November 11. It left behind in its place a Permanent Committee of 18 members that contained no Bonapartist, but did contain a few moderate republicans. The Permanent Committee of the year 1849 had numbered only men of order and Bonapartists. At that time, however, the party of Order declared itself in

permanence against the revolution; now the parliamentary republic declared itself in permanence against the President. After the law of May 31, only this rival still confronted the party of Order.

When the National Assembly reconvened in November, 1850, instead of its former petty skirmishes with the President, a great headlong struggle, a struggle for life between the two powers, seemed to have become inevitable.

As in the year 1849, the party of Order had during this year's vacation, dissolved into its two separate factions, each occupied with its own restoration intrigues, which had received new impetus from the death of Louis Philippe. The Legitimist King, Henry V, had even appointed a regular Ministry, that resided in Paris, and in which sat members of the Permanent Committee. Hence, Bonaparte was, on his part, justified in making tours through the French Departments, and — according to the disposition of the towns that he happened to be gladdening with his presence — some times covertly, other times more openly blabbing out his own restoration plans, and gaining votes for himself. On these excursions, which the large official “Moniteur” and the small private “Moniteurs” of Bonaparte were, of course, bound to celebrate as triumphal marches, he was constantly accompanied by affiliated members of the “Society of December 10.” This society dated from the year 1849. Under the pretext of founding a benevolent association, the slum-proletariat of Paris was organized into secret sections, each section led by Bonapartist agents, with a Bonapartist General at the head of all. Along with ruined rouses of questionable means of support and questionable antecedents, along with the foul and adventures-seeking dregs of the bourgeoisie, there were vagabonds, dismissed soldiers, discharged convicts, runaway galley slaves, sharpers, jugglers, lazzaroni, pickpockets, sleight-of-hand performers, gamblers, procurers, keepers of disorderly houses, porters, literati, organ grinders, rag pickers, scissors grinders, tinkers, beggars — in short, that whole undefined, dissolute, kicked-about mass that the Frenchmen style “la Boheme.” With this kindred element, Bonaparte formed the stock of the “Society of December 10,” a “benevolent association” in so far as, like Bonaparte himself, all its members felt the need of being benevolent to themselves at the expense of the toiling nation. The Bonaparte, who here constitutes himself Chief of the Slum-Proletariat; who only here finds again in plenteous form the interests which he personally pursues; who, in this refuse, offal and wreck of all classes, recognizes the

only class upon which he can depend unconditionally; — this is the real Bonaparte, the Bonaparte without qualification. An old and crafty roue, he looks upon the historic life of nations, upon their great and public acts, as comedies in the ordinary sense, as a carnival, where the great costumes, words and postures serve only as masks for the pettiest chicaneries. So, on the occasion of his expedition against Strassburg when a trained Swiss vulture impersonated the Napoleonic eagle; so, again, on the occasion of his raid upon Boulogne, when he struck a few London lackeys into French uniform: they impersonated the army; [#1 Under the reign of Louis Philippe, Bonaparte made two attempts to restore the throne of Napoleon: one in October, 1836, in an expedition from Switzerland upon Strassburg and one in August, 1840, in an expedition from England upon Boulogne.] and so now, in his “Society of December 10,” he collects 10,000 loafers who are to impersonate the people as Snug the Joiner does the lion. At a period when the bourgeoisie itself is playing the sheerest comedy, but in the most solemn manner in the world, without doing violence to any of the pedantic requirements of French dramatic etiquette, and is itself partly deceived by, partly convinced of, the solemnity of its own public acts, the adventurer, who took the comedy for simple comedy, was bound to win. Only after he has removed his solemn opponent, when he himself takes seriously his own role of emperor, and, with the Napoleonic mask on, imagines he impersonates the real Napoleon, only then does he become the victim of his own peculiar conception of history — the serious clown, who no longer takes history for a comedy, but a comedy for history. What the national work-shops were to the socialist workingmen, what the “Gardes mobiles” were to the bourgeois republicans, that was to Bonaparte the “Society of December 10,” — a force for partisan warfare peculiar to himself. On his journeys, the divisions of the Society, packed away on the railroads, improvised an audience for him, performed public enthusiasm, shouted “vive l’Empereur,” insulted and clubbed the republicans, — all, of course, under the protection of the police. On his return stages to Paris, this rabble constituted his vanguard, it forestalled or dispersed counter-demonstrations. The “Society of December 10” belonged to him, it was his own handiwork, his own thought. Whatever else he appropriates, the power of circumstances places in his hands; whatever else he does, either circumstances do for him, or he is content to copy from the deeds of others, but he posing before the citizens with the official phrases about “Order,”

“Religion,” “Family,” “Property,” and, behind him, the secret society of skipjacks and picaroons, the society of disorder, of prostitution, and of theft, — that is Bonaparte himself as the original author; and the history of the “Society of December 10” is his own history. Now, then, it happened that Representatives belonging to the party of order occasionally got under the clubs of the Decembrists. Nay, more. Police Commissioner Yon, who had been assigned to the National Assembly, and was charged with the guardianship of its safety, reported to the Permanent Committee upon the testimony of one Alais, that a Section of the Decembrists had decided on the murder of General Changarnier and of Dupin, the President of the National Assembly, and had already settled upon the men to execute the decree. One can imagine the fright of Mr. Dupin. A parliamentary inquest over the “Society of December 10,” i. e., the profanation of the Bonapartist secret world now seemed inevitable. Just before the reconvening of the National Assembly, Bonaparte circumspectly dissolved his Society, of course, on paper only. As late as the end of 1851, Police Prefect Carlier vainly sought, in an exhaustive memorial, to move him to the real dissolution of the Decembrists.

The “Society of December 10” was to remain the private army of Bonaparte until he should have succeeded in converting the public Army into a “Society of December 10.” Bonaparte made the first attempt in this direction shortly after the adjournment of the National Assembly, and he did so with the money which he had just wrung from it. As a fatalist, he lives devoted to the conviction that there are certain Higher Powers, whom man, particularly the soldier, cannot resist. First among these Powers he numbers cigars and champagne, cold poultry and garlic-sausage. Accordingly, in the apartments of the Elysee, he treated first the officers and under-officers to cigars and champagne, to cold poultry and garlic-sausage. On October 3, he repeats this manoeuvre with the rank and file of the troops by the review of St. Maur; and, on October 10, the same manoeuvre again, upon a larger scale, at the army parade of Satory. The Uncle bore in remembrance the campaigns of Alexander in Asia: the Nephew bore in remembrance the triumphal marches of Bacchus in the same country. Alexander was, indeed, a demigod; but Bacchus was a full-fledged god, and the patron deity, at that, of the “Society of December 10.”

After the review of October 3, the Permanent Committee summoned the Minister of War, d’Hautpoul, before it. He promised that such breaches of

discipline should not recur. We have seen how, on October 10th, Bonaparte kept d'Hautpoul's word. At both reviews Changarnier had commanded as Commander-in-chief of the Army of Paris. He, at once member of the Permanent Committee, Chief of the National Guard, the "Savior" of January 29, and June 13, the "Bulwark of Society," candidate of the Party of Order for the office of President, the suspected Monk of two monarchies, — he had never acknowledged his subordination to the Minister of War, had ever openly scoffed at the republican Constitution, and had pursued Bonaparte with a protection that was ambiguously distinguished. Now he became zealous for the discipline in opposition to Bonaparte. While, on October 10, a part of the cavalry cried: "Vive Napoleon! Vivent les saucissons;" [#2 Long live Napoleon! Long live the sausages!] Changarnier saw to it that at least the infantry, which filed by under the command of his friend Neumeyer, should observe an icy silence. In punishment, the Minister of War, at the instigation of Bonaparte, deposed General Neumeyer from his post in Paris, under the pretext of providing for him as Commander-in-chief of the Fourteenth and Fifteenth Military Divisions. Neumeyer declined the exchange, and had, in consequence, to give his resignation. On his part, Changarnier published on November 2, an order, wherein he forbade the troops to indulge, while under arms, in any sort of political cries or demonstrations. The papers devoted to the Elysee interests attacked Changarnier; the papers of the party of Order attacked Bonaparte; the Permanent Committee held frequent secret sessions, at which it was repeatedly proposed to declare the fatherland in danger; the Army seemed divided into two hostile camps, with two hostile staffs; one at the Elysee, where Bonaparte, the other at the Tuileries, where Changarnier resided. All that seemed wanting for the signal of battle to sound was the convening of the National Assembly. The French public looked upon the friction between Bonaparte and Changarnier in the light of the English journalist, who characterized it in these words: "The political servant girls of France are mopping away the glowing lava of the revolution with old mops, and they scold each other while doing their work."

Meanwhile, Bonaparte hastened to depose the Minister of War, d'Hautpoul; to expedite him heels over head to Algiers; and to appoint in his place General Schramm as Minister of War. On November 12, he sent to the National Assembly a message of American excursiveness, overloaded with details, redolent of order, athirst for conciliation, resignful to the

Constitution, dealing with all and everything, only not with the burning questions of the moment. As if in passing he dropped the words that according to the express provisions of the Constitution, the President alone disposes over the Army. The message closed with the following high-sounding protestations:

“France demands, above all things, peace . . . Alone bound by an oath, I shall keep myself within the narrow bounds marked out by it to me . . . As to me, elected by the people, and owing my power to it alone, I shall always submit to its lawfully expressed will. Should you at this session decide upon the revision of the Constitution, a Constitutional Convention will regulate the position of the Executive power. If you do not, then, the people will, in 1852, solemnly announce its decision. But, whatever the solution may be that the future has in store, let us arrive at an understanding to the end that never may passion, surprise or violence decide over the fate of a great nation. . . . That which, above all, bespeaks my attention is, not who will, in 1852, rule over France, but to so devote the time at my disposal that the interval may pass by with-out agitation and disturbance. I have straightforwardly opened my heart to you, you will answer my frankness with your confidence, my good efforts with your co-operation. God will do the rest.”

The honnete, hypocritically temperate, commonplace-virtuous language of the bourgeoisie reveals its deep meaning in the mouth of the self-appointed ruler of the “Society of December 10,” and of the picnic-hero of St. Maur and Satory.

The burgraves of the party of Order did not for a moment deceive themselves on the confidence that this unbosoming deserved. They were long blase on oaths; they numbered among themselves veterans and virtuosi of perjury. The passage about the army did not, however, escape them. They observed with annoyance that the message, despite its prolix enumeration of the lately enacted laws, passed, with affected silence, over the most important of all, the election law, and, moreover, in case no revision of the Constitution was held, left the choice of the President, in 1852, with the people. The election law was the ball-and-chain to the feet of the party of Order, that hindered them from walking, and now assuredly from storming. Furthermore, by the official disbandment of the “Society of December 10,” and the dismissal of the Minister of War, d’Hautpoul, Bonaparte had, with his own hands, sacrificed the scapegoats on the altar of the fatherland. He

had turned off the expected collision. Finally, the party of Order itself anxiously sought to avoid every decisive conflict with the Executive, to weaken and to blur it over. Fearing to lose its conquests over the revolution, it let its rival gather the fruits thereof. "France demands, above all things, peace," with this language had the party of Order been apostrophizing the revolution, since February; with this language did Bonaparte's message now apostrophize the party of Order: "France demands, above all things, peace." Bonaparte committed acts that aimed at usurpation, but the party of Order committed a "disturbance of the peace," if it raised the hue and cry, and explained them hypochondriacally. The sausages of Satory were mouse-still when nobody talked about them; — France demands, above all things, "peace." Accordingly, Bonaparte demanded that he be let alone; and the parliamentary party was lamed with a double fear: the fear of re-conjuring up the revolutionary disturbance of the peace, and the fear of itself appearing as the disturber of the peace in the eyes of its own class, of the bourgeoisie. Seeing that, above all things, France demanded peace, the party of Order did not dare, after Bonaparte had said "peace" in his message, to answer "war." The public, who had promised to itself the pleasure of seeing great scenes of scandal at the opening of the National Assembly, was cheated out of its expectations. The opposition deputies, who demanded the submission of the minutes of the Permanent Committee over the October occurrences, were outvoted. All debate that might excite was fled from on principle. The labors of the National Assembly during November and December, 1850, were without interest.

Finally, toward the end of December, began a guerilla warfare about certain prerogatives of the parliament. The movement sank into the mire of petty chicaneries on the prerogative of the two powers, since, with the abolition of universal suffrage, the bourgeoisie had done away with the class struggle.

A judgment for debt had been secured against Manguin, one of the Representatives. Upon inquiry by the President of the Court, the Minister of Justice, Rouher, declared that an order of arrest should be made out without delay. Manguin was, accordingly, cast into the debtors' prison. The National Assembly bristled up when it heard of the "attentat." It not only ordered his immediate release, but had him forcibly taken out of Clichy the same evening by its own greffier. In order, nevertheless, to shield its belief in the "sacredness of private property," and also with the ulterior thought of

opening, in case of need, an asylum for troublesome Mountainers, it declared the imprisonment of a Representative for debt to be permissible upon its previous consent. It forgot to decree that the President also could be locked up for debt. By its act, it wiped out the last semblance of inviolability that surrounded the members of its own body.

It will be remembered that, upon the testimony of one Allais, Police Commissioner Yon had charged a Section of Decembrists with a plan to murder Dupin and Changarnier. With an eye upon that, the questors proposed at the very first session, that the parliament organize a police force of its own, paid for out of the private budget of the National Assembly itself, and wholly independent of the Police Prefects. The Minister of the Interior, Baroche, protested against this trespass on his preserves. A miserable compromise followed, according to which the Police Commissioner of the Assembly was to be paid out of its own private budget and was to be subject to the appointment and dismissal of its own questors, but only upon previous agreement with the Minister of the Interior. In the meantime Allais had been prosecuted by the Government. It was an easy thing in Court, to present his testimony in the light of a mystification, and, through the mouth of the Public Prosecutor, to throw Dupin, Changarnier, Yon, together with the whole National Assembly, into a ridiculous light. Thereupon, on December 29, Minister Baroche writes a letter to Dupin, in which he demands the dismissal of Yon. The Committee of the National Assembly decides to keep Yon in office; nevertheless, the National Assembly, frightened by its own violence in the affair of Mauguin, and accustomed, every time it has shied a blow at the Executive, to receive back from it two in exchange, does not sanction this decision. It dismisses Yon in reward for his zeal in office, and robs itself of a parliamentary prerogative, indispensable against a person who does not decide by night to execute by day, but decides by day and executes by night.

We have seen how, during the months of November and December, under great and severe provocations, the National Assembly evaded and refused the combat with the Executive power. Now we see it compelled to accept it on the smallest occasions. In the affair of Mauguin, it confirms in principle the liability of a Representative to imprisonment for debt, but to itself reserves the power of allowing the principle to be applied only to the Representatives whom it dislikes,-and for this infamous privilege we see it wrangling with the Minister of Justice. Instead of utilizing the alleged

murder plan to the end of fastening an inquest upon the “Society of December 10,” and of exposing Bonaparte beyond redemption before France and his true figure, as the head of the slum-proletariat of Paris, it allows the collision to sink to a point where the only issue between itself and the Minister of the Interior is. Who has jurisdiction over the appointment and dismissal of a Police Commissioner? Thus we see the party of Order, during this whole period, compelled by its ambiguous position to wear out and fritter away its conflict with the Executive power in small quarrels about jurisdiction, in chicaneries, in pettifoggings, in boundary disputes, and to turn the stalest questions of form into the very substance of its activity. It dares not accept the collision at the moment when it involves a principle, when the Executive power has really given itself a blank, and when the cause of the National Assembly would be the cause of the nation. It would thereby have issued to the nation an order of march; and it feared nothing so much as that the nation should move. Hence, on these occasions, it rejects the motions of the Mountain, and proceeds to the order of the day. After the issue has in this way lost all magnitude, the Executive power quietly awaits the moment when it can take it up again upon small and insignificant occasions; when, so to say, the issue offers only a parliamentary local interest. Then does the repressed valor of the party of Order break forth, then it tears away the curtain from the scene, then it denounces the President, then it declares the republic to be in danger, — but then all its pathos appears stale, and the occasion for the quarrel a hypocritical pretext, or not at all worth the effort. The parliamentary tempest becomes a tempest in a tea-pot, the struggle an intrigue, the collision a scandal. While the revolutionary classes gloat with sardonic laughter over the humiliation of the National Assembly — they, of course, being as enthusiastic for the prerogatives of the parliament as that body is for public freedom — the bourgeoisie, outside of the parliament, does not understand how the bourgeoisie, inside of the parliament, can squander its time with such petty bickerings, and can endanger peace by such wretched rivalries with the President. It is puzzled at a strategy that makes peace the very moment when everybody expects battles, and that attacks the very moment everybody believes peace has been concluded.

On December 20, Pascal Duprat interpellated the Minister of the Interior on the “Goldbar Lottery.” This lottery was a “Daughter from Elysium”; Bonaparte, together with his faithful, had given her birth; and Police Prefect

Carlier had placed her under his official protection, although the French law forbade all lotteries, with the exception of games for benevolent purposes. Seven million tickets, a franc a piece, and the profit ostensibly destined to the shipping of Parisian vagabonds to California. Golden dreams were to displace the Socialist dreams of the Parisian proletariat; the tempting prospect of a prize was to displace the doctrinal right to labor. Of course, the workingmen of Paris did not recognize in the lustre of the California gold bars the lack-lustre francs that had been wheedled out of their pockets. In the main, however, the scheme was an unmitigated swindle. The vagabonds, who meant to open California gold mines without taking the pains to leave Paris, were Bonaparte himself and his Round Table of desperate insolvents. The three millions granted by the National Assembly were rioted away; the Treasury had to be refilled somehow or another. In vain did Bonaparte open a national subscription, at the head of which he himself figured with a large sum, for the establishment of so-called “cites ouvrières.” [#3 Work cities.] The hard-hearted bourgeois waited, distrustful, for the payment of his own shares; and, as this, of course, never took place, the speculation in Socialist castles in the air fell flat. The gold bars drew better. Bonaparte and his associates did not content themselves with putting into their own pockets part of the surplus of the seven millions over and above the bars that were to be drawn; they manufactured false tickets; they sold, of Number 10 alone, fifteen to twenty lots — a financial operation fully in the spirit of the “Society of December 10”! The National Assembly did not here have before it the fictitious President of the Republic, but Bonaparte himself in flesh and blood. Here it could catch him in the act, not in conflict with the Constitution, but with the penal code. When, upon Duprat’s interpellation, the National Assembly went over to the order of the day, this did not happen simply because Girardin’s motion to declare itself “satisfied” reminded the party of Order of its own systematic corruption: the bourgeois, above all the bourgeois who has been inflated into a statesman, supplements his practical meanness with theoretical pompousness. As statesman, he becomes, like the Government facing him, a superior being, who can be fought only in a higher, more exalted manner.

Bonaparte-who, for the very reason of his being a “bohemian,” a princely slum-proletarian, had over the scampish bourgeois the advantage that he could carry on the fight after the Assembly itself had carried him with its own hands over the slippery ground of the military banquets, of the

reviews, of the “Society of December 10,” and, finally, of the penal code—now saw that the moment had arrived when he could move from the seemingly defensive to the offensive. He was but little troubled by the intermediate and trifling defeats of the Minister of Justice, of the Minister of War, of the Minister of the Navy, of the Minister of Finance, whereby the National Assembly indicated its growling displeasure. Not only did he prevent the Ministers from resigning, and thus recognizing the subordination of the executive power to the Parliament; he could now accomplish what during the vacation of the National Assembly he had commenced, the separation of the military power from the Assembly — the deposition of Changarnier.

An Elysee paper published an order, issued during the month of May, ostensibly to the First Military Division, and, hence, proceeding from Changarnier, wherein the officers were recommended, in case of an uprising, to give no quarter to the traitors in their own ranks, to shoot them down on the spot, and to refuse troops to the National Assembly, should it make a requisition for such. On January 3, 1851, the Cabinet was interpellated on this order. The Cabinet demands for the examination of the affair at first three months, then one week, finally only twenty-four hours’ time. The Assembly orders an immediate explanation. Changarnier rises and declares that this order never existed; he adds that he would ever hasten to respond to the calls of the National Assembly, and that, in case of a collision, they could count upon him. The Assembly receives his utterances with inexpressible applause, and decrees a vote of confidence to him. It thereby resigns its own powers; it decrees its own impotence and the omnipotence of the Army by committing itself to the private protection of a general. But the general, in turn, deceives himself when he places at the Assembly’s disposal and against Bonaparte a power that he holds only as a fief from that same Bonaparte, and when, on his part, he expects protection from this Parliament, from his protegee’, itself needful of protection. But Changarnier has faith in the mysterious power with which since January, 1849, he had been clad by the bourgeoisie. He takes himself for the Third Power, standing beside the other Powers of Government. He shares the faith of all the other heroes, or rather saints, of this epoch, whose greatness consists but in the interested good opinion that their own party holds of them, and who shrink into every-day figures so soon as circumstances invite them to perform miracles. Infidelity is, indeed, the deadly enemy of these

supposed heroes and real saints. Hence their virtuously proud indignation at the unenthusiastic wits and scoffers.

That same evening the Ministers were summoned to the Elysee; Bonaparte presses the removal of Changarnier; five Ministers refuse to sign the order; the “Moniteur” announces a Ministerial crisis; and the party of Order threatens the formation of a Parliamentary army under the command of Changarnier. The party of Order had the constitutional power hereto. It needed only to elect Changarnier President of the National Assembly in order to make a requisition for whatever military forces it needed for its own safety. It could do this all the more safely, seeing that Changarnier still stood at the head of the Army and of the Parisian National Guard, and only lay in wait to be summoned, together with the Army. The Bonapartist press did not even dare to question the right of the National Assembly to issue a direct requisition for troops; — a legal scruple, that, under the given circumstances, did not promise success. That the Army would have obeyed the orders of the National Assembly is probable, when it is considered that Bonaparte had to look eight days all over Paris to find two generals — Baraguay d’Hilliers and St. Jean d’Anglely — who declared themselves ready to countersign the order cashiering Changarnier. That, however, the party of Order would have found in its own ranks and in the parliament the requisite vote for such a decision is more than doubtful, when it is considered that, eight days later, 286 votes pulled away from it, and that, as late as December, 1851, at the last decisive hour, the Mountain rejected a similar proposition. Nevertheless, the burgraves might still have succeeded in driving the mass of their party to an act of heroism, consisting in feeling safe behind a forest of bayonets, and in accepting the services of the Army, which found itself deserted in its camp. Instead of this, the Messieurs Burgraves betook themselves to the Elysee on the evening of January 6, with the view of inducing Bonaparte, by means of politic words and considerations, to drop the removal of Changarnier. Him whom we must convince we recognize as the master of the situation. Bonaparte, made to feel secure by this step, appoints on January 12 a new Ministry, in which the leaders of the old, Fould and Baroche, are retained. St Jean d’Anglely becomes Minister of War; the “Moniteur” announces the decree cashiering Changarnier; his command is divided up between Baraguay d’Hilliers, who receives the First Division, and Perrot, who is placed over the National

Guard. The “Bulwark of Society” is turned down; and, although no dog barks over the event, in the Bourses the stock quotations rise.

By repelling the Army, that, in Changarnier’s person, put itself at its disposal, and thus irrevocably stood up against the President, the party of Order declares that the bourgeoisie has lost its vocation to reign. Already there was no parliamentary Ministry. By losing, furthermore, the handle to the Army and to the National Guard, what instrument of force was there left to the National Assembly in order to maintain both the usurped power of the parliament over the people, and its constitutional power over the President? None. All that was left to it was the appeal to peaceful principles, that itself had always explained as “general rules” merely, to be prescribed to third parties, and only in order to enable itself to move all the more freely. With the removal of Changarnier, with the transfer of the military power to Bonaparte, closes the first part of the period that we are considering, the period of the struggle between the party of Order and the Executive power. The war between the two powers is now openly declared; it is conducted openly; but only after the party of Order has lost both arms and soldier. With-out a Ministry, without any army, without a people, without the support of public opinion; since its election law of May 31, no longer the representative of the sovereign nation sans eyes, sans ears, sans teeth, sans everything, the National Assembly had gradually converted itself into a French Parliament of olden days, that must leave all action to the Government, and content itself with growling remonstrances “post festum.”

[#4 After the act is done; after the fact.]

The party of Order receives the new Ministry with a storm of indignation. General Bedeau calls to mind the mildness of the Permanent Committee during the vacation, and the excessive prudence with which it had renounced the privilege of disclosing its minutes. Now, the Minister of the Interior himself insists upon the disclosure of these minutes, that have now, of course, become dull as stagnant waters, reveal no new facts, and fall without making the slightest effect upon the blase public. Upon Remusat’s proposition, the National Assembly retreats into its Committees, and appoints a “Committee on Extraordinary Measures.” Paris steps all the less out of the ruts of its daily routine, seeing that business is prosperous at the time, the manufactories busy, the prices of cereals low, provisions abundant, the savings banks receiving daily new deposits. The “extraordinary measures,” that the parliament so noisily announced fizzle

out on January 18 in a vote of lack of confidence against the Ministry, without General Changarnier's name being even mentioned. The party of Order was forced to frame its motion in that way so as to secure the votes of the republicans, because, of all the acts of the Ministry, Changarnier's dismissal only was the very one they approved, while the party of Order cannot in fact, condemn the other Ministerial acts which it had itself dictated. The January 18 vote of lack of confidence was decided by 415 ayes against 286 nays. It was, accordingly put through by a coalition of the uncompromising Legitimists and Orleanists with the pure republicans and the Mountain. Thus it revealed the fact that, in its conflicts with Bonaparte, not only the Ministry, not only the Army, but also its independent parliamentary majority; that a troop of Representatives had deserted its camp out of a fanatic zeal for harmony, out of fear of fight, out of lassitude, out of family considerations for the salaries of relatives in office, out of speculations on vacancies in the Ministry (Odillon Barrot), or out of that unmitigated selfishness that causes the average bourgeois to be ever inclined to sacrifice the interests of his class to this or that private motive. The Bonapartist Representatives belonged from the start to the party of Order only in the struggle against the revolution. The leader of the Catholic party, Montalembert, already then threw his influence in the scale of Bonaparte, since he despaired of the vitality of the parliamentary party. Finally, the leaders of this party itself, Thiers and Berryer — the Orleanist and the Legitimist — were compelled to proclaim themselves openly as republicans; to admit that their heart favored royalty, but their head the republic; that their parliamentary republic was the only possible form for the rule of the bourgeoisie. Thus were they compelled to brand, before the eyes of the bourgeois class itself, as an intrigue — as dangerous as it was senseless — the restoration plans, which they continued to pursue indefatigably behind the back of the parliament.

The January 18 vote of lack of confidence struck the Ministers, not the President. But it was not the Ministry, it was the President who had deposed Changarnier. Should the party of Order place Bonaparte himself under charges? On account of his restoration hankerings? These only supplemented their own. On account of his conspiracy at the military reviews and of the "Society of December 10"? They had long since buried these subjects under simple orders of business. On account of the discharge of the hero of January 29 and June 13, of the man who, in May, 1850,

threatened, in case of riot, to set Paris on fire at all its four corners? Their allies of the Mountain and Cavaignac did not even allow them to console the fallen “Bulwark of Society” with an official testimony of their sympathy. They themselves could not deny the constitutional right of the President to remove a General. They stormed only because he made an unparliamentary use of his constitutional right. Had they not themselves constantly made an unconstitutional use of their parliamentary prerogative, notably by the abolition of universal suffrage? Consequently they were reminded to move exclusively within parliamentary bounds. Indeed, it required that peculiar disease, a disease that, since 1848, has raged over the whole continent, “Parliamentary Idiocy,” — that fetters those whom it infects to an imaginary world, and robs them of all sense, all remembrance, all understanding of the rude outside world; — it required this “Parliamentary Idiocy” in order that the party of Order, which had, with its own hands, destroyed all the conditions for parliamentary power, and, in its struggle with the other classes, was obliged to destroy them, still should consider its parliamentary victories as victories, and imagine it hit the President by striking his Ministers. They only afforded him an opportunity to humble the National Assembly anew in the eyes of the nation. On January 20, the “Moniteur” announced that the whole the dismissal of the whole Ministry was accepted. Under the pretext that none of the parliamentary parties had any longer the majority — as proved by the January 18 vote, that fruit of the coalition between mountain and royalists — , and, in order to await the re-formation of a majority, Bonaparte appointed a so-called transition Ministry, of whom no member belonged to the parliament-altogether wholly unknown and insignificant individuals; a Ministry of mere clerks and secretaries. The party of Order could now wear itself out in the game with these puppets; the Executive power no longer considered it worth the while to be seriously represented in the National Assembly. By this act Bonaparte concentrated the whole executive power all the more securely in his own person; he had all the freer elbow-room to exploit the same to his own ends, the more his Ministers became mere supernumeraries.

The party of Order, now allied with the Mountain, revenged itself by rejecting the Presidential endowment project of 1,800.000 francs, which the chief of the “Society of December 10” had compelled his Ministerial clerks to present to the Assembly. This time a majority of only 102 votes carried

the day accordingly since January 18, 27 more votes had fallen off: the dissolution of the party of Order was making progress. Lest any one might for a moment be deceived touching the meaning of its coalition with the Mountain, the party of Order simultaneously scorned even to consider a motion, signed by 189 members of the Mountain, for a general amnesty to political criminals. It was enough that the Minister of the Interior, one Baisse, declared that the national tranquility was only in appearance, in secret there reigned deep agitation, in secret, ubiquitous societies were organized, the democratic papers were preparing to reappear, the reports from the Departments were unfavorable, the fugitives of Geneva conducted a conspiracy via Lyons through the whole of southern France, France stood on the verge of an industrial and commercial crisis, the manufacturers of Roubaix were working shorter hours, the prisoners of Belle Isle had mutinied; — it was enough that even a mere Baisse should conjure up the “Red Spectre” for the party of Order to reject without discussion a motion that would have gained for the National Assembly a tremendous popularity, and thrown Bonaparte back into its arms. Instead of allowing itself to be intimidated by the Executive power with the perspective of fresh disturbances, the party of Order should rather have allowed a little elbow-room to the class struggle, in order to secure the dependence of the Executive upon itself. But it did not feel itself equal to the task of playing with fire.

Meanwhile, the so-called transition Ministry vegetated along until the middle of April. Bonaparte tired out and fooled the National Assembly with constantly new Ministerial combinations. Now he seemed to intend constructing a republican Ministry with Lamartine and Billault; then, a parliamentary one with the inevitable Odillon Barrot, whose name must never be absent when a dupe is needed; then again, a Legitimist, with Batismenil and Lenoist d’Azy; and yet again, an Orleansist, with Malleville. While thus throwing the several factions of the party of Order into strained relations with one another, and alarming them all with the prospect of a republican Ministry, together with the there-upon inevitable restoration of universal suffrage, Bonaparte simultaneously raises in the bourgeoisie the conviction that his sincere efforts for a parliamentary Ministry are wrecked upon the irreconcilable antagonism of the royalist factions. All the while the bourgeoisie was clamoring louder and louder for a “strong Government,” and was finding it less and less pardonable to leave France “without an

administration,” in proportion as a general commercial crisis seemed to be under way and making recruits for Socialism in the cities, as did the ruinously low price of grain in the rural districts. Trade became daily duller; the unemployed hands increased perceptibly; in Paris, at least 10,000 workingmen were without bread; in Rouen, Muehlhausen, Lyons, Roubaix, Tourcoign, St. Etienne, Elbeuf, etc., numerous factories stood idle. Under these circumstances Bonaparte could venture to restore, on April 11, the Ministry of January 18; Messieurs Rouher, Fould, Baroche, etc., reinforced by Mr. Leon Faucher, whom the constitutive assembly had, during its last days, unanimously, with the exception of five Ministerial votes, branded with a vote of censure for circulating false telegraphic dispatches. Accordingly, the National Assembly had won a victory on January 18 over the Ministry, it had, for the period of three months, been battling with Bonaparte, and all this merely to the end that, on April 11, Fould and Baroche should be able to take up the Puritan Faucher as third in their ministerial league.

In November, 1849, Bonaparte had satisfied himself with an Unparliamentary, in January, 1851, with an Extra-Parliamentary, on April 11, he felt strong enough to form an Anti-Parliamentary Ministry, that harmoniously combined within itself the votes of lack of confidence of both assemblies—the constitutive and the legislative, the republican and the royalist. This ministerial progression was a thermometer by which the parliament could measure the ebbing temperature of its own life. This had sunk so low by the end of April that, at a personal interview, Persigny could invite Changarnier to go over to the camp of the President. Bonaparte, he assured Changarnier, considered the influence of the National Assembly to be wholly annihilated, and already the proclamation was ready, that was to be published after the steadily contemplated, but again accidentally postponed “coup d’etat.” Changarnier communicated this announcement of its death to the leaders of the party of Order; but who was there to believe a bed-bug bite could kill? The parliament, however beaten, however dissolved, however death-tainted it was, could not persuade itself to see, in the duel with the grotesque chief of the “Society of December 10,” anything but a duel with a bed-bug. But Bonaparte answered the party of Order as Agesilaus did King Agis: “I seem to you an ant; but shall one day be a lion.”

VI

The coalition with the Mountain and the pure republicans, to which the party of Order found itself condemned in its fruitless efforts to keep possession of the military and to reconquer supreme control over the Executive power, proved conclusively that it had forfeited its independent parliamentary majority. The calendar and clock merely gave, on May 29, the signal for its complete dissolution. With May 29 commenced the last year of the life of the National Assembly. It now had to decide for the unchanged continuance or the revision of the Constitution. But a revision of the Constitution meant not only the definitive supremacy of either the bourgeoisie of the small traders' democracy, of either democracy or proletarian anarchy, of either a parliamentary republic or Bonaparte, it meant also either Orleans or Bourbon! Thus fell into the very midst of the parliament the apple of discord, around which the conflict of interests, that cut up the party of Order into hostile factions, was to kindle into an open conflagration. The party of Order was a combination of heterogeneous social substances. The question of revision raised a political temperature, in which the product was reduced to its original components.

The interest of the Bonapartists in the revision was simple: they were above all concerned in the abolition of Article 45, which forbade Bonaparte's reelection and the prolongation of his term. Not less simple seemed to be the position of the republicans; they rejected all revision, seeing in that only a general conspiracy against the republic; as they disposed over more than one-fourth of the votes in the National Assembly, and, according to the Constitution, a three-fourths majority was requisite to revise and to call a revisory convention, they needed only to count their own votes to be certain of victory. Indeed, they were certain of it.

Over and against these clear-cut positions, the party of Order found itself tangled in inextricable contradictions. If it voted against the revision, it endangered the "status quo," by leaving to Bonaparte only one expedient — that of violence and handing France over, on May 2, 1852, at the very time of election, a prey to revolutionary anarchy, with a President whose authority was at an end; with a parliament that the party had long ceased to own, and with a people that it meant to re-conquer. If it voted constitutionally for a revision, it knew that it voted in vain and would constitutionally have to go under before the veto of the republicans. If,

unconstitutionally, it pronounced a simple majority binding, it could hope to control the revolution only in case it surrendered unconditionally to the domination of the Executive power: it then made Bonaparte master of the Constitution, of the revision and of itself. A merely partial revision, prolonging the term of the President, opened the way to imperial usurpation; a general revision, shortening the existence of the republic, threw the dynastic claims into an inevitable conflict: the conditions for a Bourbon and those for an Orleanist restoration were not only different, they mutually excluded each other.

The parliamentary republic was more than a neutral ground on which the two factions of the French bourgeoisie — Legitimists and Orleanists, large landed property and manufacture — could lodge together with equal rights. It was the indispensable condition for their common reign, the only form of government in which their common class interest could dominate both the claims of their separate factions and all the other classes of society. As royalists, they relapsed into their old antagonism into the struggle for the overlordship of either landed property or of money; and the highest expression of this antagonism, its personification, were the two kings themselves, their dynasties. Hence the resistance of the party of Order to the recall of the Bourbons.

The Orleanist Representative Creton moved periodically in 1849, 1850 and 1851 the repeal of the decree of banishment against the royal families; as periodically did the parliament present the spectacle of an Assembly of royalists who stubbornly shut to their banished kings the door through which they could return home. Richard III murdered Henry VI, with the remark that he was too good for this world, and belonged in heaven. They declared France too bad to have her kings back again. Forced by the power of circumstances, they had become republicans, and repeatedly sanctioned the popular mandate that exiled their kings from France.

The revision of the Constitution, and circumstances compelled its consideration, at once made uncertain not only the republic itself, but also the joint reign of the two bourgeois factions; and it revived, with the possibility of the monarchy, both the rivalry of interests which these two factions had alternately allowed to preponderate, and the struggle for the supremacy of the one over the other. The diplomats of the party of Order believed they could allay the struggle by a combination of the two dynasties through a so-called fusion of the royalist parties and their respective royal

houses. The true fusion of the restoration and the July monarchy was, however, the parliamentary republic, in which the Orleanist and Legitimist colors were dissolved, and the bourgeois species vanished in the plain bourgeois, in the bourgeois genus. Now however, the plan was to turn the Orleanist Legitimist and the Legitimist Orleanist. The kingship, in which their antagonism was personified, was to incarnate their unity, the expression of their exclusive faction interests was to become the expression of their common class interest; the monarchy was to accomplish what only the abolition of two monarchies — the republic could and did accomplish. This was the philosopher's stone, for the finding of which the doctors of the party of Order were breaking their heads. As though the Legitimate monarchy ever could be the monarchy of the industrial bourgeoisie, or the bourgeois monarchy the monarchy of the hereditary landed aristocracy! As though landed property and industry could fraternize under one crown, where the crown could fall only upon one head, the head of the older or the younger brother! As though industry could at all deal upon a footing of equality with landed property, so long as landed property did not decide itself to become industrial. If Henry V were to die tomorrow, the Count of Paris would not, therefore, become the king of the Legitimists, unless he ceased to be the King of the Orleanists. Nevertheless, the fusion philosophers, who became louder in the measure that the question of revision stepped to the fore, who had provided themselves with a daily organ in the "Assemblée Nationale," who, even at this very moment (February, 1852) are again at work, explained the whole difficulty by the opposition and rivalries of the two dynasties. The attempts to reconcile the family of Orleans with Henry V., begun since the death of Louis Philippe, but, as all these dynastic intrigues carried on only during the vacation of the National Assembly, between acts, behind the scenes, more as a sentimental coquetry with the old superstition than as a serious affair, were now raised by the party of Order to the dignity of a great State question, and were conducted upon the public stage, instead of, as heretofore in the amateurs' theater. Couriers flew from Paris to Venice, from Venice to Claremont, from Claremont to Paris. The Duke of Chambord issues a manifesto in which he announces not his own, but the "national" restoration, "with the aid of all the members of his family." The Oleanist Salvandy throws himself at the feet of Henry V. The Legitimist leaders Berryer, Benoit d'Azy, St. Priest travel to Claremont, to persuade the Orleans; but in vain. The fusionists

learn too late that the interests of the two bourgeois factions neither lose in exclusiveness nor gain in pliancy where they sharpen to a point in the form of family interests, of the interests of the two royal houses. When Henry V. recognized the Count of Paris as his successor — the only success that the fusion could at best score — the house of Orleans acquired no claim that the childlessness of Henry V. had not already secured to it; but, on the other hand, it lost all the claims that it had conquered by the July revolution. It renounced its original claims, all the title, that, during a struggle nearly one hundred years long, it had wrested from the older branch of the Bourbons; it bartered away its historic prerogative, the prerogative of its family-tree. Fusion, accordingly, amounted to nothing else than the resignation of the house of Orleans, its Legitimist resignation, a repentful return from the Protestant State Church into the Catholic; — a return, at that, that did not even place it on the throne that it had lost, but on the steps of the throne on which it was born. The old Orleanist Ministers Guizot, Duchatel, etc., who likewise hastened to Claremont, to advocate the fusion, represented in fact only the nervous reaction of the July monarchy; despair, both in the citizen kingdom and the kingdom of citizens; the superstitious belief in legitimacy as the last amulet against anarchy. Mediators, in their imagination, between Orleans and Bourbon, they were in reality but apostate Orleanists, and as such were they received by the Prince of Joinville. The virile, bellicose part of the Orleanists, on the contrary — Thiers, Baze, etc. — , persuaded the family of Louis Philippe all the easier that, seeing every plan for the immediate restoration of the monarchy presupposed the fusion of the two dynasties, and every plan for fusion the resignation of the house of Orleans, it corresponded, on the contrary, wholly with the tradition of its ancestors to recognize the republic for the time being, and to wait until circumstances permitted I the conversion of the Presidential chair into a throne. Joinville's candidacy was set afloat as a rumor, public curiosity was held in suspense, and a few months later, after the revision was rejected, openly proclaimed in September.

Accordingly, the essay of a royalist fusion between Orleanists and Legitimists did not miscarry only, it broke up their parliamentary fusion, the republican form that they had adopted in common, and it decomposed the party of Order into its original components. But the wider the breach became between Venice and Claremont, the further they drifted away from each I other, and the greater the progress made by the Joinville agitation, all

the more active and earnest became the negotiations between Faucher, the Minister of Bonaparte, and the Legitimists.

The dissolution of the party of Order went beyond its original elements. Each of the two large factions fell in turn into new fragments. It was as if all the old political shades, that formerly fought and crowded one another within each of the two circles — be it that of the Legitimists or that of the Orleanists —, had been thawed out like dried infusoria by contact with water; as if they had recovered enough vitality to build their own groups and assert their own antagonisms. The Legitimists dreamed they were back amidst the quarrels between the Tuileries and the pavilion Marsan, between Villele and Polignac; the Orleanists lived anew through the golden period of the tourneys between Guizot, Mole, Broglie, Thiers, and Odillon Barrot.

That portion of the party of Order — eager for a revision of the Constitution but disagreed upon the extent of revision — made up of the Legitimists under Berryer and Falloux and of those under Laroche Jacquelin, together with the tired-out Orleanists under Mole, Broglie, Montalembert and Odillon Barrot, united with the Bonapartist Representatives in the following indefinite and loosely drawn motion:

“The undersigned Representatives, with the end in view of restoring to the nation the full exercise of her sovereignty, move that the Constitution be revised.”

At the same time, however, they unanimously declared through their spokesman, Tocqueville, that the National Assembly had not the right to move the abolition of the republic, that right being vested only in a Constitutional Convention. For the rest, the Constitution could be revised only in a “legal” way, that is to say, only in case a three-fourths majority decided in favor of revision, as prescribed by the Constitution. After a six days’ stormy debate, the revision was rejected on July 19, as was to be foreseen. In its favor 446 votes were cast, against it 278. The resolute Oleanists, Thiers, Changarnier, etc., voted with the republicans and the Mountain.

Thus the majority of the parliament pronounced itself against the Constitution, while the Constitution itself pronounced itself for the minority, and its decision binding. But had not the party of Order on May 31, 1850, had it not on June 13, 1849, subordinated the Constitution to the parliamentary majority? Did not the whole republic they had been hitherto having rest upon the subordination of the Constitutional clauses to the

majority decisions of the parliament? Had they not left to the democrats the Old Testament superstitious belief in the letter of the law, and had they not chastised the democrats therefor? At this moment, however, revision meant nothing else than the continuance of the Presidential power, as the continuance of the Constitution meant nothing else than the deposition of Bonaparte. The parliament had pronounced itself for him, but the Constitution pronounced itself against the parliament. Accordingly, he acted both in the sense of the parliament when he tore up the Constitution, and in the sense of the Constitution when he chased away the parliament.

The parliament pronounced the Constitution, and, thereby, also, its own reign, “outside of the pale of the majority”; by its decision, it repealed the Constitution, and continued the Presidential power, and it at once declared that neither could the one live nor the other die so long as itself existed. The feet of those who were to bury it stood at the door. While it was debating the subject of revision, Bonaparte removed General Baraguay d’Hilliers, who showed himself irresolute, from the command of the First Military Division, and appointed in his place General Magnan, the conqueror of Lyon; the hero of the December days, one of his own creatures, who already under Louis Philippe, on the occasion of the Boulogne expedition, had somewhat compromised himself in his favor.

By its decision on the revision, the party of Order proved that it knew neither how to rule nor how to obey; neither how to live nor how to die; neither how to bear with the republic nor how to overthrow it; neither how to maintain the Constitution nor how to throw it overboard; neither how to co-operate with the President nor how to break with him. From what quarter did it then, look to for the solution of all the existing perplexities? From the calendar, from the course of events. It ceased to assume the control of events. It, accordingly, invited events to don its authority and also the power to which in its struggle with the people, it had yielded one attribute after another until it finally stood powerless before the same. To the end that the Executive be able all the more freely to formulate his plan of campaign against it, strengthen his means of attack, choose his tools, fortify his positions, the party of Order decided, in the very midst of this critical moment, to step off the stage, and adjourn for three months, from August 10 to November 4.

Not only was the parliamentary party dissolved into its two great factions, not only was each of these dissolved within itself, but the party of

Order, inside of the parliament, was at odds with the party of Order, outside of the parliament. The learned speakers and writers of the bourgeoisie, their tribunes and their press, in short, the ideologists of the bourgeoisie and the bourgeoisie itself, the representatives and the represented, stood estranged from, and no longer understood one another.

The Legitimists in the provinces, with their cramped horizon and their boundless enthusiasm, charged their parliamentary leaders Berryer and Falloux with desertion to the Bonapartist camp, and with apostacy from Henry V. Their lily-mind [#1 An allusion to the lilies of the Bourbon coat-of-arms] believed in the fall of man, but not in diplomacy.

More fatal and completer, though different, was the breach between the commercial bourgeoisie and its politicians. It twitted them, not as the Legitimists did theirs, with having apostatized from their principle, but, on the contrary, with adhering to principles that had become useless.

I have already indicated that, since the entry of Fould in the Ministry, that portion of the commercial bourgeoisie that had enjoyed the lion's share in Louis Philippe's reign, to-wit, the aristocracy of finance, had become Bonapartist. Fould not only represented Bonaparte's interests at the Bourse, he represented also the interests of the Bourse with Bonaparte. A passage from the London "Economist," the European organ of the aristocracy of finance, described most strikingly the attitude of this class. In its issue of February 1, 1851, its Paris correspondent writes: "Now we have it stated from numerous quarters that France wishes above all things for repose. The President declares it in his message to the Legislative Assembly; it is echoed from the tribune; it is asserted in the journals; it is announced from the pulpit; it is demonstrated by the sensitiveness of the public funds at the least prospect of disturbance, and their firmness the instant it is made manifest that the Executive is far superior in wisdom and power to the factious ex-officials of all former governments."

In its issue of November 29, 1851, the "Economist" declares editorially: "The President is now recognized as the guardian of order on every Stock Exchange of Europe." Accordingly, the Aristocracy of Finance condemned the parliamentary strife of the party of Order with the Executive as a "disturbance of order," and hailed every victory of the President over its reputed representatives as a "victory of order." Under "aristocracy of finance" must not, however, be understood merely the large bond negotiators and speculators in government securities, of whom it may be

readily understood that their interests and the interests of the Government coincide. The whole modern money trade, the whole banking industry, is most intimately interwoven with the public credit. Part of their business capital requires to be invested in interest-bearing government securities that are promptly convertible into money; their deposits, i. e., the capital placed at their disposal and by them distributed among merchants and industrial establishments, flow partly out of the dividends on government securities. The whole money market, together with the priests of this market, is part and parcel of this “aristocracy of finance” at every epoch when the stability of the government is to them synonymous with “Moses and his prophets.” This is so even before things have reached the present stage when every deluge threatens to carry away the old governments themselves.

But the industrial Bourgeoisie also, in its fanaticism for order, was annoyed at the quarrels of the Parliamentary party of Order with the Executive. Thiers, Anglas, Sainte Beuve, etc., received, after their vote of January 18, on the occasion of the discharge of Changarnier, public reprimands from their constituencies, located in the industrial districts, branding their coalition with the Mountain as an act of high treason to the cause of order. Although, true enough, the boastful, vexatious and petty intrigues, through which the struggle of the party of Order with the President manifested itself, deserved no better reception, yet notwithstanding, this bourgeois party, that expects of its representatives to allow the military power to pass without resistance out of the hands of their own Parliament into those of an adventurous Pretender, is not worth even the intrigues that were wasted in its behalf. It showed that the struggle for the maintenance of their public interests, of their class interests, of their political power only incommoded and displeased them, as a disturbance of their private business.

The bourgeois dignitaries of the provincial towns, the magistrates, commercial judges, etc., with hardly any exception, received Bonaparte everywhere on his excursions in the most servile manner, even when, as in Dijon, he attacked the National Assembly and especially the party of Order without reserve.

Business being brisk, as still at the beginning of 1851, the commercial bourgeoisie stormed against every Parliamentary strife, lest business be put out of temper. Business being dull, as from the end of February, 1851, on, the bourgeoisie accused the Parliamentary strifes as the cause of the stand-

still, and clamored for quiet in order that business may revive. The debates on revision fell just in the bad times. Seeing the question now was the to be or not to be of the existing form of government, the bourgeoisie felt itself all the more justified in demanding of its Representatives that they put an end to this tormenting provisional status, and preserve the "status quo." This was no contradiction. By putting an end to the provisional status, it understood its continuance, the indefinite putting off of the moment when a final decision had to be arrived at. The "status quo" could be preserved in only one of two ways: either by the prolongation of Bonaparte's term of office or by his constitutional withdrawal and the election of Cavaignac. A part of the bourgeoisie preferred the latter solution, and knew no better advice to give their Representatives than to be silent, to avoid the burning point. If their Representatives did not speak, so argued they, Bonaparte would not act. They desired an ostrich Parliament that would hide its head, in order not to be seen. Another part of the bourgeoisie preferred that Bonaparte, being once in the Presidential chair, be left in the Presidential chair, in order that everything might continue to run in the old ruts. They felt indignant that their Parliament did not openly break the Constitution and resign without further ado. The General Councils of the Departments, these provisional representative bodies of the large bourgeoisie, who had adjourned during the vacation of the National Assembly since August 25, pronounced almost unanimously for revision, that is to say, against the Parliament and for Bonaparte.

Still more unequivocally than in its falling out with its Parliamentary Representatives, did the bourgeoisie exhibit its wrath at its literary Representatives, its own press. The verdicts of the bourgeois juries, inflicting excessive fines and shameless sentences of imprisonment for every attack of the bourgeois press upon the usurping aspirations of Bonaparte, for every attempt of the press to defend the political rights of the bourgeoisie against the Executive power, threw, not France alone, but all Europe into amazement.

While on the one hand, as I have indicated, the Parliamentary party of Order ordered itself to keep the peace by screaming for peace; and while it pronounced the political rule of the bourgeoisie irreconcilable with the safety and the existence of the bourgeoisie, by destroying with its own hands in its struggle with the other classes of society all the conditions for its own, the Parliamentary regime; on the other hand, the mass of the

bourgeoisie, outside of the Parliament, urged Bonaparte — by its servility towards the President, by its insults to the Parliament, by the brutal treatment of its own press — to suppress and annihilate its speaking and writing organs, its politicians and its literati, its orators' tribune and its press, to the end that, under the protection of a strong and unhampered Government, it might ply its own private pursuits in safety. It declared unmistakably that it longed to be rid of its own political rule, in order to escape the troubles and dangers of ruling.

And this bourgeoisie, that had rebelled against even the Parliamentary and literary contest for the supremacy of its own class, that had betrayed its leaders in this contest, it now has the effrontery to blame the proletariat for not having risen in its defence in a bloody struggle, in a struggle for life! Those bourgeois, who at every turn sacrificed their common class interests to narrow and dirty private interests, and who demanded a similar sacrifice from their own Representatives, now whine that the proletariat has sacrificed their idea-political to its own material interests! This bourgeois class now strikes the attitude of a pure soul, misunderstood and abandoned, at a critical moment, by the proletariat, that has been misled by the Socialists. And its cry finds a general echo in the bourgeois world. Of course, I do not refer to German crossroad politicians and kindred blockheads. I refer, for instance, to the "Economist," which, as late as November 29, 1851, that is to say, four days before the "coup d'etat" pronounced Bonaparte the "Guardian of Order" and Thiers and Berryer "Anarchists," and as early as December 27, 1851, after Bonaparte had silenced those very Anarchists, cries out about the treason committed by "the ignorant, untrained and stupid proletaires against the skill, knowledge, discipline, mental influence, intellectual resources and moral weight of the middle and upper ranks." The stupid, ignorant and contemptible mass was none other than the bourgeoisie itself.

France had, indeed; experienced a sort of commercial crisis in 1851. At the end of February, there was a falling off of exports as compared with 1850; in March, business languished and factories shut down; in April, the condition of the industrial departments seemed as desperate as after the February days; in May, business did not yet pick up; as late as June 28, the reports of the Bank of France revealed through a tremendous increase of deposits and an equal decrease of loans on exchange notes, the standstill of production; not until the middle of October did a steady improvement of

business set in. The French bourgeoisie accounted for this stagnation of business with purely political reasons; it imputed the dull times to the strife between the Parliament and the Executive power, to the uncertainty of a provisional form of government, to the alarming prospects of May 2, 1852. I shall not deny that all these causes did depress some branches of industry in Paris and in the Departments. At any rate, this effect of political circumstances was only local and trifling. Is there any other proof needed than that the improvement in business set in at the very time when the political situation was growing worse, when the political horizon was growing darker, and when at every moment a stroke of lightning was expected out of the Elysee — in the middle of October? The French bourgeois, whose “skill, knowledge, mental influence and intellectual resources,” reach no further than his nose, could, moreover, during the whole period of the Industrial Exposition in London, have struck with his nose the cause of his own business misery. At the same time that, in France, the factories were being closed, commercial failures broke out in England. While the industrial panic reached its height during April and May in France, in England the commercial panic reached its height in April and May. The same as the French, the English woolen industries suffered, and, as the French, so did the English silk manufacture. Though the English cotton factories went on working, it, nevertheless, was not with the same old profit of 1849 and 1850. The only difference was this: that in France, the crisis was an industrial, in England it was a commercial one; that while in France the factories stood still, they spread themselves in England, but under less favorable circumstances than they had done the years just previous; that, in France, the export, in England, the import trade suffered the heaviest blows. The common cause, which, as a matter of fact, is not to be looked for with-in the bounds of the French political horizon, was obvious. The years 1849 and 1850 were years of the greatest material prosperity, and of an overproduction that did not manifest itself until 1851. This was especially promoted at the beginning of 1851 by the prospect of the Industrial Exposition; and, as special causes, there were added, first, the failure of the cotton crop of 1850 and 1851; second, the certainty of a larger cotton crop than was expected: first, the rise, then the sudden drop; in short, the oscillations of the cotton market. The crop of raw silk in France had been below the average. Finally, the manufacture of woolen goods had received such an increment since 1849, that the production of wool could

not keep step with it, and the price of the raw material rose greatly out of proportion to the price of the manufactured goods. Accordingly, we have here in the raw material of three staple articles a threefold material for a commercial crisis. Apart from these special circumstances, the seeming crisis of the year 1851 was, after all, nothing but the halt that overproduction and overspeculation make regularly in the course of the industrial cycle, before pulling all their forces together in order to rush feverishly over the last stretch, and arrive again at their point of departure — the General Commercial Crisis. At such intervals in the history of trade, commercial failures break out in England, while, in France, industry itself is stopped, partly because it is compelled to retreat through the competition of the English, that, at such times becomes resistless in all markets, and partly because, as an industry of luxuries, it is affected with preference by every stoppage of trade. Thus, besides the general crisis, France experiences her own national crises, which, how-ever, are determined by and conditioned upon the general state of the world's market much more than by local French influences. It will not be devoid of interest to contrast the prejudgment of the French bourgeois with the judgment of the English bourgeois. One of the largest Liverpool firms writes in its yearly report of trade for 1851: "Few years have more completely disappointed the expectations entertained at their beginning than the year that has just passed; instead of the great prosperity, that was unanimously looked forward to, it proved itself one of the most discouraging years during the last quarter of a century. This applies, of course, only to the mercantile, not to the industrial classes. And yet, surely there were grounds at the beginning of the year from which to draw a contrary conclusion; the stock of products was scanty, capital was abundant, provisions cheap, a rich autumn was assured, there was uninterrupted peace on the continent and no political and financial disturbances at home; indeed, never were the wings of trade more unshackled. . . . What is this unfavorable result to be ascribed to? We believe to excessive trade in imports as well as exports. If our merchants do not themselves rein in their activity, nothing can keep us going, except a panic every three years."

Imagine now the French bourgeois, in the midst of this business panic, having his trade-sick brain tortured, buzzed at and deafened with rumors of a "coup d'etat" and the restoration of universal suffrage; with the struggle between the Legislature and the Executive; with the Fronde warfare

between Orleanists and Legitimists; with communistic conspiracies in southern France; with alleged Jacqueries [#2 Peasant revolts] in the Departments of Nièvre and Cher; with the advertisements of the several candidates for President; with “social solutions” huckstered about by the journals; with the threats of the republicans to uphold, arms in hand, the Constitution and universal suffrage; with the gospels, according to the emigrant heroes “in partibus,” who announced the destruction of the world for May 2, — imagine that, and one can understand how the bourgeois, in this unspeakable and noisy confusion of fusion, revision, prorogation, constitution, conspiracy, coalition, emigration, usurpation and revolution, blurts out at his parliamentary republic: “Rather an End With Fright, Than a Fright Without End.”

Bonaparte understood this cry. His perspicacity was sharpened by the growing anxiety of the creditors’ class, who, with every sunset, that brought nearer the day of payment, the 2d of May, 1852, saw in the motion of the stars a protest against their earthly drafts. They had become regular astrologers. The National Assembly had cut off Bonaparte’s hope of a constitutional prolongation of his term; the candidature of the Prince of Joinville tolerated no further vacillation.

If ever an event cast its shadow before it long before its occurrence, it was Bonaparte’s “coup d’etat.” Already on January 29, 1849, barely a month after his election, he had made to Changarnier a proposition to that effect. His own Prime Minister, Odillon Barrot, had covertly, in 1849, and Thiers openly in the winter of 1850, revealed the scheme of the “coup d’etat.” In May, 1851, Persigny had again sought to win Changarnier over to the “coup,” and the “*Messenger de l’Assemblée*” newspaper had published this conversation. At every parliamentary storm, the Bonapartist papers threatened a “coup,” and the nearer the crisis approached, all the louder grew their tone. At the orgies, that Bonaparte celebrated every night with a swell mob of males and females, every time the hour of midnight drew nigh and plenteous libations had loosened the tongues and heated the minds of the revelers, the “coup” was resolved upon for the next morning. Swords were then drawn, glasses clinked, the Representatives were thrown out at the windows, the imperial mantle fell upon the shoulders of Bonaparte, until the next morning again drove away the spook, and astonished Paris learned, from not very reserved Vestals and indiscreet Paladins, the danger it had once more escaped. During the months of

September and October, the rumors of a “coup d’etat” tumbled close upon one another’s heels. At the same time the shadow gathered color, like a confused daguerreotype. Follow the issues of the European daily press for the months of September and October, and items like this will be found literally:

“Rumors of a ‘coup’ fill Paris. The capital, it is said, is to be filled with troops by night and the next morning decrees are to be issued dissolving the National Assembly, placing the Department of the Seine in state of siege restoring universal suffrage, and appealing to the people. Bonaparte is rumored to be looking for Ministers to execute these illegal decrees.”

The newspaper correspondence that brought this news always close ominously with “postponed.” The “coup” was ever the fixed idea of Bonaparte. With this idea he had stepped again upon French soil. It had such full possession of him that he was constantly betraying and blabbing it out. He was so weak that he was as constantly giving it up again. The shadow of the “coup” had become so familiar a spectre to the Parisians, that they refused to believe it when it finally did appear in flesh and blood. Consequently, it was neither the reticent backwardness of the chief of the “Society of December 10,” nor an unthought of surprise of the National Assembly that caused the success of the “coup.” When it succeeded, it did so despite his indiscretion and with its anticipation — a necessary, unavoidable result of the development that had preceded.

On October 10, Bonaparte announced to his Ministers his decision to restore universal suffrage; on the 16th day they handed in their resignations; on the 26th Paris learned of the formation of the Thorigny Ministry. The Prefect of Police, Carlier, was simultaneously replaced by Maupas; and the chief of the First Military Division Magnan, concentrated the most reliable regiments in the capital. On November 4, the National Assembly re-opened its sessions. There was nothing left for it to do but to repeat, in short recapitulation, the course it had traversed, and to prove that it had been buried only after it had expired. The first post that it had forfeited in the struggle with the Executive was the Ministry. It had solemnly to admit this loss by accepting as genuine the Thorigny Ministry, which was but a pretence. The permanent Committee had received Mr. Giraud with laughter when he introduced himself in the name of the new Ministers. So weak a Ministry for so strong a measure as the restoration of universal suffrage!

The question, however, then was to do nothing in, everything against the parliament.

On the very day of its re-opening, the National Assembly received the message from Bonaparte demanding the restoration of universal suffrage and the repeal of the law of May 31, 1850. On the same day, his Ministers introduced a decree to that effect. The Assembly promptly rejected the motion of urgency made by the Ministers, but repealed the law itself, on November 13, by a vote of 355 against 348. Thus it once more tore to pieces its own mandate, once more certified to the fact that it had transformed itself from a freely chosen representative body of the nation into the usurpatory parliament of a class; it once more admitted that it had itself severed the muscles that connected the parliamentary head with the body of the nation.

While the Executive power appealed from the National Assembly to the people by its motion for the restoration of universal suffrage, the Legislative power appealed from the people to the Army by its "Questors' Bill." This bill was to establish its right to immediate requisitions for troops, to build up a parliamentary army. By thus appointing the Army umpire between itself and the people, between itself and Bonaparte; by thus recognizing the Army as the decisive power in the State, the National Assembly was constrained to admit that it had long given up all claim to supremacy. By debating the right to make requisitions for troops, instead of forthwith collecting them, it betrayed its own doubts touching its own power. By thus subsequently rejecting the "Questors' Bill," it publicly confessed its impotence. The bill fell through with a minority of 108 votes; the Mountain had, accordingly, thrown the casting vote. It now found itself in the predicament of Buridan's donkey, not, indeed, between two sacks of hay, forced to decide which of the two was the more attractive, but between two showers of blows, forced to decide which of the two was the harder; fear of Changarnier, on one side, fear of Bonaparte, on the other. It must be admitted the position was not a heroic one.

On November 18, an amendment was moved to the Act, passed by the party of Order, on municipal elections to the effect that, instead of three years, a domicile of one year should suffice. The amendment was lost by a single vote — but this vote, it soon transpired, was a mistake. Owing to the divisions within its own hostile factions, the party of Order had long since forfeited its independent parliamentary majority. It was now plain that there

was no longer any majority in the parliament. The National Assembly had become impotent even to decide. Its atomic parts were no longer held together by any cohesive power; it had expended its last breath, it was dead.

Finally, the mass of the bourgeoisie outside of the parliament was once more solemnly to confirm its rupture with the bourgeoisie inside of the parliament a few days before the catastrophe. Thiers, as a parliamentary hero conspicuously smitten by that incurable disease — Parliamentary Idiocy — , had hatched out jointly with the Council of State, after the death of the parliament, a new parliamentary intrigue in the shape of a “Responsibility Law,” that was intended to lock up the President within the walls of the Constitution. The same as, on September 15, Bonaparte bewitched the fishwives, like a second Massaniello, on the occasion of laying the corner-stone for the Market of Paris, — though, it must be admitted, one fishwife was equal to seventeen Burgraves in real power — ; the same as, after the introduction of the “Questors’ Bill,” he enthused the lieutenants, who were being treated at the Elysee; — so, likewise, did he now, on November 25, carry away with him the industrial bourgeoisie, assembled at the Circus, to receive from his hands the prize-medals that had been awarded at the London Industrial Exposition. I here reproduce the typical part of his speech, from the “Journal des Debats”:

“With such un hoped for successes, I am justified to repeat how great the French republic would be if she were only allowed to pursue her real interests, and reform her institutions, instead of being constantly disturbed in this by demagogues, on one side, and, on the other, by monarchic hallucinations. (Loud, stormy and continued applause from all parts of the amphitheater). The monarchic hallucinations hamper all progress and all serious departments of industry. Instead of progress, we have struggle only. Men, formerly the most zealous supporters of royal authority and prerogative, become the partisans of a convention that has no purpose other than to weaken an authority that is born of universal suffrage. (Loud and prolonged applause). We see men, who have suffered most from the revolution and complained bitterest of it, provoking a new one for the sole purpose of putting fetters on the will of the nation. . . . I promise you peace for the future.” (Bravo! Bravo! Stormy bravos.)

Thus the industrial bourgeoisie shouts its servile “Bravo!” to the “coup d’etat” of December 2, to the destruction of the parliament, to the downfall of their own reign, to the dictatorship of Bonaparte. The rear of the applause

of November 25 was responded to by the roar of cannon on December 4, and the house of Mr. Sallandrouze, who had been loudest in applauding, was the one demolished by most of the bombs.

Cromwell, when he dissolved the Long Parliament, walked alone into its midst, pulled out his watch in order that the body should not continue to exist one minute beyond the term fixed for it by him, and drove out each individual member with gay and humorous invectives. Napoleon, smaller than his prototype, at least went on the 18th Brumaire into the legislative body, and, though in a tremulous voice, read to it its sentence of death. The second Bonaparte, who, moreover, found himself in possession of an executive power very different from that of either Cromwell or Napoleon, did not look for his model in the annals of universal history, but in the annals of the "Society of December 10," in the annals of criminal jurisprudence. He robs the Bank of France of twenty-five million francs; buys General Magnan with one million and the soldiers with fifteen francs and a drink to each; comes secretly together with his accomplices like a thief by night; has the houses of the most dangerous leaders in the parliament broken into; Cavagnac, Lamoriciere, Leflo, Changarnier, Charras, Thiers, Baze, etc., taken out of their beds; the principal places of Paris, the building of the parliament included, occupied with troops; and, early the next morning, loud-sounding placards posted on all the walls proclaiming the dissolution of the National Assembly and of the Council of State, the restoration of universal suffrage, and the placing of the Department of the Seine under the state of siege. In the same way he shortly after sneaked into the "Moniteur" a false document, according to which influential parliamentary names had grouped themselves round him in a Committee of the Nation.

Amidst cries of "Long live the Republic!", the rump-parliament, assembled at the Mayor's building of the Tenth Arrondissement, and composed mainly of Legitimists and Orleanists, resolves to depose Bonaparte; it harangues in vain the gaping mass gathered before the building, and is finally dragged first, under the escort of African sharpshooters, to the barracks of Orsay, and then bundled into convicts' wagons and transported to the prisons of Mazas, Ham and Vincennes. Thus ended the party of Order, the Legislative Assembly and the February revolution.

Before hastening to the end, let us sum up shortly the plan of its history:

I. — First Period. From February 24 to May 4, 1848. February period. Prologue. Universal fraternity swindle.

II. — Second Period. Period in which the republic is constituted, and of the Constitutive National Assembly.

1. May 4 to June 25, 1848. Struggle of all the classes against the house of Mr. proletariat. Defeat of the proletariat in the June days.

2. June 25 to December 10, 1848. Dictatorship of the pure bourgeois republicans. Drafting of the Constitution. The state of siege hangs over Paris. The Bourgeois dictatorship set aside on December 10 by the election of Bonaparte as President.

3. December 20, 1848, to May 20, 1849. Struggle of the Constitutive Assembly with Bonaparte and with the united party of Order. Death of the Constitutive Assembly. Downfall of the republican bourgeoisie.

III. — Third Period. Period of the constitutional republic and of the Legislative National Assembly.

1. May 29 to June 13, 1849. Struggle of the small traders', middle class with the bourgeoisie and with Bonaparte. Defeat of the small traders' democracy.

2. June 13, 1849, to May, 1850. Parliamentary dictatorship of the party of Order. Completes its reign by the abolition of universal suffrage, but loses the parliamentary Ministry.

3. May 31, 1850, to December 2, 1851. Struggle between the parliamentary bourgeoisie and Bonaparte.

a. May 31, 1850, to January 12, 1851. The parliament loses the supreme command over the Army.

b. January 12 to April 11, 1851. The parliament succumbs in the attempts to regain possession of the administrative power. The party of Order loses its independent parliamentary majority. Its coalition with the republicans and the Mountain.

c. April 11 to October 9, 1851. Attempts at revision, fusion and prorogation. The party of Order dissolves into its component parts. The breach between the bourgeois parliament and the bourgeois press, on the one hand, and the bourgeois mass, on the other, becomes permanent.

d. October 9 to December 2, 1851. Open breach between the parliament and the executive power. It draws up its own decree of death, and goes under, left in the lurch by its own class, by the Army, and by all the other

classes. Downfall of the parliamentary regime and of the reign of the bourgeoisie. Bonaparte's triumph. Parody of the imperialist restoration.

VII

The Social Republic appeared as a mere phrase, as a prophecy on the threshold of the February Revolution; it was smothered in the blood of the Parisian proletariat during the days of 1848 but it stalks about as a spectre throughout the following acts of the drama. The Democratic Republic next makes its bow; it goes out in a fizzle on June 13, 1849, with its runaway small traders; but, on fleeing, it scatters behind it all the more bragging announcements of what it means do to. The Parliamentary Republic, together with the bourgeoisie, then appropriates the whole stage; it lives its life to the full extent of its being; but the 2d of December, 1851, buries it under the terror-stricken cry of the allied royalists: "Long live the Republic!"

The French bourgeoisie reared up against the reign of the working proletariat; — it brought to power the slum-proletariat, with the chief of the "Society of December 10" at its head. It kept France in breathless fear over the prospective terror of "red anarchy;" — Bonaparte discounted the prospect when, on December 4, he had the leading citizens of the Boulevard Montmartre and the Boulevard des Italiens shot down from their windows by the grog-inspired "Army of Order." It made the apotheosis of the sabre; now the sabre rules it. It destroyed the revolutionary press; — now its own press is annihilated. It placed public meetings under police surveillance; — now its own salons are subject to police inspection. It disbanded the democratic National Guards; — now its own National Guard is disbanded. It instituted the state of siege; — now itself is made subject thereto. It supplanted the jury by military commissions; — now military commissions supplant its own juries. It subjected the education of the people to the parsons' interests; — the parsons' interests now subject it to their own systems. It ordered transportations without trial; — now itself is transported without trial. It suppressed every movement of society with physical force; — now every movement of its own class is suppressed by physical force. Out of enthusiasm for the gold bag, it rebelled against its own political leaders and writers; — now, its political leaders and writers are set aside, but the gold hag is plundered, after the mouth of the bourgeoisie has been

gagged and its pen broken. The bourgeoisie tirelessly shouted to the revolution, in the language of St. Orsenius to the Christians: “Fuge, Tace, Quiesce!” — flee, be silent, submit! — ; Bonaparte shouts to the bourgeoisie: “Fuge, Tace, Oniesce!” — flee, be silent, submit!

The French bourgeoisie had long since solved Napoleon’s dilemma: “Dans cinquante ans l’Europe sera republicaine ou cosaque.” [#1 Within fifty years Europe will be either republican or Cossack.] It found the solution in the “republique cosaque.” [#2 Cossack republic.] No Circe distorted with wicked charms the work of art of the bourgeois republic into a monstrosity. That republic lost nothing but the appearance of decency. The France of to-day was ready-made within the womb of the Parliamentary republic. All that was wanted was a bayonet thrust, in order that the bubble burst, and the monster leap forth to sight.

Why did not the Parisian proletariat rise after the 2d of December?

The downfall of the bourgeoisie was as yet merely decreed; the decree was not yet executed. Any earnest uprising of the proletariat would have forthwith revived this bourgeoisie, would have brought on its reconciliation with the army, and would have insured a second June rout to the workingmen.

On December 4, the proletariat was incited to fight by Messrs. Bourgeois & Small-Trader. On the evening of that day, several legions of the National Guard promised to appear armed and uniformed on the place of battle. This arose from the circumstance that Messrs. Bourgeois & Small-Trader had got wind that, in one of his decrees of December 2, Bonaparte abolished the secret ballot, and ordered them to enter the words “Yes” and “No” after their names in the official register. Bonaparte took alarm at the stand taken on December 4. During the night he caused placards to be posted on all the street corners of Paris, announcing the restoration of the secret ballot. Messrs. Bourgeois & Small-Trader believed they had gained their point. The absentees, the next morning, were Messieurs. Bourgeois & Small-Trader.

During the night of December 1 and 2, the Parisian proletariat was robbed of its leaders and chiefs of barricades by a raid of Bonaparte’s. An army without officers, disinclined by the recollections of June, 1848 and 1849, and May, 1850, to fight under the banner of the Montagnards, it left to its vanguard, the secret societies, the work of saving the insurrectionary honor of Paris, which the bourgeoisie had yielded to the soldiery so

submissively that Bonaparte was later justified in disarming the National Guard upon the scornful ground that he feared their arms would be used against themselves by the Anarchists!

“C’est le triomphe complet et définitif du Socialisme!” Thus did Guizot characterize the 2d of December. But, although the downfall of the parliamentary republic carries with it the germ of the triumph of the proletarian revolution, its immediate and tangible result was the triumph of Bonaparte over parliament, of the Executive over the Legislative power, of force without phrases over the force of phrases. In the parliament, the nation raised its collective will to the dignity of law, i.e., it raised the law of the ruling class to the dignity of its collective will. Before the Executive power, the nation abdicates all will of its own, and submits to the orders of an outsider of Authority. In contrast with the Legislative, the Executive power expresses the heteronomy of the nation in contrast with its autonomy. Accordingly, France seems to have escaped the despotism of a class only in order to fall under the despotism of an individual, under the authority, at that of an individual without authority. The struggle seems to settle down to the point where all classes drop down on their knees, equally impotent and equally dumb.

All the same, the revolution is thoroughgoing. It still is on its passage through purgatory. It does its work methodically: Down to December 2, 1851, it had fulfilled one-half of its programme, it now fulfils the other half. It first ripens the power of the Legislature into fullest maturity in order to be able to overthrow it. Now that it has accomplished that, the revolution proceeds to ripen the power of the Executive into equal maturity; it reduces this power to its purest expression; isolates it; places it before itself as the sole subject for reproof in order to concentrate against it all the revolutionary forces of destruction. When the revolution shall have accomplished this second part of its preliminary programme, Europe will jump up from her seat to exclaim: “Well hast thou grubbed, old mole!”

The Executive power, with its tremendous bureaucratic and military organization; with its wide-spreading and artificial machinery of government — an army of office-holders, half a million strong, together with a military force of another million men — ; this fearful body of parasites, that coils itself like a snake around French society, stopping all its pores, originated at the time of the absolute monarchy, along with the decline of feudalism, which it helped to hasten. The princely privileges of

the landed proprietors and cities were transformed into so many at-tributes of the Executive power; the feudal dignitaries into paid office-holders; and the confusing design of conflicting medieval seigniories, into the well regulated plan of a government, work is subdivided and centralized as in the factory. The first French revolution, having as a mission to sweep away all local, territorial, urban and provincial special privileges, with the object of establishing the civic unity of the nation, was bound to develop what the absolute monarchy had begun — the work of centralization, together with the range, the attributes and the menials of government. Napoleon completed this governmental machinery. The Legitimist and the July Monarchy contribute nothing thereto, except a greater subdivision of labor, that grew in the same measure as the division and subdivision of labor within bourgeois society raised new groups and interests, i.e., new material for the administration of government. Each Common interest was in turn forthwith removed from society, set up against it as a higher Collective interest, wrested from the individual activity of the members of society, and turned into a subject for governmental administration, from the bridges, the school house and the communal property of a village community, up to the railroads, the national wealth and the national University of France. Finally, the parliamentary republic found itself, in its struggle against the revolution, compelled, with its repressive measures, to strengthen the means and the centralization of the government. Each overturn, instead of breaking up, carried this machine to higher perfection. The parties, that alternately wrestled for supremacy, looked upon the possession of this tremendous governmental structure as the principal spoils of their victory.

Nevertheless, under the absolute monarchy, was only the means whereby the first revolution, and under Napoleon, to prepare the class rule of the bourgeoisie; under the restoration, under Louis Philippe, and under the parliamentary republic, it was the instrument of the ruling class, however eagerly this class strained after autocracy. Not before the advent of the second Bonaparte does the government seem to have made itself fully independent. The machinery of government has by this time so thoroughly fortified itself against society, that the chief of the “Society of December 10” is thought good enough to be at its head; a fortune-hunter, run in from abroad, is raised on its shield by a drunken soldiery, bought by himself with liquor and sausages, and whom he is forced ever again to throw sops to. Hence the timid despair, the sense of crushing humiliation and degradation

that oppresses the breast of France and makes her to choke. She feels dishonored.

And yet the French Government does not float in the air. Bonaparte represents an economic class, and that the most numerous in the commonweal of France — the Allotment Farmer. [#4 The first French Revolution distributed the bulk of the territory of France, held at the time by the feudal lords, in small patches among the cultivators of the soil. This allotment of lands created the French farmer class.]

As the Bourbons are the dynasty of large landed property, as the Orleans are the dynasty of money, so are the Bonapartes the dynasty of the farmer, i.e. of the French masses. Not the Bonaparte, who threw himself at the feet of the bourgeois parliament, but the Bonaparte, who swept away the bourgeois parliament, is the elect of this farmer class. For three years the cities had succeeded in falsifying the meaning of the election of December 10, and in cheating the farmer out of the restoration of the Empire. The election of December 10, 1848, is not carried out until the “coup d’etat” of December 2, 1851.

The allotment farmers are an immense mass, whose individual members live in identical conditions, without, however, entering into manifold relations with one another. Their method of production isolates them from one another, instead of drawing them into mutual intercourse. This isolation is promoted by the poor means of communication in France, together with the poverty of the farmers themselves. Their field of production, the small allotment of land that each cultivates, allows no room for a division of labor, and no opportunity for the application of science; in other words, it shuts out manifoldness of development, diversity of talent, and the luxury of social relations. Every single farmer family is almost self-sufficient; itself produces directly the greater part of what it consumes; and it earns its livelihood more by means of an interchange with nature than by intercourse with society. We have the allotted patch of land, the farmer and his family; alongside of that another allotted patch of land, another farmer and another family. A bunch of these makes up a village; a bunch of villages makes up a Department. Thus the large mass of the French nation is constituted by the simple addition of equal magnitudes — much as a bag with potatoes constitutes a potato-bag. In so far as millions of families live under economic conditions that separate their mode of life, their interests and their culture from those of the other classes, and that place them in an attitude

hostile toward the latter, they constitute a class; in so far as there exists only a local connection among these farmers, a connection which the individuality and exclusiveness of their interests prevent from generating among them any unity of interest, national connections, and political organization, they do not constitute a class. Consequently, they are unable to assert their class interests in their own name, be it by a parliament or by convention. They can not represent one another, they must themselves be represented. Their representative must at the same time appear as their master, as an authority over them, as an unlimited governmental power, that protects them from above, bestows rain and sunshine upon them. Accordingly, the political influence of the allotment farmer finds its ultimate expression in an Executive power that subjugates the commonweal to its own autocratic will.

Historic tradition has given birth to the superstition among the French farmers that a man named Napoleon would restore to them all manner of glory. Now, then, an individual turns I up, who gives himself out as that man because, obedient to the “Code Napoleon,” which provides that “La recherche de la paternite est interdite,” [#5 The inquiry into paternity is forbidden.] he carries the name of Napoleon. [#6 L. N. Bonaparte is said to have been an illegitimate son.] After a vagabondage of twenty years, and a series of grotesque adventures, the myth is verified, and that man becomes the Emperor of the French. The rooted thought of the Nephew becomes a reality because it coincided with the rooted thought of the most numerous class among the French.

“But,” I shall be objected to, “what about the farmers’ uprisings over half France, the raids of the Army upon the farmers, the wholesale imprisonment and transportation of farmers?”

Indeed, since Louis XIV., France has not experienced such persecutions of the farmer on the ground of his demagogic machinations.

But this should be well understood: The Bonaparte dynasty does not represent the revolutionary, it represents the conservative farmer; it does not represent the farmer, who presses beyond his own economic conditions, his little allotment of land it represents him rather who would confirm these conditions; it does not represent the rural population, that, thanks to its own inherent energy, wishes, jointly with the cities to overthrow the old order, it represents, on the contrary, the rural population that, hide-bound in the old order, seeks to see itself, together with its allotments, saved and favored by

the ghost of the Empire; it represents, not the intelligence, but the superstition of the farmer; not his judgment, but his bias; not his future, but his past; not his modern Cevennes; [#7 The Cevennes were the theater of the most numerous revolutionary uprisings of the farmer class.] but his modern Vendee. [#8 La Vendee was the theater of protracted reactionary uprisings of the farmer class under the first Revolution.]

The three years' severe rule of the parliamentary republic had freed a part of the French farmers from the Napoleonic illusion, and, though even only superficially; had revolutionized them. The bourgeoisie threw them, however, violently back every time that they set themselves in motion. Under the parliamentary republic, the modern wrestled with the traditional consciousness of the French farmer. The process went on in the form of a continuous struggle between the school teachers and the parsons; — the bourgeoisie knocked the school teachers down. For the first time, the farmer made an effort to take an independent stand in the government of the country; this manifested itself in the prolonged conflicts of the Mayors with the Prefects; — the bourgeoisie deposed the Mayors. Finally, during period of the parliamentary republic, the farmers of several localities rose against their own product, the Army; — the bourgeoisie punished them with states of siege and executions. And this is the identical bourgeoisie, that now howls over the “stupidity of the masses,” over the “vile multitude,” which, it claims, betrayed it to Bonaparte. Itself has violently fortified the imperialism of the farmer class; it firmly maintained the conditions that constitute the birth-place of this farmer-religion. Indeed, the bourgeoisie has every reason to fear the stupidity of the masses — so long as they remain conservative; and their intelligence — so soon as they become revolutionary.

In the revolts that took place after the “coup d’etat” a part of the French farmers protested, arms in hand, against their own vote of December 10, 1848. The school house had, since 1848, sharpened their wits. But they had bound themselves over to the nether world of history, and history kept them to their word. Moreover, the majority of this population was still so full of prejudices that, just in the “reddest” Departments, it voted openly for Bonaparte. The National Assembly prevented, as it thought, this population from walking; the farmers now snapped the fetters which the cities had struck upon the will of the country districts. In some places they even

indulged the grotesque hallucination of a “Convention together with a Napoleon.”

After the first revolution had converted the serf farmers into freeholders, Napoleon fixed and regulated the conditions under which, unmolested, they could exploit the soil of France, that had just fallen into their hands, and expiate the youthful passion for property. But that which now bears the French farmer down is that very allotment of land, it is the partition of the soil, the form of ownership, which Napoleon had consolidated. These are the material condition that turned French feudal peasant into a small or allotment farmer, and Napoleon into an Emperor. Two generations have sufficed to produce the inevitable result the progressive deterioration of agriculture, and the progressive encumbering of the agriculturist. The “Napoleonic” form of ownership, which, at the beginning of the nineteenth century was the condition for the emancipation and enrichment of the French rural population, has, in the course of the century, developed into the law of their enslavement and pauperism. Now, then, this very law is the first of the “idees Napoleoniennes,” which the second Bonaparte must uphold. If he still shares with the farmers the illusion of seeking, not in the system of the small allotment itself, but outside of that system, in the influence of secondary conditions, the cause of their ruin, his experiments are bound to burst like soap-bubbles against the modern system of production.

The economic development of the allotment system has turned bottom upward the relation of the farmer to the other classes of society. Under Napoleon, the parceling out of the agricultural lands into small allotments supplemented in the country the free competition and the incipient large production of the cities. The farmer class was the ubiquitous protest against the aristocracy of land, just then overthrown. The roots that the system of small allotments cast into the soil of France, deprived feudalism of all nutriment. Its boundary-posts constituted the natural buttress of the bourgeoisie against every stroke of the old overlords. But in the course of the nineteenth century, the City Usurer stepped into the shoes of the Feudal Lord, the Mortgage substituted the Feudal Duties formerly yielded by the soil, bourgeois Capital took the place of the aristocracy of Landed Property. The former allotments are now only a pretext that allows the capitalist class to draw profit, interest and rent from agricultural lands, and to leave to the farmer himself the task of seeing to it that he knock out his wages. The mortgage indebtedness that burdens the soil of France imposes upon the

French farmer class they payment of an interest as great as the annual interest on the whole British national debt. In this slavery of capital, whither its development drives it irresistibly, the allotment system has transformed the mass of the French nation into troglodytes. Sixteen million farmers (women and children included), house in hovels most of which have only one opening, some two, and the few most favored ones three. Windows are to a house what the five senses are to the head. The bourgeois social order, which, at the beginning of the century, placed the State as a sentinel before the newly instituted allotment, and that manured this with laurels, has become a vampire that sucks out its heart-blood and its very brain, and throws it into the alchemist's pot of capital. The "Code Napoleon" is now but the codex of execution, of sheriff's sales and of intensified taxation. To the four million (children, etc., included) official paupers, vagabonds, criminals and prostitutes, that France numbers, must be added five million souls who hover over the precipice of life, and either sojourn in the country itself, or float with their rags and their children from the country to the cities, and from the cities back to the country. Accordingly, the interests of the farmers are no longer, as under Napoleon, in harmony but in conflict with the interests of the bourgeoisie, i.e., with capital; they find their natural allies and leaders among the urban proletariat, whose mission is the overthrow of the bourgeois social order. But the "strong and unlimited government" — and this is the second of the "idees Napoleoniennes," which the second Napoleon has to carried out — , has for its mission the forcible defence of this very "material" social order, a "material order" that furnishes the slogan in Bonaparte's proclamations against the farmers in revolt.

Along with the mortgage, imposed by capital upon the farmer's allotment, this is burdened by taxation. Taxation is the fountain of life to the bureaucracy, the Army, the parsons and the court, in short to the whole apparatus of the Executive power. A strong government, and heavy taxes are identical. The system of ownership, involved in the system of allotments lends itself by nature for the groundwork of a powerful and numerous bureaucracy: it produces an even level of conditions and of persons over the whole surface of the country; it, therefore, allows the exercise of an even influence upon all parts of this even mass from a high central point downwards: it annihilates the aristocratic gradations between the popular masses and the Government; it, consequently, calls from all sides for the

direct intervention of the Government and for the intervention of the latter's immediate organs; and, finally, it produces an unemployed excess of population, that finds no room either in the country or in the cities, that, consequently, snatches after public office as a sort of dignified alms, and provokes the creation of further offices. With the new markets, which he opened at the point of the bayonet, and with the plunder of the continent, Napoleon returned to the farmer class with interest the taxes wrung from them. These taxes were then a goad to the industry of the farmer, while now, on the contrary, they rob his industry of its last source of support, and completely sap his power to resist poverty. Indeed, an enormous bureaucracy, richly gallooned and well fed is that "idee Napoleonienne" that above all others suits the requirements of the second Bonaparte. How else should it be, seeing he is forced to raise alongside of the actual classes of society, an artificial class, to which the maintenance of his own regime must be a knife-and-fork question? One of his first financial operations was, accordingly, the raising of the salaries of the government employees to their former standard and the creation of new sinecures.

Another "idee Napoleonienne" is the rule of the parsons as an instrument of government. But while the new-born allotment, in harmony with society, in its dependence upon the powers of nature, and in its subordination to the authority that protected it from above, was naturally religious, the debt-broken allotment, on the contrary, at odds with society and authority, and driven beyond its own narrow bounds, becomes as naturally irreligious. Heaven was quite a pretty gift thrown in with the narrow strip of land that had just been won, all the more as it makes the weather; it, however, becomes an insult from the moment it is forced upon the farmer as a substitute for his allotment. Then the parson appears merely as the anointed blood-hound of the earthly police, — yet another "idee Napoleonienne." The expedition against Rome will next time take place in France, but in a reverse sense from that of M. de Montalembert.

Finally, the culminating point of the "idees Napoleoniennes" is the preponderance of the Army. The Army was the "point of honor" with the allotment farmers: it was themselves turned into masters, defending abroad their newly established property, glorifying their recently conquered nationality, plundering and revolutionizing the world. The uniform was their State costume; war was their poetry; the allotment, expanded and rounded up in their phantasy, was the fatherland; and patriotism became the

ideal form of property. But the foe, against whom the French farmer must now defend his property, are not the Cossacks, they are the sheriffs and the tax collectors. The allotment no longer lies in the so-called fatherland, but in the register of mortgages. The Army itself no longer is the flower of the youth of the farmers, it is the swamp-blossom of the slum-proletariat of the farmer class. It consists of “remplacants,” substitutes, just as the second Bonaparte himself is but a “remplacant,” a substitute, for Napoleon. Its feats of heroism are now performed in raids instituted against farmers and in the service of the police; — and when the internal contradictions of his own system shall drive the chief of the “Society of December 10” across the French frontier, that Army will, after a few bandit-raids, gather no laurels but only hard knocks.

It is evident that all the “idees Napoleoniennes” are the ideas of the undeveloped and youthfully fresh allotment; they are an absurdity for the allotment that now survives. They are only the hallucinations of its death struggle; words turned to hollow phrases, spirits turned to spooks. But this parody of the Empire was requisite in order to free the mass of the French nation from the weight of tradition, and to elaborate sharply the contrast between Government and Society. Along with the progressive decay of the allotment, the governmental structure, reared upon it, breaks down. The centralization of Government, required by modern society, rises only upon the ruins of the military and bureaucratic governmental machinery that was forged in contrast to feudalism.

The conditions of the French farmers’ class solve to us the riddle of the general elections of December 20 and 21, that led the second Bonaparte to the top of Sinai, not to receive, but to decree laws.

The bourgeoisie had now, manifestly, no choice but to elect Bonaparte. When at the Council of Constance, the puritans complained of the sinful life of the Popes, and moaned about the need of a reform in morals, Cardinal d’Ailly thundered into their faces: “Only the devil in his Own person can now save the Catholic Church, and you demand angels.” So, likewise, did the French bourgeoisie cry out after the “coup d’etat”: “Only the chief of the ‘Society of December 10’ can now save bourgeois society, only theft can save property, only perjury religion, only bastardy the family, only disorder order!”

Bonaparte, as autocratic Executive power, fulfills his mission to secure “bourgeois order.” But the strength of this bourgeois order lies in the middle class. He feels himself the representative of the middle class, and issues his decrees in that sense. Nevertheless, he is something only because he has broken the political power of this class, and daily breaks it anew. Hence he feels himself the adversary of the political and the literary power of the middle class. But, by protecting their material, he nourishes anew their political power. Consequently, the cause must be kept alive, but the result, wherever it manifests itself, swept out of existence. But this procedure is impossible without slight mistakings of causes and effects, seeing that both, in their mutual action and reaction, lose their distinctive marks. Thereupon, new decrees, that blur the line of distinction. Bonaparte, furthermore, feels himself, as against the bourgeoisie, the representative of the farmer and the people in general, who, within bourgeois society, is to render the lower

classes of society happy. To this end, new decrees, intended to exploit the “true Socialists,” together with their governmental wisdom. But, above all, Bonaparte feels himself the chief of the “Society of December 10,” the representative of the slum-proletariat, to which he himself, his immediate surroundings, his Government, and his army alike belong, the main object with all of whom is to be good to themselves, and draw Californian tickets out of the national treasury. And he affirms his chieftainship of the “Society of December 10” with decrees, without decrees, and despite decrees.

This contradictory mission of the man explains the contradictions of his own Government, and that confused groping about, that now seeks to win, then to humiliate now this class and then that, and finishes by arraying against itself all the classes; whose actual insecurity constitutes a highly comical contrast with the imperious, categorical style of the Government acts, copied closely from the Uncle.

Industry and commerce, i.e., the business of the middle class, are to be made to blossom in hot-house style under the “strong Government.” Loans for a number of railroad grants. But the Bonapartist slum-proletariat is to enrich itself. Speculation is carried on with railroad concessions on the Bourse by the initiated; but no capital is forthcoming for the railroads. The bank then pledges itself to make advances upon railroad stock; but the bank is itself to be exploited; hence, it must be cajoled; it is released of the obligation to publish its reports weekly. Then follows a leonine treaty between the bank and the Government. The people are to be occupied: public works are ordered; but the public works raise the tax rates upon the people; thereupon the taxes are reduced by an attack upon the national bond-holders through the conversion of the five per cent “rentes” [The name of the French national bonds.] into four-and-halves. Yet the middle class must again be tipped: to this end, the tax on wine is doubled for the people, who buy it at retail, and is reduced to one-half for the middle class, that drink it at wholesale. Genuine labor organizations are dissolved, but promises are made of future wonders to accrue from organization. The farmers are to be helped: mortgage-banks are set up that must promote the indebtedness; of the farmer and the concentration of property but again, these banks are to be utilized especially to the end of squeezing money out of the confiscated estates of the House of Orleans; no capitalist will listen to this scheme, which, moreover, is not mentioned in the decree; the mortgage bank remains a mere decree, etc., etc.

Bonaparte would like to appear as the patriarchal benefactor of all classes; but he can give to none without taking from the others. As was said of the Duke of Guise, at the time of the Fronde, that he was the most obliging man in France because he had converted all his estates into bonds upon himself for his Parisians, so would Napoleon like to be the most obliging man in France and convert all property and all labor of France into a personal bond upon himself. He would like to steal the whole of France to make a present thereof to France, or rather to be able to purchase France back again with French money; — as chief of the “Society of December 10,” he must purchase that which is to be his. All the State institutions, the Senate, the Council of State, the Legislature, the Legion of Honor, the Soldiers’ decorations, the public baths, the public buildings, the railroads, the General Staff of the National Guard, exclusive of the rank and file, the confiscated estates of the House of Orleans, — all are converted into institutions for purchase and sale. Every place in the Army and the machinery of Government becomes a purchasing power. The most important thing, however, in this process, whereby France is taken to be given back to herself, are the percentages that, in the transfer, drop into the hands of the chief and the members of the “Society of December 10.” The witticisms with which the Countess of L., the mistress of de Morny, characterized the confiscations of the Orleanist estates: “C’est le premier vol de l’aigle,” [#10 “It is the first flight of the eagle” The French word “vol” means theft as well as flight.] fits every flight of the eagle that is rather a crow. He himself and his followers daily call out to themselves, like the Italian Carthusian monk in the legend does to the miser, who displayfully counted the goods on which he could live for many years to come: “Tu fai conto sopra i beni, bisogna prima far il conto sopra gli anni.” [#11 “You count your property you should rather count the years left to you.”] In order not to make a mistake in the years, they count by minutes. A crowd of fellows, of the best among whom all that can be said is that one knows not whence he comes — a noisy, restless “Boheme,” greedy after plunder, that crawls about in gallooned frocks with the same grotesque dignity as Soulonque’s [#12 Soulonque was the negro Emperor of the short-lived negro Empire of Hayti.] Imperial dignitaries — , thronged the court crowded the ministries, and pressed upon the head of the Government and of the Army. One can picture to himself this upper crust of the “Society of December 10” by considering that Veron Crevel [#13 Crevel is a character

of Balzac, drawn after Dr. Veron, the proprietor of the “Constitutional” newspaper, as a type of the dissolute Parisian Philistine.] is their preacher of morality, and Granier de Cassagnac their thinker. When Guizot, at the time he was Minister, employed this Granier on an obscure sheet against the dynastic opposition, he used to praise him with the term: “C’est le roi des droles.” [#14 “He Is the king of the clowns.”] It were a mistake to recall the days of the Regency or of Louis XV. by the court and the kit of Louis Bonaparte’s: “Often did France have a mistress-administration, but never yet an administration of kept men.” [#15 Madame de Girardin.]

Harassed by the contradictory demands of his situation, and compelled, like a sleight-of-hands performer, to keep, by means of constant surprises, the eyes of the public riveted upon himself as the substitute of Napoleon, compelled, consequently, everyday to accomplish a sort of “coup” on a small scale, Bonaparte throws the whole bourgeois social system into disorder; he broaches everything that seemed unbroachable by the revolution of 1848; he makes one set people patient under the revolution and another anxious for it; he produces anarchy itself in the name of order by rubbing off from the whole machinery of Government the veneer of sanctity, by profaning it, by rendering it at once nauseating and laughable. He rehearses in Paris the cult of the sacred coat of Trier with the cult of the Napoleonic Imperial mantle. But when the Imperial Mantle shall have finally fallen upon the shoulders of Louis Bonaparte, then will also the iron statue of Napoleon drop down from the top of the Vendome column. [#16 A prophecy that a few years later, after Bonaparte’s coronation as Emperor, was literally fulfilled. By order of Emperor Louis Napoleon, the military statue of the Napoleon that originally surmounted the Vendome was taken down and replaced by one of first Napoleon in imperial robes.]

A CONTRIBUTION TO THE CRITIQUE OF POLITICAL ECONOMY, 1859

Translated by N. I. Stone

A Contribution to the Critique of Political Economy first appeared in print in 1859 and provides an analysis of capitalism and quantity theory of money, achieved by critiquing the writings of the leading theoretical exponents of capitalism at that time; namely the classical economists, Adam Smith (1723–90) and David Ricardo (1772–1823), both regarded as the foremost representatives of the genre.

Much of the text was later incorporated by Marx into his magnum opus, *Capital* (Volume I), published in 1867, and the *Critique* is generally considered to be of secondary importance among Marx's writings. This does not apply, however, to the *Preface of the Critique*, which contains the first connected account of one of Marx's main theories: the economic interpretation of history. Briefly, this is the idea that economic factors – the way people produce the necessities of life – conditions the kind of politics and ideology a society can have:

ZUR KRITIK
DER
POLITISCHEN OEKONOMIE.

2. THE GENERAL RELATION OF PRODUCTION TO DISTRIBUTION, EXCHANGE, AND CONSUMPTION.

3. THE METHOD OF POLITICAL ECONOMY.

4. PRODUCTION, MEANS OF PRODUCTION, AND CONDITIONS OF PRODUCTION, THE RELATIONS OF PRODUCTION AND DISTRIBUTION.¹⁶⁵

THE CONNECTION BETWEEN FORM OF STATE AND PROPERTY ON THE ONE HAND AND RELATIONS OF PRODUCTION AND DISTRIBUTION(1) ON THE OTHER. LEGAL RELATIONS. FAMILY RELATIONS.

ENDNOTES

Adam Smith (1723-1790), a Scottish moral philosopher, pioneer of political economy and a key figure in the Scottish Enlightenment.

David Ricardo (1772-1823) was a British political economist.

TRANSLATOR'S PREFACE.

The present translation has been made from the second edition of the “Zur Kritik der Politischen Oekonomie,” published by Karl Kautsky in 1897 with slight changes from the original edition of 1859; changes that had been indicated by Marx on the margins of his own copy of the book.

As will be seen from the author's preface, the work was originally issued as the first instalment of a complete treatise of political economy. As he went on with his work, however, Marx modified his plans and eight years after the appearance of the “Zur Kritik” he published the first volume of his *Capital*, whose scope was intended to cover the entire field of political economy.

The plan to which Marx alludes in the preface to the present work was thus abandoned in its formal aspects, but not in substance. The subject matter treated here was reproduced or rather “summarized,” as Marx himself puts it, in *Capital*. But that was done in so far as was necessary to secure continuity of treatment. On the other hand, many important matters are treated here more thoroughly than in *Capital*, especially the part devoted to the discussion of money. This, as well as the chapters on the history of the theories of value and of money, which do not appear in *Capital*, make “Zur Kritik” a work practically complete in itself.

The recent silver agitation in this country shows how timely and useful this work still is, though written nearly half a century ago. That a great part of the working-men employed in the cities were not carried away by the Democratic-Populist agitation in 1896 and 1900 is probably due in a greater measure than is commonly realized to the direct and indirect influence of Marx, whose economic teachings guided the socialists in their counter agitation. And since the conditions which once gave rise to a demand for an inflated currency have by no means disappeared beyond a possibility of return, this book has a wide field before it, outside of the library of the college and of the student of economics, which the author's name and prestige with the working class insures for it.

There is another reason, if any need be given why this book should have been translated into English. Marx's preface to the present work contains the classic formulation of his historico-philosophic theory known as the

Materialistic Interpretation of History. This theory, which until recently was entertained almost exclusively by socialist writers and was hardly heard of outside of socialist circles in English speaking countries, is at last receiving not only due recognition but sympathetic appreciation at the hands of men of science.¹ It is rather a significant coincidence that the work which for the first time clearly formulated the law governing social evolution should have seen the light of day in the same year in which Darwin gave to the world his theory of organic evolution. And as the latter had to fight its way to recognition in the teeth of religious prejudices, so has the recognition of the former been retarded by even more powerful social and political prejudices.

The Introduction to the Critique of Political Economy which is added as a supplement to this book is for the first time published in book form in any language. It was written by Marx in 1857, but for reasons explained by him in the preface was not published and in fact was never finished by him, since according to his changed plans it would have fitted more into the last volume of Capital which was to contain a history of political economy. The introduction has been published but lately in the form of a magazine article by Karl Kautsky, editor of the *Neue Zeit* and literary executor of Karl Marx.

A few explanations are here in order with reference to the work of translation. No one is more keenly alive to the shortcomings of the English rendering of the original than the translator himself. While fully conscious that the translation might be greatly improved, he has at times deliberately sacrificed literary finish to closeness to the original. It will be found that many passages have been rendered more clear and concise in Capital in which, according to Marx's own statement in the preface to that work, they were much simplified and popularized. The Hegelian phraseology is more in evidence in the present work rendering translation a more difficult task. Yet for that very reason it seemed particularly desirable to give to English speaking readers as close a version of the original as was possible. In the few cases where certain passages from this work were reproduced by Marx in Capital, the translation of the latter by Moore and Aveling was freely drawn upon with slight modifications here and there.

About the only liberty taken with Marx's terminology has been in the case of the word "bürgerlich." Marx speaks here of "bürgerliche Produktion" and "bürgerlicher Reichthum" and "bürgerliche Arbeit" where eight years later he used in corresponding passages in Capital the word "kapitalistische." As the English speaking reader is more accustomed to

hear of the “capitalist” system of production than of the “bourgeois” system of production, etc., the translator considered Marx’s own change of this term within a few years from the publication of “Zur Kritik” a sufficient justification for rendering the word “bürgerlich” into “capitalistic” wherever it seemed more likely to carry the meaning home to the reader.

In view of the fact that the work is likely to be read in wide circles it was thought desirable to translate the numerous quotations from Italian, Greek, Latin and French writers, the translation being given side by side with the original quotation. All English citations given by Marx in German have been restored from the original sources, which necessitated the use of four libraries, the Astor and the Columbia University libraries in New York, the Congressional Library in Washington, and the private library of Professor Seligman to whose kindness the translator is indebted for the permission to use rare works of the seventeenth century quoted by Marx. Several of Marx’s references to the pages of the books quoted by him have been found to be wrong and therefore differ here from those given in the original. In two or three cases where the original English citations could not be found they were retranslated from German with the quotation marks omitted.

This statement would be incomplete if the translator failed to mention the helpful participation in this work by his wife whose share in the translation is equal to his own.

New York, October, 1903.

AUTHOR'S PREFACE.

I consider the system of bourgeois economy in the following order: *Capital, landed property, wage labor; state, foreign trade, world market*. Under the first three heads I examine the conditions of the economic existence of the three great classes, which make up modern bourgeois society; the connection of the three remaining heads is self evident. The first part of the first book, treating of capital, consists of the following chapters: 1. Commodity; 2. Money, or simple circulation; 3. Capital in general. The first two chapters form the contents of the present work. The entire material lies before me in the form of monographs, written at long intervals not for publication, but for the purpose of clearing up those questions to myself, and their systematic elaboration on the plan outlined above will depend upon circumstances.

I omit a general introduction which I had prepared, as on second thought any anticipation of results that are still to be proven, seemed to me objectionable, and the reader who wishes to follow me at all, must make up his mind to pass from the special to the general. On the other hand, some remarks as to the course of my own politico-economic studies may be in place here.

The subject of my professional studies was jurisprudence, which I pursued, however, in connection with and as secondary to the studies of philosophy and history. In 1842-43, as editor of the "Rheinische Zeitung," I found myself embarrassed at first when I had to take part in discussions concerning so-called material interests. The proceedings of the Rhine Diet in connection with forest thefts and the extreme subdivision of landed property; the official controversy about the condition of the Mosel peasants into which Herr von Schaper, at that time president of the Rhine Province, entered with the "Rheinische Zeitung;" finally, the debates on free trade and protection, gave me the first impulse to take up the study of economic questions. At the same time a weak, quasi-philosophic echo of French socialism and communism made itself heard in the "Rheinische Zeitung" in those days when the good intentions "to go ahead" greatly outweighed knowledge of facts. I declared myself against such botching, but had to admit at once in a controversy with the "Allgemeine Augsburger Zeitung"

that my previous studies did not allow me to hazard an independent judgment as to the merits of the French schools. When, therefore, the publishers of the “*Rheinische Zeitung*” conceived the illusion that by a less aggressive policy the paper could be saved from the death sentence pronounced upon it, I was glad to grasp that opportunity to retire to my study room from public life.

The first work undertaken for the solution of the question that troubled me, was a critical revision of Hegel’s “*Philosophy of Law*”; the introduction to that work appeared in the “*Deutsch-Französische Jahrbücher*,” published in Paris in 1844. I was led by my studies to the conclusion that legal relations as well as forms of state could neither be understood by themselves, nor explained by the so-called general progress of the human mind, but that they are rooted in the material conditions of life, which are summed up by Hegel after the fashion of the English and French of the eighteenth century under the name “*civic society*,” the anatomy of that civic society is to be sought in political economy. The study of the latter which I had taken up in Paris, I continued at Brussels whither I emigrated on account of an order of expulsion issued by Mr. Guizot. The general conclusion at which I arrived and which, once reached, continued to serve as the leading thread in my studies, may be briefly summed up as follows: In the social production which men carry on they enter into definite relations that are indispensable and independent of their will; these relations of production correspond to a definite stage of development of their material powers of production. The sum total of these relations of production constitutes the economic structure of society — the real foundation, on which rise legal and political superstructures and to which correspond definite forms of social consciousness. The mode of production in material life determines the general character of the social, political and spiritual processes of life. It is not the consciousness of men that determines their existence, but, on the contrary, their social existence determines their consciousness. At a certain stage of their development, the material forces of production in society come in conflict with the existing relations of production, or — what is but a legal expression for the same thing — with the property relations within which they had been at work before. From forms of development of the forces of production these relations turn into their fetters. Then comes the period of social revolution. With the change of the economic foundation the entire immense superstructure is more or less

rapidly transformed. In considering such transformations the distinction should always be made between the material transformation of the economic conditions of production which can be determined with the precision of natural science, and the legal, political, religious, aesthetic or philosophic — in short ideological forms in which men become conscious of this conflict and fight it out. Just as our opinion of an individual is not based on what he thinks of himself, so can we not judge of such a period of transformation by its own consciousness; on the contrary, this consciousness must rather be explained from the contradictions of material life, from the existing conflict between the social forces of production and the relations of production. No social order ever disappears before all the productive forces, for which there is room in it, have been developed; and new higher relations of production never appear before the material conditions of their existence have matured in the womb of the old society. Therefore, mankind always takes up only such problems as it can solve; since, looking at the matter more closely, we will always find that the problem itself arises only when the material conditions necessary for its solution already exist or are at least in the process of formation. In broad outlines we can designate the Asiatic, the ancient, the feudal, and the modern bourgeois methods of production as so many epochs in the progress of the economic formation of society. The bourgeois relations of production are the last antagonistic form of the social process of production — antagonistic not in the sense of individual antagonism, but of one arising from conditions surrounding the life of individuals in society; at the same time the productive forces developing in the womb of bourgeois society create the material conditions for the solution of that antagonism. This social formation constitutes, therefore, the closing chapter of the prehistoric stage of human society.

Frederick Engels, with whom I was continually corresponding and exchanging ideas since the appearance of his ingenious critical essay on economic categories (in the “Deutsch-Französische Jahrbücher”), came by a different road to the same conclusions as myself (see his “Condition of the Working Classes in England”). When he, too, settled in Brussels in the spring of 1845, we decided to work out together the contrast between our view and the idealism of the German philosophy, in fact to settle our accounts with our former philosophic conscience. The plan was carried out in the form of a criticism of the post-Hegelian philosophy. The manuscript

in two solid octavo volumes had long reached the publisher in Westphalia, when we received information that conditions had so changed as not to allow of its publication. We abandoned the manuscript to the stinging criticism of the mice the more readily since we had accomplished our main purpose — the clearing up of the question to ourselves. Of the scattered writings on various subjects in which we presented our views to the public at that time, I recall only the “Manifesto of the Communist Party” written by Engels and myself, and the “Discourse on Free Trade” written by myself. The leading points of our theory were first presented scientifically, though in a polemic form, in my “*Misère de la Philosophie, etc.*” directed against Proudhon and published in 1847. An essay on “Wage Labor,” written by me in German, and in which I put together my lectures on the subject delivered before the German Workmen’s Club at Brussels, was prevented from leaving the hands of the printer by the February revolution and my expulsion from Belgium which followed it as a consequence.

The publication of the “*Neue Rheinische Zeitung*” in 1848 and 1849, and the events which took place later on, interrupted my economic studies which I could not resume before 1850 in London. The enormous material on the history of political economy which is accumulated in the British Museum; the favorable view which London offers for the observation of bourgeois society; finally, the new stage of development upon which the latter seemed to have entered with the discovery of gold in California and Australia, led me to the decision to resume my studies from the very beginning and work up critically the new material. These studies partly led to what might seem side questions, over which I nevertheless had to stop for longer or shorter periods of time. Especially was the time at my disposal cut down by the imperative necessity of working for a living. My work as contributor on the leading Anglo-American newspaper, the “*New York Tribune*,” at which I have now been engaged for eight years, has caused very great interruption in my studies, since I engage in newspaper work proper only occasionally. Yet articles on important economic events in England and on the continent have formed so large a part of my contributions that I have been obliged to make myself familiar with practical details which lie outside the proper sphere of political economy.

This account of the course of my studies in political economy is simply to prove that my views, whatever one may think of them, and no matter how little they agree with the interested prejudices of the ruling classes, are

the result of many years of conscientious research. At the entrance to science, however, the same requirement must be put as at the entrance to hell:

Qui si convien lasciare ogni sospetto

Ogni viltà convien che qui sia morta.

Karl Marx.

London, January, 1859.

BOOK I. Capital in general.

CHAPTER I. COMMODITIES.

At first sight the wealth of society under the capitalist system presents itself as an immense accumulation of commodities, its unit being a single commodity. But every commodity has a twofold aspect, that of *use value* and *exchange value*.²

A commodity is first of all, in the language of English economists, “any thing necessary, useful or pleasant in life,” an object of human wants, a means of existence in the broadest sense of the word. This property of commodities to serve as use-values coincides with their natural palpable existence. Wheat e. g. is a distinct use-value differing from the use-values cotton, glass, paper, etc. Use-value has a value only in use and is realized only in the process of consumption. The same use-value may be utilized in various ways. But the extent of its possible applications is circumscribed by its distinct properties. Furthermore, it is thus limited not only qualitatively but also quantitatively. According to their natural properties the various use-values have different measures, such as a bushel of wheat, a quire of paper, a yard of linen, etc.

Whatever the social form of wealth may be, use-values always have a substance of their own, independent of that form. One can not tell by the taste of wheat whether it has been raised by a Russian serf, a French peasant, or an English capitalist. Although the object of social wants and, therefore, mutually connected in society, use-values do not bear any marks of the relations of social production. Suppose, we have a commodity whose use-value is that of a diamond. We can not tell by looking at the diamond that it is a commodity. When it serves as a use-value, aesthetic or mechanical, on the breast of a harlot, or in the hand of a glasscutter, it is a diamond and not a commodity. It is the necessary pre-requisite of a commodity to be a use-value, but it is immaterial to the use-value whether it is a commodity or not. Use-value in this indifference to the nature of its economic destination, i.e. use-value as such lies outside the sphere of investigation of political economy.³ It falls within the sphere of the latter only in so far as it forms its own economic destination. It forms the material basis which directly underlies a definite economic relation called *exchange value*.

Exchange-value appears at first sight as a *quantitative relation*, as a proportion in which use-values are exchanged for one another. In such a relation they constitute equal exchangeable quantities. Thus, a volume of Propertius and eight ounces of snuff may represent the same exchange value, in spite of the dissimilar use-values of tobacco and elegy. As exchange-value, one kind of use-value is worth as much as another kind, if only taken in right proportion. The exchange value of a palace can be expressed in a certain number of boxes of shoe-blackening. On the contrary, London manufacturers of shoe-blackening have expressed the exchange value of their many boxes of blackening, in palaces. Thus, entirely apart from their natural forms and without regard to the specific kind of wants for which they serve as use-values, commodities in certain quantities equal each other, take each other's place in exchange, pass as equivalents, and in spite of their variegated appearance, represent the same entity.

Use-values are primarily means of existence. These means of existence, however, are themselves products of social life, the result of expended human vital power, *materialized labor*. As the embodiment of social labor, all commodities are the crystallization of the same substance. Let us now consider the nature of this substance, i.e., of labor, which is expressed in exchange value.

Let one ounce of gold, one ton of iron, one quarter of wheat and twenty yards of silk represent equal exchange values. As equivalents, in which the qualitative difference between their use-values has been eliminated, they represent equal volumes of the same kind of labor. The labor which is equally embodied in all of them must be uniform, homogeneous, simple labor. It matters as little in the case of labor whether it be embodied in gold, iron, wheat, or silk, as it does in the case of oxygen, whether it appears in the rust of iron, in the atmosphere, in the juice of a grape, or in the blood of a human being. But the digging of gold, the extraction of iron from a mine, the raising of wheat and the weaving of silk are so many kinds of labor, differing in quality. As a matter of fact, what in reality appears as a difference in use-values, is in the process of production, a difference in the work creating those use-values. Just as labor, which creates exchange value, is indifferent to the material of use-values, so it is to the special form of labor itself. Furthermore, the different use-values are the products of the work of different individuals, consequently the result of various kinds of

labor differing individually from one another. But as exchange values, they represent the same homogeneous labor, i.e., labor from which the individuality of the workers is eliminated. Labor creating exchange value is, therefore, *abstract general labor*.

If one ounce of gold, one ton of iron, one quarter of wheat, and twenty yards of silk are exchange values of equal magnitude or equivalents; then one ounce of gold, half a ton of iron, three bushels of wheat and five yards of silk are exchange values of different magnitudes, and this quantitative difference is the only difference of which they are capable as exchange values. As exchange values of different magnitudes, they represent greater or smaller quantities of that simple, homogeneous, abstract, general labor, which forms the substance of exchange value. The question arises, how are these quantities to be measured? Or, rather what constitutes the substance of labor, which makes it capable of quantitative measurement, since the quantitative differences of commodities in their capacity of exchange values are but quantitative differences of labor embodied in them. Just as motion is measured by time, so is labor measured by *labor-time*. Given the quality of labor, the difference in its duration is the only property by which it can be distinguished. As labor-time, labor has the same standard of measurement as the natural time measures, viz., hours, days, weeks, etc. Labor-time is the vital substance of labor, independent of its form, composition, individuality; it is its vital substance quantitatively, having at the same time its own inherent measure. Labor-time embodied in the use-values of commodities is the substance which makes exchange values and, therefore, commodities of them and at the same time serves to measure definite quantities of their value. Corresponding quantities of different use-values, in which the same quantity of labor-time is embodied, are equivalents; or, to put it in another form, all use-values are equivalents when taken in proportions containing the same quantity of expended, materialized labor-time. As exchange values, all commodities are but definite measures of *congealed labor-time*.

To understand how exchange value is determined by labor-time, the following main points must be kept in mind: The reduction of labor to simple labor, devoid of any quality, so to speak; the specific ways and means by which exchange — value-creating, i.e., commodity producing labor becomes *social labor*; finally, the difference between labor as the producer of use-values, and labor as the creator of exchange values.

In order to measure commodities by the labor-time contained in them, the different kinds of labor must be reduced to uniform, homogeneous, simple labor, in short, to labor which is qualitatively the same, and, therefore, differs only in quantity.

This reduction appears to be an abstraction; but it is an abstraction which takes place daily in the social process of production. The conversion of all commodities into labor-time is no greater abstraction nor a less real process than the chemical reduction of all organic bodies to air. Labor, thus measured by time, does not appear in reality as the labor of different individuals, but on the contrary, the various working individuals rather appear as mere organs of labor; or, in so far as labor is represented by exchange values, it may be defined as human labor in general. This abstraction of human labor in general virtually exists in the average labor which the average individual of a given society can perform — a certain productive expenditure of human muscles, nerves, brain, etc. It is unskilled labor to which the average individual can be put and which he has to perform in one way or another. The character of this average labor varies in different countries and at different stages of civilization, but appears fixed in a particular society. Unskilled labor constitutes the bulk of all labor performed in capitalist society, as may be seen from all statistics.

It is obvious that if A spends six hours in the production of iron and six hours on linen, and B also produces iron during six hours and linen during another six hours, it is but a different application of *the same* labor time that would be expended, if A produced iron during twelve hours, while B worked twelve hours on linen. But how about skilled labor which rises above the level of average labor by its higher intensity, by its greater specific gravity? This kind of labor resolves itself into unskilled labor composing it; it is simple labor of a higher intensity, so that one day of skilled labor, e. g., may equal three days of unskilled labor. This is not the place to consider the laws regulating this reduction. It is clear, however, that such reduction does take place, for, as exchange value, the product of the most skilled labor is, when taken in a certain proportion, equivalent to the product of unskilled average labor, or equal to a definite quantity of that unskilled labor.

The determination of exchange-value by means of labor-time implies, further, the fact that an equal quantity of labor is embodied in any given commodity, e. g., a ton of iron, no matter whether it is the work of A or B,

that is to say, various individuals expend an equal amount of labor-time for the production of the same use-value of a given quality and quantity. It is thus assumed that the labor-time contained in a commodity is the labor-time *necessary* for its production, i.e., it is the labor-time which is required for the production of another specimen of the same commodity under the same general conditions of production.

The conditions of labor, which creates exchange value, as shown by the analysis of the latter, are *social conditions* of labor or conditions of *social labor*. Social, not in the ordinary, but in a special sense. It is a specific form of the social process. The homogeneous simplicity of labor means first of all *equality* of the labors of various individuals, a reciprocal relation of equality of their labors determined by the actual reduction of all kinds of labor to uniform labor. The labor of every individual, as far as it is expressed in exchange value possesses this social character of equality and finds expression in exchange value only in so far as it is a relation of equality with the labor of all other individuals.

Furthermore, the labor-time of a single individual is directly expressed in exchange value as *universal labor-time*, and this *universal character* of individual labor is the manifestation of its *social character*. The labor-time represented by exchange value is the labor-time of an individual, but of an individual undistinguished from other individuals in so far as they perform the same labor; therefore, the time required by one individual for the production of a certain commodity is the *necessary* labor-time which any other individual would have to spend on the production of the same commodity. It is the labor-time of an individual, *his* labor-time, but only as labor-time common to all, regardless as to which particular individual's labor-time it is. As universal labor-time it is represented in a universal product, in a *universal equivalent*, in a definite quantity of materialized labor-time: the latter is indifferent as to the particular form of use-value in which it appears directly as the product of an individual, and may be turned at will into any other form of use-value to represent the product of any other individual. Only as such a *universal* quantity, is it a *social* quantity. In order to result in exchange value, the labor of an individual must be turned into a *universal equivalent*, i.e., the labor-time of an individual must be expressed as universal labor-time, or universal labor-time as that of an individual. It is the same as though different individuals had put together their labor-time and contributed the different quantities of labor-time at their common

disposal in the form of different use-values. The labor-time of the individual is thus, in fact, the labor time which society requires for the production of a certain use-value, i.e., for the satisfaction of a certain want. But the question that interests us here is as to the specific form in which labor acquires a social character. Let us suppose that a certain quantity of labor-time of a spinner is realized in 100 lbs. of yarn. Suppose 100 yards of linen, the product of the weaver, represent the same quantity of labor-time. Inasmuch as these two products represent equal quantities of universal labor-time and, hence, are equivalents of *every* use-value which contains the same amount of labor-time, they are also equivalent to each other. Only because the labor-time of the spinner and that of the weaver take the form of universal labor-time and their products appear as universal equivalents, is the labor of the weaver realized for the spinner, and that of the spinner, for the weaver, the labor of one takes the place of the labor of the other, i.e., the social character of their labors is realized for both. Quite different it was under the patriarchal system of production, when spinner and weaver lived under the same roof, when the female members of the family did the spinning, and the male members did the weaving to supply the wants of their own family; then yarn and linen were *social* products, spinning and weaving were *social* labor within the limits of the family. But their social character did not manifest itself in the fact that yarn, as a universal equivalent, could be exchanged for linen as a universal equivalent, or that one was exchanged for another, as identical and equivalent expressions of the same universal labor-time. It was rather the family organization with its natural division of labor that impressed its peculiar social stamp on the product of labor. Or, let us take the services and payments in kind of the Middle Ages. It was the specific kind of labor performed by each individual in its natural form, the particular and not the universal aspect of labor, that constituted then the social tie. Or, let us finally take labor carried on in common in its primitive natural form, as we find it at the dawn of history of all civilized races.⁴ It is clear that in this case labor does not acquire its social character from the fact that the labor of the individual takes on the abstract form of universal labor or that his product assumes the form of a universal equivalent. The very nature of production under a communal system makes it impossible for the labor of the individual to be private labor and his product to be a private product; on the contrary, it makes individual labor appear as the direct function of a member of a social organism. On the contrary, labor, which is

expressed in exchange value, at once appears as the labor of a separate individual. It becomes social labor only by taking on the form of its direct opposite, the form of abstract universal labor.

Labor, which creates exchange value, is, finally, characterized by the fact that even the social relations of men appear in the reversed form of a social relation of things. Only in so far as two use-values are in a mutual relation of exchange values does the labor of different persons possess the common property of being identical universal labor. Hence, if it be correct to say that exchange value is a relation between persons,⁵ it must be added that it is a relation disguised under a material cover. Just as a pound of iron and a pound of gold represent the *same* weight in spite of their different physical and chemical properties, so do two use-values, as commodities containing the same quantity of labor-time, represent the *same exchange value*. Exchange value thus appears as the natural social destination of use-values, a property which they possess by virtue of being things and in consequence of which they are exchanged for one another in definite proportions, or form equivalents, just as chemical elements combine in certain proportions, forming chemical equivalents. It is only through the habit of everyday life that we come to think it perfectly plain and commonplace, that a social relation of production should take on the form of a thing, so that the relation of persons in their work appears in the form of a mutual relation between things, and between things and persons.

In commodities this mystification is as yet very simple. It is more or less plain to everybody that a relation of commodities as exchange values is nothing but a mutual relation between persons in their productive activity. This semblance of simplicity disappears in higher productive relations. All the illusions in regard to the monetary system are due to the fact that money is not regarded as something representing a social relation of production, but as a product of nature endowed with certain properties. The modern economists who sneer at the illusions of the monetary system, betray the same illusion as soon as they have to deal with higher economic forms, as, e. g., capital.⁶ It breaks forth in their confession of naive surprise, when what they have just thought to have defined with great difficulty as a thing suddenly appears as a social relation and then reappears to tease them again as a thing, before they have barely managed to define it as a social relation.

Since the exchange value of commodities is, in fact, nothing but a mutual relation of the labors of individuals — labors which are similar and

universal — nothing but a material expression of a specific social form of labor, it is a tautology to say that labor is the *only* source of exchange value and consequently of wealth, in so far as the latter consists of exchange values. Similarly, it is a tautology to say that matter in its natural state has no exchange value, because it does not contain any labor, and that exchange value as such does not contain matter. But when William Petty calls “labor the father and earth the mother of wealth,” or when Bishop Berkeley asks “whether the four elements and man’s labour therein, be not the true source of wealth,”⁷ or when the American, Thomas Cooper puts it popularly: “Take away from a piece of bread the labour bestowed by the baker on the flour, by the miller on the grain brought to him, by the farmer in ploughing, sowing, tending, gathering, threshing, cleaning and transporting the seed, and what will remain? A few grains of grass, growing wild in the woods, and unfit for any human purpose”⁸ — then all these views do not refer to abstract labor as the source of exchange value, but to concrete labor as the source of material wealth; in short, to labor in so far as it produces use-values. In assuming that a commodity has use-value we assume the special usefulness and distinct fitness of the labor absorbed by it, but that is all there is to the view of labor as useful labor from the standpoint of commodity. Considering bread as a use-value, we are interested in its properties as an article of food and not at all in the different kinds of labor of the farmer, miller, baker, etc. If by some invention nineteen-twentieths of this labor could be saved, the loaf of bread would still render the same service as before. If it fell ready-made from the sky it would not lose a single atom of its use-value. While labor which creates exchange value is realized in the equality of commodities as universal equivalents, labor as a productive activity with a useful purpose is realized in the endless variety of use-values created by it. While labor which creates exchange values is *abstract, universal* and *homogeneous*, labor which produces use-values is concrete and special and is made up of an endless variety of kinds of labor according to the way in which and the material to which it is applied.

It is wrong to speak of labor in so far as it is applied to the production of use-values as of *the only* source of wealth, namely, the material wealth produced by it. Being an activity intended to adapt materials to this or that purpose, it requires matter as a pre-requisite. In different use-values the proportion between labor and raw material varies greatly, but use-value always has a natural substratum. Labor, as an activity, directed to the

adaptation of raw material in one form or another, is a natural condition of human existence, a condition of exchange of matter between man and nature, independent of all social forms. On the contrary, labor producing exchange value is a specifically social form of labor. Tailoring, e. g., in its material manifestation as a distinct productive activity, produces a coat, but not the exchange value of the coat. The latter is produced not by the labor of the tailor as such, but by abstract universal labor, and that belongs to a certain organization of society which has not been brought about by the tailor. Thus, the women under the ancient system of house industry made coats without producing the exchange value of the coats. Labor as a source of material wealth was known to Moses, the legislator, as well as to Adam Smith, the customs official.⁹

Let us consider now some propositions which follow from the determination of exchange value by labor-time.

As a use-value, every commodity owes its usefulness to itself. Wheat, e. g., serves as an article of food. A machine saves labor to a certain extent. This function of a commodity by virtue of which it serves only as use-value, as an article of consumption, may be called its service, the service which it renders as use-value. But as an exchange value, a commodity is always regarded as a result; the question in this case is not as to the service which it renders, but as to the service¹⁰ which it has been rendered in its production. Thus, the exchange value of a machine is determined not by the quantity of labor-time which it saves, but by the quantity of labor-time which has been expended on its own production and which is, therefore, required to produce a new machine of the same kind.

If, therefore, the quantity of labor-time required for the production of commodities remained constant, their exchange value would remain the same. But the ease and the difficulty of production are constantly changing. If the productivity of labor increases, the same use-value will be produced in less time. If the productivity of labor declines, more time will be required for the production of the same use-value. Thus, the labor-time contained in a commodity or its exchange-value is a variable quantity, increasing or diminishing in an inverse ratio to the rise and fall of the productivity of labor. The productive power of labor which is applied in the manufacturing industry on a predetermined scale depends in the agricultural and extractive industries also on natural conditions which are beyond human control. *The same labor* will yield a greater or less output of various metals, according to

their more or less close occurrence in the earth's crust. *The same labor* may be embodied in two bushels of wheat in a favorable season, and only in one in an unfavorable season. In this case, scarcity or abundance, as natural conditions, seem to determine the exchange value of commodities, because they determine the productivity of certain kinds of labor which depend upon natural conditions.

Unequal volumes of different use-value contain the same quantity of labor-time or the same exchange value. The smaller the volume of a use-value containing a certain quantity of labor-time as compared with other use-values, the greater its *specific exchange-value*. If we find that certain use-values, such as, e. g., gold, silver, copper and iron, or wheat, rye, barley and oats, form a series of specific exchange values which, though not retaining exactly the same numerical ratio, still retain through widely remote epochs of civilization the same rough proportion of relatively larger and smaller quantities, we may draw the conclusion that the progressive development of the productive powers of society has equally, or approximately so, affected the labor-time necessary for the production of the various commodities.

The exchange value of a commodity is not revealed in its own use-value. But, as the embodiment universal social labor-time, the use-value of one commodity bears a certain ratio to the use-values of other commodities. Thus, the exchange value of one commodity is manifested in the use-values of other commodities. An equivalent is, in fact, the exchange value of one commodity expressed in the use-value of another commodity. If I say, e. g., that one yard of linen is worth two pounds of coffee, then the exchange value of linen is expressed in terms of the use-value of coffee, viz., in a certain quantity of that use-value. This ratio being given, I can express the value of any quantity of linen in coffee. It is clear that the exchange value of one commodity, say linen, is not confined to the ratio of any one commodity, e. g. coffee, as its equivalent. The quantity of universal labor-time which is represented in one yard of linen is at the same time embodied in an endless variety of volumes of use-values of all other commodities. The use-value of any other commodity forms the equivalent of one yard of linen, in the proportion in which it represents the same quantity of labor-time as that yard of linen. The exchange value of *this single commodity* is, therefore, fully expressed in the endless number of equations in which the use-values of all other commodities form its equivalents. Not until the

exchange value of a commodity is expressed in the sum total of these equations or of the different proportions in which one commodity is exchanged for every other commodity, does it find an exhaustive expression as a *universal equivalent*; e. g., the series of equations:

1 yard of linen = 1/2 lb. of tea,
1 yard of linen = 2 lbs. of coffee,
1 yard of linen = 8 lbs. of bread,
1 yard of linen = 6 yards of calico,

may be represented as follows:

1 yard of linen = 1/8 lb. of tea + 1/2 lb. of coffee + 2 lbs. of bread + 1 1/2 yards of calico.

Therefore, if we had before us the sum total of the equations, in which the value of a yard of linen is exhaustively expressed, we could represent its exchange value in the form of a series. As a matter of fact, the series is an endless one, since the circle of commodities, constantly expanding, can never be closed up. But while the exchange value of one commodity is thus measured by the use-values of all other commodities, the exchange values of all the other commodities are, in their turn, measured by the use-value of this one commodity.¹¹

If the exchange value of one yard of linen is expressed in 1/2 lb. of tea, or 2 lbs. of coffee, or 6 yards of calico, or 8 lbs. of bread, etc., it follows that coffee, tea, calico, bread, etc., are equal to each other if taken in the same proportion in which they are equal to the third article, linen; consequently, linen serves as the common measure of their exchange values. Every commodity, as the embodiment of universal labor-time, i.e., as a certain quantity of universal labor-time, expresses in turn its exchange value in definite quantities of the use-values of all other commodities, and the exchange values of all the other commodities are, on the other hand, measured by the use-value of this one exclusive commodity. But as an exchange value, every commodity is at the same time the one exclusive commodity that serves as a common measure of the exchange values of all other commodities; and, on the other hand, it is but one of the many commodities in the entire series of which every commodity expresses directly its exchange value.

The value of a commodity is not affected by the number of commodities of other kinds. But the length of the series of equations in which its exchange value is realized does depend upon the greater or less variety of

other commodities. The series of equations in which the value of coffee, e. g., is represented, indicates the extent to which it is exchangeable, the limits within which it performs the function of an exchange value. The exchange value of a commodity as an embodiment of universal social labor-time is expressed in its equivalence to an endless variety of use-values.

We have seen that the exchange value of a commodity varies with the quantity of labor-time directly contained in it. Its realized exchange value, i.e., its exchange value expressed in the use-values of other commodities, must also depend on the proportion in which the labor-time spent on the production of all other commodities is changing. If, e. g., the labor-time required for the production of a bushel of wheat remained constant, while that required for the production of all other commodities doubled, the exchange value of a bushel of wheat expressed in its equivalents would become half as large as before. The result would be practically the same as if the amount of time necessary for the production of one bushel of wheat had been reduced by one-half, and that required for all other commodities had remained unchanged. The value of commodities is determined by the proportion in which they can be produced in the same labor-time. In order to see what possible changes this proportion may undergo, let us take two commodities, A and B.

First case. Let the labor-time required for the production of commodity B remain unchanged. In that case the exchange value of A, expressed in terms of B, rises and falls with the rise and fall of the labor-time required for the production of A.

Second case. Let the labor-time required for the production of commodity A remain constant. Then the exchange value of A, expressed in terms of B, falls and rises in an inverse ratio with the rise and fall of the labor-time required for the production of B.

Third case. Let the labor-time required for the production of commodities A and B rise and fall in equal proportion. Then the expression of equivalence of A and B remains unchanged. If through some cause the productivity of all kinds of labor were to decline uniformly, so that the production of all commodities would require an equally increased quantity of labor-time, then the value of all commodities would rise, though the expression of their exchange values would remain unchanged, and the actual wealth of society would decrease, because it would have to expend more labor-time on the production of the same stock of use-values.

Fourth case. Let the labor-time required for the production of A and B rise and fall, but not uniformly; that is to say, the labor-time required for the production of A may rise, while that required for B may fall, or vice versa. All of which can be reduced to the simple case where the labor-time required for the production of one commodity remains unchanged, while that required for the other rises or falls.

The exchange value of any commodity is expressed in the use-value of any other commodity, be it in integral units or in fractions thereof. As exchange value, every commodity is capable of subdivision, like the labor-time embodied in it. The equivalence of commodities is independent of their physical divisibility as use-values, just as the sum of the exchange values of commodities is indifferent to the change of form which use-values have to undergo when converted into a *single* new commodity.

So far we have considered commodities from a two-fold point of view, as use-values and exchange values alternately. But a commodity as such is a direct combination of use-value and exchange value; and it is a commodity only in relation to other commodities. The *actual* relation between commodities constitutes the *process of their exchange*. It is a social process participated in by individuals independent of each other but the part they take in it is that of owners of commodities only. Their mutual relations are those of their commodities, and thus they really appear as conscious factors of the process of exchange.

A commodity *is* a use-value, wheat, linen, a diamond, a machine, etc., but as a commodity it is, at the same time, *not* a use-value. If it were a use-value for its owner, i.e., a direct means for the satisfaction of his own wants, then it would not be a commodity. To him it is rather *a non-use-value*; it is merely the material depository of exchange-value, or simply a *means of exchange*; as an active bearer of exchange value, use-value becomes a means of exchange. To the owner it is a use-value only in so far as it constitutes exchange value.^{[12](#)}

It has yet *to become* a use-value, viz., to others. Not being a use-value to its owner, it is a use-value to the owners of other commodities. If it is not, then the labor expended on it was useless labor, and the result of that labor is not a commodity. On the other hand, the commodity must become a use-value *to the owner himself*, because his means of existence lie outside of it in the use-values of commodities not belonging to him. In order to become

a use-value, the commodity must meet the particular want of which it is the means of satisfaction. Use-values of commodities are thus *realized* use-values through a universal change of hands by passing from the hands in which they were held as means of exchange into those where they become use values. Only through this universal transfer of commodities does the labor contained in them become useful labor. In this process of their mutual interchange as use-values, commodities do not acquire any new economic forms. On the contrary, even the form which marked them as commodities disappears. Bread, e. g., by changing hands from the baker to the consumer does not change its identity as bread. On the contrary, it is only the consumer that begins to regard it as a use-value, as a certain article of food, while in the hands of the baker it was only the bearer of an economic relation, a palpable yet transcendental object. Thus, the only change of form that commodities undergo while becoming use-values, consists in the fact that they cease to be, as a matter of form, non-use-values to their owners, and use-values to those who do not own them. To become use-values commodities must be universally alienated; they must enter the sphere of exchange; but they are subject to exchange in their capacity of exchange values. Hence, in order to be realized as use-values, they must be realized as exchange values.

While the single commodity appeared from the standpoint of use-value as something independent, as exchange value it was regarded first of all in its relation to all other commodities. This relation was, however, merely theoretical, imaginary. It becomes real only in the process of exchange. On the other hand, a commodity *is* an exchange value in so far as a certain quantity of labor-time has been expended on it, and it consequently represents *materialized labor-time*. But of itself it is only materialized individual labor-time of a particular kind, and not *universal* labor-time. Therefore, it *is not* directly an exchange value, but must first *become* such. First of all, it is an embodiment of universal labor-time only in so far as it represents labor-time applied to a definite useful purpose, i.e., when it represents a use-value. This was the material condition under which alone labor-time contained in commodities was regarded as universal social labor. Thus, while a commodity can become a use-value only after it has been realized as an exchange value, it can, on the other hand, be realized as an exchange value only if it proves to be a use-value in the process of alienation.

A commodity can be alienated as a use-value only to one whom it serves as a use-value, i.e., as a means of satisfying a certain want. On the other hand, it is exchanged for another commodity, or, if we put ourselves on the side of the owner of the other commodity, it, too, can be alienated, i.e., be realized, only if brought in contact with that particular want of which it is the object. In the universal exchange of commodities as *use-values* the basis for their mutual relations is in their material difference as distinct objects which satisfy different wants by their specific properties. But as mere use-values, they are indifferent to each other, and are incommensurable. As use-values they can be exchanged only with reference to certain wants. They are exchangeable only as equivalents, and they are equivalents only as equal quantities of materialized labor-time, so that all regard to their natural properties as use-values and therefore to the relation of the commodities to particular wants is eliminated. On the contrary, a commodity is realized as an exchange value by replacing as an equivalent any definite quantity of any other commodity, regardless of whether it is a use-value for the owner of the other commodity or not. But to the owner of the other commodity it is a commodity only in so far as it is a use-value to him, and it becomes an exchange value to its owner only in so far as it is a commodity to that other person. Thus, the same relation appears as a proportion between commodities as magnitudes of the same denomination, but differing qualitatively; or, as an expression of their equivalence as embodiments of universal labor-time, and, at the same time, as a relation of qualitatively different objects, of use-values intended for the satisfaction of particular wants, in short, a relation in which they are distinguished as actual use-values. But this equivalence and non-equivalence mutually exclude each other. Thus we have before us not only a vicious circle of problems in which the solution of one implies that of the other, but a combination of contradicting claims, since the fulfillment of one is directly connected with that of its opposite.

The process of exchange of commodities must result both in the unfolding and in the solution of these contradictions, neither of which, however, can appear in that process in this simple way. We have only observed how commodities are mutually related to each other as use-values, i.e., how they appear as use-values *within* the process of exchange. The exchange-value, on the contrary, as we have considered it so far, appeared as an abstraction formed in our own minds, or — if we may so put it — in

the mind of the individual owner of commodities, which lie stored in his warehouse as use-values, and weigh upon his conscience as exchange values. In the process of exchange, however, commodities must be not only use-values, but also exchange values to one another, and that should appear as their own mutual relation. The difficulty which we first encountered was that a commodity must be first alienated and delivered to its purchasers as a use-value, in order to appear as an exchange value, as materialized labor, while on the other hand its alienation as use-value implies its being an exchange value. But let us assume that this difficulty has been overcome. Suppose the commodity has divested itself of its use-value, and has thereby fulfilled the material condition of being socially useful labor, instead of a particular labor of an individual. In that case, the commodity must become an exchange value, a universal equivalent, an embodiment of universal labor-time for all other commodities in the process of exchange, and thus, leaving behind its limited role of a particular use-value, acquire the ability to be directly represented in all use-values as its equivalents. But every commodity is *just such* a commodity, appearing as a direct incarnation of universal labor-time by divesting itself of its particular use-value. On the other hand, however, commodities confront each other in the process of exchange as particular commodities, as the labor of private individuals embodied in particular use-values. Universal labor-time is itself an abstraction, which, as such, does not exist for commodities.

Let us examine the series of equations in which the exchange value of a commodity finds its concrete expression, e. g.:

1 yard of linen = 2 lbs. of coffee.

1 yard of linen = 1/2 lb. of tea.

1 yard of linen = 8 lbs. of bread, etc.

These equations simply signify that equal quantities of universal social labor-time are embodied in one yard of linen, two pounds of coffee, half a pound of tea, etc. But as a matter of fact the individual labors which are represented in these particular use-values, become universal, and, in that form, also social labor, only when they are actually exchanged for one another in proportion to the labor-time contained in them. Social labor-time exists in these commodities in a latent state, so to say, and is first revealed in the process of exchange. We do not proceed from the labor of individuals as social labor, but, on the contrary, from special labor of private individuals which appears as universal social labor only by divesting itself of its

original character in the process of exchange. Universal social labor is, therefore, no ready-made assumption, but a growing result. And thus we are confronted with a new difficulty, that on the one hand commodities must enter the process of exchange as embodiments of universal labor-time, while, on the other hand, this embodiment of the labor-time of individuals as social labor-time is itself a result of the process of exchange.

Every commodity becomes an exchange value by divesting itself of its use-value, or of its original nature. The commodity must therefore assume a double capacity in the process of exchange. But that second capacity of exchange value can appear only in the shape of another commodity, because only commodities confront each other in the process of exchange. How is a particular commodity to represent directly *materialized universal* labor-time, or — to put it differently — how is individual labor-time, which is embodied in a particular commodity to be made directly universal in character? The concrete expression of the exchange value of a commodity, i.e., of every commodity as a universal equivalent, is represented in an endless series of equations, such as:

1 yard of linen	=	2 lbs. of coffee.
1 yard of linen	=	1/2 lb. of tea.
1 yard of linen	=	8 lbs. of bread.
1 yard of linen	=	6 yards of calico.
1 yard of linen	=	etc.

The above form is theoretical in so far as commodities are only *thought of* as definite quantities of materialized universal labor-time. But the capacity of a particular commodity to serve as a universal equivalent from a mere abstraction becomes a *social* result of the process of exchange by a simple inversion of the above series of equations, viz.:

2 lbs. of coffee	=	1 yard of linen.
1/2 lb. of tea	=	1 yard of linen.
8 lbs. of bread	=	1 yard of linen.
6 yards of calico	=	1 yard of linen.

While coffee, tea, bread, calico, in short, all commodities express in linen the labor-time contained in them, the exchange value of linen, on the other hand, unfolds itself in all other commodities as its equivalents, and the labor-time embodied in it becomes direct universal labor-time, which is equally expressed in different volumes of all other commodities. Linen thus

becomes the *universal equivalent* through the *universal action* of all other commodities upon it. As exchange value, every commodity served as a measure of value of all other commodities. Now, on the contrary, since all commodities measure their exchange values by means of a particular commodity, this excluded commodity becomes the special expression of exchange value, as a universal equivalent. At the same time, the endless series of equations in which the exchange value of every commodity was expressed, is reduced to one single equation consisting of two members. The equation 2 lbs. of coffee = 1 yard of linen now fully expresses the exchange value of coffee, for in this expression a yard of linen appears as the direct equivalent of a definite quantity of every other commodity. Thus, within the sphere of exchange all commodities are or appear to each other as exchange values in the form of linen. The proposition that commodities, as exchange values, are to each other as different quantities of materialized universal labor-time, may now be worded to the effect that commodities, as exchange values, represent nothing but different quantities of *the same* article, linen. Universal labor-time thus assumes the aspect of a distinct thing, as a commodity existing along with and outside of all other commodities. At the same time the equation 2 lbs. of coffee = 1 yard of linen, in which one commodity appears as the exchange value of another, is yet to be realized. Only by being alienated as use-value — which depends upon whether it proves to be in the process of exchange the object of a certain want — does the commodity actually transform its existence as coffee into the existence as linen and thus takes on the form of a universal equivalent and becomes, indeed, an exchange value for all other commodities. Conversely, since all commodities are turned into linen by being alienated as use-values, linen becomes the converted form of all other commodities, and only as a result of this transformation of all other commodities into it, it becomes the direct *embodiment of universal labor-time*, i.e., the product of universal exchange and of the elimination of individual labor. If commodities thus assume a twofold character in order to appear as exchange values to each other, the commodity which has been singled out as the universal equivalent becomes, on the other hand, a use-value in two ways. Besides its special use-value as a particular commodity, it assumes a universal use-value. This latter kind of use-value constitutes its special feature, emanating as it does, from the specific part which the commodity plays as a result of the universal relation which all other

commodities bear toward it in the process of exchange. The use-value of every commodity as an object of a particular want, has a different value in different hands, e. g., it has a different value in the hands of the one who disposes of it, than in those of the one who acquires it. But the commodity singled out as the universal equivalent, is now an object of a universal want arising from the very process of exchange, and it has the same use-value to everybody, viz., that of serving as the depository of exchange value, of being a universal means of exchange. Thus we find in one commodity the solution of the contradiction which is inherent in commodity as such, namely, of being at one and the same time a particular use-value and a universal equivalent, and, therefore, a use-value for everybody or universal use-value. Thus, while all other commodities express their exchange value in the form of an ideal equation with the excluded commodity — an equation yet to be realized — the use-value of the special commodity, although real, appears in the process itself as a mere form which is yet to be realized through transformation into actual use-values. Originally the commodity appeared simply as commodity, as universal labor-time embodied in a particular use-value. In the process of exchange, all commodities are related to the one excluded commodity as to a simple commodity, one which appears as the embodiment of universal labor-time in a particular use-value. Thus, *particular* commodities become related to one particular commodity as a universal commodity.¹³ In that manner the mutual relations of possessors of commodities based on the fact that they regard their labor as universal social labor, takes on the aspect of their relations to commodities as exchange values; and the mutual relation of commodities as exchange values appears in the process of exchange as the relation of all of them to one particular commodity as to a specially adopted means of expression of their exchange value; again, from the point of view of that particular commodity the above relation appears as its specific relation to all other commodities, and, therefore, as its own definite, spontaneous, social character. The particular commodity which thus appears as the specially adopted expression of the exchange value of all other commodities, or the exchange value of commodities as a particular exclusive commodity, is *money*. Money is a crystallization of the exchange value of commodities which they themselves form in the process of exchange. Thus, while commodities become *use-values* to each other in the process of exchange by casting off all definite forms and entering into

mutual relations in their direct material shape, they must assume a new form, viz., proceed to the formation of money in order to appear as *exchange values* to each other. Money is not a symbol, no more than the commodity aspect of a use-value is a symbol. That a social relation of production takes the form of an object existing outside of individuals, and that the definite relations into which individuals enter in the process of production carried on in society, assume the form of specific properties of a thing, is a perversion and by no means imaginary, but prosaically real, mystification marking all social forms of labor which creates exchange value. In money this mystification appears only more strikingly than in commodities.

The necessary physical properties of the particular commodity in which the money form of all other commodities is to be crystallized — as far as they are directly determined by the nature of exchange value — are: divisibility to any desired extent, homogeneity of its parts, and uniformity of all the specimens of the commodity. As an embodiment of universal labor-time it must be homogeneous in its structure and capable of representing only quantitative differences. Another necessary property is durability of its use-value, as it must last through the process of exchange. The precious metals excel in these qualities. Money not being a result of a scheme or agreement, but having been produced instinctively in the process of exchange, a great variety of more or less unsuited commodities had successively performed its functions. At a certain stage of development of the process of exchange, the necessity arises for a polar distribution of the functions of exchange value and use-value among commodities, so that one commodity e. g. should act as a medium of exchange, while another is being alienated as a use-value. This necessity brings it about that one or even several commodities possessing the most generally accepted use-value, begin, incidentally at first, to play the part of money. Even if not direct means of satisfying existing wants, their being the most considerable material constituent part of wealth, insures to them a more general character than to the other use-values.

Direct barter, the original natural form of exchange, represents rather the beginning of the transformation of use-values into commodities, than that of commodities into money. Exchange value has as yet no form of its own, but is still directly bound up with use-value. This is manifested in two ways. Production, in its entire organization, aims at the creation of use-values and

not of exchange values, and it is only when their supply exceeds the measure of consumption that use-values cease to be use-values, and become means of exchange, i.e., commodities. At the same time, they become commodities only within the limits of being direct use-values distributed at opposite poles, so that the commodities to be exchanged by their possessors must be use-values to both, — each commodity to its non-possessor. As a matter of fact, the exchange of commodities originates not within the primitive communities,¹⁴ but where they end, on their borders at the few points, where they come in contact with other communities. That is where barter begins, and from here it strikes back into the interior of the community, decomposing it. The various use-values which first become commodities in the barter between different communities, such as slaves, cattle, metals, constitute therefore in most cases the first money within those communities themselves. We have seen how the exchange value of a commodity is manifested the more perfectly as exchange value, the longer the series of its equivalents or the *greater* the sphere of exchange of that commodity. With the gradual expansion of barter, the increase in the number of exchanges, and the growing diversification of the commodities drawn into exchange, commodities develop into exchange values, which leads to the formation of money and has a destructive effect on direct barter. The economists are in the habit of ascribing the origin of money to the difficulties which are encountered in the way of extensive barter, but they forget that these difficulties arise from the development of exchange value and from the fact that social labor becomes universal labor. E. g., commodities as use-values can not be subdivided at will, a property which they should possess as exchange values. Or, a commodity belonging to A may be a use-value to B, while the commodity belonging to B may not have any use-value to A. Or the owners of the commodities may need each other's indivisible goods in unequal proportions. In other words, under the pretence of analyzing simple barter, economists bring out certain aspects of the contradiction which is inherent in commodities as entities simultaneously embodying both use-value and exchange value. On the other hand, they consistently cling to the idea that barter is the natural form of exchange, which suffers only from certain technical difficulties, for which money is a cunningly devised expedient. Arguing from this perfectly superficial view, an ingenious English economist has rightly maintained that money is merely a material instrument like a ship or a steam-engine, but not

an expression of a social relation in the field of production and consequently not an economic category; and that it is, therefore, wrong to treat the subject in political economy, which really has nothing in common with technology.¹⁵

The world of commodities implies the existence of a highly developed division of labor; this division is manifested directly in the great variety of use-values, which confront each other as particular commodities and which embody as many different kinds of labor. The division of labor embracing all the particular kinds of productive occupations, is the complete expression of social labor in its material aspect viewed as labor creating use-values. But from the standpoint of commodities and within the process of exchange, it exists only in its results, in the variety of the commodities themselves.

The exchange of commodities constitutes the social metabolic process, i.e. the process in which the exchange of the special products of private individuals is the result of certain social relations of production into which the individuals enter in this interchange of matter. As they develop, the mutual relations of commodities crystalize into various aspects of the universal equivalent and thus the process of exchange becomes at the same time the process of the formation of money. The whole of this process which takes the form of a succession of processes, constitutes circulation.

NOTES ON THE HISTORY OF THE THEORY OF COMMODITIES.

The analysis of commodities according to their twofold aspect of use-value and exchange value by which the former is reduced to work or deliberate productive activity; and the latter, to labor time or homogeneous social labor, is the result of a century and a half of critical study by the classical school of political economy which dates from William Petty in England and Boisguillebert in France¹⁶ and closes with Ricardo in the former country and Sismondi in the latter.

Petty reduces use-value to labor, without deceiving himself as to the natural limitation of its creative power. As regards concrete labor, he sizes it up in the magnitude of its social aspect, as *the division of labor*.¹⁷ This view of the source of material wealth does not remain more or less fruitless as in the case of his contemporary, Hobbes, but leads up to his *Political Arithmetic*, the first form in which Political Economy is differentiated as an independent science.

He defines exchange value, however, just as it *appears* in the process of exchange of commodities, viz. as money; and money he defines as an existing commodity, gold and silver. Laboring under the ideas of the monetary system, he declares the special branch of labor which is devoted to the production of gold and silver as the labor which determines exchange value. What he really means is that the labor of members of society must produce not direct use-values, but commodities or use-values which by means of exchange are capable of assuming the form of gold and silver, i.e. of money, i.e. of exchange value, i.e. of embodiments of universal labor. His example, however, shows strikingly that the recognition of labor as the source of material wealth by no means excludes the misconception of the particular social form in which labor constitutes the source of exchange value.

In his turn, Boisguillebert, if not consciously, at any rate actually reduces the exchange value of a commodity to labor-time, since he determines “true value” (*la juste valeur*) by the right proportion in which the labor-time of individuals is distributed among the several branches of industry, and defines free competition as the social process which determines these

correct proportions. At the same time, however, and in contrast with Petty he wages a fanatical war against money which, by its interference, disturbs the natural equilibrium or harmony of exchange of commodities and, like a wanton Moloch, demands all natural wealth as sacrifice. It is true that this assault on money was called forth by certain historic conditions. Since Boisguillebert attacked¹⁸ the blind destructive lust after gold which possessed the court of Louis XIV, his tax collectors, and his nobility; on the other hand, Petty extolled in the greed of gold the mighty impulse which spurred on the nation in her industrial development and in her conquest of the world-market; still, there asserts itself here a deeper antagonism of principles which constantly recurs between true English and true French¹⁹ Political Economy. Boisguillebert sees, in fact, only the material substance of wealth, its use-value, the enjoyment²⁰ of it, and considers the capitalistic form of labor, i.e. the production of use-values as commodities and the exchange of those commodities, as the natural social form in which individual labor attains its end. When he is, therefore, confronted with the specific character of capitalistic wealth as in the case of money, he sees in it the usurping interference of extraneous elements and gets into a rage about the capitalist system of labor in one form while utopian-like he praises it in another.²¹ Boisguillebert furnishes us with proof that one may treat labor-time as the measure of value of commodities, and at the same time confound labor embodied in the exchange value of commodities and measured by time, with the direct natural activity of individuals.

The first sensible analysis of exchange value as labor-time, made so clear as to seem almost commonplace, is to be found in the work of a man of the New World where the bourgeois relations of production imported together with their representatives sprouted rapidly in a soil which made up its lack of historical traditions with a surplus of humus. That man was Benjamin Franklin, who formulated the fundamental law of modern political economy²² in his first work which he wrote when a mere youth and published in 1721.

He declares it necessary to look for another measure of value than precious metals. That measure is labor. "By labor may the value of silver be measured as well as other things. As, suppose one man employed to raise corn, while another is digging and refining silver; at the year's end, or at any other period of time, the complete produce of corn, and that of silver, are the natural price of each other; and if one be twenty bushels, and the

other twenty ounces, then an ounce of that silver is worth the labor of raising a bushel of that corn. Now if by the discovery of some nearer, more easy or plentiful mines, a man may get forty ounces of silver as easily as formerly he did twenty, and the same labor is still required to raise twenty bushels of corn, then two ounces of silver will be worth no more than the same labor of raising one bushel of corn, and that bushel of corn will be as cheap at two ounces, as it was before at one, *ceteris paribus*. Thus the riches of a country are to be valued by the quantity of labor its inhabitants are able to purchase.”²³ Thus Franklin regards labor-time from the one-sided economic point of view, as the measure of value. The transformation of actual products into exchange values is self-evident with him and the only question is as to finding a quantitative measure of value. “Trade,” says he, “in general being nothing else but the exchange of labour for labour, the value of all things is, as I have said before, most justly measured by labour.”²⁴ Substitute the word “work” for “labor” in the above statement, and the confusion of labor in one form and labor in another form becomes at once apparent. Since trade consists e. g. in the exchange of the respective labors of the shoemaker, miner, spinner, painter, etc., does it follow that the value of shoes is most justly measured by the work of a painter? On the contrary, Franklin meant that the value of shoes, mining products, yarn, paintings, etc., is determined by abstract labor which possesses no particular qualities and can, therefore, be measured only quantitatively.²⁵ But since he does not develop the idea that labor contained in exchange value is abstract universal labor which assumes the form of social labor as a result of the universal alienation of the products of individual labor, he necessarily fails to recognize in money the direct embodiment of this alienated labor. For that reason he sees no inner connection between money and labor which creates exchange value, and considers money merely as an instrument introduced from outside into the sphere of exchange for purposes of technical convenience.²⁶ Franklin’s analysis of exchange value did not exert any direct influence on the general trend of science, because he discussed only special questions of political economy whenever there was a definite practical occasion for it.

The contrast between useful work and labor which creates exchange value agitated all Europe during the eighteenth century in the form of this question: what particular kind of labor constitutes the source of bourgeois wealth? It was thus assumed that not every kind of labor which is realized

in use-values or yields certain products does thereby directly create wealth. With the physiocrats, however, as well as with their opponents, the burning question was not, what kind of labor creates *value*, but which is it that creates *surplus value*. They approached the problem in its complicated form before they had solved it in its elementary form; such is the historical course of all sciences leading them by a labyrinth of intersecting paths to the real starting points. Unlike other builders, science not only erects castles in the air, but constructs separate stories of the building, before it has laid the foundation. Without dwelling any longer on the physiocrats and omitting quite a number of Italian economists who in some more or less ingenious ideas came close to a correct analysis of the nature of commodity,²⁷ we pass at once to the first Briton who elaborated the general system of bourgeois economics, Sir James Steuart.²⁸ His idea of exchange value as well as all the abstract categories of political economy still seem to be with him in the process of differentiation from the material elements they represent and therefore appear quite vague and unsettled. In one place he determines *real value by labor-time* (“what a workman can perform in a day”), but immediately creates confusion by introducing the elements of wages and raw material.²⁹ In another place his struggle with the material substance of the subject he treats of is revealed even more strikingly. He calls the material of nature contained in a commodity, such as the silver in a silver plate, its “intrinsic worth,” while the labor-time contained in it he calls “useful value.” The former, he says “is ... something real in itself,” while “the value of the second must be estimated according to the labour it has cost to produce it.... The labour employed in the modification [of the substance] represents a portion of a man’s time.”³⁰

What distinguishes Steuart from his predecessors and followers is his keen differentiation between specifically social labor which is represented in exchange value, and concrete labor which produces use-values. Labor, he says, which through its alienation creates a universal equivalent, I call *industry*. Labor as industry he distinguishes not only from concrete labor, but from all other social forms of labor.³¹ It is to him the capitalistic form of labor in contrast to its antique and mediaeval forms. He is especially interested in the difference between capitalistic and feudal labor, of which he had observed the latter in its decaying forms both in Scotland and on his extensive travels over the continent. Steuart knew, of course, very well that products took on the form of commodities and commodities, the form of

money in pre-capitalistic epochs as well; but he proves conclusively that it is only in the capitalistic period of production that the commodity becomes the elementary and fundamental form of wealth, and alienation [of commodities], the ruling form of acquisition and that consequently labor creating exchange value is specifically capitalistic in its character.³²

After different forms of concrete labor, such as agriculture, manufacture, navigation, trade, etc., had each in turn been declared the true source of wealth, Adam Smith proclaimed labor in general, and namely in its general social form of *division of labor*, to be the only source of material wealth or use-values. While ignoring in connection with the latter the part played by nature, he is troubled by it when he comes to deal with purely social wealth i.e. exchange value. To be sure, Adam determines the value of a commodity by the labor-time contained in it, but relegates the actual application of the principle to pre-Adamic times. In other words, what seems to him true from the standpoint of simple commodity, ceases to be clear as soon as the higher and more complex forms of capital, wage-labor, rent, etc. take its place. This he expresses by saying, that the value of commodities used to be measured by labor-time in the paradise lost of bourgeois society, in which men dealt with each other not as capitalists, wage-workers, landlords, tenants, usurers, etc., but merely as plain producers of commodities which they exchanged. He constantly confuses the determination of the value of commodities by the labor-time contained in them with the determination of their value by the value of labor. He becomes confused in working out the details and fails to see the objective equalization of different kinds of labor which the social process forcibly carries out, mistaking it for the subjective equality of the labors of individuals.³³ The transition from concrete labor to labor creating exchange value, i.e. to labor in its fundamental capitalistic form he tries to derive from the *division of labor*. Yet, while it is true that private exchange implies the division of labor, it is false to maintain that division of labor implies private exchange. Among the Peruvians, e. g., labor was divided to an extraordinary extent, although there was no private exchange, no exchange of products, as commodities.

Contrary to Adam Smith, David Ricardo elaborated with great clearness the determination of the value of a commodity by labor-time and showed that this law governs also such relations of capitalistic production which seem to contradict it most. Ricardo confines his investigations exclusively

to the *quantitative determination of value* and as regards the latter he is at least conscious of the fact that the realization of the law depends upon certain historical conditions. He says, namely, that the determination of value by labor-time holds good for commodities “only as can be increased in quantity by the exertion of human industry, and on the production of which competition operates without restraint.”³⁴ What he really means is that the law of value presupposes for its full development an industrial society in which production is carried on a large scale and free competition prevails, i.e. the modern capitalist society. In all other respects, Ricardo considers the capitalist form of labor as the eternal natural form of social labor. He makes the primitive fisherman and the primitive hunter straightway exchange their fish and game as owners of commodities, in proportion to the labor-time embodied in these exchange values. On this occasion he commits the anachronism of making the primitive fisherman and primitive hunter consult the annuity tables in current use on the London Exchange in the year 1817 in the calculation relating to their instruments. The “parallelograms of Mr. Owen” seem to be the only form of society outside of the bourgeois form with which he was acquainted. Although confined within this bourgeois horizon, Ricardo analyzes the bourgeois economy — which looks quite different to deeper insight than it does on the surface — with such keen power of theoretical penetration that Lord Brougham could say of him: “Mr. Ricardo seemed as if he had dropped from another planet.”

In a direct controversy with Ricardo, Sismondi lays stress upon the specifically social character of labor which creates exchange value,³⁵ and says it is “characteristic of our economic progress” to reduce the magnitude of value to the *necessary* labor-time, to the relation between the demand of society as a whole and the quantity of labor which is sufficient to satisfy this demand.³⁶ Sismondi is no more laboring under Boisguillebert’s idea, that labor which creates exchange value is adulterated by money; but just as Boisguillebert denounced money, so does Sismondi denounce large industrial capital. In Ricardo political economy reached its climax, after recklessly drawing its ultimate conclusions, while Sismondi supplemented it by impersonating its doubts.

Since Ricardo gave to classical political economy its final shape, having formulated and elaborated with the greatest clearness the law of the determination of exchange value by labor-time, it is natural that all the

polemics among economists should center about him. Stripped of its puerile³⁷ form this controversy comes down to the following points:

First: Labor itself has exchange value, and different kinds of labor have different exchange values. We get into a vicious circle by making exchange value the measure of exchange value, because the measuring exchange value needs a measure itself. This objection may be reduced to the following problem: Given labor-time as the intrinsic measure of exchange value, develop from that the determination of wages. The theory of wages gives the answer to that.

Second: If the exchange value of a product is equal to the labor-time contained in it, then the exchange value of one day of labor is equal to the product of that labor. In other words, wages must be equal to the product of labor.³⁸ But the very opposite is actually the case. Ergo. this objection comes down to the following problem: How does production, based on the determination of exchange value by labor-time only, lead to the result that the exchange value of labor is less than the exchange value of its product? This problem is solved by us in the discussion of capital.

Third: The market price of commodities either falls below or rises above its exchange value with the changing relations of supply and demand. *Therefore*, the exchange value of commodities is determined by the relation of supply and demand and not by the labor-time contained in them. As a matter of fact, this queer conclusion merely amounts to the question, how a market price based on exchange value can deviate from that exchange value; or, better still, how does the law of exchange value assert itself only in its antithesis? This problem is solved in the theory of competition.

Fourth: The last and apparently the most striking objection, if not raised in the usual form of queer examples: If exchange value is nothing but mere labor-time time contained in commodities, how can commodities which contain no labor possess exchange-value, or in other words, whence the exchange value of mere forces of nature? This problem is solved in the theory of rent.

CHAPTER II. MONEY OR SIMPLE CIRCULATION.

In a parliamentary debate on Sir Robert Peel's Bank Act of 1844 and 1845, Gladstone remarked that not even love has made so many fools of men as the pondering over the nature of money. He spoke of Britons to Britons. The Dutch, on the contrary, who, from times of yore, have had, Petty's doubts notwithstanding, "angelical wits" for money speculation have never lost their wits in speculations about money.

The main difficulty in the analysis of money is overcome as soon as the evolution of money from commodity is understood. This point once granted, it only remains to comprehend clearly the particular forms of money, which is to some extent made difficult by the fact that all bourgeois relations, being gilt or silver plated, have the appearance of money relations, and money, therefore, seems to possess an endless variety of forms, which have nothing in common with it.

In the following investigation only those forms of money are treated of which directly grow out of the exchange of commodities; the forms which belong to a higher stage of production, as e. g., credit money will not be discussed here. For the sake of simplicity gold is assumed throughout as the money commodity.

1. THE MEASURE OF VALUE.

The first process of circulation constitutes, so to say, the theoretical preparatory process to actual circulation. To begin with, commodities which are use-values by nature, acquire a form in which they *appear* in idea to each other as exchange values, as definite quantities of incorporated *universal* labor-time. The first necessary step in this process is, as we have seen, the setting apart by the commodities of a specific commodity, say *gold*, as the direct incarnation of universal labor-time, or the universal equivalent. Let us go back for a moment to the form in which commodities turn gold into money.

1 ton of iron = 2 ounces of gold

1 quarter of wheat = 1 ounce of gold

1 hundred weight of Mocca coffee = 1-1/4 ounce of gold

1 hundred weight of potash = 1/2 ounce of gold

1 ton of Brazil timber = 1-1/2 ounces of gold

Y commodities = X ounces of gold

In the above series of equations iron, wheat, coffee, potash, etc. appear to each other as embodiments, of homogeneous labor, namely, as labor materialized in money, from which all the peculiarities of the different kinds of concrete labor represented in the different use-values are completely eliminated. As value they are all identical, they are the incarnation of *the same* labor, or *the same* incarnation of labor, viz., gold. As uniform embodiments of the same labor they display only *one* difference, a quantitative one, by appearing as different quantities of value, because *unequal* quantities of labor-time are contained in their use-values. The mutual relation of these separate commodities is that of embodiments of universal labor-time, since they are related to universal labor-time as to an excluded commodity, viz., gold. The same relation the development of which causes commodities to appear to each other as exchange values, causes the labor time contained in gold to appear as universal labor-time, a given quantity of which is expressed in different quantities of iron, wheat, coffee, etc., — in short, in the use-values of all commodities, or is directly

unfolded in the endless series of commodity-equivalents. While all commodities express their exchange values in gold, gold expresses its exchange value directly in all commodities. While commodities assume the form of exchange value in relation to each other, they lend to gold the form of the universal equivalent, or of money.

Gold becomes the *measure of value*, because *all* commodities measure their exchange values in gold, in proportion as a certain quantity of gold and a certain quantity of the commodity contain the same amount of labor-time; and it is only by virtue of this function of being a measure of value, in which capacity its own value is measured directly in the entire series of commodity equivalents, that gold becomes a universal equivalent or money. On the other hand, the exchange value of all commodities is expressed in gold. In this expression, the qualitative aspect is to be distinguished from the quantitative: there is the exchange value of the commodity as the embodiment of the same uniform labor-time; while the magnitude of value is exhaustively expressed, since in the same proportion in which commodities are equated to gold they are equated to one another. On the one hand the *universal* character of the labor-time contained in them is revealed; on the other, its quantity is expressed in its golden equivalent. The exchange value of commodities thus expressed in the form of a universal equivalent and, moreover, as a numerical proportion of this equivalent, in terms of one specific commodity, or represented in the form of a series of commodities equated to one specific commodity, is PRICE. Price is the form into which the exchange value of commodities is converted when it *appears* within the sphere of circulation.

By the same process by which commodities express their values in gold prices, they turn gold into a measure of value i.e. into money. If all of them were to measure their values in silver, wheat, or copper, and therefore express them in the form of silver, wheat or copper prices, then silver, wheat or copper would be measures of value and consequently universal equivalents. In order to appear as prices in circulation, commodities must be exchange values before they enter circulation. Gold becomes the measure of value only because all commodities estimate their exchange value in it.

The universality of this relation which is the result of evolution and from which alone springs the function of gold as the measure of value, implies however, that every single commodity is measured in gold, in proportion to the labor-time contained in both; that the actual common measure of the

commodity and of gold is labor; or that commodity and gold are passed for each other in direct barter as equal exchange values. How this equalization actually takes place, can not be discussed here when treating of simple circulation. So much, however, is clear, that in countries producing gold and silver, certain quantities of labor-time are directly embodied in definite quantities of gold and silver, while in countries which do not produce gold and silver the same result is reached in a round-about way, by direct or indirect exchange of the commodities of those countries; i.e. a definite portion of average national labor is given for a definite quantity of labor-time, embodied in the gold and silver of the mine-owning countries. In order to be able to serve as a measure of value, gold must be as far as possible a *variable* value, because it can become the equivalent of other commodities only as an incarnation of labor-time, and the same labor-time is realized in unequal volumes of use-values with the change in the productive power of concrete labor. In estimating all commodities in gold it is only assumed that gold represents a given quantity of labor at a given moment, as was done when the exchange value of any commodity was expressed in terms of the use-value of any other commodity. As for the variations of the value of gold, the law of exchange value formulated above holds good in its case as well. If the exchange value of commodities remains unchanged, then a general rise in their gold prices is possible only in the case of a fall in the exchange value of gold. If the exchange value of gold remains unchanged, a general rise of gold prices is possible only when the exchange value of all commodities rises. The reverse is true in case of a general fall in the prices of commodities. If the value of an ounce of gold falls or rises in consequence of a change in the labor-time required for its production, then the values of all other commodities fall or rise to an equal extent. Thus, the ounce of gold represents after the change, as it did before, a *given* quantity of labor-time with regard to all commodities. The same exchange values are now estimated in greater or smaller quantities of gold than before, but they are estimated in proportion to the magnitude of their values, and consequently retain the same proportion to each other. The ratio $2 \div 4 \div 8$ remains the same when expressed as $1 \div 2 \div 4$ or as $4 \div 8 \div 16$. The change in the quantity of gold in which exchange values are estimated with a variation in the value of gold, interferes as little with the function of gold as a measure of value, as the fifteen times smaller value of silver as compared with that of gold interferes with the performance of that function

by the latter. Since labor-time is the common measure of gold and commodities, and since gold figures as the measure of value only in so far as all commodities are measured by it, the idea that money makes commodities commensurable, is therefore a mere fiction of the process of circulation.³⁹ It is rather the commensurability of commodities as incorporated labor-time, that turns gold into money.

Commodities enter the process of exchange in the concrete form of use-values. They are yet to be turned into the real universal equivalent through their alienation. The determination of their prices merely amounts to their ideal transformation into the universal equivalent, a process of equation to gold which is yet to be realized. But since commodities are, in their prices, transformed into gold only in imagination, or are converted only into imaginary gold, and since their money form is not differentiated as yet from their concrete selves, it follows that gold has also been turned into money only in imagination; it appears so far but as a measure of value, and in fact definite quantities of gold serve merely as names for certain quantities of labor-time. The form in which gold is crystallized in money always depends upon the way in which commodities express their own exchange value to each other.

Commodities now confront one another in a double capacity: actually as use-values, ideally as exchange values. The twofold aspect of labor contained in them is reflected in their mutual relations; the special concrete labor being virtually present as their use-value, while universal abstract labor-time is ideally represented in their price in which commodities appear as commensurable embodiments of the same value — substance differing merely in quantity.

The difference between exchange value and price appears to be merely nominal or, as Adam Smith says, labor is the real price, and money the nominal price of commodities. Instead of estimating the value of one quarter of wheat in thirty days of labor, it is estimated in one ounce of gold if one ounce of gold is the product of thirty days 'labor. However, far from this difference being merely nominal, all the storms which threaten commodities in the actual process of circulation center about it. Thirty days of labor are contained in a quarter of wheat and it need not, therefore, be expressed in terms of labor-time. But gold is a commodity distinct from wheat, and only in circulation it can be ascertained, whether the quarter of wheat can be actually turned into an ounce of gold as is anticipated in its

price. That will depend on whether or not it proves to be a use-value, whether or not the quantity of labor-time contained in it is the quantity necessarily required by society for the production of a quarter of wheat. The commodity as such *is* an exchange value, it *has* a price. In this difference between exchange value and price lies the demonstration of the fact that the particular individual labor contained in a commodity has first to be expressed through the process of alienation in terms of its counterpart, i.e. as impersonal, abstract, universal and, only in that form, social labor, viz. money. Whether it can be so expressed seems to be a matter of chance. Thus, although the exchange value of a commodity finds only ideally a distinct expression in price, and the twofold character of labor contained in the commodity exists as yet merely as two distinct forms of expression, and, although in consequence thereof, the embodiment of universal labor-time, gold, confronts actual commodities only as an imaginary measure of value, yet the fact that exchange value exists as price, or that gold exists as a measure of value implies the necessity of the alienation of commodities for hard cash and the possibility of their non-alienation. In short, here lies latent the entire contradiction which is inherent in the fact that products are commodities or that the particular work of a private individual can be of no account in society until it has taken the very opposite form of abstract universal labor. For that reason, the utopians, who want to have commodities but not money, who want a system of production based on private exchange without the necessary conditions underlying such a system, are consistent when they “destroy” money not in its tangible form but in its nebulous illusory form of a measure of value. Under the invisible measure of value there lurks the hard cash.

The process by which gold has become the measure of value and exchange value has been turned into price, being once assumed, all commodities express in their prices but imagined quantities of gold of various magnitudes. As such various quantities of the same thing, gold, they are equated, compared and measured with each other, and thus arises the technical necessity of referring them to a definite quantity of gold as a unit of measure, a unit which develops into a standard measure by virtue of its divisibility into aliquot parts, which in their turn can be sub-divided into aliquot parts.⁴⁰ But quantities of gold as such are measured by weight.

The standard of measure is thus found ready in the general measures of weight of metals and, therefore, where-ever metallic circulation is in vogue, these measures serve originally as standards of price. Since commodities no more relate to each other as exchange values to be measured by labor-time, but as magnitudes of the same denomination measured in gold, the latter is transformed from a *measure of value* into a *standard of price*. The comparison of prices with each other as different quantities of gold is thus crystallized in figures which correspond to an assumed quantity of gold and represent it as a standard of aliquot parts. Gold as measure of value and as standard of price has entirely different forms of manifestation and the confusing of the two has resulted in the wildest of theories. Gold is a measure of value as incorporated labor-time; it is the standard of price as certain weight of metal. Gold becomes the measure of value by virtue of its relation as exchange value to commodities as exchange values; as standard of price, a definite quantity of gold serves as a unit for other quantities of gold. Gold is the measure of value, because its value is variable; it is the standard of price, because it is fixed as a constant unit of weight. In this case, as in all cases of measuring quantities of the same denomination, the establishment of a definite and unvarying unit of measure is all-important. The necessity of settling upon a quantity of gold as a unit of measure and upon its aliquot parts as subdivisions of that unit, has given rise to the notion that a certain quantity of gold which has naturally a variable value had been assigned a fixed ratio of value to the exchange values of all commodities; the fact is overlooked that exchange values of commodities are transformed into prices, i.e. into quantities of gold, before gold develops as a standard of price. No matter how the value of gold may vary, the ratios between the values of different quantities of gold remain constant. Let the fall in the value of gold amount to 1000 per cent., still twelve ounces of gold will have a twelve times greater value than one ounce of gold; and in prices the only thing considered is the ratio between different quantities of gold. Since, on the other hand, no rise or fall in the value of an ounce of gold can alter its weight, no alteration can take place in the weight of its aliquot parts. Thus gold always renders the same service as an invariable standard of price, no matter how much its value may vary.⁴¹

An historical process which, as we shall explain later, was determined by the nature of metallic circulation, led to the result that the same denomination of weight was retained for a constantly changing and

decreasing weight of precious metals in their function of a standard of price. Thus the English pound sterling denotes less than one-third of its original weight; the pound Scot, before the Union, only 1-36; the French livre, 1-74; the Spanish Maravedi, less than 1-1000; the Portuguese Rei, a still smaller fraction. Such was the historical origin of the discrepancy between the current money names of various weights of metals and their weight denominations.⁴² Since the determination of the unit of measure, of its aliquot parts, and of their names is purely conventional, and since they should possess within the sphere of circulation the character of universality and compulsion, they had to be settled *by law*. The purely formal operation thus devolved upon the government.⁴³ The metal which was to serve as the money material, was found already adopted in the community. In different countries the legal standard of price is naturally different. In England e. g. the ounce as a weight of metal is divided into pennyweights, grains and carats Troy, but the ounce of gold as the unit of money is divided into 3 7-8 sovereigns, the sovereign into 20 shillings, the shilling into 12 pence, so that 100 pounds of 22 carat gold (1200 ounces) = 4672 sovereigns and 10 shillings. In the world market, however, where national boundaries disappear, these national characteristics of the measure of money also disappear and give place to the general measures of weight of metals.

The price of a commodity or the quantity of gold into which it is ideally transformed, is, therefore, now expressed in the names of coins of the gold standard. Thus, instead of saying: a quarter of wheat is worth an ounce of gold, it is said in England to be worth 3£ 17s. 10-1/2d. All prices are thus expressed in the same denominations. The peculiar form which commodities lend to their exchange values is transformed into a *money-denomination* by which commodities tell each other how much they are worth. Money in its turn becomes *money of account*.⁴⁴

We transform commodities into money of account, in our mind, on paper, in conversation, whenever it is a question of expressing any kind of wealth in terms of exchange value.⁴⁵ For that transformation we need the gold substance, but only in imagination. In order to estimate the value of a thousand bales of cotton in a certain number of ounces of gold and then to express this number of ounces in the denominations of the ounce, £. s. d., not a single atom of gold is required. Thus, not a single ounce of gold was in circulation in Scotland before Robert Peel's Bank Act of 1845, although the gold ounce, expressed in its English standard of account, 3£ 17s. 10-

1/2d., served as the legal standard of price. In a similar manner silver serves as standard of price in the trade between Siberia and China, although that trade virtually amounts to barter. It is, therefore, immaterial to money, as money of account, whether or not its entire unit of measure or the fractions thereof are really coined. In England, at the time of William the Conqueror, 1£, then a pound of pure silver, and the shilling, 1-20 of a pound, existed only as money of account, while the penny, 1-240 of a pound of silver, was the largest silver coin in existence. On the other hand, there are no shillings and pence in England to-day, although they are legal denominations for certain parts of an ounce of gold. Money as money of account may exist exclusively in idea, while the money in actual existence may be coined according to an entirely different standard. Thus the money in circulation in many English colonies of North America consisted until late in the eighteenth century of Spanish and Portuguese coins, although the money of account was throughout the same as in England.⁴⁶

Owing to the fact that money, when serving as the standard of price, appears under the same reckoning names as do the prices of commodities, and that, therefore, the sum of 3£ 17s. 10-1/2d. may signify, on the one hand, an ounce weight of gold, and on the other, the value of a ton of iron, this reckoning name of money has been called its *mint-price*. Hence, there sprang up the extraordinary notion that the value of gold is estimated in its own material, and that, in contradistinction to all other commodities, its price is *fixed* by the State. It was erroneously thought that the giving of reckoning names to definite weights of gold is the same thing as fixing the value of those weights.⁴⁷ In so far as gold serves as one of the elements in determining price, i.e., where it performs the function of money of account, it not only has no *fixed* price, but has *no* price whatever. In order to have a price, i.e., in order to express itself in a *specific* commodity as a *universal* equivalent that other commodity would have to play the same exclusive role in the process of circulation as gold. But two commodities excluding all other commodities mutually exclude each other. Therefore, wherever gold and silver have by law been made to perform side by side the function of money or of a measure of value it has always been tried, but in vain, to treat them as one and the same material. To assume that there is an invariable ratio between the quantities of gold and silver in which a given quantity of labor-time is incorporated, is to assume, in fact, that gold and silver are of

one and the same material, and that a given mass of the less valuable metal, silver, is a constant fraction of a given mass of gold. From the reign of Edward III to the time of George II, the history of money in England consists of one long series of perturbations caused by the clashing of the legally fixed ratio between the values of gold and silver, with the fluctuations in their real values. At one time gold was too high; at another, silver. The metal that for the time being was estimated below its value was withdrawn from circulation, melted and exported. The ratio between the two metals was then again altered by law, but the new nominal ratio soon came into conflict again with the real one. In our own times, the slight and transient fall in the value of gold compared with silver, which was a consequence of the Indo-Chinese demand for silver, produced on a far more extended scale in France the same phenomena, export of silver, and its expulsion from circulation by gold. During the years 1855, 1856 and 1857, the excess in France of gold imports over gold exports amounted to £41,580,000, while the excess of silver exports over silver imports was £14,04,000. In fact, in those countries in which both metals are legally measures of value, and therefore both legal tender, so that every one has the option of paying in either metal, the metal that rises in value is at a premium, and, like every other commodity, measures its price in the over-estimated metal which alone serves in reality as the standard of value. The result of all experience and history with regard to this question is simply that, where two commodities perform by law the functions of a measure of value, in practice one alone maintains that position.^{[48](#)}

B. THEORIES OF THE UNIT OF MEASURE OF MONEY.

The circumstance that commodities are converted into gold only in ideas as prices and that gold is therefore turned into money only in idea, gave rise to the theory of the *ideal unit of measure of money*. Since, in the determination of prices, gold and silver serve only ideally as money of account, it was asserted that the names pound, shilling, pence, thaler, franc, etc., instead of denoting certain weights of gold and silver or labor incorporated in some way, stood rather for ideal atoms of value. Thus, if, e. g., the value of an ounce of silver should rise it would contain more such atoms and would therefore have to be estimated and coined in a greater number of shillings. This doctrine, revived again during the last commercial crisis in England and even voiced in Parliament in two separate reports attached to the report of the select Committee on the Bank Acts sitting in July, 1858, dates from the end of the seventeenth century.

At the time of the accession of William III., the English mint-price of an ounce of silver was 5s. 2d., or 1-62 of an ounce of silver was equal to a penny; 12 of these pence were called a shilling. According to that standard, a piece of silver weighing, say, 6 ounces, would be coined into thirty-one coins, each called a shilling. But the *market price* of an ounce of silver rose above its *mint price*, from 5s. 2d. to 6s. 3d., or, in order to buy an ounce of silver bullion 6s. 3d. had to be paid. How could the market price of an ounce of silver rise above its mint price, when the mint price is merely a reckoning name for aliquot parts of an ounce of silver? The riddle was easily solved. Out of £5,600,000 of silver money which was in circulation at that time, four millions were worn out, clipped and debased. A trial disclosed that £57,000 of silver which were supposed to weigh 220,000 ounces, weighed only 141,000 ounces. The mint went on coining according to the same standard, but light-weighted shillings in actual circulation represented smaller parts of an ounce than their name implied. Hence, a greater quantity of these light-weighted shillings had to be paid in the market for an ounce of silver bullion. When a general recoinage was decided upon in consequence of the derangement that had been produced, LOWNDES, the Secretary of the Treasury, declared that the value of an

ounce of silver had risen and therefore it must henceforth be coined into 6s. 3d. instead of into 5s. 2d. as heretofore. His argument practically amounted to the assertion that the rise in the value of the ounce caused a fall in the value of its aliquot parts. His false theory, however, served merely as an embellishment for a just, practical purpose. The government debts were contracted in light shillings, were they to be paid in heavy ones? Instead of saying pay back four ounces of silver, when you had received nominally five ounces but virtually only four, he said pay back nominally five ounces but reduce the metallic contents to four ounces and call a shilling what you had called four-fifths of a shilling heretofore. Thus Lowndes practically adhered to the metallic weight while theoretically he clung to the reckoning name. His adversaries who clung only to the name and therefore declared the 25 to 50 per cent. lighter shilling to be identical with the full-weight shilling maintained on the contrary that they adhered to the metallic weight.

JOHN LOCKE, who was an advocate of the new bourgeoisie in all forms, the manufacturers against the working classes and paupers, the commercial class against the old fashioned usurers, the financial aristocracy against the state debtors, and who went so far as to prove in his own work that the bourgeois reason is the normal human reason, also took up the challenge against Lowndes. John Locke carried the day and money borrowed at ten or fourteen shillings to a guinea was repaid in guineas of twenty shillings.⁴⁹ SIR JAMES STEUART sums up the entire transaction as follows: “ ... the state gained considerably upon the score of taxes, as well as the creditors upon their capitals and interest; and the nation, which was the principal loser, was pleased; because their *standard* (The standard of their own value) was not debased.”⁵⁰ Steuart thought that the nation would prove more alert with the further development of commerce. He was mistaken. About 120 years later the same *quid pro quo* was repeated.

It was just in the order of things that Bishop BERKELEY, the representative of a mystical idealism in English philosophy, should have given a theoretical turn to the doctrine of the ideal unit of measure of money, something which the practical “Secretary to the Treasury” had failed to do. He asks: “Whether the terms Crown, Livre, Pound Sterling, etc., are not to be considered as Exponents or Denominations of such Proportion? [namely proportions of abstract value as such.] And whether Gold, Silver, and Paper are not Tickets or Counters for Reckoning, Recording and Transferring thereof? (of the proportion of value). Whether

*Power to command the Industry of others be not real Wealth? And whether Money be not in Truth, Tickets or Tokens for conveying and recording such Power, and whether it be of great consequence what Materials the Tickets are made of?"*⁵¹ Here we find a confusion, first of the measure of value and the standard of price, and secondly of gold and silver as measures on the one hand and mediums of circulation on the other. Because precious metals can be replaced by tokens in the process of circulation Berkeley comes to the conclusion that these tokens represent nothing, i.e., only the abstract idea of value.

SIR JAMES STEUART had so fully developed the theory of the ideal unit of measure of money, that his successors — unconscious successors since they do not know him — have added to it neither a new version nor even a new example. “Money, which I call of account, is no more than an arbitrary scale of equal parts, invented for measuring the respective value of things vendible. Money of account, therefore, is quite a different thing from money coin, which is price⁵² and might exist, although there was no such thing in the world as any substance which could become an adequate and proportional equivalent, for every commodity.... Money of account ... performs the same office with regard to the value of things, that degrees, minutes, seconds, etc., do with regard to angles, or as scales do to geographical maps, or to plans of any kind. In all these inventions, there is constantly some denomination taken for the unit. ... The usefulness of all those inventions being solely confined to the marking of proportion. Just so the unit in money can have no invariable determinate proportion to any part of value, that is to say, it cannot be fixed to any particular quantity of gold, silver, or any other commodity whatsoever. The unit once fixed, we can, by multiplying it, ascend to the greatest value.... The value of commodities, therefore, depending upon a general combination of circumstances relative to themselves and to the fancies of men, their value ought to be considered as changing only with respect to one another; consequently, anything which troubles or perplexes the ascertaining those changes of proportion by the means of a general, determinate and invariable scale, must be hurtful to trade.... Money ... is an ideal scale of equal parts. If it be demanded what ought to be the standard value of one part? I answer by putting another question: What is the standard length of a degree, a minute, a second? It has none ... but so soon as one part becomes determined by the nature of a scale, all the rest must follow in proportion. Of this kind of money ... we

have two examples. The bank of Amsterdam presents us with the one, the coast of Angola with the other.”⁵³

Steuart speaks here simply of the part money plays in circulation as the *standard of price* and *money of account*. If different commodities are marked in the price-list at 15s., 20s., 36s., respectively, then I care, in fact, neither for the silver substance, nor for the name of the shilling when comparing the magnitudes of their values. The ratios between the numbers 15, 20, 36, tell everything, and the number 1 has become the only unit of measure. Only the abstract proportion of numbers can at all serve as a purely abstract expression of proportion. In order to be consistent, Steuart should have dropped not only gold and silver, but their legal baptismal names as well. Since he does not understand the nature of the transformation of the measure of value into a standard of price, he naturally believes that the definite quantity of gold which serves as a unit of measure relates as a measure not to other quantities of gold, but to values as such. Since commodities appear as quantities of the same denomination through the conversion of their exchange values into prices, he denies that property of the measure which reduces them to one denomination; and since in this comparison of different quantities of gold the quantity of gold which serves as a unit of measure is conventional, he does not see the necessity of fixing it at all. Instead of calling 1-360 part of a circle degree, he might give that name to 1-180th part; the right angle would then be measured by 45 degrees instead of 90, and acute and obtuse angles would be measured accordingly. Nevertheless, the measure of the angle would remain, then, as before, first a qualitatively definite mathematical figure, the circle, and second a quantitatively definite part of the circle. As for Steuart’s economic illustrations, he refutes his own argument with one and does not prove anything with the other. The bank money of Amsterdam was, in fact, merely the reckoning name for Spanish doubloons, which retained their full weight by lying idly in the bank vaults, while the circulating coins became thinner from hard rubbing against the outer world. And as for the African idealists we have to abandon them to their fate until critical travelers will tell us more about them.⁵⁴ The French assignat could be called an almost ideal money in Steuart’s sense: “*National property. Assignment of 100 francs.*” To be sure, the use-value which the assignation was supposed to represent, namely, the confiscated land, was indicated here, but the quantitative definition of the unit of measure was forgotten and “the franc”

became a meaningless word. How much or how little land the assignation franc represented depended on the results of the public auctions. In practice, however, the assignation franc circulated as a token of value of silver money and its depreciation was, therefore, measured by this silver standard.

The period of the suspension of cash payments by the Bank of England was hardly more fruitful of war-bulletins than of money theories. The depreciation of bank notes and the rise of the market price of gold above its mint price called forth again the doctrine of the ideal unit of money on the part of some of the advocates of the Bank. Lord Castlereagh found the classical confused expression for the confused idea by speaking of the unit of measure of money as “a sense of value in reference to currency as compared with commodities.” When a few years after the peace of Paris conditions permitted the resumption of cash payments, the same question which had been stirred up by Lowndes under William III., came up, hardly changed in form. An enormous government debt, as well as a mass of private debts, accumulated in twenty years, fixed obligations, etc., had been contracted on the basis of depreciated bank notes. Were they to be paid back in bank notes of which £4672, 10s. nominal, actually represented 100 pounds of 22 carat gold? THOMAS ATTWOOD, a banker of Birmingham, came forth as *Lowndes redivivus*. The creditors were to receive nominally as many shillings as had been nominally borrowed, but if about 1-78 of an ounce of gold constituted a shilling according to the old standard of coinage, then say 1-90 of an ounce should now be christened a shilling. Attwood’s adherents are known as the Birmingham school of “little shillingmen.” The controversy over the ideal money unit, which had started in 1819, still went on in 1845 between Sir Robert Peel and Attwood, whose own wisdom, as far as the function of money as a measure is concerned, is exhaustively summed up in the following passage, in which, referring to Sir Robert Peel’s controversy with the Birmingham Chamber of Commerce, he says: “The substance of your queries is ... in what sense is the word pound to be used?... To what will the sum one pound be equivalent?... Before I venture a reply I must enquire what constitutes a standard of value?... Is £3 17s. 10-1/2d. an *ounce* of gold, or is it only of the *value* of an ounce of gold? If £3 17s. 10-1/2d. be an ounce of gold, why not call things by their proper names, and, dropping the terms pounds, shillings and pence, say ounces, pennyweights and grains?... If we adopt the terms ounces, pennyweights and grains of gold, as our monetary system, we should pursue

a direct system of barter.... But if gold be estimated as of the *value* of £3 17s. 10-1/2d. per ounce ... how is this ... that much difficulty has been experienced at different periods to check gold from rising to £5 4s. per ounce, and we now notice that gold is quoted at £3 17s. 9d. per ounce?... The expression *pound* has reference to value, but not a fixed standard value.... The term pound is the *ideal unit*.... Labour is the parent of cost and gives the relative value to gold or iron. *Whatever denomination of words are used to express the daily or weekly labour of a man*, such words express the cost of the commodity produced.”⁵⁵

In the last words the hazy conception of the ideal money measure melts away and its real meaning breaks through. The reckoning names of gold, pound sterling, shilling, etc., should be names for definite quantities of labor-time. Since labor-time constitutes the substance and the intrinsic measure of values, these names would then actually represent definite proportions of value. In other words, labor-time is maintained to be the true unit of measure of money. With this we leave the Birmingham school, but should add in passing that the doctrine of the ideal measure of money acquired new importance in the controversy over the question of the convertibility or non-convertibility of bank notes. If paper receives its name from gold or silver, then the convertibility of a note or its exchangeability for gold or silver remains an economic law, no matter what the civil law may be. Thus a Prussian paper thaler, although legally inconvertible, would immediately depreciate if it were worth less than a silver thaler in ordinary trade, i.e., if it were not practically convertible. The consistent advocates of inconvertible paper money in England, therefore, sought refuge in the ideal measure of money. If the reckoning names of money, £, s., etc., are names of certain quantities of atoms of value, of which a commodity absorbs or loses now more, now less in exchange for other commodities, then an English £5 note, e. g., is just as independent of its relation to gold as of that to iron and cotton. Since its title would no more imply its theoretical equality with a certain quantity of gold or any other commodity, the demand for its convertibility, i.e., for its practical equality with a definite quantity of a specified thing would be excluded by the very conception of the note.

The theory of labor-time as the direct measure of money was first systematically developed by JOHN GRAY.⁵⁶ He makes a National Central Bank ascertain through its branches the labor-time consumed in the production of various commodities. The producer receives an official

certificate of value in exchange for his commodity. i.e., he gets a receipt for as much labor-time as his commodity contains,⁵⁷ and these bank notes of one week's labor, one day's labor, one hour's labor, etc., serve at the same time as a check for an equivalent in all other commodities stored in the bank warehouses.⁵⁸ This is the fundamental principle carefully worked out in detail and based throughout on existing English institutions. Under this system, says Gray, "to sell for money may be rendered, at all times, precisely as easy as it now is to buy with money; ... production would become the uniform and never-failing cause of demand."⁵⁹ The precious metals would lose their "privilege" as against other commodities and "take their proper place in the market beside butter and eggs, and cloth and calico, and then the value of the precious metals will concern us just as little ... as the value of the diamond."⁶⁰ "Shall we retain our fictitious standard of value, gold, and thus keep the productive resources of the country in bondage? or, shall we resort to the natural standard of value, labour, and thereby set our productive resources free?"⁶¹

Labor-time being the intrinsic measure of value, why should there be another external measure side by side with it? Why does exchange value develop into price? Why do all commodities estimate their value in one exclusive commodity, which is thus converted into a special embodiment of exchange value into money? That was the problem which Gray had to solve. Instead of solving it, he imagined that commodities could be related directly to each other as products of social labor. But they can relate to each other only in their capacity of commodities. Commodities are the direct products of isolated independent private labors, which have to be realized as universal social labor through their alienation in the process of private exchange, that is to say, labor based on the production of commodities becomes social labor only through universal alienation of individual labors. But by assuming that the labor-time contained in commodities is *directly social* labor-time, Gray assumes it to be common labor-time or labor-time of directly associated individuals. Under such conditions a specific commodity like gold or silver could not confront other commodities as the incarnation of universal labor, and exchange value would not be turned into price; but, on the other hand, use-value would not become exchange value, products would not become commodities and thus the very foundation of the capitalistic system of production would be removed. But that is not what Gray has in mind. *Products are to be produced as commodities, but are not*

to be exchanged as commodities. He entrusts a national bank with the carrying out of this pious wish. On the one hand, society, through the bank, makes individuals independent of the conditions of private exchange, and on the other, it allows them to go on producing on the basis of private exchange. The logic of things, however, compels Gray to do away with one condition of capitalistic production after another, although he wishes to “reform” only the money system which results from the exchange of commodities. Thus he transforms capital into national capital,⁶² land into national property,⁶³ and if his bank is to be watched closely, it will be found that it not only receives commodities with one hand and issues certificates for work delivered with the other, but that it regulates production as well. In his last work, “Lectures on Money,” in which Gray is anxious to demonstrate that his labor-money is a purely bourgeois reform, he gets tangled up in even more glaring contradictions.

Every commodity is directly money. That was Gray’s theory deduced from his incomplete and, therefore, false analysis of commodities. The “organic” structure of “labor money,” the “national bank” and the “ware-docks” are mere fantastic visions in which the dogma is made by a legerdemain to appear to us as a universal law. The dogma that a commodity is money or that the isolated labor of the individual contained in it is direct social labor, will of course not become true through the mere fact that a bank believes in it and carries on operations accordingly. It is more likely that bankruptcy would play in that case the part of the practical critic. What remains concealed in Gray’s writings and hidden from himself as well, namely, that labor-money is a well-sounding economic phrase for the pious wish to get rid of money, and with money, of exchange value, and with exchange value, of commodities, and with commodities, of the capitalistic mode of production, was clearly expressed by some English socialists of whom a few preceded and others followed Gray.⁶⁴

But it remained for Mr. Proudhon and his school to preach in all earnest the degradation of *money* and the exaltation of the *commodity* as the gist of socialism and thus to reduce socialism to an elementary misconception of the necessary connection between commodity and money.⁶⁵

2. THE MEDIUM OF CIRCULATION.

After the commodity has received in the process of price determination the form in which it becomes capable of circulation, and after gold has acquired the character of money in the same process, circulation will both present and solve the contradictions which are inherent in the process of exchange of commodities. The actual exchange of commodities, i.e., the social interchange of matter consists of a change of form in which is unfolded the double character of the commodity as use-value and exchange value, and at the same time its own change of form is crystallized in distinct forms of money. To describe this change of form is to describe circulation. As we have seen, given a world of commodities and with it a system of division of labor, commodity is but a developed form of exchange value; in the same manner, circulation implies a steady stream of exchange transactions which are being continually renewed on all sides. The second assumption we make is that commodities enter the process of exchange with a *definite price* or that they appear to each other in that process in a double capacity, really as use-values, ideally — in price — as exchange values.

The liveliest streets of London are crowded with stores whose show windows are filled with the riches of the world, Indian shawls, American revolvers, Chinese porcelain, Parisian corsets, Russian furs and tropical spices, but all of these things of joy bear fatal white labels marked with Arabian figures with the laconic characters £, s., d. Such is the picture of the commodity appearing in circulation.

a. THE METAMORPHOSIS OF COMMODITIES.

On close examination the process of circulation is seen to consist of two distinct cycles. If we denote commodity by the letter C and money by the letter M we can express these two forms as follows:

C — M — C
M — C — M.

In this chapter we are interested exclusively in the first form, i.e., in the form which serves as the direct expression of the circulation of commodities.

The process C — M — C consists of the movement C — M, the exchange of the commodity for money, or *selling*; the opposite movement M — C, exchange of money for a commodity, or *buying*; and of the unity of the two movements C — M — C, exchange of the commodity for money in order to exchange the money for a commodity, or *selling* in order to *buy*. But the result which marks the end of the process is C — C, exchange of commodity for commodity, real interchange of matter.

If we look at it from the extreme end of the first commodity, C — M — C represents its transformation into gold and its retransformation from gold into a commodity; a movement in which the commodity exists first as a particular use-value, then divests itself of that character, acquires the character of exchange value or universal equivalent, in which capacity it has nothing in common with its natural form, then throws off the last form as well to remain finally an actual use-value for the satisfaction of particular wants. In this last form it falls out of the sphere of circulation into that of consumption. The entire process of circulation C — M — C thus includes the combined series of metamorphoses, which every single commodity undergoes in order to become a direct use-value to its possessor. The first metamorphosis is accomplished in the first phase of the circulation process, C — M; the second in the last phase, M — C; and the entire process constitutes the *curriculum vitae* of the commodity. But the process C — M — C represents the combined metamorphosis of a single commodity and

constitutes at the same time the sum of certain one-sided metamorphoses of other commodities, since every metamorphosis of the first commodity constitutes its transformation into another commodity and therefore the transformation of the other commodity into it; hence it constitutes a twofold transformation which takes place at the same stage of circulation. We must then consider separately each of the two processes of exchange into which circulation $C — M — C$ breaks up.

$C — M$ or *sale*: commodity C enters the process of circulation not only as a particular use-value, e. g., a ton of iron, but as a use-value of a certain price, say, £3 17s. 10-1/2d., or an ounce of gold. While this price is on the one hand the exponent of the quantity of labor-time contained in a ton of iron, i.e., of the magnitude of its value, it at the same time expresses the pious wish of the iron to become gold, i.e., to give to the labor-time it contains the aspect of universal social labor-time. Unless this transubstantiation takes place, the ton of iron not only ceases to be a commodity, but even a product, for it is a commodity only because it is a non-use-value to its owner; that is to say, his labor counts as actual labor only in so far as it is labor useful to others, and the thing is useful to him only as abstract universal labor. It is, therefore, the business of iron, or of its owner, to find that point in the world of commodities where iron attracts gold. But this difficulty, the *salto mortale* of the commodity, is overcome when the sale actually takes place, as is assumed here on the analysis of simple circulation. When the ton of iron is realized as a use-value through its alienation, i.e., by passing from the hands in which it is a non-use-value to hands in which it is a use-value, it at the same time realizes its price and from mere imaginary gold it becomes real gold. In place of the name one ounce of gold or £3 17s. 10-1/2d., an ounce of real gold has appeared, but the ton of iron has cleared that place. Not only does the commodity — which in its price had been ideally converted into gold — actually turn into gold through the sale $C — M$, but gold, which as a measure of value had been only ideal money and in fact figured merely as a money name of commodities — is now turned into actual money⁶⁶ by the same process. Just as gold became the ideal universal equivalent, because all commodities measured their values by it, so does it now become the absolutely alienable commodity, real money, because it is the product of the universal alienation of commodities for it — and the sale $C — M$ is the process by means of which that universal alienation takes place. But gold becomes real money

only through sale, because the exchange values of commodities were already ideal gold in their prices.

In the sale $C — M$, as well as in the purchase $M — C$, two commodities, entities of exchange value and use-value, confront each other, but the exchange value of the commodity exists only ideally as price; while as regards gold, although it is really a use-value, its use-value is confined only to its being the bearer of exchange value and is, therefore, merely a formal use-value, having no relation to a real individual want. The antithesis of use-value and exchange value is thus distributed at the two extreme poles of $C — M$, so that the commodity confronts gold as a use-value which has yet to realize in gold its exchange value or its price, while gold confronts the commodity as an exchange value, whose formal use-value is yet to be realized in the commodity. Only through this duplication of the commodity as commodity and gold, and, further, through the twofold and polar relation by virtue of which each extreme represents but ideally what its opposite is in reality and is in reality what its opposite is only ideally — in short, only through the appearance of commodities as two-sided polar opposites are the contradictions solved that are inherent in the process of exchange.

So far we have considered $C — M$ as sale, as the conversion of commodity into money. But if we look at it from the other end, the same process will assume the form $M — C$, or purchase, i.e., the conversion of money into commodity. Sale is necessarily its opposite at the same time; it is the former if we look at the process from one end, and the latter if we regard the process from the other end. In practice this process differs only in that the initiative in $C — M$ originates at the commodity end or with the seller, while in $M — C$ it comes from the money end or the buyer. In describing the first metamorphosis of the commodity, its conversion into money as a result of the completion of the first phase of circulation $C — M$, we assume at the same time that another commodity has been converted into money and is now in its second phase of circulation, $M — C$. Thus we get into a vicious circle of assumptions. Circulation itself constitutes such a vicious circle. If we did not consider M in $M — C$ as the result of a metamorphosis of another commodity, we would thereby take exchange out of the process of circulation. But outside of the latter the form $C — M$ disappears and only two different C s confront each other, say iron and gold, the exchange of which does not constitute a part of the process of circulation, being direct barter. Gold, at the source of its production, is a

commodity like any other commodity. Its relative value and that of iron or of any other commodity is expressed here in quantities in which they are mutually exchanged. But in the process of circulation this operation is implied, the value of gold being already given in the prices of commodities. Nothing can, therefore, be more erroneous than the idea that gold and commodity enter into the relation of direct barter *within the process of circulation* and that their relative values are ascertained through their exchange as simple commodities. The illusion that gold is bartered as a simple commodity for other commodities in the process of circulation is due to the fact that prices represent equations in which certain quantities of commodities are made equal to certain quantities of gold, i.e., that the commodities are made to relate to gold in its capacity of money, as a universal equivalent, and, therefore, appear to be directly exchangeable for it. In so far as the price of a commodity is *realized* in gold, it is exchanged for gold as a commodity, as a particular embodiment of labor-time; but in so far as it is the *price* that is realized in gold, the commodity is exchanged for gold in its capacity of money and not of a commodity, i.e., it is exchanged for gold as a universal embodiment of labor-time. But in either case the quantity of gold for which the commodity is exchanged in the process of circulation is not determined by exchange, but the exchange is determined by the price of the commodity, i.e., by its exchange value estimated in gold.⁶⁷

Within the process of circulation gold appears in everybody's hands as the result of sale $C \rightarrow M$. But since $C \rightarrow M$, sale, is at the same time $M \rightarrow C$, purchase, it is apparent that while C , the commodity from which the process starts, is passing through its first metamorphosis, another commodity, which confronts it as the opposite pole M , is completing its second metamorphosis and is, therefore, passing through the second phase of circulation, while the first commodity is still in the first phase of its course.

As a result of the first phase of circulation, the sale, we get money which is the starting point of the second phase. In place of the commodity in its first form appears its golden equivalent. This result may now form a resting point, since the commodity in this second form possesses a lasting existence of its own. The commodity, a non-use-value in the hands of its possessor, is now on hand in an always useful, since always exchangeable, form, and it depends upon circumstances when and at what point of the surface of the

commodity world it will again enter circulation. Its formation into a gold chrysalis constitutes an independent period in its life which may last a greater or less length of time. While in the case of barter the exchange of one particular use-value is directly bound up with the exchange of another particular use-value, the universal character of labor which creates exchange value is manifested in the separation and lack of coincidence of acts of purchase and sale.

$M — C$, *purchase*, is the inverted movement of $C — M$ and at the same time the second or final metamorphosis of the commodity. As gold, i.e., in the form of the universal equivalent, the commodity can be directly represented in the use-values of all other commodities; the latter aspire to gold as their hereafter, but at the same time indicate in their prices the key in which it must sound in order that their bodies, their use-values, may take the place of money, while their souls, their exchange-values, may enter gold. The universal product of the alienation of commodities is the absolutely alienable commodity. There is no qualitative and only a quantitative limit to the transformation of gold into commodity, namely, the limit of its own quantity or magnitude of its value. “Everything is to be had for cash.” While in the movement $C — M$, the commodity, through its alienation as a use-value, realizes its own price and the use-value of somebody else’s money; it realizes in the movement $M — C$, through its alienation as an exchange value, its own use-value and the price of the other commodity. While through the realization of its price the commodity transforms gold into actual money, it turns gold into its merely fleeting money-form, through its own retransformation. Since the circulation of commodities implies an extensive division of labor and consequently a diversity of wants on the part of individuals, a diversity which bears an inverse ratio to the specialization of their own products, the purchase $M — C$ may appear as an equation with one commodity equivalent or split up into a series of commodity-equivalents limited by the variety of the demands of the purchaser and by the amount of money in his possession. Just as a sale is a purchase, so is a purchase a sale. $M — C$ is at the same time $C — M$, but the initiative belongs in this case to gold or the purchaser.

Coming back now to $C — M — C$, or to circulation as a whole, it is apparent that it contains the combined series of metamorphoses through which a commodity passes. But at the same time as one commodity enters the first phase of its circulation and completes its first metamorphosis,

another commodity enters the second phase of circulation, completes its second metamorphosis and falls out of circulation; the first commodity enters at the same time the second phase of circulation completes its second metamorphosis and falls out of circulation, while a third commodity enters circulation, passes through the first phase of its course completing the first metamorphosis.

Thus, the combined circulation $C — M — C$, as a complete metamorphosis of a commodity always constitutes at the same time the end of the complete metamorphosis of another commodity and the beginning of a complete metamorphosis of a third commodity, i.e., a series without beginning or end. To illustrate this let us call C in either extreme C' and C'' respectively, in order to distinguish the commodities, the series reading thus: $C' — M — C''$. The first member, $C' — M$, presupposes in fact that M is the result of another transaction $C — M$, and is thus itself merely the last member of a series $C — M — C'$, while the second part $M — C''$ is merely a result of $C'' — M$, or appears as the first part of $C'' — M — C'''$, and so on. Furthermore, although M is the result of only *one* sale, it appears that the last part $M — C$, may be represented as $M — C' + M — C'' + M — C'''$, etc., i.e., it may be split up into a number of purchases, and consequently a number of sales, or into a number of first members of new complete metamorphoses of commodities. Since the complete metamorphosis of a single commodity thus appears as a link not only of one endless chain of metamorphoses, but of many such chains, the process of circulation in the world of commodities presents a hopeless confusion of intertwined movements constantly ending and starting anew at a countless number of points. But every single sale or purchase stands as an independent isolated act, whose supplemental act may be separated from it in time and place, and therefore does not need to follow it directly as its continuation. Every separate process of circulation, $C — M$ or $M — C$, as a transformation of one commodity into use-value and of another into money, i.e., as the first and second phases of circulation respectively forms an independent halting point from either direction; but, on the other hand, all commodities commence their second metamorphosis in the common form of the universal equivalent, gold, and stop at the starting point of the second phase of circulation; for that, reason any $M — C$ dovetails in actual circulation with any $C — M$; the second chapter in the life-course of one

commodity with the first chapter of that of another commodity. A, e. g., sells £2 worth of iron. He thus completes the transaction $C — M$ or the first metamorphosis of commodity iron, but postpones his purchase until some other time. At the same time B, who sold 2 quarters of wheat for £6 a fortnight since, buys with the same £6 a coat and trousers of Moses & Son, thus completing $M — C$ or the second metamorphosis of the commodity, wheat.

The two transactions $M — C$ and $C — M$ appear here merely as links of one chain, because a commodity expressed in gold looks like any other commodity, and one cannot tell by the looks of the gold whether it is transformed iron or transformed wheat. $C — M — C$ appears, therefore, in the actual process of circulation as a jumble of countless accidentally coinciding or successively following members of different complete metamorphoses. The actual process of circulation thus appears not as a complete metamorphosis of a commodity, not as its movement through opposite phases, but as a mere agglomeration of many accidentally coinciding or successive purchases and sales. The process thus loses all clearness of outline which is so much more the case since every single act of circulation, e. g., sale, is at the same time its opposite, purchase, and vice versa. On the other hand, the process of circulation is nothing but the movement of metamorphoses in the world of commodities and, therefore, must reflect them also in its movement as a whole. How that reflection takes place we shall consider in the following chapter. It may be added here that in $C — M — C$ the two extreme Cs constitute two forms of commodities which do not bear the same relation to M. The first C relates to money as a commodity of a special class to a universal commodity, while money relates to the second C as a universal commodity to an individual commodity. $C — M — C$ can, therefore, be reduced by abstract logic to the final form $S — U — I$ in which S, standing for species, forms the first extreme; U, signifying universality, forms the connecting medium, and I, individuality, constitutes the last extreme.

The owners of commodities entered the sphere of circulation simply as guardians of commodities. Within that sphere they confront each other in the opposite roles of buyer and seller, one as a personified sugar-loaf, the other as personified gold. As soon as the sugar-loaf is turned into gold, the seller becomes a buyer. These definite social functions are no outgrowths of human nature, but are the products of relations of exchange between men

who produce their goods in the form of commodities. They are so far from being purely individual relations between buyer and seller that both enter this relation only to the extent that their individual labor is disregarded and is turned into money as labor of *no* individual. Just as it is, therefore, childish to consider these economic bourgeois roles of buyer and seller as eternal social forms of human individuality, so it is on the other hand, preposterous to lament in them the extinction of individuality.⁶⁸ They are the necessary manifestations of individuality at a certain stage of the social system of production. Moreover, in the opposition of buyer and seller the antagonistic nature of capitalistic production is expressed as yet so superficially and as mere matter of form, that this opposition belongs also to precapitalistic forms of society, since it merely requires that the mutual relations of individuals should be those of owners of commodities.

Now, if we consider the result of $C — M — C$, it comes down to mere interchange of matter, $C — C$. A commodity has been exchanged for a commodity, a use-value for a use-value, and the transformation of the commodity into money, or the commodity in its form of money, serves merely as a means of effecting this interchange of matter. Money thus appears merely as a *medium of exchange* of commodities; not as a medium of exchange in general, but as a means of exchange in the sphere of circulation, i.e., a *medium of circulation*.⁶⁹

We have seen that the process of circulation of commodities comes to a completion in $C — C$, appearing as mere barter carried on by means of money; further, that $C — M — C$ represents in general not only two isolated processes, but their dynamic union as well; but to draw from that the conclusion that purchase and sale form an indivisible unit, is a mode of thinking the criticism of which belongs to the domain of logic, and not to that of economics. The separation of purchase and sale in the process of exchange destroys all local, primitive, patriarchal and naively genial barriers to interchange of matter in society. It is, moreover, the general form of the separation of the points of coincidence and opposition in this interchange, carrying within it the possibility of commercial crises, because the antagonism of commodity and money is the abstract and general form of all antagonisms with which the capitalistic system of labor is pregnant. Hence, circulation of money is possible without crises, but crises can not occur without money circulation. In other words, where labor based on the

system of private exchange has not reached the stage marked by the existence of money, it is less capable of producing those phenomena which presuppose the full development of the capitalistic mode of production. Bearing this in mind we can appreciate the depth of the criticism which proposes to do away with the “shortcomings” of capitalistic production by abolishing the “privilege” enjoyed by the precious metals and introducing a so-called “rational monetary system.” As a sample of economic defence of an opposite character may serve the following piece of reasoning which has been proclaimed exceedingly keen. JAMES MILL, the father of the well-known English economist, John Stuart Mill, says: “Whatever ... be the amount of the annual produce, it never can exceed the amount of the annual demand.... Of two men who perform an exchange, the one does not come with only a supply, the other with only a demand; each of them comes with both a demand and a supply.... The supply which he brings is the instrument of his demand; and his demand and supply are of course exactly equal to one another. It is therefore, impossible that there should ever be in any country a commodity or commodities in quantity greater than the demand, without there being, to an equal amount, some other commodity or commodities in quantity less than the demand.”⁷⁰

Mill restores the balance by turning the process of circulation into direct barter and then smuggling into direct barter the character of buyer and seller borrowed by him from the process of circulation. To put it in his own confused language, during certain periods when all commodities are unsaleable there are really more buyers than sellers of one commodity, *money*, and more sellers than buyers of *all other money*, commodities; such was, e. g., the case at certain moments during the commercial crisis of 1857-58 in London and Hamburg. The metaphysical balance of purchases and sales amounts to this, that every purchase is a sale and every sale is a purchase, which is a poor consolation to the guardian of the commodity who can not bring about its sale and therefore can not buy.⁷¹

The separation of sale and purchase makes possible a large number of fictitious transactions side by side with genuine trade before the final exchange between the producer and the consumer of commodities takes place. It enables a host of parasites to penetrate the process of production and exploit the separation. But this, again, means that with money as the

universal form of labor under the capitalist system, there is *the possibility* of the development of its contradictions.

b. THE CIRCULATION OF MONEY.

Actual circulation appears at first sight as a mass of purchases and sales accidentally taking place side by side. In buying as in selling, commodities and money always stand in the same mutual relation: the seller, on the side of the commodity; the buyer, on that of money. Money as a medium of circulation always appears therefore as *a means of purchase*; and in that way the difference in its destinations in the opposite phases of the metamorphosis of the commodity becomes indistinguishable.

Money passes into the hands of the seller in the same transaction in which the commodity passes into the hands of the buyer. Commodities and money thus flow in opposite directions and this change of place in which the commodity passes over to one side and money to the other side, occurs simultaneously at an indefinitely large number of points on the entire surface of bourgeois society. But the first step which the commodity makes in the sphere of circulation is also its last step.⁷² Whether it leaves its place on account of its attraction for gold (C — M), or on account of its attraction by gold (M — C), with one move, with one change of place it falls out of the sphere of circulation into that of consumption. Circulation is a continuous flow of commodities, but different commodities all the time, since each commodity makes but one move. Every commodity enters upon the second phase of its circulation not as the same commodity, but as another commodity, gold. Hence the movement of a metamorphosed commodity is the movement of gold. The same piece of gold or the identical gold coin which changed places with one commodity in the act C — M, reappears from the opposite end as the starting point for M — C and thus changes places for the second time with another commodity. Just as it passed from the hands of buyer B into those of seller A, it now leaves A's hands who has become a buyer and passes into C's hands. The path described by a commodity in its transformation into money and its retransformation from money, i.e., the movement of a complete metamorphosis of a commodity assumes the aspect of an apparent movement of the same coin that changes places twice with two different commodities. No matter in how scattered and haphazard fashion purchases and sales may take place near each other, there is always in actual

circulation a seller for each buyer and the money which moves into the place of the commodity sold, before it came into the hands of the buyer, must have already changed places with another commodity. Sooner or later it again leaves the hands of the seller, who turns buyer, to pass into the hands of a new seller and this frequently repeated change of place forms the interlacing of the metamorphoses of commodities. The same coins are moving, some more, others less frequently, from one place in the sphere of circulation to another, always in the direction opposite to that of the commodities moved, thus describing a longer or shorter circulation-curve. The different movements of the same coin can follow each other in point of time only, and on the contrary, the many scattered purchases and sales which appear as so many separate changes of place between commodities and money, occur simultaneously separated only in point of space.

The circulation of commodities $C — M — C$ in its elementary form is completely described in the transition of money from the hands of the buyer into those of the seller and from the hands of the latter, as soon as he has turned buyer, into those of a new seller. This completes the metamorphosis of the commodity and with it the movement of money in so far as that movement is the expression of the metamorphosis. But since new use-values are continually produced in the shape of new commodities and must thus be constantly thrown anew into circulation, the process $C — M — C$ is repeatedly renewed by the same commodity owners. The money which they have spent as buyers gets back into their hands as soon as they appear again as vendors of commodities. The constant renewal of the circulation of commodities finds its reflection in the continual circulation over the entire surface of bourgeois society of a quantity of money which, passing from hand to hand, describes at the same time a number of different small cycles starting from numberless points and returning each to its own starting point, to repeat the same movement over again.

The change of form on the part of commodities appears as a mere change of place on the part of money and the continuity of the circulation movement is all on the side of money, since the commodity always makes but one step in the direction opposite to money, while the latter makes in each case the second step for the commodity; the entire movement seems, therefore, to proceed from money, although in the case of a sale the commodity draws money out of its place, i.e., it circulates money as much as it is circulated by the latter in the case of a purchase. Furthermore, owing

to the fact that money always confronts commodities in its capacity of a means of purchase, and in that capacity moves commodities only by realizing their price, the entire movement of circulation appears as a change of place between money and commodities, the former realizing the prices of the latter either by separate acts of circulation taking place simultaneously and side by side, or by successive transactions when the same coin realizes the prices of different commodities one after another. If we consider, e. g., the series $C — M — C' — M — C'' — M — C'''$, etc., without regard to the qualitative aspects which become indistinguishable in the process of circulation, we witness the same monotonous operation. After realizing the price of C , M successively realizes those of C' , C'' , etc., and commodities C' , C'' , C''' , etc., constantly take the place which money has left. Money thus appears to keep commodities in circulation by realizing their prices. In discharging this function of realization of prices, money is itself constantly circulating, now changing its place, now describing a curve of circulation, now completing a small circuit where the starting and returning points coincide. As a medium of circulation, money is subject to a circulation of its own. The change of form of the circulating commodities appears, therefore, as a movement of money which furthers the exchange of commodities, motionless in themselves. The movement of the circulation process of commodities thus takes on the form of the movement of gold as a medium of circulation, i.e. of the *circulation of money*.

Since owners of commodities give the products of their individual labor the appearance of products of social labor by turning one object, viz. gold, into the direct expression of universal labor-time and therefore into money, their own movement by which all of them effect the interchange of the material products of their labor now appears to them as the direct movement of that one object, as the circulation of gold. The social movement itself appears to the owners of commodities partly as an outward necessity and partly as a mere formal intermediary process which enables every individual who puts any use-value into circulation to get other use-values out of it of an equal value. The use-value of commodities comes into play with their disappearance from the sphere or circulation, while the use-value of money as a medium of circulation is in its very circulation. The movement of a commodity in the sphere of circulation is of a transitory kind, while ceaseless motion in that sphere constitutes the function of money. Through this special function which it performs within the sphere of

circulation money acquires a new capacity, which we have to consider now more closely.

In the first place, we see that the circulation of money forms an endlessly split up movement, since it reflects the splitting up of the process of circulation into an infinitely large number of purchases and sales and the independent separation of the mutually supplementary phases of metamorphoses of commodities. In the small cycles described by money, where the starting and returning points coincide, we do find a return movement, i.e., an actual circular movement, but the fact that there are as many starting points as there are commodities and that the number of these cycles is infinitely large puts them beyond all control, measurement, or computation. The time between the start and the return of a commodity is just as indefinite. Moreover, it is immaterial whether or not such a circuit has been actually described in a given case. No economic fact is more generally known than that one can spend money with one hand without getting it back with the other. Money proceeds from an endless number of points and returns to as many different points, but the coincidence of the starting and returning points is a matter of chance, because in the movement $C — M — C$ the turning of the buyer again into a seller is not a necessary condition. Still less does the circulation of money resemble a movement radiating from a common centre to all points of the periphery and back from the peripheral points to the centre. The so-called cycle described by money, as it is pictured, amounts simply to this, that at all points we observe its appearance and disappearance, its never ceasing transition from place to place. In a higher, more involved form of money circulation, e. g. bank-note circulation, we shall find that the conditions of emission of money include those for its return. But in the simple money circulation it is a matter of chance for the same buyer to become again a seller. Where we really see constant cycle motions taking place, they are only reflections of deeper forces in the sphere of production, e. g., the manufacturer draws money from his banker on Friday, pays it out to his working-men on Saturday, the men immediately pay out the greater part of it to the storekeepers, etc., and the latter turn it in on Monday back to the banker.

We have seen that money realizes simultaneously a certain number of prices in the variegated purchases and sales which take place side by side at the same time. On the other hand, in so far as its movement represents the movement of the combined metamorphoses of commodities and the

interlacing of these metamorphoses, the same coin realizes the prices of different commodities and thus makes a larger or smaller number of moves. If we take the circulation of a country for a given length of time, say a day, the quantity of gold required for the realization of prices and, consequently, for the circulation of commodities, will be determined by two conditions: first, the sum total of the prices; second, the average number of moves made by one coin. This number of moves or the rapidity of circulation of money is in its turn determined by or expresses the average rapidity with which commodities go through the different phases of their metamorphoses, the rapidity with which these metamorphoses succeed one another, and with which those commodities that have gone through their metamorphoses are replaced by new commodities in the process of circulation. We have seen that in the process of the determination of prices the exchange value of all commodities is ideally converted into a certain quantity of gold of the same value and that the same amount of value is present in a double form in either of the isolated acts of circulation $M - C$ and $C - M$, first embodied in the commodity, and second, in gold; yet gold enjoys the capacity of a medium of circulation not by virtue of its isolated relation to separate commodities in a state of rest, but owing to its active presence in the dynamic world of commodities, viz., its function of expressing the change of form of commodities by its change of place and expressing the rapidity of their change of form by the rapidity of its change of place. The extent to which it is present in the sphere of circulation, i.e., the actual quantity of gold in circulation, is thus determined by the extent to which it is discharging its function throughout the entire process.

The circulation of money implies the circulation of commodities; money circulates commodities which have prices, i.e., which are beforehand ideally equated to certain quantities of gold. In the determination of the prices of commodities, the value of the quantity of gold which serves as a unit of measure, or the value of gold, is assumed to be given. Under that assumption the quantity of gold necessary for circulation is determined first of all by the sum total of the prices of commodities that are to be realized. But this sum is itself determined: 1. By the level of prices, the relatively high or low exchange value of commodities estimated in gold; and 2. By the mass of commodities circulating at fixed prices, i.e. by the number of purchases and sales at given prices.⁷³ If one quarter of wheat is worth 60 shillings, then twice as much gold is required to circulate it or to realize its

price as would be the case if it were worth only 30 shillings. To circulate 500 quarters of wheat at 60 shillings, twice as much gold is necessary as for the circulation of 250 quarters at the same price. Finally, to circulate 10 quarters at 100 shillings only half as much money is necessary as when circulating 40 quarters at 50 shillings. It follows that the quantity of gold required for circulation may fall in spite of a rise in price, if the mass of commodities in circulation declines in a greater ratio than the rise of the combined sum of prices; and, inversely, the quantity of the circulating medium may rise in spite of a decline of the mass of commodities in circulation, if the sum total of prices rises in a greater ratio. Thorough and minute English investigations have demonstrated e. g. that in the early stages of a dearth of grain in England the quantity of money in circulation increases, because the total price of the diminished supply of grain is greater than the former total price of a larger supply of grain, while the circulation of the other commodities continues undisturbed for some time at their old prices. At a later stage of the dearth of grain, there is a decline in the quantity of circulating money, either because less goods are sold at old prices besides grain, or the same quantity of those goods is sold at lower prices.

But, as we have seen, the quantity of money in circulation is determined not only by the sum total of prices of commodities that are to be realized, but also by the rapidity with which money circulates or with which it completes this work of realization. If the same sovereign makes ten purchases a day, each of a commodity having a price of one sovereign, and thus changes hands ten times, it does as much work as would be accomplished by ten sovereigns each performing but a single act of circulation a day.⁷⁴ Consequently, rapidity of gold circulation can make up for its quantity, or the presence of gold in the sphere of circulation is determined not only by its presence as an equivalent of a commodity side by side with it, but also by its participation in the movement of metamorphoses of commodities. The rapidity of the circulation of money, however, can serve as a substitute for its quantity only to a limited extent, since at any given moment an endless number of isolated purchases and sales takes places in different localities.

If the total price of the commodities in circulation rises, but in a smaller ratio than the increase in the rapidity of circulation of money, the volume of the circulating medium will diminish. If on the contrary the rapidity of

circulation decreases in a greater ratio than the total price of the commodities in circulation, the volume of currency will increase. An increasing volume of currency combined with a general fall of prices or a diminishing volume of currency in connection with a general rise of prices is one of the best known phenomena in the history of prices. But the consideration of the causes which bring about a simultaneous rise in the level of prices and a still greater rise in the rate of velocity of circulation of money, or the opposite phenomenon, falls outside of the sphere of simple circulation. By way of illustration, it may be mentioned that in periods of prevailing credit, the rapidity of circulation of money grows faster than the prices of commodities, while in times of declining credit the prices of commodities fall slower than the rapidity of circulation. The shallow and artificial character of the simple circulation of money is manifested in the fact that all the elements which have a determining influence on the volume of currency, such as the volume of commodities in circulation, prices, the rise or fall of prices, the number of simultaneous purchases and sales, the rapidity of the circulation of money, — depend on the metamorphic process which takes place in the world of commodities, and that again depends on the general character of the methods of production, the size of population, the relation between city and country, the development of the means of transportation, the greater or less division of labor, credit, etc.; in short, on circumstances all of which lie *outside* of the sphere of simple circulation of money and are only reflected in it.

The rapidity of circulation being given, the volume of currency is simply determined by the prices of commodities. Hence, prices are not high or low, because there is more or less money in circulation, but on the contrary, there is more or less money in circulation, because prices are high or low. This is one of the most important laws, whose demonstration in detail by means of the history of prices constitutes perhaps the only merit of the post-Ricardian English Political Economy. If experience shows, that the level of metallic circulation or the mass of gold and silver in circulation in a given country is subject to temporary ebbs and tides and very violent ones at times,⁷⁵ but on the whole remains stationary for long periods, the deviations forming but small oscillations about the average level, this is explained by the antagonistic nature of the circumstances which determine the quantity of money in circulation. Their simultaneous modifications neutralize their effects and leave everything where it was before.

The law, that with a given rapidity of circulation of money and a given total sum of prices of commodities the quantity of the circulating medium is determined, may also be expressed as follows. If the exchange values of commodities and the average rapidity of their metamorphoses are given, the quantity of gold in circulation depends on its own value. If, therefore, the value of gold, i.e. the labor-time necessary for its production, should rise or fall, the prices of commodities will rise or fall in inverse ratio, and corresponding to that rise or fall of prices, the rapidity of circulation remaining the same, a larger or smaller quantity of gold would be required to keep the same volume of commodities in circulation. The same change would occur, if the old standard of value were superseded by a more or less valuable metal. Thus, Holland required from fourteen to fifteen times as much silver as it had previously required gold, in order to circulate the same volume of commodities, when out of tender regard for the government creditors and out of fear of the effects of the discoveries in California and Australia it substituted silver for gold money.

From the fact that the quantity of gold in circulation depends on the variable sum total of prices of commodities and the varying rapidity of circulation, it follows that the volume of the circulating medium must be capable of contraction and expansion; in short, that according to the requirements of circulation, gold must now enter, now leave the sphere of circulation in its capacity of a medium of circulation. How the circulation process itself realizes these conditions, we shall see later on.

c. COIN AND SYMBOLS OF VALUE.

In its capacity of a medium of circulation, gold acquires a shape of its own, it becomes *coin*. In order to prevent any technical difficulties in the way of its circulation, it is coined according to the standard of the money of account. Gold pieces whose imprints and legends show that they contain certain weights of gold corresponding to the reckoning names of money, £, s., etc., are coins. The establishment of a mint-price, as well as the technical work of coining, are the business of the state. Both as money of account and as coin, money acquires a *local and political character*; it speaks different languages and wears different national uniforms. The sphere in which money circulates as coin, is distinguished as an *internal* sphere of circulation which is separated from the *universal* sphere of circulation in the commodity world by national boundaries.

Yet, the only difference between gold bullion and gold coin is that between coin denomination and weight denomination. What seems to be a difference in name in the latter case appears as a difference in shape in the former. Gold coin can be thrown into the melting-pot and thus be converted again into gold *sans phrase*, just as, on the contrary, gold bars only have to be sent to the mint to receive the shape of coins. The conversion and reconversion from one form into another appears to be a purely technical matter.

For 100 pounds or 1200 ounces troy of 22 carat gold one can get £4,672-1/2 or gold sovereigns at the English mint; if these sovereigns be put on one side of the weighing scale and one hundred pounds of gold bullion on the other, the two will balance each other, which proves that the sovereign is nothing but a piece of gold of certain weight bearing this name in English coinage and having a shape and stamp of its own. The 4,672-1/2 sovereigns are put into circulation at different points, and once in its grasp they make a certain number of moves per day, some sovereigns more, others less. If the average number of moves per day of each ounce be ten, the 1200 ounces of gold would realize 12,000 ounces or 46,725 sovereigns as the total price of commodities. You may turn and toss an ounce of gold in any way you like, and it will never weigh ten ounces. But here in the process of circulation one ounce practically does weigh ten ounces. The work performed by a coin

in the sphere of circulation is equivalent to the quantity of gold it contains multiplied by the number of its moves. Besides the actual importance which a coin possesses by virtue of its being an individual piece of gold of a definite weight, it acquires an ideal significance due to its function. But whether the sovereign circulates once or ten times, in each particular purchase or sale it acts only as one sovereign. It is like a general who by timely appearance at ten different points on the battle field does the work of ten generals, but still remains the same identical general at each point. The idealization of the means of circulation which is due to the supplanting of quantity by rapidity in money circulation, affects only the function of the coin within the sphere of circulation, but not the nature of the individual coin.

The circulation of money is a movement through the outside world, and the sovereign, though it *non olet*, keeps rather mixed company. In the course of its friction against all kinds of hands, pouches, pockets, purses, money-belts, bags, chests and strong-boxes, the coin rubs off, loses one gold atom here and another one there and thus, as it wears off in its wanderings over the world, it loses more and more of its intrinsic substance. By being used it gets used up. Let us take up a sovereign at the moment when its natural, inborn character has been slightly affected. A baker, says Dodd,⁷⁶ who receives from the bank to-day a brand new sovereign and pays it to-morrow to the miller, does not pay the same veritable sovereign; the latter has become lighter than it was at the time he received it. It is clear, says an anonymous writer,⁷⁷ that in the very nature of things, coins must depreciate one by one as a result of ordinary and unavoidable friction. It is a physical impossibility to entirely exclude light coins from circulation at any time, even for one day. Jacob estimates that of the 380 million pounds sterling which were in existence in Europe in 1809, nineteen million pounds sterling entirely disappeared by 1829, i.e., within a period of twenty years.⁷⁸ Thus, while a commodity at its first step into the sphere of circulation, falls out of it, a coin, after a couple of steps within that sphere represents more metal than it actually contains. The longer a coin remains in circulation, the rapidity of circulation remaining the same, or the greater its rapidity of circulation within the same period of time, the greater the discrepancy between its form as coin and its actual gold or silver substance. What remains is *magni nominis umbra*. The body of the coin becomes but a shadow. If at first it became heavier through the process of circulation, it

now becomes lighter on account of it, but continues to represent the original quantity of gold in each single purchase or sale. The sovereign, as a fictitious sovereign, as fictitious gold, continues to perform the function of a legitimate coin. While other beings lose their idealism in contact with the outer world, the coin is idealized by practice, being gradually transformed into a mere phantom of its golden or silver body. This second idealization of metal money springing from the very process of circulation, or from the discrepancy between its nominal weight and its real weight is exploited in all kinds of coin counterfeiting practiced partly by governments, partly by private adventurers. The entire history of coinage from the beginning of the middle ages until late in the eighteenth century is nothing but a history of these two-fold and antagonistic adulterations, and Custodi's voluminous collection of writings of Italian economists turns mostly about this point.

But the fictitious importance of gold due to its function, comes in conflict with its real substance. One gold coin has lost more, another, less of its metal substance in the course of circulation, and one of them is, as a matter of fact, worth more now than the other. But since in the discharge of their function of coins they are taken at the same value, the sovereign weighing a quarter of an ounce passing for no more than the sovereign which only stands for a quarter of an ounce, the full-weight sovereigns are subjected in the hands of unscrupulous owners to surgical operations which produce artificially what the circulation process has caused in a natural way to their more light-weighted brothers. They are clipped and reduced and the superfluous gold fat lands in the melting pot. If 4,672-1/2 gold sovereigns when put on one side of the weighing scale weigh on an average only 800 ounces instead of 1200, they will buy when brought to the gold market only 800 ounces of gold; that is, the market price of gold would rise above its mint price. Every coin, even if of full weight would pass in its mint form for less than in bullion form. The full weight sovereigns would be reconverted into bullion, a form in which a greater quantity of gold is always worth more than a smaller quantity. As soon as this decline of metallic weight would affect a sufficiently large number of sovereigns to bring about a permanent rise of the market price of gold above its mint price, the reckoning names of the coins, though remaining the same, would begin to denote a smaller quantity of gold. That is to say, the standard of money would change and gold would be coined in the future according to this new standard. By virtue of its idealization as a medium of circulation, gold

would react upon and change the legally determined ratios under which it acted as the standard of price. The same revolution would be repeated after a certain length of time and thus gold would be subject to constant change both as a standard of price and as a medium of circulation, a change under one of these forms leading to a change under the other and vice versa. This explains the phenomenon mentioned above, namely that in the history of all modern nations the same money-name stands for a constantly diminishing quantity of metal. The contradiction between gold as coin and gold as standard of price becomes also one between gold as coin and gold as the universal equivalent; in the latter capacity it circulates not only within the limits of national boundaries, but in the world market. As a measure of value gold was always of full weight, because it served only as ideal gold. In its capacity of equivalent in the isolated transaction C — M it passes at once from a state of motion to a state of rest; but in its capacity of coin its natural substance comes in constant conflict with its function. The transformation of the gold sovereign into fictitious gold can not be wholly avoided, but legislation seeks to prevent its unlimited circulation as coin by prescribing its withdrawal from circulation as soon as its shortage of metallic substance reaches a certain degree. According to the English law, e. g., a sovereign which lacks more than 0.747 grains of its weight ceases to be legal tender. The Bank of England which weighed forty-eight million gold sovereigns in the short period between 1844 and 1848, possesses in Mr. Cotton's gold weighing scale a machine which not only detects a difference of 1-100 part of a grain between two sovereigns, but like a sensible being, immediately throws out the light-weight coin on a board where it lands under another machine which cuts it up with oriental cruelty.

That being the case, gold coins could not circulate at all were not their circulation confined to definite spheres in which they do not wear off so rapidly. In so far as a gold coin weighing only one-fifth of an ounce passes in circulation for a quarter of an ounce of gold, it is practically merely a sign or a symbol for one-twentieth of an ounce of gold, and in that way all gold coins are transformed by the very process of circulation into more or less of a mere sign or symbol of their substance. But no thing can be its own symbol. Painted grapes are no symbol of real grapes, they are imaginary grapes. Still less can a light-weight sovereign be a symbol of a full-weighted one, just as a lean horse can not serve as a symbol of a fat one. Since gold thus becomes a symbol of its own self, but at the same time can

not serve in that capacity, it receives a symbolical, silver or copper substitute in those spheres of circulation in which it is most subject to wear and tear, namely where purchases and sales are constantly taking place on the smallest scale. In these spheres, even if not the same identical coins, still a certain part of the entire supply of gold money would constantly circulate as coin. To that extent gold is substituted by silver or copper tokens. Thus, while only a specific commodity can perform in a given country the function of a measure of value and therefore of money, different commodities can serve as coin side by side with gold. These subsidiary mediums of circulation, such as silver or copper coins, represent definite fractions of a gold coin within the sphere of circulation. Their own silver or copper weight is, therefore, not determined by the proportions of the respective values of silver and copper to that of gold, but is arbitrarily fixed by law. They may be issued only in such quantities in which the diminutive fractions of gold coin which they represent would constantly circulate either for purposes of change for gold coins of higher denominations, or for realizing equally small prices of commodities. In retail trade silver and copper tokens belong to distinct spheres of circulation. In the nature of things, the rapidity of their circulation is in inverse ratio to the price which they realize in each separate purchase or sale, or to the size of the fraction of gold coin which they represent. If we consider how immense the volume of the daily retail trade in a country like England is, we will understand from the comparatively insignificant proportions of its combined volume how rapid and steady the circulation of the subsidiary coin must be. From a parliamentary report of recent date we see, e. g., that in 1857 the English mint coined £4,859,000 worth of gold, £733,000 of silver nominal value which contained metal actually worth £363,000. The total amount of gold coined in the ten years ending December 31, 1857, was £55,239,000, and of silver only £2,434,000. The supply of copper coin in 1857 amounted only to £6,720 nominal value containing £3,492 worth of copper; of this £3,136 was in pennies, £2,464 in half-pennies, and £1,120 in farthings. The total value of copper coined in the ten years was £141,477 nominal, the metallic value being £73,503. Just as gold coin is prevented from permanently retaining its function of coin by the legal provision of the loss of weight which demonetizes it, so are the silver and copper tokens prevented from passing from their spheres of circulation into that of gold coin and acquiring the character of money by the provision of the maximum amount for which

they are legal tender. In England e. g. copper is legal tender only to the amount of six pence and silver up to forty shillings. If silver and copper tokens were to be issued in greater quantities than the requirements of their spheres of circulation call for, prices of commodities would not rise as a result, but the accumulation of these tokens in the hands of retail dealers would reach such an extent that they would be finally compelled to sell them as metal. Thus in 1798 English copper coins, issued by private individuals, accumulated in the hands of small traders to the amount of £20,350 which they tried in vain to put again in circulation, being finally compelled to throw them as metal on the copper market.⁷⁹

The silver and copper tokens which represent gold coin in certain spheres of circulation in the interior of the country, contain a definite quantity of silver and copper prescribed by law, but after they get into circulation, they wear off like gold coins and become even more rapidly mere phantoms, according to the rapidity and steadiness of their circulation. To draw again a line of demonetization beyond which silver and copper tokens would lose their character of coins, they would have to be replaced in turn within certain spheres of their own circulation by some other symbolic money, say iron and lead, and such representation of one kind of symbolic money by another kind would form an endless process. In all countries with a well developed circulation the very requirements of money circulation make it necessary that the character of silver and copper tokens as money be made independent of any loss of weight in those coins. Thus, as it was in the nature of things, it appears that they serve as symbols of gold coin not because they are symbols made of silver or copper, not because they have certain value, but only in so far as they have no value.

Relatively worthless things, such as *paper*, can consequently perform the function of symbols of gold money. That subsidiary currency consists of metal tokens, such as silver, copper, etc., is mainly due to the fact that in most countries the less valuable metals such as silver in England, copper in ancient Rome, Sweden, Scotland, etc., had circulated as money before they were degraded by the process of circulation to the rank of small change and replaced by a more precious metal. Besides, it is natural that the money symbol which grows directly out of metallic circulation, should itself be a metal. Just as that portion of gold which would always have to circulate as small change, is replaced by metal tokens; so can the other portion of gold which is constantly absorbed as coin by circulation in the interior of the

country and, therefore, must continually circulate, be replaced with worthless tokens. The level below which the mass of circulating coin never sinks is determined in each country by experience. Thus, the originally imperceptible difference between the nominal weight and the metallic weight of a metal coin can grow apace until it reaches the point of absolute separation. The mint name of money parts company with its substance and exists outside of it in worthless slips of paper. Just as the exchange value of commodities is crystallized by their process of exchange into gold money, so is gold money sublimated in its currency into its own symbol first in the form of worn coin, then in the form of subsidiary metal currency, and finally in the form of a worthless token, paper, mere *sign of value*.

Gold coin has produced its substitutes, first metallic and then paper, only because in spite of its loss of metallic weight it continued to perform the function of coin. It did not circulate because of its wear and tear; on the contrary, it wore out to a symbol because it continued to circulate. Only in so far as gold money becomes simply a token of its own value in the process of circulation, can mere tokens of value take its place.

In so far as the movement $C — M — C$ represents a dynamic unity of two processes $C — M$ and $M — C$ which pass directly one into the other, or in so far as a commodity passes through the complete process of its metamorphosis, it expresses its exchange value in price and in money only to discard that form at once and to become again a commodity or, rather, a use-value. That is to say, it develops *only an apparent assertion of the independence* of its exchange value. On the other hand, we have seen that gold, in so far as it performs the function of coin or in so far as it continually circulates, actually forms only a connecting link between the metamorphoses of commodities and constitutes *but their transitory money form*; furthermore, that it realizes the price of one set of commodities only in order to realize that of another, but in no case does it constitute a stable form of exchange value or appear itself as a commodity in a state of rest. The reality which the exchange value of commodities acquires in the process and which is represented by gold in its circulation, is the reality of an electric spark. Although real gold, it plays the part of fictitious gold, and can, therefore, be replaced in this function by a token of itself.

The token of value, say paper, which plays the part of coin, is the token of a quantity of gold expressed in its currency name, i.e., it is a gold token. Just as a certain quantity of gold does not in itself express a value ratio, so

is that true of the token which takes its place. In so far as a certain quantity of gold, as embodied labor-time, has a value of a certain magnitude, the gold token represents value. But the magnitude of the value which it represents depends all the time on the value of the quantity of gold for which it stands. As regards commodities the token of value expresses *the reality of their price*, it is *signum pretii* and sign of their value only because their value is expressed in their price. In the process $C - M - C$, in so far as it represents the dynamic unity or direct alternation of the two metamorphoses — and that is the aspect it assumes in the sphere of circulation in which the token of value discharges its function — the exchange value of commodities acquires in price only an ideal expression and in money only an imaginary symbolic existence. Exchange value thus acquires *only* an imaginary though material expression, but it has no real existence except in the commodities themselves, in so far as a certain quantity of labor-time is embodied in them. It *appears*, therefore, that the token of value represents *directly* the value of commodities, by figuring not as a token of gold but as a token of the value which exists in the commodity alone and is only expressed in price. But it is a false appearance. The token of value is directly only *a token of price*, i.e., *a token of gold*, and only indirectly a token of value of a commodity. Unlike Peter Shlemihl, gold has not sold its shadow, but buys with its shadow. The token of value operates only in so far as it represents the price of one commodity as against that of another within the sphere of circulation, or in so far as it *represents gold* to every owner of commodities. A certain comparatively worthless object such as a piece of leather, a slip of paper, etc., becomes by force of custom a token of money material, but maintains its existence in that capacity only so long as its character as a symbol of money is guaranteed by the general acquiescence of the owners of commodities, i.e., so long as it enjoys a legally established conventional existence and compulsory circulation. Paper money issued by the state and circulating as legal tender is the perfected form of the token of value, and the only form of paper money, which has its immediate origin in metallic circulation or even in the simple circulation of commodities. *Credit money* belongs to a higher sphere of the social process of production and is governed by entirely different laws. Symbolic paper money does not in fact, differ in the least from subsidiary metal coin, except that it reaches wider spheres of circulation. We have seen that the mere technical development of the standard of price or of the mint

price and later the shaping of gold bullion into coin have called forth the interference of the state; this circumstance brought about a visible separation of national circulation from the world circulation of commodities: this separation is completed by the evolution of coin into a token of value. As a mere medium of circulation money can assume an independent existence only within the sphere of national circulation.⁸⁰

Our presentation has shown that the coin form of gold as a token of value differentiated from the gold substance itself, has its direct origin in the process of circulation and not in any agreement or state interference. Russia offers a striking example of the natural origin of the token of value. At the time when hides and furs played there the part of money, the conflict between the perishable and bulky nature of the material and its function as a medium of circulation resulted in the custom of replacing it by small pieces of stamped leather which thus became a kind of draft payable in hides and furs. Later on they became under the name of copecs mere tokens for fractions of the silver rouble and remained in use in some parts until 1700, when Peter the Great ordered their withdrawal in exchange for small copper coins issued by the state. Ancient writers who could observe the phenomena of exclusively metallic circulation, already took the view of coin as a symbol or token of value. That is true both of *Plato*⁸¹ and *Aristotle*.⁸² In countries where credit is not developed, as e. g. in China, legal tender paper money is found at an early date⁸³. Early advocates of paper money expressly point out the fact that metallic coin is transformed into a token of value in the very process of circulation. So Benjamin Franklin⁸⁴ and Bishop Berkeley.⁸⁵

How many reams of paper cut up into bills can circulate as money? Put in that way, the question would be absurd. The worthless tokens are signs of value only in so far as they represent gold within the sphere of circulation and they represent it only to the extent to which it would itself be absorbed as coin by the process of circulation; this quantity is determined by its own value, the exchange values of the commodities and the rapidity of their metamorphoses being given. Bills of a denomination of £5 could circulate in a quantity five times less than those of £1 denomination, and if all payments were made in shilling bills, then twenty times as many shilling bills would have to be in circulation as are one pound bills. If the gold currency were represented by bills of different denominations, e. g. five pound, one pound and ten shilling bills, then the quantity of these different

tokens of value would be determined not only by the quantity of gold necessary for circulation as a whole, but also by that required in the sphere of circulation of each kind of bills. If fourteen million pounds sterling (this is the provision of the English Bank Law, not for the entire currency but only for credit money) were the level below which the circulation of a country never sank, then fourteen million paper bills, each a token of value of one pound, could circulate. If the value of gold fell or rose because the labor-time necessary for its production had fallen or risen, then, the exchange value of the same volume of commodities remaining the same, the number of one pound bills in circulation would rise or fall in inverse ratio to the change in the value of gold. If gold were replaced by silver as a measure of value, the ratio of the respective values of silver and gold being 1:15, and if each bill were to represent now the same quantity of silver as it represented gold before, then there would be 210 million one pound bills in circulation instead of the previous fourteen million. The number of paper bills is thus determined by the quantity of gold money which they represent in circulation, and since they are tokens of value only in so far as they represent it, their value is simply determined by their *quantity*. Thus, while the quantity of gold in circulation is determined by the prices of commodities, the value of the paper bills in circulation, on the contrary, depends exclusively on their own quantity.

The interference of the state which issues paper money as legal tender — and we are treating of paper money of that kind only — seems to do away with the economic law. The state which in its mint price gave a certain name to a piece of gold of certain weight, and in the act of coinage only impressed its stamp on gold, seems now to turn paper into gold by the magic of its stamp. Since paper bills are legal tender, no one can prevent the state from forcing as large a quantity of them as it desires into circulation and from impressing upon it any coin denomination, such as £1, £5, £20. The bills which have once gotten into circulation can not be removed, since on the one hand their course is hemmed in by the frontier posts of the country and on the other they lose all value, use-value, as well as exchange-value, outside of circulation. Take away from them their function and they become worthless rags of paper. Yet this power of the state is a mere fiction. It may throw into circulation any desired quantity of paper bills of whatever denomination, but with this mechanical act its control ceases. Once in the

grip of circulation and the token of value or paper money becomes subject to its intrinsic laws.

If fourteen million pounds sterling were the quantity of gold required for the circulation of commodities and if the state were to put into circulation two hundred and ten million bills each of the denomination of £1, then these two hundred and ten millions would become the representatives of gold to the amount of fourteen million pounds sterling. It would be the same as if the state were to make the one pound bills represent a fifteen times less valuable metal or a fifteen times smaller weight of gold. Nothing would be changed but the nomenclature of the standard of price, which by its very nature is conventional, no matter whether such change takes place as a direct result of a change of the mint standard or indirectly owing to an increase of paper bills to an extent required by a new lower standard. Since the name £ would stand now for a fifteen times smaller quantity of gold, the prices of all commodities would increase fifteen times and two hundred and ten million one pound bills would now be actually as necessary as fourteen million had been before. To the same extent to which the combined quantity of tokens of value would increase now, the quantity of gold which each of them represents would decrease. The rise of prices would constitute but a reaction on the part of the process of circulation which forcibly equates the tokens of value to the quantity of gold which they are supposed to replace.

In the history of the debasement of money in England and France by their governments, we find repeatedly that prices had not risen in the same proportion in which the silver coinage had been debased. That was simply due to the fact that the proportion in which the currency was increased did not correspond to the proportion in which it had been debased; that is to say, because an inadequate quantity of coins of the poorer metallic composition was issued, if the exchange values of commodities were to be estimated in the future in the new coin as a measure of value and be realized in coins corresponding to this smaller unit of measure. This solves the difficulty left unsettled in the controversy between Locke and Lowndes. The ratio which a token of value, whether made of paper or of debased gold or silver, bears to certain weights of gold or silver estimated according to the mint price, depends not on its own composition but on the quantity in which it is found in circulation. The difficulty in understanding this is due to the fact that money in its two functions of a measure of value and a medium of circulation is subject to two not only opposite but apparently contradictory

laws corresponding to the difference in the two functions. In the discharge of its function of a measure of value where money serves merely as money of account and gold only as ideal gold, everything depends on the natural substance of money. Estimated in silver or expressed in silver prices exchange values are naturally estimated quite differently than when measured in gold or as gold prices. On the contrary, in its function of a medium of circulation, where gold is not only imagined but is actually present side by side with other commodities, its substance is immaterial and everything depends on its quantity. For the unit of measure the determining factor is whether it consists of a pound of gold, silver or copper; while in the case of coin, no matter what its own composition is, it will become the embodiment of each of these units of measure in accordance with its quantity. But it goes against common sense that in the case of mere imaginary money everything should depend on its material substance, while in that of the palpably present coin all should be determined by an ideal ratio of numbers.

The rise or fall of prices of commodities following a rise or fall of the quantity of paper notes — the latter only where paper currency constitutes the exclusive medium of circulation — is thus nothing but an assertion through the process of circulation of a law mechanically violated from without; namely, that the quantity of gold in circulation is determined by the prices of commodities, and the quantity of tokens of value in circulation is determined by the quantity of gold coin which it represents. For that reason any desired number of paper notes will be absorbed and equally digested by the process of circulation, because the token of value, no matter with what gold title it may enter circulation, will be compressed within the latter to a token of that quantity of gold which could actually circulate in its place.

In the case of the circulation of tokens of value all laws pertaining to the circulation of real money appear to be reversed and standing on their heads. While gold circulates because it has value, paper has value because it circulates. While with a given exchange value of commodities, the quantity of gold in circulation depends on its own value, the value of paper depends on its own quantity in circulation. While the quantity of gold in circulation rises or falls with the rise or fall of prices of commodities, the prices of commodities seem to rise or fall with the change in the quantity of paper in circulation. While the circulation of commodities can absorb only a definite quantity of gold coin and as a result of that the alternating contraction and

expansion of the currency appears as a necessary law, paper money seems to enter circulation in any desired amount. While the state is guilty of debasing gold and silver coin and of disturbing their function of a medium of circulation, if it turns out a coin, only 1-100 of a grain below its nominal weight; it performs a perfectly proper operation by issuing absolutely worthless paper notes which contain nothing of the metal except its mint denomination. While gold coin apparently represents the value of commodities only in so far as that value is itself estimated in gold or is expressed in price, the token of value seems to represent directly the value of commodities. It is, therefore, clear why students who examined one-sidedly the phenomena of circulation of money by confining their observations to the circulation of legal tender paper money, should have failed to grasp the intrinsic laws governing the circulation of money. As a matter of fact, these laws appear not only reversed but extinct in the circulation of tokens of value, since paper currency, if issued in the right quantity, goes through certain movements which are not in its nature as a token of value, while its proper movement instead of growing directly out of the metamorphosis of commodities, springs from the violation of its proper proportion to gold.

3. MONEY.

Money as distinguished from coin, the result of the circulation process $C — M — C$, forms the starting point of the circulation process $M — C — M$, i.e. the exchange of money for commodity in order to exchange commodity for money. In the form $C — M — C$, commodity forms the starting and final points of the movement; in the form $M — C — M$, money plays that part. In the former case money is the medium of exchange of commodities, in the latter the commodity helps money to become money. Money which appears merely as a means of circulation in the first form becomes an end in the second form; while commodity which appeared first as the end, now becomes but a means. Since money is itself the result of circulation $C — M — C$, the result of circulation appears at the same time as its starting point in the form $M — C — M$. While in the case of $C — M — C$ the interchange of matter constituted the real import of the process, the form of the commodity resulting from this first process constitutes the import of the second process $M — C — M$.

In the form $C — M — C$ the two extreme members are commodities of the same value, but qualitatively different use-values. Their mutual exchange $C — C$ constitutes actual interchange of matter. In the form $M — C — M$ the two extremes are gold and at the same time gold of equal value. To exchange gold for a commodity in order to exchange the commodity for gold, or if we consider the final result $M — M$, to exchange gold for gold, seems absurd. But if we translate the formula $M — C — M$ into the expression: *to buy* in order *to sell*, which means nothing but to exchange gold for gold through an intervening movement, we recognize at once the prevailing form of capitalist production. In actual practice, however, people do not buy in order to sell, but they buy cheap in order to sell dear. Money is exchanged for a commodity in order to exchange the same commodity for a larger amount of money, so that the extremes M, M are, if not qualitatively, then quantitatively different. Such a quantitative difference presupposes the *exchange of non-equivalents*, yet commodity and money as such are only opposite forms of the same commodity, i.e. they are different forms of the same magnitude of value. The circuit $M — C — M$ thus conceals under the forms of money and commodity more highly developed

relations of production, and is but a reflection within the sphere of simple circulation of a movement of a more advanced character. Money, as distinguished from the medium of circulation, must therefore be developed from the direct form of circulation of commodities, C — M — C.

Gold, i.e., the specific commodity which serves as a measure of value and a medium of circulation, becomes money without any further assistance on the part of society. In England, where silver is neither the measure of value nor the prevailing medium of circulation, it does not become money, just as gold in Holland, as soon as it had been dethroned as a measure of value, ceased to be money. A commodity thus becomes money only in its combined capacity of a measure of value and medium of circulation; or, the unity of the measure of value and medium of circulation is money. As such a unity, however, gold has a separate existence independent of its existence in the two functions. As a measure of value it is only ideal money and ideal gold; as a mere medium of circulation it is symbolic money and symbolic gold; but in its plain metallic bodily form gold is money or money is real gold.

Let us now consider for a moment the commodity gold when it is in a state of rest, and plays the part of money in its relation to other commodities. All commodities represent in their prices a certain quantity of gold, that is to say, they are merely imaginary gold or imaginary money, representatives of gold, just as, on the other hand, money in the form of a token of value appeared as a mere representative of prices of commodities.⁸⁶ Since all commodities are thus but imaginary money, money is the only real commodity. Contrary to commodities, which only represent the independently existing exchange value, i.e., universal social labor, or abstract wealth, gold is the *material form of abstract wealth*. Through its use-value, every commodity, by its relation to some particular want, expresses only one aspect of material wealth, but one side of wealth. Money, however, satisfies every want since it can be directly converted into the object of any want. Its own use-value is realized in the endless series of use-values which form its equivalents. In its virgin metallic state it holds locked up all the material wealth which lies unfolded in the world of commodities. Thus, while commodities represent in their prices the universal equivalent or abstract wealth, viz., gold, the latter represents in its use-value the use-values of all commodities. Gold is, therefore, *the bodily representative of material wealth*. It is the “*precis de toutes les choses*”

(Boisguillebert), the compendium of the wealth of society. At one and the same time, it is the direct incarnation of universal labor in its form, and the aggregate of all concrete labor in its substance. It is universal wealth individualized.^{[87](#)} As a medium of circulation it underwent all kinds of injury, was clipped, and even reduced to the condition of a mere symbolic paper rag. As money it is restored to its golden glory.^{[88](#)} From a serve it becomes a lord. From a mere understrapper it rises to the position of Lord of commodities.^{[89](#)}

a. HOARDING.

Gold separates itself as money from the process of circulation whenever a commodity interrupts the process of its metamorphosis and remains in its form of a gold chrysalis. This occurs every time a sale is not immediately followed by purchase. The independent isolation of gold as money is, thus, a material expression of the disintegration of the process of circulation, or of the metamorphosis of commodities, into two separate acts independent of each other. The coin itself becomes money as soon as its course is interrupted. In the hands of the seller who takes it in exchange for his commodity, it is money and not coin; as soon as it passes out of his hands it is again coin. Everybody is a seller of the one commodity which he produces, but a buyer of all other commodities which he needs for his existence in society. While his selling is determined by the labor-time required for the production of his commodity, his buying is determined by the continual renewal of the wants of life. In order to be able to buy without having sold anything, he must sell without buying. In fact, the circulation process $C — M — C$ is a dynamic unity of sale and purchase only in so far as it constitutes at the same time the constant process of its separation. In order that money should flow continuously as coin, coin must constantly coagulate as money. The continuous flow of coin depends on its constant accumulations in the form of reserve-funds of coin which spring up throughout the sphere of circulation and form sources of supply; the formation, distribution, disappearance, and reformation of these reserve funds is constantly changing, their existence constantly disappears, their disappearance constantly exists. Adam Smith expressed this never-ceasing transformation of coin into money and of money into coin by saying that every owner of commodities must always keep in supply besides the particular commodity which he sells, a certain quantity of the universal commodity with which he buys. We saw, that in the process $C — M — C$ the second member $M — C$ splits up into a series of purchases which do not take place at once, but at intervals of time, so that one part of M circulates as money while the other rests as money. Money is in that case only *suspended coin* and the separate parts of the circulating mass of coins appear now in one form, now in another, constantly changing. This first

transformation of the medium of circulation into money represents, therefore, but a technical aspect of money circulation.⁹⁰

The primitive form of wealth is that of a surplus or superabundance, i.e., that part of the products which are not immediately required as use-values, or the possession of such products whose use-value falls outside the sphere of mere necessities. When considering the transition of commodity into money we saw that this surplus or superabundance of products constitutes the proper sphere of exchange at a low stage of development of production. Superfluous products become exchangeable products or commodities. The adequate form of this surplus is gold and silver, the first form in which wealth as abstract social wealth is preserved. Commodities can not only be stored up in the form of gold and silver, i.e., in the substance of money, but gold and silver are wealth in preserved form. While every use-value performs its service as such by being consumed, i.e., destroyed, the use-value of gold as money consists in its being the bearer of exchange value, in embodying universal labor-time as a shapeless raw material. As shapeless metal, exchange value possesses an indestructible form. Gold or silver thus brought to rest as money, forms a *hoard*. Among nations with an exclusively metallic circulation, such as the ancients were, hoarding is practiced universally from the individual to the state which guards its state hoard. In more ancient times, in Asia and Egypt, these hoards under the protection of kings and priests appear rather as a mark of their power. In Greece and Rome it was part of public policy to accumulate state hoards as the safest and most available form of surplus. The quick transfer of such hoards by conquerors from one country to another and the sudden outpour of a part of these hoards into the general circulation constitute a peculiar feature of ancient economy.

As the incarnation of labor-time gold is a pledge for its own value, and since it is the embodiment of *universal* labor-time, the process of circulation pledges gold its constant rôle of exchange value. Owing to the mere fact that the owner of commodities can retain his commodity in the form of exchange value or retain the exchange-value as a commodity, the exchange of commodities for the purpose of retaining them in the transformed shape of gold becomes circulation's own motive. The metamorphosis C — M takes place for the sake of the metamorphosis, i.e., in order to transform it from particular natural wealth into universal social wealth. Instead of change of matter, change of form becomes its own purpose. From a mere

form of the movement exchange value becomes its substance. Commodity is preserved as wealth, as commodity, only in so far as it keeps within the sphere of circulation, and it keeps in that fluent state only in so far as it solidifies in the form of silver and gold. It remains in the stream of circulation as its crystal. At the same time gold and silver themselves become money only in so far as they do not play the part of mediums of circulation. *As non-mediums of circulation they become money.* The withdrawal of a commodity from circulation in the form of gold is therefore the only means of keeping it constantly within the sphere of circulation.

The owner of commodities can receive money from circulation only in return for a commodity which he gives to it. Constant selling, continual throwing of commodities into circulation is, therefore, the first condition of hoarding from the standpoint of the circulation of commodities. On the other hand, money as a medium of circulation constantly disappears in the very process of circulation by being realized all the time in use-values and becoming dissolved in fleeting pleasures. It must, therefore, be taken out of the all-consuming stream of circulation or the commodity must be kept up in its first metamorphosis, so that money is prevented from performing its function of a means of purchase. The commodity owner who has now become a hoarder, must sell as much as possible and buy as little as possible, as old Cato had taught: “patrem familias vendacem, non emacem esse.” While industry constitutes the positive condition of hoarding, saving forms the negative one. The less the equivalent of a commodity is withdrawn from circulation in the form of particular commodities or use-values, the more it is withdrawn in the shape of money or exchange value.⁹¹ The acquisition of wealth in its universal form thus requires abstinence from wealth in its material reality. Thus the stimulating impulse for hoarding is *greed*, the objects of which are not commodities as use-values, but exchange value as commodity. In order to get possession of the surplus in its universal form, the particular wants must be treated as so much luxury and excess. Thus the Cortes presented a report to Philipp II., in 1593, in which, among other things, was said: “The Cortes of Valladolid in the year 1586 petitioned Your Majesty not to allow the further importation into the Kingdom of candles, glassware, jewelry, knives and similar articles; these things useless to human life come from abroad to be exchanged for gold, as though the Spaniards were Indians.” The hoarder despises the worldly, temporary and transitory enjoyments in his hunt after the eternal treasure,

which neither moth nor rust can eat, which is perfectly celestial and earthly at the same time. “The general remote cause of our want of money is the great excess of this Kingdom in consuming the Commodities of Forreine Countries, which prove to us discommodities, in hindering us of so much treasure, which otherwise would bee brought in, in lieu of those toyes.... Wee ... consume amongst us, that great abundance of the Wines of Spaine, of France, of the Rhene, of the Levant ... the Raisins of Spaine, the Corints of the Levant, the Lawnes and Cambricks of Hannaults ... the Silkes of Italie, the Sugers and Tobacco of the West Indies, the Spices of the East Indies: All which are of no necessetie unto us and yet are bought with ready mony.”⁹²

In the form of gold and silver, wealth is indestructible, both because exchange value is preserved in the shape of indestructible metal, and, especially, because gold and silver are prevented from becoming, as mediums of circulation, mere vanishing money forms of the commodity. The destructible substance is thus sacrificed for the indestructible form. “If money be taken (by means of taxation) from him, who spendeth the same ... upon eating and drinking, or any other perishing Commodity; and the same transferred to one that bestoweth it on Cloaths; I say that even in this case the Commonwealth hath some little advantage; because Cloaths do not altogether perish so soon as Meats and Drinks. But if the same be spent in Furniture of Houses, the advantage is yet a little more; if in Building of Houses, yet more; if in improving of Lands, working of Mines, Fishing, etc., yet more; but most of all, in bringing Gold and Silver into the Country; because those things are not only not perishable, but are esteemed for Wealth at all times and everywhere; whereas other Commodities which are perishable, or whose value depends upon the Fashion; or which are contingently scarce and plentiful, are Wealth, but *pro hic et nunc*.”⁹³ The withdrawal of money from the stream of circulation and the saving of it from the social interchange of matter reaches its extreme form in the *burying* of money, so that social wealth is brought as an underground indestructible treasure into a perfectly secret private relation with the owner of commodities. Dr. Bernier, who stayed for some time at the court of Aurenzeb at Delhi, tells us how the merchants, especially the Mohammedan heathens, who control nearly all the trade and all money, secretly bury their money deep in the ground, “being imbued with the faith that the gold and silver which they put away during their lives will serve them after death in

the next world.”⁹⁴ However, in so far as the asceticism of the hoarder is combined with active industry, he is rather a Protestant by religion and still more a Puritan. “It can not be denied that buying and selling are necessary, that one can not get along without them, and that one can buy like a Christian especially things that serve in need and in honor; for the patriarchs had also bought and sold cattle, wool, grain, butter, milk and other goods. They are gifts of God which He gives out of the earth and divides among men. But foreign trade which brings over from Calcutta, India and other such places commodities consisting of costly silks, and gold ware, and spices which only serve for luxury and are of no use, draining the land and the people of their money, should not be tolerated if we but had a government of princes. Yet I do not wish to write of that now, for I believe it will have to stop of itself, when we have no money any longer; and so will luxury and gluttony; for no writing or teaching will help until want and poverty will force us.”⁹⁵

In times of disturbance in the process of the social interchange of matter, the burying of money takes place even in bourgeois societies which are at a high stage of development. The social bond in its compact form is being saved from the social movement (with the owner of commodities this bond is the commodity and the adequate form of the commodity is money). The social *nervus rerum* is buried next to the body whose nerve it is.

The hoard would now become mere useless metal, its money soul would depart from it and it would remain as the burnt ashes of circulation, as its caput mortuum, if it did not constantly tend to get back into circulation. Money, or crystallized exchange value, is, according to its nature, the form of abstract wealth; but, on the other hand, any given sum of money is a quantitatively limited magnitude of value. The quantitative limitation of exchange value is in contradiction with its qualitative universality and the hoarder conceives in it a barrier which turns, in fact, into a qualitative barrier as well and makes of the hoard merely a limited representative of material wealth. Money, in its capacity of a universal equivalent, appears, as we have seen, as a member of an equation, the other member of which consists of an endless series of commodities. It depends on the magnitude of the exchange value to what extent money will be realized in such an endless series, i.e., to what degree it corresponds to the conception of it as an exchange value. The automatic movement of exchange value as exchange value can only tend to its passing beyond its quantitative limits.

But by exceeding the quantitative limits of the hoard a new limit is created which must be removed in its turn. There is no definite limit which appears as a barrier to further hoarding, every limit plays that part. Hoard accumulation has, therefore, no inherent limits, no inherent measure; it is an endless process which finds in each successive result an impulse for a new beginning. While the hoard is increased only by being preserved, it is preserved only by being increased.

Money is not only *an* object of the passion for riches; it is *the* object of that passion. The latter is essentially *auri sacra fames*. The passion for riches, contrary to that for special kinds of natural wealth or use-values, such as clothing, ornaments, herds, etc., is possible only when universal wealth has been individualized as such in a particular object and can, therefore, be retained in the form of a single commodity. Money appears then no less as an object than as a source of the passion for riches.⁹⁶ The underlying fact of the matter is that exchange value as such and with it its increase become the final aim. Greed holds the hoard fast by not allowing the money to become a medium of circulation, but the thirst for gold saves the money soul of the hoard by keeping up the lasting affinity of gold for circulation.

To sum up, the activity by which hoards are built up resolves itself into withdrawal of money from circulation by continually repeated sales, and simple hoarding or *accumulation*. In fact, it is only in the sphere of simple circulation and, especially, in the form of hoarding, that accumulation of wealth as such takes place, while, as we shall see later, in the case of other so-called forms of accumulation it is only a misnomer to call them by that name in mere recollection of the simple accumulation of money. All other commodities are hoarded either as use-values, in which case the manner of storing them up is determined by the peculiarities of their use-value: the storing of grain, e. g., requires special equipment; the accumulation of sheep makes one a shepherd; the accumulation of slaves and land creates relations of master and servant, etc.; the accumulation of particular kinds of wealth requires special processes different from the simple act of hoarding, and develops special individual traits. Or, wealth in the form of commodities is hoarded as exchange-value and in that case hoarding appears as a commercial or a specific economic operation. The one who carries on such operations becomes a dealer in corn, in cattle, etc. Gold and silver are money not through some activity of the individual who

accumulates it, but as crystals of the process of circulation which goes on without any aid on his part. He has nothing to do but to put them aside, adding new weights of metal to his hoard, a perfectly senseless operation which, if applied to all other commodities, would deprive them of all value.⁹⁷

Our hoarder appears as a martyr of exchange value, a holy ascetic crowning the metal pillar. He cares for wealth only in its social form and therefore he buries it away from society. He wants to have the commodity in the form in which it is always capable of entering circulation and therefore he withdraws it from circulation. He dreams of exchange value and therefore does not exchange. The fluid form of wealth and its petrification, the elixir of life and the stone of wisdom madly haunt each other in alchemic fashion. In his imaginary unlimited passion for enjoyment he denies himself all enjoyment. Because he wishes to satisfy all social wants, he barely satisfies his elementary natural wants. While holding fast to his wealth in its metallic bodily form, the latter escapes him as a phantom. As a matter of fact, however, the hoarding of money for the sake of money is the barbaric form of production for production's sake, i.e., the development of the productive forces of social labor beyond the limits of ordinary wants. The less the production of commodities is developed, the more important is the first crystallization of exchange value into money, or hoarding, which plays, therefore, an important part among the ancient nations, in Asia until the present day, and among modern agricultural nations where exchange value has not as yet taken hold of all the relations of production. Before taking up the consideration of the specific economic function of hoarding within the sphere of metallic circulation, let us mention another form of hoarding.

Quite apart from their aesthetic properties, silver and gold commodities are convertible into money, since the material of which they are made is a money material; and, inversely, gold money and gold bullion can be converted into commodities. Because gold and silver constitute the material of abstract wealth, the greatest display of wealth consists of the utilization of these metals as concrete use-values, and if the owner of commodities hides his treasure at certain stages of production, he is very anxious to appear before other owners of commodities as *rico hombre* whenever he can do so with safety. He gilds himself and his house.⁹⁸ In Asia, especially in India, where, unlike under the capitalist system, the hoarding of wealth

appears not as a subordinate function of the system of production, but as an end in itself, gold and silver commodities are practically but aesthetic forms of hoards. In mediaeval England gold and silver commodities were considered before the law as mere forms of treasure, since their value was but slightly increased by the crude labor spent upon them. They were destined to re-enter circulation and their fineness was therefore prescribed in the same manner as that of coin. The increasing use of gold and silver as objects of luxury with the growth of wealth is such a simple matter that it was perfectly clear to the ancients,⁹⁹ while modern economists have advanced the erroneous proposition that the use of silver and gold articles increases not in proportion to the growth of wealth, but in proportion to the fall in value of the precious metals. Their otherwise accurate references to the use of Californian and Australian gold are inconclusive, since the increased consumption of gold as a raw material does not find justification, according to their theory, in any corresponding decline in its value. From 1810 to 1830, in consequence of the struggle of the American colonies against Spain and the interruption of mining caused by revolutions, the annual average production of precious metals declined by more than one-half. The decline of coin in circulation in Europe amounted to nearly one-sixth, comparing the years 1829 and 1809. Although the quantity produced had thus declined and the cost of production, if it had changed at all, had increased, yet the consumption of precious metals as objects of luxury increased to an extraordinary extent in England during the very war and on the continent after the Peace of Paris. The consumption increased with the general growth of wealth.¹⁰⁰ It may be stated as a general law that the conversion of gold and silver money into articles of luxury prevails in times of peace, while their reconversion into bullion or even coin takes place in stormy periods.¹⁰¹ How considerable the proportion is of the gold and silver treasure in the form of articles of luxury to the quantity of precious metals serving as money may be seen from the fact that in 1829 the proportion in England, according to Jacob, was two to one, and in entire Europe and America the precious metals in the form of articles of luxury exceeded those in the form of money by one-fourth.

We have seen that the circulation of money is but the manifestation of the metamorphoses of commodities, or of the form under which the social interchange of matter takes place. With the change in the total price of commodities in circulation or in the volume of their simultaneous

metamorphoses, the rapidity of their change of form in each case being given, the total quantity of gold in circulation must always expand or contract. That is possible only under the condition that the total quantity of money in the country continually bear a varying ratio to the quantity of money in circulation. This condition is met by the process of hoarding. With a fall in prices or rise in the rapidity of circulation, the hoard-reservoirs absorb that part of money which is thrown out of circulation; with a rise in price or a decline in the rapidity of circulation, the hoards open up and return a part of their contents to the stream of circulation. The solidification of circulating money into hoards and the outpouring of hoards into circulation is a constantly oscillating movement in which the prevalence of the one or the other tendency is determined exclusively by fluctuations in the circulation of commodities. Hoards thus serve as conduits for the supply and withdrawal of money to or from circulation, so that every time only that quantity of money circulates as coin which is required by the immediate needs of circulation. If the volume of the entire circulation suddenly expands and the fluent unity of sale and purchase assumes such dimensions that the total sum of prices to be realized increases more rapidly than the rapidity of the circulation of money, the hoards decrease perceptibly; but when the combined movement slackens to an unusual extent, or the movement of buying and selling steadies itself, the medium of circulation solidifies into money in large measure, and the treasure reservoirs fill up far above their average level. In countries with an exclusively metallic circulation or where production is at a low stage of development, the hoards are endlessly split up and scattered all over the land, while in countries where the capitalist system is developed they are concentrated in bank reservoirs. Hoards are not to be confounded with coin reservoirs, which form a constituent part of the total supply of money in circulation, while the interaction between hoards and currency implies the decline or rise of its total supply. Gold and silver commodities form, as we have seen, both conduits for the withdrawal of precious metals, as well as sources of their supply. In ordinary times only their former function is of importance to the economy of metallic circulation.^{[102](#)}

b. MEANS OF PAYMENT.

The two forms which have so far distinguished money from the circulating medium are those of *suspended coin* and of the *hoard*. The temporary transformation of coin into money in the case of the former means that the second phase of $C — M — C$, namely purchase $M — C$, must break up within a certain sphere of circulation into a series of successive purchases. As to hoarding, it is simply based on the isolation of the act $C — M$ when it does not immediately pass into $M — C$, or is but an independent development of the first metamorphosis of a commodity; it represents money as the result of the alienation of all commodities in contradistinction to the medium of circulation as the embodiment of commodities in their always alienable form. Coin reserves and hoards are money only as non-circulating mediums and are non-circulating mediums only because they do not circulate. In the capacity in which we consider money now, it circulates or enters circulation, but does not perform the function of a circulating medium. As a medium of circulation money is always a means of purchase, now it does not act in that capacity.

As soon as money develops through the process of hoarding into the embodiment of abstract social wealth and the tangible representative of material wealth, it assumes in that capacity special functions within the process of circulation. If money circulates merely as a medium of circulation and therefore as a means of purchase, it is understood that commodity and money confront each other at the same time, i.e., that the same value is present in a double form: at one pole, as a commodity in the hands of the seller; at the other pole as money in the hands of the buyer. This simultaneous existence of the two equivalents at opposite poles and their simultaneous change of places or mutual alienation presupposes in its turn that seller and buyer enter into relations as owners of equivalents that are on hand. But in the course of time, the process of the metamorphosis of commodities which produces the different forms of money, transforms also the owners of commodities or changes the character in which they appear before each other in the community. In the process of metamorphosis of the commodity the guardian of the latter changes his skin as often as the commodity changes place or as the money assumes new forms. Thus, the

owners of commodities originally confronted each other only as commodity owners, but later on they became one a buyer, the other a seller; then each became alternately buyer and seller, then hoarders, and finally rich men. In that manner, the owners of commodities do not come out of the process of circulation the same men that they entered. In fact the different forms which money assumes in the process of circulation are but crystallized changes of form of the commodities themselves, which in their turn are but concrete expressions of the changing social relations in which commodity owners carry on the interchange of matter with one another. New trade relations spring up in the process of circulation, and, as representatives of these changed relations, commodity owners assume new economic roles. Just as gold becomes idealized within the process of circulation and plain paper, in its capacity of a representative of gold, performs the function of money, so does the same process of circulation lend the weight of actual seller and buyer to the buyer and seller who enter it merely as representatives of future money and future commodities.

All the forms in which gold develops into money, are but the unfolding of potentialities which the metamorphosis of commodities bears within itself. These forms did not become distinctly differentiated in the process of simple money circulation where money appears as coin and the movement $C — M — C$ forms a dynamic unity; at most, they appeared as mere potentialities as, e. g., in the case of the break in the metamorphosis of a commodity. We have seen that in the process $C — M$ the relations between the commodity and money were those of an actual use-value and ideal exchange-value to an actual exchange value and only ideal use-value. By alienating his commodity as a use-value the seller realized its own exchange value and the use-value of money. On the contrary, the buyer, by alienating his money as exchange value, realized its own use-value and the price of the commodity. Commodity and money changed places accordingly. When it comes to a realization in actual life of this bi-polar contrast, a new break occurs. The seller actually alienates his commodity, but realizes its price only in idea: he has sold his commodity at its price, which is to be realized, however, only subsequently, at a time agreed upon. The purchaser buys as the representative of future money, while the vender sells as the owner of present goods. On the part of the vender, the commodity as use-value is actually alienated, without the price being actually realized; on the part of the purchaser, money is actually realized in the use-value of the commodity,

without being actually alienated as exchange value. Instead of a token of value representing money symbolically as was the case before, the purchaser himself performs that part now. And just as in the former case the symbolic nature of the token of value called forth the guarantee of the state which has made it legal tender, so does the personal symbolism of the buyer bring about legally enforceable private contracts among commodity owners.

The contrary may happen in the process $M — C$, where the money can be alienated as a real means of purchase, and in that way the price of the commodity can be realized before the use-value of the money is realized and the commodity actually delivered. This occurs constantly under the everyday form of pre-payments. And it is under this form that the English government purchases opium from the ryots of India, or, foreign merchants residing in Russia mostly buy agricultural products. In these cases, however, the money always acts in its well known role of a means of purchase and therefore, does not assume any new forms.¹⁰³ We need not dwell, therefore, on this case any longer; but with reference to the changed form which the two processes $M — C$ and $C — M$ assume now, we may note that the difference between purchase and sale which appeared but imaginary in the direct process of circulation, now becomes a real difference, since in the former case only the money is present and in the latter only the commodity, and in either case only that extreme is present from which the initiative comes. Besides, the two forms have this in common: that in either, one of the equivalents is present only in the common will of the buyer and seller, — a will that is binding on both and assumes definite legal forms.

Seller and buyer become creditor and debtor. While the commodity owner looked comical as the guardian of a treasure, he now becomes awe-inspiring, since he no longer identifies himself but his neighbor with a certain sum of money and makes him and not himself a martyr of exchange value. From a believer he becomes a creditor, for religion he substitutes law.

“I stay here on my bond!”

Thus, in the modified form $C — M$ in which the commodity is present and money is only represented, money plays first of all the part of a measure of value. The exchange value of the commodity is estimated in money as its measure; but as exchange value, established by contract, price exists not only in the mind of the seller, but also as a measure of obligation on the part of the buyer. Besides serving as a measure of value, money plays

here the part of a means of purchase, although in that capacity it only casts ahead the shadow of its future existence. It attracts the commodity from its position in the hand of the seller into that of the buyer. As soon as the term of the contract expires, money enters circulation, since it changes its position by passing from the hands of the former buyer into those of the former seller. But it does not enter circulation as a circulating medium or as a means of purchase. It performed those functions before it was present and it appears after it has ceased to perform them. It now enters circulation as the only adequate equivalent of the commodity, as the absolute form of existence of exchange value, as the last word of the process of exchange, in short as money, and money in its distinct role of a *universal means of payment*. In this capacity of a means of payment money appears as the absolute commodity, but within the sphere of circulation and not without it as was the case with hoards. The difference between the means of purchase and the means of payment makes itself unpleasantly felt in periods of commercial crises.¹⁰⁴

Originally, the conversion of the product into money in the sphere of circulation appears only as an individual necessity for the commodity owner in so far as his own product has no use-value to him, but has to acquire it first by being alienated. But in order to pay at the expiration of the contract, he must have sold commodities before that. Thus, entirely apart from his individual wants, the movement of the circulation process makes selling a social necessity with every owner of commodities. As a former buyer of a commodity he is compelled to become a seller of another commodity in order to get money not as a means of purchase but as a means of payment, as the absolute form of exchange value. The conversion of commodity into money as a final act, or the first metamorphosis of a commodity as an end in itself which in the case of hoarding seemed to be a matter of caprice on the part of the commodity owner, becomes now an economic function. The motive and essence of sale for the sake of payment becomes from a mere form of the process of circulation its self emanating substance.

In this form of sale the commodity completes its change of position; it circulates while it postpones its first metamorphosis, viz. its transformation into money. On the contrary, on the part of the buyer the second metamorphosis is completed, i.e. money is reconverted into a commodity before the first metamorphosis has taken place, i.e., before the commodity has been turned into money. The first metamorphosis thus takes place after

the second in point of time; and thereby, money i.e. the form of the commodity in its first metamorphosis, acquires a new destination. Money or the spontaneous development of exchange value, is no longer a mere intermediary form of the circulation of commodities, but its final result.

That such *time sales* in which the two poles of the sale are separated in point of time, have their natural origin in the simple circulation of commodities, requires no elaborate proof. In the first place, the development of circulation leads to a continual repetition of the mutual transactions between the same commodity owners who confront each other as seller and buyer. The repetition is not accidental; on the contrary, goods are ordered, let us say, for a certain date in the future when they are to be delivered and paid for. In that case the sale is ideal, i.e. it is legally accomplished without the actual presence of the goods and money. Both forms of money, those of a medium of circulation and of a means of payment still coincide here, since in the first place, commodity and money change places simultaneously, and secondly, the money does not buy the commodity, but realizes the price of the commodity purchased before. In the second place, the nature of a great many use-values makes the simultaneous alienation and delivery of the goods impossible, and delivery has to be postponed for a certain time; e. g., when the use of a house is sold for one month, the use-value of the house is delivered only at the expiration of the month, although it changes hands at the beginning of the month. Since the actual transfer of the use-value and its virtual alienation are separated here in point of time, the realization of its price occurs also after its change of place. Finally, the difference in the seasons and in the length of time required for the production of various commodities brings about a situation where one tries to sell his goods, while the other is not ready to buy; and with the repeated purchases and sales between the same commodity owners the two ends of sale fall apart according to the conditions of production of the respective commodities. Thus arises a relation of creditor and debtor between the owners of commodities which, though constituting the natural foundation of the credit system, may be fully developed before the latter comes into existence. It is clear that with the extension of the credit system, and, consequently, with the development of the capitalist system of production in general, the function of money as a means of payment will extend at the expense of its function as a means of purchase and, still more, as an element of hoarding. In England, e. g.,

money as coin has been almost completely banished into the sphere of retail and petty trade between producers and consumers, while it dominates the sphere of large commercial transactions as a means of payment.^{[105](#)}

As the universal means of payment money becomes the *universal commodity* of all contracts, at first only in the sphere of circulation of commodities.^{[106](#)} But with the development of this function of money, all other forms of payment are gradually converted into money payments. The extent to which money is developed as the exclusive means of payment indicates the degree to which exchange value has taken hold of production in its depth and breadth.^{[107](#)}

The volume of money in circulation, as a means of payment, is determined in the first place, by the amount of payments, i.e. by the sum total of the prices of the commodities alienated, but not about to be alienated, as in the case of the simple circulation of money. The quantity thus determined is subject, however, to two modifications. The first modification is due to the rapidity with which the same piece of money repeats the same function, i.e. with which the several payments succeed one another. A pays B, whereupon B pays C, and so forth. The rapidity with which the same coin repeats its function as a means of payment, depends first, upon the continuity of the relation of creditor and debtor among the owners of commodities, the same commodity owner being the creditor of one person and the debtor of another, etc., and secondly, upon the interval which separates the times of various payments. This chain of payments or of supplementary first metamorphoses of commodities is qualitatively different from the chain of metamorphoses which is formed by the circulation of money as a circulating medium. The latter not only makes its appearance gradually, but is even formed in that manner. A commodity is first converted into money, then again into a commodity, thereby enabling another commodity to become money, etc.; or, seller becomes buyer, whereby another commodity owner turns seller. This successive connection is accidentally formed in the very process of the exchange of commodities. But when the money which A has paid to B is passed on from B to C, from C to D, etc., and that, too, at intervals rapidly succeeding one another, then this external connection reveals but an already existing social connection. The same money passes through different hands not because it appears as a means of payment; it passes as a means of payment because the different hands have already clasped each other. The rapidity with which money

circulates as a means of payment thus shows that individuals have been drawn into the process of circulation much deeper than would be indicated by the same rapidity of the circulation of money as coin or as a means of purchase.

The sum total of prices made up by all the purchases and sales taking place at the same time, and, therefore, side by side, constitutes the limit for the substitution of the volume of coin by the rapidity of its circulation. If the payments that are to be made simultaneously are concentrated at one place — which naturally arises at first at points where the circulation of commodities is largest — the payments balance each other as negative and positive quantities: A is under obligations to pay B, while he has to be paid by C. etc. The quantity of money required as a means of payment will, therefore, be determined not by the total amount of payments which have to be made simultaneously, but by the greater or less concentration of the same and by the magnitude of the balance remaining after their mutual neutralization as negative and positive quantities. Special arrangements are made for settlements of this kind even where the credit system is not developed at all, as was the case e. g. in ancient Rome. The consideration of these arrangements, however, as well as that of the general time limits of payment, which are everywhere established among certain elements in the community, does not belong here. We may add that the specific influence which these time settlements exert on the periodic fluctuations in the quantity of money in circulation, has been scientifically investigated but lately.

In so far as the payments mutually balance as positive and negative quantities, no money actually appears on the scene. It figures here only in its capacity of a measure of value: first, in the prices of commodities, and second, in the magnitude of mutual obligations. Aside from its ideal form, exchange value does not exist here independently, not even in the form of a token of value; that is to say, money plays here only the part of ideal money of account. The function of money as a means of payment thus implies a contradiction. On the one hand, in so far as payments balance, it serves only ideally as a measure of value. On the other hand, in so far as a payment has actually to be made, money enters circulation not as a transient circulating medium, but as the final resting form of the universal equivalent, as the absolute commodity, in a word, as money. Therefore, whenever such a thing as a chain of payments and an artificial system of settling them, is

developed, money suddenly changes its visionary nebulous shape as a measure of value, turning into hard cash or means of payment, as soon as some shock causes a violent interruption of the flow of payments and disturbs the mechanism of their settlement. Thus, under conditions of fully developed capitalist production, where the commodity owner has long become a capitalist, knows his Adam Smith, and condescendingly laughs at the superstition that gold and silver alone constitute money or that money differs at all from other commodities as the absolute commodity, money suddenly reappears not as a medium of circulation, but as the only adequate form of exchange value, as the only form of wealth, exactly as it is looked upon by the hoarder. In its capacity of such an exclusive form of wealth, it reveals itself, unlike under the monetary system, not in mere imaginary, but in actual depreciation and worthlessness of all material wealth. That is what constitutes the particular phase of crises of the world market which is known as a money crisis. The *summum bonum* for which everybody is crying at such times as for the only form of wealth, is cash, hard cash; and by the side of it all other commodities just because they are use-values, appear useless like so many trifles and toys, or, as our Dr. Martin Luther says, as mere objects of ornament and gluttony. This sudden reversion from a system of credit to a system of hard cash heaps theoretical fright on top of the practical panic; and the dealers by whose agency circulation is affected shudder before the impenetrable mystery in which their own economical relations are involved.¹⁰⁸

Payments, in their turn, require the formation of reserve funds, the accumulation of money as a means of payment. The building up of reserve funds appears no longer as a practice carried on outside of the sphere of circulation, as in the case of hoarding; nor as a mere technical accumulation of coin, as in the case of coin reserves; on the contrary, money must now be gradually accumulated to be available on certain future dates when payments become due. While hoarding, in its abstract form as a means of enrichment, declines with the development of the capitalist system of production, that species of hoarding which is directly called for by the process of production, increases; or, to put it differently, a part of the treasure which is generally formed in the sphere of circulation of commodities, is absorbed as a reserve fund of means of payment. The more developed the capitalist system of production, the more these reserve funds are limited to the necessary minimum. Locke, in his work “On the

Lowering of Interest”¹⁰⁹ furnishes interesting data with reference to the size of these reserve funds in his time. They show what a considerable part of the total money in circulation the reservoirs for means of payment absorbed in England just at the time when banking began to develop.

The law as to quantity of money in circulation, as it has been formulated in the analysis of the simple circulation of money, receives an essential modification when the circulation of the means of payment is taken into account. The rapidity of the circulation of money whether as circulating medium or as means of payment — being given, the total amount of money in circulation at a given time will be determined by the sum total of the prices of commodities to be realized, *plus* the total amount of payments falling due at the same time, *minus* the amount of payments balancing each other. The general law that the volume of money in circulation depends on the prices of commodities is not affected by this in the least, since the extent of the payments is itself determined by the prices stipulated in contracts. What is, however, strikingly demonstrated, is that even if the rapidity of circulation and the economy of payments be assumed to remain the same, the sum total of the prices of the commodities circulating in a given period of time, say one day, and the volume of money in circulation on the same day are by no means equal, because there is a large number of commodities in circulation whose prices have yet to be realized in money at a future date, and there is a quantity of money in circulation which constitutes the payment for commodities which have long gone out of circulation. The latter amount will depend on the sum of payments falling due on the same day although contracted for at entirely different periods.

We have seen that a change in the values of gold and silver does not affect their function as measures of value or money of account. But this change is of decisive importance for money as a hoard, since with the rise or fall of value of gold and silver, the total value of a gold or silver hoard will also rise or fall. Of still greater importance is the effect of this change on money as a means of payment. The payment takes place after the sale of the commodity, or the money serves in two different capacities at two different periods; first, as a measure of value, then as a means of payment corresponding to the measurement. If, during this interval, the value of the precious metals or the labor-time necessary for their production undergoes a change, the same quantity of gold or silver will be worth more or less when it appears as a means of payment than what it was when it served as a

measure of value, i.e., when the contract was concluded. The function of a particular commodity, like gold or silver, to serve as money or independent exchange value comes here in conflict with the nature of the particular commodity whose magnitude of value depends on changes in the cost of its production. The great social revolution which caused the fall in value of the precious metals in Europe, is as well known as the revolution of an opposite character which had been brought about at an early period in the history of the ancient Roman republic by the rise in value of copper in terms of which the debts of the plebeians had been contracted. Without attempting here to follow any further the fluctuations of value of the precious metals and their effect on the system of bourgeois political economy, it is at once apparent that a fall in the value of the precious metals favors the debtors at the expense of the creditors, while a rise in their value favors the creditors at the expense of the debtors.

c. WORLD MONEY.

Gold becomes money as distinguished from coin only after it is withdrawn from circulation in the shape of a hoard; it then enters circulation as a non-medium of circulation, and finally breaks through the barriers of home circulation to assume the part of a universal equivalent in the world of commodities. It becomes *world money*.

While the general measures of weight of the precious metals served as their original measures of value, the reverse process takes place now in the world market, and the reckoning names of money are turned back into corresponding weight names. In the same way, while shapeless crude metal (*aes rude*) was the original form of the medium of circulation and the coin form constituted but the official stamp certifying that a given piece of metal was of a certain weight, now the precious metal in its capacity of a world coin throws off its stamp and shape and reassumes the indistinguishable bullion form; and even if national coins, such as Russian imperials, Mexican dollars, and English sovereigns, do circulate abroad, their name is of no importance, and only their contents count. Finally, as international money, the precious metals come again to perform their original function of mediums of exchange, which, like the exchange of commodities, arose first not within the various primitive communities, but at their points of contact with one another. As world money, money thus reassumes its primitive form. On leaving the sphere of home circulation, it strips off the particular forms which it has acquired in the course of the development of the process of exchange within that particular national sphere, those local garbs of standard of price, of coin, of auxiliary coin, and of token of value.

We have seen that in the home circulation of a country, only one commodity serves as a measure of value. Since, however, that function is performed by gold in some countries and by silver in others, there is a double standard of value in the world market and money assumes two forms in all its other functions. The translation of the values of commodities from gold prices into silver prices and vice versa depends in each case upon the relative value of the two metals, which is constantly changing and, therefore, appears to be constantly in the process of determination.

Commodity owners in every national sphere of circulation have to use gold and silver alternately for foreign circulation and thus to exchange the metal which is accepted as money at home for the metal which they happen to need as money abroad. Every nation is, therefore, utilizing both metals, gold and silver, as world money.

In the international circulation of commodities, gold and silver appear not as mediums of circulation, but as universal mediums of exchange. The universal medium of exchange performs its function only under its two developed forms of a means of purchase and of a means of payment, whose mutual relation in the world market is the very reverse of what it is at home. In the sphere of home circulation, money in the form of coin, played exclusively the part of a means of purchase, either as the intermediary in the dynamic unity $C — M — C$ or as the representative of the transient form of exchange value in the unceasing change of positions by commodities. In the world market it is just the contrary. Gold and silver appear here as a means of purchase when the exchange of matter is but one-sided, and purchase and sale do not coincide. The frontier trade at Kiachta e. g. is both actually and according to treaty, one of barter, in which silver plays only the part of a measure of value. The war of 1857-58 compelled the Chinese to sell without buying. Silver suddenly appeared now as a means of purchase. Out of regard to the letter of the treaty, the Russians made up the French five frank coins into crude silver commodities, which were made to serve as a means of exchange. Silver has always served as a means of purchase between Europe and America on one side and Asia on the other, where it settles down in the form of hoards. Furthermore, the precious metals serve as international means of purchase whenever the ordinary balance of exchange of matter between two nations is suddenly upset, as e. g. when a failure of crops forces one of them to buy on an extraordinary scale. Finally, the precious metals are international means of purchase in the hands of gold and silver producing countries, in which case they directly constitute a product and commodity and not merely a converted form of a commodity. The more the exchange of commodities between different national spheres of circulation is developed, the more important becomes the function of world money to serve as a *means of payment* for the settlement of international balances.

Like home circulation, international circulation requires a constantly changing quantity of gold and silver. A part of the accumulated hoards

serves therefore, in each country as a reserve fund of world money, which now declines, now rises, according to the fluctuations of the exchange of commodities.¹¹⁰ Besides the special movements which take place between national spheres of circulation, world-money possesses a universal movement, whose starting points are at the sources of production from which gold and silver streams spread out in different directions all over the world market. Here gold and silver enter the world circulation as commodities and are exchanged for commodity equivalents in proportion to the labor-time contained in them, before they penetrate national spheres of circulation. In the latter, they appear now with a given magnitude of value. Every fall or rise in the cost of their production equally affects, therefore, their relative value throughout the world market; on the other hand, that value is entirely independent of the extent to which the different national spheres of circulation absorb gold or silver. The part of the metal stream which is caught up by every separate sphere in the world of commodities, partly enters directly the home circulation of money to make up for worn out coin; partly is dammed up in the different reservoirs containing hoards of coin, means of payment and world-money; partly is turned into articles of luxury, while the rest simply forms a treasure. At an advanced stage of development of the capitalist system of production the formation of hoards is reduced to the minimum required by the various processes of circulation for the free play of their mechanism. The hoard as such becomes idle wealth, unless it appears as a temporary form of a surplus resulting from a favorable balance of payments or as the result of an interrupted exchange of matter, i.e. as the solidification of a commodity in its first metamorphosis.

Gold and silver, in their capacity of money, being by conception universal commodities, assume in their capacity of world money the form adapted to a universal commodity. To the extent to which all commodities are exchanged for them, they become the transformed impersonation of all commodities and, therefore, universally alienable commodities. Their function of serving as the embodiment of universal labor-time is realized more and more as the interchange of matter produced by concrete labor embraces increasing parts of the world. They become universal equivalents to the extent to which the series of particular equivalents which constitute their spheres of exchange, increases. Since in the sphere of world circulation commodities unfold their own exchange value on a universal scale, they assume the form of world money when transformed into gold

and silver. As commodity owning nations are thus turning gold into money by their diversified industry and universal trade, industry and trade appear to them only as a means of getting money out of the world market in the shape of gold and silver. Gold and silver, as world money, are, therefore, as much products of the universal circulation of commodities as they are means of widening its sphere. Like chemistry which grew up behind the backs of the alchemists who tried to find a way of making gold, so do the sources of world industry and world trade spring up behind the backs of the owners of commodities, while they are hunting for the commodity in its magic form. Gold and silver help to create the world market by anticipating its existence in their conception of money. That this magic effect of the precious metals is by no means confined to the period of infancy of capitalist society but is a necessary outgrowth of the perverse conception which the representatives of the commodity world have of their own work in society, is shown by the extraordinary influence exerted in the middle of the nineteenth century by the discovery of new gold fields.

Just as money develops into world-money, so the commodity owner develops into a cosmopolitan. The cosmopolitan relation of men is originally only a relation of commodity owners. The commodity as such rises above all religious, political, national, and language barriers. Price is its universal language and money, its common form. But with the development of world-money as distinguished from national coin, there develops the cosmopolitanism of the commodity owner as the faith of practical reason opposed to traditional, religious, national and other prejudices which hinder the interchange of matter among mankind. As the identical gold that lands in England in the form of American eagles, turns there into sovereigns and three days later circulates in Paris in the form of Napoleons, only to emerge in Venice in a few weeks as so many ducats, retaining all the while the same value, it becomes clear to the commodity owner that nationality “is but the guinea’s stamp.” The lofty idea which he conceives of the entire world is that of a market, the *world market*.^{[111](#)}

4. THE PRECIOUS METALS.

The process of capitalist production first of all takes hold of the metallic circulation as of a ready, transmitted organ which, though undergoing a gradual transformation, always retains its fundamental structure. The question as to why gold and silver and not other commodities serve as money material falls outside the limits of the capitalist system. We shall, therefore, confine ourselves to summing up the most essential points.

Since universal labor-time admits of quantitative differences only, the object which is to serve as its specific incarnation must be capable of representing purely quantitative differences, i.e., it must be homogeneous and uniform in quality throughout. That is the first condition a commodity must satisfy to perform the function of a measure of value. If commodities were estimated in oxen, hides, grain, etc., they would really have to be estimated in an ideal average ox, or average hide, since there are qualitative differences between an ox and an ox, grain and grain, hide and hide. On the contrary, gold and silver, as elementary substances, are always the same, and equal quantities of them represent, therefore, values of equal magnitude.¹¹² The other condition which a commodity that is to serve as a universal equivalent must satisfy and which follows directly from its function of representing purely quantitative differences, is that it must be capable of being divided and re-united at will, so that money of account may be represented materially as well. Gold and silver possess these properties to a superior degree.

As mediums of circulation, gold and silver have this advantage over other commodities, that their high specific gravity which condenses much weight in little space, corresponds to their economic specific gravity which condenses relatively much labor-time, i.e. a great quantity of exchange value in a small volume. This insures facility of transport, of transition from hand to hand and from one country to another, the ability to appear as rapidly as to disappear, in short, that material mobility which constitutes the *sine qua non* of the commodity that is to serve as the *perpetuum mobile* of the process of circulation.

The high specific value of the precious metals, their durability, comparative indestructibility, insusceptibility of oxidation through the

action of the air, in the case of gold insolubility in acids except in aqua regia, — all these natural properties make the precious metals the natural material for hoarding. Peter Martyr who seems to have been a great lover of chocolate, remarks, therefore, of the cacao-bags which formed a species of Mexican gold: “O felicem monetam, quae suavem utilemque praebet humano generi potum, et a tartarea peste avaritiae suos immunes servat possessores, quod suffodi aut diu servari nequeat.”¹¹³

The great importance of metals in general in the direct process of production is due to the part they play as instruments of production. Apart from their scarcity, the great softness of gold and silver as compared with iron and even copper (in the hardened state in which it was used by the ancients), makes them unfit for that application and deprives them, therefore, to a great extent, of that property on which the use-value of metals is generally based. Useless as they are in the direct process of production, they are easily dispensed with as means of existence, as articles of consumption. For that reason any desired quantity of them may be absorbed by the social process of circulation without disturbing the processes of direct production and consumption. Their individual use-value does not come in conflict with their economic function. Furthermore, gold and silver are not only negatively superfluous, i.e. dispensable articles, but their aesthetic properties make them the natural material of luxury, ornamentation, splendor, festive occasions, in short, the positive form of abundance and wealth. They appear, in a way, as spontaneous light brought out from the underground world, since silver reflects all rays of light in their original combination, and gold only the color of highest intensity, viz. red light. The sensation of color is, generally speaking, the most popular form of aesthetic sense. The etymological connection between the names of the precious metals, and the relations of colors, in the different Indo-Germanic languages has been established by Jacob Grimm (see his History of the German Language).

Finally, the susceptibility of gold and silver of being turned from coin into bullion, from bullion into articles of luxury and vice versa, i.e. the advantage they possess as against other commodities in not being tied down to a definite, exclusive form in which they can be used, makes them the

natural material of money, which must constantly change from one form to another.

Nature no more produces money than it does bankers or discount rates. But since the capitalist system of production requires the crystallization of wealth as a fetich in the form of a single article, gold and silver appear as its appropriate incarnation. Gold and silver are not money by nature, but money is by nature gold and silver. In the first place, the silver or gold money crystal is not only the product of the process of circulation, but in fact its only final product. In the second place, gold and silver are ready and direct products of nature, not distinguished by any difference of form. The universal product of the social process or the social process itself as a product is a peculiar natural product, a metal hidden in the bowels of the earth and extracted therefrom.¹¹⁴

We have seen that gold and silver are unable to fulfill the requirements which they are expected to meet in their capacity of money, viz. to remain values of unvarying magnitude. Still, as Aristotle had already observed, they possess a more constant value than the average of other commodities. Apart from the universal effect of an appreciation or depreciation of the precious metals, the fluctuations in the ratio between the values of gold and silver has a special importance, since both serve side by side in the world market as money material. The purely economic causes of this change of value must be traced to the change in the labor-time required for the production of these metals; conquests and other political upheavals which exercised a great influence on the value of metals in the ancient world, have nowadays only a local and transitory effect. The labor-time required for the production of the metals will depend on the degree of their natural scarcity, as well as on the greater or less difficulty with which they can be obtained in a purely metallic state. As a matter of fact, gold is the first metal discovered by man. This is due to the fact that nature itself furnishes it partly in pure crystalline form, individualized, free from chemical combination with other substances, or, as the alchemists used to say, in a virgin state; and so far as it does not appear in that state, nature does the technical work in the great gold washeries of rivers. Only the crudest kind of labor is thus required of man in the extraction of gold, either from rivers or from alluvial deposits; while the extraction of silver presupposes the development of mining and a comparatively high degree of technical skill generally. For that reason the value of silver is originally greater than that of

gold in spite of the lesser absolute scarcity of the former. Strabo's assertion that a certain Arabian tribe gave ten pounds of gold for one pound of iron and two pounds of gold for one pound of silver, seems by no means incredible. But as the productive powers of labor in society are developed and the product of unskilled labor rises in value as compared with the product of skilled labor; as the earth's crust is more thoroughly broken up and the original superficial sources of gold supply give out, the value of silver begins to fall in proportion to that of gold. At a given stage of development of engineering and of the means of communication, the discovery of new gold or silver fields become the decisive factor. In ancient Asia the ratio of gold to silver was 6 to 1 or 8 to 1; the latter ratio prevailed in China and Japan as late as the beginning of the nineteenth century; 10 to 1, the ratio in Xenophon's time, may be considered as the average ratio of the middle period of antiquity. The exploitation of the Spanish silver mines by Carthage and later by Rome had about the same effect in antiquity, as the discovery of the American mines in modern Europe. For the period of the Roman empire 15 or 16 to 1 may be assumed as a rough average, although we frequently find cases of still greater depreciation of silver in Rome. The same movement beginning with the relative depreciation of gold and concluding with the fall in the value of silver, is repeated in the following epoch which has lasted from the Middle Ages to the present time. As in Xenophon's times the average ratio in the Middle Ages was 10 to 1, changing to 16 or 15 to 1 in consequence of the discovery of the American mines. The discovery of the Australian, Californian and Columbian gold sources makes a new fall in the value of gold probable.^{[115](#)}

C. THEORIES OF THE MEDIUM OF CIRCULATION AND OF MONEY.

As the universal thirst for gold prompted nations and princes in the sixteenth and seventeenth centuries, the period of infancy of modern bourgeois society, to crusades beyond the sea in search of the golden grail,¹¹⁶ the first interpreters of the modern world, the founders of the monetary system, of which the mercantile system is but a variation, proclaimed gold and silver, i.e. money, as the only thing that constitutes wealth. They were quite right when, from the point of view of the simple circulation of commodities, they declared that the mission of bourgeois society was to make money, i.e. to build up everlasting treasures which neither moth nor rust could eat. It is no argument with the monetary system to say that a ton of iron whose price is £3 constitutes a value of the same magnitude as £3 worth of gold. The point here is not the magnitude of the exchange value, but as to what constitutes its adequate form. If the monetary and mercantile systems single out international trade and the particular branches of national industry directly connected with that trade as the only true sources of wealth or money, it must be borne in mind, that in that period the greater part of national production was still carried on under forms of feudalism and was the source from which producers drew directly their means of subsistence. Products, as a rule, were not turned into commodities nor, therefore, into money; they did not enter into the general social interchange of matter; did not, therefore, appear as embodiments of universal abstract labor; and did not, in fact, constitute bourgeois wealth. Money as the end and object of circulation is exchange value or abstract wealth, but it is no material element of wealth and does not form the directing goal and impelling motive of production. True to the conditions as they prevailed in that primitive stage of bourgeois production, those unrecognized prophets held fast to the pure, tangible, and resplendent form of exchange value, to its form of a universal commodity as against all special commodities. The proper bourgeois economic sphere of that period was the sphere of the circulation of commodities. Hence, they judged the entire complex process of bourgeois production from the point of view of that elementary sphere and confounded money with capital. The unceasing

war of modern economists against the monetary and mercantile system is mostly due to the fact that this system blabs out in brutally naive fashion, the secret of bourgeois production, viz. its subjection to the domination of exchange value. Ricardo, though wrong in the application he makes of it, remarks somewhere that even in times of famine, grain is imported not because the nation is starving, but because the grain dealer is making money. In its criticism of the monetary and mercantile system, political economy, by attacking that system as a mere illusion and as a false theory, fails to recognize in it the barbaric form of its own fundamental principles. Furthermore, this system has not only an historic justification, but within certain spheres of modern economy retains until now the full rights of citizenship. At all stages of the bourgeois system of production in which wealth assumes the elementary form of a commodity, exchange value assumes the elementary form of money and in all phases of the process of production wealth reassumes for a moment the universal elementary commodity form. Even at the most advanced stage of bourgeois economy, the specific functions of gold and silver to serve as money, in contradistinction to their function of mediums of circulation — a function which distinguishes them from all other commodities — is not done away with, but only limited, hence the monetary and mercantile system retains its right of citizenship. The Catholic fact that gold and silver are contrasted with other profane commodities as the direct incarnation of social labor, that is as the expression of abstract wealth, naturally offends the Protestant point d'honneur of bourgeois economy, and out of fear of the prejudices of the monetary system it had lost for a long time its grasp of the phenomena of money circulation, as will be shown presently.

It was quite natural that, contrary to the monetary and mercantile system which knew money only in its form of a crystallized product of circulation, classical political economy should have conceived money first of all in its fluent form of exchange value arising and disappearing within the process of the metamorphosis of commodities. And since the circulation of commodities is regarded exclusively in the form of $C — M — C$ and the latter in its turn, exclusively in its aspect of a dynamic unity of sale and purchase, money comes to be regarded in its capacity of a medium of circulation as opposed to its capacity of money. And when that medium of circulation is isolated in its function of coin, it turns, as we have seen, into a token of value. But since classical political economy had to deal with

metallic circulation as the prevailing form of circulation, it defined metallic money as coin, and metallic coin as a mere token of value. In accordance with the law governing the circulation of tokens of value, the proposition was advanced that the prices of commodities depend on the quantity of money in circulation instead of the opposite principle that the quantity of money in circulation depends on the prices of commodities. We find this view more or less clearly expressed by the Italian economists of the seventeenth century; LOCKE now asserts, now denies that principle; it is clearly elaborated in the “Spectator” (of October 19, 1711) by MONTESQUIEU AND HUME. Since Hume was by far the most important representative of this theory in the eighteenth century, we shall commence our review with him.

Under certain assumptions, an increase or decrease in the quantity either of the metallic money in circulation, or of the tokens of value in circulation seems to affect *uniformly* the prices of commodities. With each fall or rise of the *value* of gold or silver in which the exchange values of commodities are estimated as prices, there is a rise or fall of prices, because of the change in their measure of value; as a result of the rise or fall of prices, a greater or smaller quantity of gold and silver is circulating as coin. But the apparent phenomenon is the fall in prices — the exchange value of commodities remaining the same — accompanied by an increased or diminished quantity of the medium of circulation. On the other hand, if the quantity of tokens of value rises above or falls below its required level, it is forcibly reduced to the latter by a fall or rise of prices. In either case the same effect seems to be brought about by the same cause, and Hume holds fast to this semblance.

Every scientific inquiry into the relation between the volume of the circulating medium and the movement of prices must assume the value of the money material as given. Hume, on the contrary, considers exclusively periods of revolution in the value of the precious metals, i.e. revolutions in the measure of value. The rise of prices which occurred simultaneously with the increase of metallic money after the discovery of the American mines forms the historical background of his theory, while his polemic against the monetary and mercantile system furnishes its practical motive. The importation of precious metals can naturally increase while their cost of production remains the same. On the other hand, a decrease in their value, i.e. in the labor-time required for their production will reveal itself first of all in their increased imports. Hence, said the later followers of Hume, a

decrease in the value of the precious metals, reveals itself in an increased volume of the circulating medium, and the increased volume of the latter is shown in the rise of prices. As a matter of fact, however, the rise in price affects only exported commodities, which are exchanged for gold and silver as commodities and not as mediums of circulation. Thus, the prices of these commodities, which are now estimated in gold and silver of lower value, rise as compared with the prices of all other commodities whose exchange value continues to be estimated in gold or silver according to the standard of their old cost of production. This two-fold appraisal of the exchange values of commodities in the same country can naturally be only temporary, and the gold and silver prices must become equalized in the proportions determined by the exchange values themselves, so that finally the exchange values of all commodities come to be estimated according to the new value of the money material. The development of this process, as well as the ways and means in which the exchange value of commodities asserts itself within the limits of the fluctuations of market prices, do not fall within the scope of this work. But that this equalization takes place but gradually in the early periods of development of bourgeois production and extends over long periods of time, never keeping pace with the increase of cash in circulation, has been strikingly demonstrated by new critical investigations of the movement of prices of commodities in the sixteenth century.¹¹⁷ The favorite references of Hume's followers to the rise of prices in ancient Rome in consequence of the conquests of Macedonia, Egypt and Asia Minor, are quite irrelevant. The characteristic method of antiquity of suddenly transferring hoarded treasures from one country to another, which was accomplished by violence and thus brought about a temporary reduction of the cost of production of precious metals in a certain country by the simple process of plunder, affects just as little the intrinsic laws of money circulation, as the gratuitous distribution of Egyptian and Sicilian grain in Rome affected the universal law governing the price of grain. Hume, as well as all other writers of the eighteenth century, was not in possession of the material necessary for the detailed observation of the circulation of money. This material, which first becomes available with the full development of banking, includes in the first place a critical history of prices of commodities, and in the second, official and current statistics relating to the expansion and contraction of the circulating medium, the imports and exports of the precious metals, etc. Hume's theory of

circulation may be summed up in the following propositions: 1. The prices of commodities in a country are determined by the quantity of money existing there (real or symbolic money); 2. The money current in a country represents all the commodities to be found there. In proportion “as there is more or less of this representation,” i.e. of money, “there goes a greater or less quantity of the thing represented to the same quantity of it”; 3. If commodities increase in quantity, their price falls or the value of money rises. If money increases in quantity, then, on the contrary, the price of commodities rises and the value of money declines.¹¹⁸

“The dearness of everything,” says Hume, “from plenty of money, is a disadvantage, which attends an established commerce, and sets bounds to it in every country, by enabling the poorer states to undersell the richer in all foreign markets.”¹¹⁹ “Where coin is in greater plenty; as a greater quantity of it is required to represent the same quantity of goods; it can have no effect, either good or bad, taking a nation within itself; any more than it would make an alteration on a merchant’s books, if, instead of the Arabian method of notation, which requires few characters, he should make use of the Roman, which requires a great many. Nay, the greater quantity of money, like the Roman characters, is rather inconvenient, and requires greater trouble both to keep and transport it.”¹²⁰ In order to prove anything, Hume should have shown that under a *given* system of notation the quantity of characters used does not depend on the magnitude of the numbers, but that on the contrary, the magnitude of the numbers depends on the quantity of the characters used. It is perfectly true that there is no advantage in estimating or “counting” values of commodities in depreciated gold and silver, and that is the reason why nations have always found it more convenient with the growth of the value of the commodities in circulation to count in silver in preference to copper, and in gold rather than in silver. In proportion as the nations became richer, they converted the less valuable metals into subsidiary coin and the more valuable ones into money. Furthermore, Hume forgets that in order to count values in gold and silver, it is not necessary that either gold or silver should be “on hand.” Money of account and the medium of circulation are identical with him and both are “coin.” Hume concludes that a rise or fall of prices depends on the quantity of money in circulation, because a change in the value of the measure of value, i.e. of the precious metals which serve as money of account, causes a rise or fall of prices and, consequently, also a change in the amount of

money in circulation, the rapidity of the latter remaining the same. That not only the quantity of gold and silver increased in the sixteenth and seventeenth centuries, but that the cost of their production had declined at the same time, Hume could know from the closing up of the European mines. In the sixteenth and seventeenth centuries the prices of commodities increased in Europe with the influx of the mass of American gold and silver; hence the prices of commodities in every land are determined by the mass of gold and silver to be found there. This was Hume's first "necessary consequence."¹²¹ In the sixteenth and seventeenth centuries prices had not risen uniformly with the increase of the quantity of precious metals; more than half a century passed before *any* change in prices became perceptible, and even then it took a long time before the exchange values of commodities came to be generally estimated according to the depreciated value of gold and silver, i.e. before the revolution affected the general price level. Hence, concludes Hume, who, quite contrary to the principles of his philosophy, generalizes indiscriminately from imperfectly observed facts, prices of commodities or the value of money depend not on the total amount of money to be found in the country, but rather on the quantity of gold and silver which is actually in circulation; but in the long run all the gold and silver in the country must be absorbed by circulation in the form of coin.¹²² It is clear that if gold and silver have a value of their own, then, apart from all other laws of circulation, only a definite quantity of gold and silver can circulate as the equivalent of commodities of a given value. If, therefore, every quantity of gold and silver which happens to be in a country must enter the sphere of exchange of commodities as a medium of circulation without regard to the total value of the commodities, then gold and silver have no intrinsic value and are in fact no real commodities. That is Hume's third "necessary consequence." He makes commodities enter the process of circulation without price and gold and silver without value. That is the reason why he never speaks of the value of commodities and of gold, but only of their relative quantities. Locke had already said that gold and silver had merely an imaginary or conventional value; the first brutal expression of opposition to the assertion of the monetary "system" that gold and silver alone have true value. That gold and silver owe their character of money to the function they perform in the social process of exchange is interpreted to the effect that they owe their own value and therefore the magnitude of their value to a social function.¹²³ Gold and silver are thus

worthless things, which, however, acquire a fictitious value within the sphere of circulation *as representatives of commodities*. They are converted by the process of circulation not into money, but into value. This value of theirs is determined by the proportion between their own volume and that of the commodities, since the two must balance each other. Thus, Hume makes gold and silver enter the world of commodities as non-commodities; but as soon as they appear in the form of coin, he turns them, on the contrary, into mere commodities, which must be exchanged for other commodities by simple barter. In that manner, if the world of commodities consisted of but one commodity, say one million quarters of grain, the idea would work itself out very simply; viz., one quarter of grain would be exchanged for two ounces of gold if there were altogether two million ounces of gold, and for twenty ounces of gold, if there were a total of twenty million ounces, the price of the commodity and the value of money rising or falling in inverse ratio to the quantity of gold in existence.¹²⁴ But the world of commodities consists of an endless variety of use-values, whose relative values are by no means determined by their relative quantities. How, then, does Hume conceive this exchange of the volume of commodities for the volume of gold? He contents himself with the meaningless, hollow idea that every commodity is exchanged as an aliquot part of the entire volume of commodities for a corresponding aliquot part of the volume of gold. The process of the movement of commodities due to the antagonism between exchange value and use-value which commodities bear within themselves, and which manifests itself in the circulation of money, becoming crystallized in different forms of the latter, is thus done away with, giving place to the imaginary mechanical equalization process between the quantity of precious metals to be found in a country and the volume of commodities existing there at the same time.

SIR JAMES STEUART opens his inquiry into the nature of coin and money with an elaborate criticism of Hume and Montesquieu.¹²⁵ He is really the first to ask this question: is the quantity of current money determined by the prices of commodities, or are the prices of commodities determined by the quantity of current money? Although his analysis is obscured by his fantastic conception of the measure of value, his vacillating view of exchange value and by reminiscences of the mercantile system, he discovers the essential forms of money and the general laws of the circulation of money, because he makes no attempt at a mechanical

separation of commodities from money, but proceeds to develop its different functions from the different aspects of the exchange of commodities. Money is used, he says, for two principal purposes: for the payment of debts and for the purchase of what one needs; the two together form “ready money demands.” The state of trade and industry, the mode of living, the customary expenditures of the people, taken all together regulate and determine the volume of “ready money demands,” i.e. the number of “alienations.” In order to effect this multitude of payments, a certain proportion of money is required. This proportion may increase or decrease according to circumstances, even while the number of alienations remains the same. At any rate, the circulation of a country can absorb only a definite quantity of money.¹²⁶ “It is the complicated operations of demand and competition which determines the standard price of everything”; the latter “does not in the least depend on the quantity of gold and silver in the country.”¹²⁷ What then will become of the gold and silver that is not required as coin? They are hoarded or used in the manufacture of articles of luxury. If the quantity of gold and silver fall below the level required for circulation, symbolic money or other substitutes take its place. If a favorable rate of exchange brings about a surplus of money in the country and cuts off at the same time the demand for its shipment abroad, it will accumulate in strong-boxes, where the “riches will remain without producing more effect than if they had remained in the mine.”

The second law discovered by Steuart is that of the reflux of credit circulation to its starting point. Finally, he works out the effects which the disparity of the rates of interest in different countries produces upon the international export and import of precious metals. The last two points we mention here only for the sake of completeness, since they have but a remote bearing on the subject of our discussion.¹²⁸ Symbolic money or credit money — Steuart does not as yet distinguish between the two forms of money — may take the place of precious metals as a means of purchase or means of payment in the sphere of home circulation, but never in the world market. Paper notes are therefore “money of the society,” while gold and silver are “money of the world.”¹²⁹

It is characteristic of nations with an “historical” development, in the sense in which the term is used by the historical school of law, to keep forgetting their own history. Although the controversy as to the relation of prices of commodities to the volume of the circulating medium has been

continually agitating Parliament for the last half a century, and has precipitated in England thousands of pamphlets, large and small, Steuart has remained even more of a “dead dog” than Spinoza seemed to be to Moses Mendelson in Lessing’s time. Even the latest writer on the history of “currency,” Maclaren, makes Adam Smith the original author of Steuart’s theory, and Ricardo of Hume’s theory.¹³⁰

While Ricardo elaborated Hume’s theory, Adam Smith registered the results of Steuart’s investigations as dead facts. Adam Smith applied the Scotch saying that “mony mickles mak a muckle” even to his spiritual wealth, and therefore concealed with petty care the sources to which he owed the little out of which he tried to make so much. More than once he prefers to break off the point of the discussion, whenever he feels that an attempt on his part clearly to formulate the question would compel him to settle his accounts with his predecessors. So in the case of the money theory. He tacitly adopts Steuart’s theory when he says that the gold and silver existing in a country is partly utilized as coin; partly accumulated in the form of reserve funds for merchants in countries without banks, or of bank reserves in countries with a credit currency; partly serves as a hoard for the settling of international payments; partly is turned into articles of luxury. He passes over without remark the question as to the quantity of coin in circulation, treating money quite wrongly as a mere commodity.¹³¹ His vulgarizer, the dull J. B. Say, whom the French have proclaimed *prince de la science* — like Johann Christoph Gottsched, who proclaimed his Schönaich a Homer and himself a Pietro Aretino to the *terror principum and lux mundi* — has with great pomp raised this not altogether innocent oversight of Adam Smith to a dogma.¹³² It must be said, however, that his hostile attitude to the illusions of the mercantile system prevented Adam Smith from taking an objective view of the phenomena of metallic circulation, while his views on credit money are original and deep. As in the eighteenth century petrification theories there is always felt the presence of an undercurrent which springs from either a critical or apologetic attitude toward the biblical tradition of the flood, so there is concealed behind all the money theories of the eighteenth century a secret struggle with the monetary system, the ghost which had stood guard over the cradle of bourgeois economy and continued to throw its shadow over legislation.

In the nineteenth century, inquiries into the nature of money were not prompted directly by phenomena of metallic circulation, but rather by those of banknote circulation. The former was touched upon only in order to discover the laws governing the latter. The suspension of specie payments by the Bank of England in 1797, the rise of prices of many commodities which followed it, the fall of the mint price of gold below its market price, the depreciation of bank-notes, especially since 1809, furnished the direct practical occasion for a party struggle in parliament and a theoretical tournament outside of it, both conducted with like passion. The historical background for the controversy was furnished by the history of paper money during the eighteenth century: the fiasco of Law's bank; the depreciation of the provincial bank-notes of the English Colonies in North America from the beginning to the middle of the eighteenth century which went hand in hand with the increase in the number of tokens of value; further, the Continental bills issued as legal tender by the American government during the War of Independence; and finally, the experiment with the French *assignats* carried out on a still larger scale. Most of the English writers of that period confound the circulation of bank-notes, which is governed by quite different laws, with the circulation of tokens of value or government legal tender paper money; and while they claim to explain the phenomena of this legal tender circulation by the laws of metallic circulation, they proceed, as a matter of fact, just the opposite way, viz., deducting laws for the latter from phenomena observed in connection with the former. We omit all the numerous writers of the period of 1800-1809 and turn directly to RICARDO, both because he embodies the views of his predecessors, which he formulates with greater precision, and because the shape he gave to the theory of money governs English bank legislation until this moment. Ricardo, like his predecessors, confounds the circulation of bank-notes, or credit money, with the circulation of mere tokens of value. The fact which impresses him most is the depreciation of paper currency accompanied by the rise of prices of commodities. What the American mines had been to Hume, the paper-bill presses in Threadneedle street were to Ricardo, and he himself expressly identifies the two factors at some place in his works. His first writings, which dealt exclusively with the money question belong to the time of the most violent controversy between the Bank of England, which had on its side the ministers and the war party, and its opponents about whom were centered the parliamentary opposition, the

Whigs and the Peace party. They appeared as immediate forerunners of the famous Report of the Bullion Committee of 1810, in which Ricardo's views were adopted.¹³³ The singular circumstance, that Ricardo and his adherents, who held money to be merely a token of value, are called bullionists, is due not only to the name of that committee, but also to the nature of their theory. In his work on political economy, Ricardo repeated and developed further the same views, but nowhere has he investigated the nature of money as such, as he had done in the case of exchange value, profit, rent, etc.

To begin with, Ricardo determines the value of gold and silver, like that of all other commodities, by the quantity of labor-time embodied in them.¹³⁴ By means of them, as commodities of a given value, the values of all other commodities are measured.¹³⁵ The volume of the circulating medium in a country is determined by the value of the unit of measure of money on the one hand, and by the sum total of the exchange values of commodities, on the other. This quantity is modified by economy in the method of payment.¹³⁶ Since the quantity of money, of a given value, which can be absorbed by circulation, is thus determined and since the value of money within the sphere of circulation manifests itself only in its quantity, it follows that mere tokens of value, if issued in proportions determined by the value of money, may replace it in circulation, and in fact, "a currency is in its most perfect state when it consists wholly of paper money, but of paper money of an equal value with the gold which it professes to represent."¹³⁷ So far Ricardo determines the volume of the circulating medium by the prices of commodities, assuming the value of money to be given; money as a token of value means with him a token of a definite quantity of gold and not a mere worthless representative of commodities as was the case with Hume.

When Ricardo suddenly gets off the straight path of his presentation and takes the very opposite view, he does so to turn his attention to the international circulation of precious metals and thus brings confusion into the problem by introducing considerations that are foreign to the subject. Let us follow his own course of reasoning, and, in order to remove everything that is artificial and incidental, let us assume that the gold and silver mines are located in the interior of the countries in which the precious metals circulate as money. The only inference which follows from Ricardo's reasoning as so far developed, is that, the value of gold being

given, the quantity of money in circulation will be determined by the prices of commodities. Thus, at a given moment, the quantity of gold in circulation in a country is simply determined by the exchange value of the commodities in circulation. Let us suppose now that the sum total of these exchange values has declined either because there are less commodities produced at the old exchange values, or because, in consequence of an increased productivity of labor, the same quantity of commodities has a smaller value. Or, we may assume on the contrary that the sum total of exchange values has increased, either because the quantity of commodities has increased while the cost of their production has remained the same, or because the value of the same or of a smaller quantity of commodities has risen in consequence of a diminished productivity of labor. What becomes in either case of the *given* quantity of metal in circulation? If gold is money merely because it is current as a medium of circulation; if it is compelled to remain in circulation like government legal tender paper money (and that is what Ricardo has in mind), then the quantity of money in circulation will rise above the normal level, as determined by the exchange value of the metal, in the former case, and fall below that level in the latter. Although possessing a value of its own, gold will become in the former case a token of a metal of lower exchange value than its own, and in the latter, a token of a metal of higher value. In the former case it will remain as a token of value less than its own, in the latter greater than its own (again an abstract deduction from legal tender paper money). In the former case it is the same as though commodities were estimated in a metal of lower value than gold, in the latter, as though they were estimated in a metal of higher value. In the former case, prices of commodities would rise therefore, in the latter they would fall. In either case the movement of prices, their rise or fall, would appear as the effect of a relative expansion or contraction of the volume of gold in circulation above or below the level corresponding to its own value, i.e. above or below the normal quantity which is determined by the proportion between its own value and that of the commodities in circulation.

The same process would take place if the sum total of the prices of the commodities in circulation remained unchanged, while the volume of gold in circulation came to be below or above the right level: the former in case the gold coin worn out in the course of circulation were not replaced by the production of a corresponding quantity of gold in the mines; the latter, if the

output of the mines exceeded the requirements of circulation. In either case it is assumed that the cost of production of gold or its value remain the same.

To sum up: the money in circulation is at its normal level, when its volume is determined by its own bullion value, the exchange value of commodities being given. It rises above that level, bringing about a fall in the value of gold below its own bullion value and a rise of prices of commodities, whenever the sum total of the exchange values of commodities declines, or the output of gold from the mines increases. It sinks below its right level, leading to a rise of gold above its own bullion value and to a fall of prices of commodities, whenever the sum total of the exchange values of the commodities or the gold output of the mines is not sufficient to replace the quantity of outworn gold. In either case the gold in circulation becomes a token of value greater or smaller than that it really possesses. It may become an appreciated or depreciated token of itself. As soon as all commodities would come to be estimated in gold of this new value and the general price level would accordingly rise or fall, the quantity of current gold would again answer the requirements of circulation (a consequence which Ricardo emphasizes with great pleasure), but would be at variance with the cost of production of the precious metals and, therefore, with their relation as commodities to all other commodities. According to the general Ricardian theory of exchange value, the rise of gold above its exchange value, i.e., above the value as determined by the labor-time contained in it, would cause an increase in the production of gold until the increased output of it would reduce its value to the proper magnitude. And in the same manner, a fall of gold below its value would cause a decline in its production until its value rose again to its proper magnitude. By these opposite movements the discrepancy between the bullion value of gold and its value as a medium of circulation would disappear, the normal level of the volume of gold in circulation would be restored, and the price level would again correspond to the measure of value. These fluctuations in the value of gold in circulation would to the same extent affect gold in the form of bullion, because by assumption, all gold that is not utilized as an article of luxury, is supposed to be in circulation. Since gold itself may become, both as coin and bullion, a token of value of greater or smaller magnitude than its bullion value, it is self understood that convertible bank-notes in circulation have to share the same fate. Although bank-notes are

convertible, i.e. their real value and nominal value agree, “the aggregate currency consisting of metal and of convertible notes” may appreciate or depreciate according as to whether it rises or falls, for reasons already stated, above or below the level determined by the exchange value of the commodities in circulation and the bullion value of gold. Inconvertible paper money, has, from this point of view, only that advantage as against convertible paper money, that it may depreciate in a two-fold manner. It may fall below the value of the metal which it is supposed to represent, because it has been issued in too great quantity, or it may depreciate because the metal it represents has itself fallen in value. This depreciation, not of paper as compared with gold, but of gold and paper together, or of the aggregate currency of a country, is one of the principal discoveries of Ricardo, which Lord Overstone and Co. pressed into their service and made a fundamental principle of Sir Robert Peel’s Bank legislation of 1844 and 1845.

What should have been proven was that the price of commodities or the value of gold depends on the quantity of gold in circulation. The proof consists in the assumption of what is to be proven, viz. that any quantity of the precious metal employed as money must become a medium of circulation or coin, and thereby a token of value for the commodities in circulation, no matter in what proportion to its own intrinsic value and no matter what the total value of those commodities may be. To put it differently, the proof consists in overlooking all the other functions which money performs besides its function of a medium of circulation. When hard pressed, as in his controversy with Bosanquet, Ricardo, completely under the influence of the phenomenon of depreciated tokens of value caused by their quality, takes recourse to dogmatic assurances.^{[138](#)}

If Ricardo had built up this theory by abstract reasoning, as we have done it here, without introducing concrete facts and incidental matters which only distract his attention from the main question, its hollowness would be striking. But he takes up the entire subject in its *international* aspect. It will be easy to prove, however, that the apparent magnitude of scale does not make his fundamental ideas less diminutive.

His first proposition was as follows: the volume of metallic currency is normal when it is determined by the total value of the commodities in circulation estimated in its bullion value. Expressed so as to apply to international conditions, it reads thus: in a normal state of circulation every

country possesses a quantity of money “according to the state of its commerce and wealth.” Money circulates at a value corresponding to its real value or to its cost of production, i.e. it has the same value *in all countries*.¹³⁹ That being the case, “there could be no temptation offered to either for their importation or exportation.”¹⁴⁰ There would thus be established a balance of currencies between the different countries. The normal level of a national currency is now expressed in terms of an international balance of currencies, which practically amounts to the statement that nationality does not change anything in a universal economic law. We have reached again the same fatal point as before. How is the normal level disturbed? Or, speaking in terms of the new terminology, how is the international balance of currencies disturbed? Or, how does money cease to have the same value in all countries? Or, finally, how does it cease to pass at its own value in every country? We have seen that the normal level was disturbed by an increase or decrease of the volume of money in circulation while the total value of commodities remained the same; or, because the quantity of money in circulation remained the same while the exchange values of commodities rose or fell. In the same manner, the international level, determined by the value of the metal itself, is disturbed by an increase in the quantity of gold in a country brought about by the discovery of new gold mines,¹⁴¹ or by an increase or decrease of the total exchange-value of the circulating commodities in any particular country. Just as in the former case the output of the precious metals decreased or increased according as to whether it was necessary to contract or expand the currency and thereby to lower or raise prices, so are the same effects produced now by export and import from one country to another. In the country in which prices would rise or the value of gold would fall below the bullion value in consequence of a redundant currency, gold would be depreciated, and the prices of commodities would rise as compared with other countries. Gold would, therefore, be exported, while commodities would be imported, and vice versa. Just as in the former case the output of gold, so now the import or export of gold and, with it, the rise or fall of prices of commodities would continue until, as we would have said before, the right value relation would be restored between the metal and commodities, or as we shall say now, the international balance of currencies would be restored. Just as in the former case the production of gold increased or decreased because gold stood above or below its value, so now

the international migration of gold would take place for the same reason. Just as in the former case, every change in the production of the circulating metal affected its quantity and, thereby, prices, so would the same effect be produced now by international import and export. As soon as the relative values of gold and commodities or the normal quantity of currency would be restored, no further production would take place in the former case, and no further export or import in the latter, except in so far as would be necessary to replace outworn coin and to meet the demand of manufacturers of articles of luxury. It follows “that the temptation to export money in exchange for goods, or what is termed an unfavorable balance of trade, never arises but from a redundant currency.”¹⁴² “The exportation of the coin is caused by its cheapness, and is not the effect, but the cause of an unfavourable balance.”¹⁴³ Since the increase or decrease in the production of gold in the former case and the importation or exportation of gold in the latter, take place only whenever its volume rises above or sinks below its normal level, i.e. whenever gold appreciates or depreciates in comparison with its bullion value, or whenever prices of commodities are too high or too low; it follows that every such movement works as a corrective,¹⁴⁴ since, through the resultant expansion or contraction of the currency, prices are restored to their true level: in the former case this level represents the balance between the respective values of gold and of commodities; in the latter, the international balance of currencies. To put it in other words: money circulates in different countries only in so far as it circulates as coin in every country. Money is but coin and all the gold existing in a country must therefore enter circulation, i.e. it can rise above or fall below its value as a token of value. Thus we safely land again, by the round-about way of this international complication, at the simple dogma which constituted our starting point.

With what violence to actual facts Ricardo has to explain them in the sense of his abstract theory, a few illustrations will suffice to show. He maintains, e. g. that in years of poor crops, which happened frequently in England during 1800-1820, gold is exported not because corn is needed and gold as money is at all times an effectual means of purchase in the world market, but because gold is in such cases depreciated in its value as compared with other commodities and, therefore, the currency of the country in which there has been a failure of crops is depreciated with respect to other national currencies. “In consequence of a bad harvest, a

country having been deprived of a part of its commodities ... the currency which was before at its just level ... become(s) redundant,” and prices of all commodities rise in consequence.¹⁴⁵ Contrary to this paradoxical interpretation it has been proven statistically that from 1793 to the present time, whenever England had a bad harvest the available supply of currency not only did not become superabundant, but became inadequate and that, therefore, more money circulated and had to circulate on such occasions.¹⁴⁶

In the same manner, Ricardo maintained, with reference to Napoleon's Continental System and the English Blockade Decree, that the English exported gold instead of commodities to the Continent, because their money was depreciated with respect to the money on the Continent, that their commodities were, therefore, more high priced, which made it a more profitable commercial speculation to export gold than goods. According to him England was a market in which commodities were dear and money was cheap, while on the Continent commodities were cheap and money was dear. The trouble, according to an English writer, was “the ruinously low prices of our manufactures and of our colonial productions under the operation ... of the ‘Continental System ‘during the last six years of the war.... The prices of sugar and coffee, for instance, on the Continent, computed in gold, were four or five times higher than their prices in England, computed in bank-notes. I am speaking ... of the times in which the French chemists discovered sugar in beet-root, and a substitute for coffee in chicory; and when the English grazier tried experiments upon fattening oxen with treacle and molasses — of the times when we took possession of the island of Heligoland, in order to form there a depot of goods to facilitate, if possible, the smuggling of them into the north of Europe; and when the lighter descriptions of British manufactures found their way into Germany through Turkey.... Almost all the merchandise of the world accumulated in our warehouses, where they became impounded, except when some small quantity was released by a French License, for which the merchants at Hamburgh and Amsterdam had, perhaps, given Napoleon such a sum as forty or fifty thousand pounds. They must have been strange merchants ... to have paid so large a sum for liberty to carry a cargo of goods from a dear market to a cheap one. What was the ostensible alternative the merchant had?... Either to buy coffee at 6d. a pound in bank-notes, and send it to a place where it would instantly sell at 3s. or 4s. a pound in gold, or to buy gold with bank-notes at £5 an ounce, and send it to

a place where it would be received at £3 17s. 10-1/2d. an ounce.... It is too absurd, of course, to say ... that the gold was remitted instead of the coffee, as a preferable mercantile operation.... There was not a country in the world in which so large a quantity of desirable goods could be obtained, in return for an ounce of gold, as in England.... Bonaparte ... was constantly examining the English Price Current.... So long as he saw that gold was dear and coffee was cheap in England, he was satisfied that his 'Continental System' 'worked well.'¹⁴⁷

At the very time when Ricardo first formulated his theory of money, and the Bullion Committee embodied it in its parliamentary report, namely in 1810, a ruinous fall of prices of all English commodities as compared with those of 1808 and 1809 took place, while gold rose in value accordingly. Only agricultural products formed an exception, because their importation from abroad met with obstacles and their domestic supply was decimated by unfavorable crop conditions.¹⁴⁸ Ricardo so utterly failed to comprehend the rôle of precious metals as an international means of payment, that in his testimony before the Committee of the House of Lords in 1819 he could say "that drains for exportation would cease altogether so soon as cash payments should be resumed, and the currency be restored to its metallic level." He died just in time, on the very eve of the crisis of 1825, which belied his prophecies.

The time when Ricardo wrote was generally little adapted for the observation of the function of precious metals as world money. Before the introduction of the Continental System, the balance of trade had almost always been in favor of England, and while that system lasted, the commercial intercourse with the European continent was too insignificant to affect the English rate of exchange. The money transmissions were mostly of a political nature and Ricardo seems to have utterly failed to grasp the part which subsidy payments played at that time in English gold exports.¹⁴⁹

Among the contemporaries of Ricardo who formed the school which adopted his economic principles, JAMES MILL was the most important one. He attempted to work out Ricardo's theory of money on the basis of simple metallic circulation, without the irrelevant international complications which served Ricardo to hide the inadequacy of his theory, and without any controversial regard for the operations of the Bank of England. His main arguments are as follows:

“By value of money, is here to be understood the proportion in which it exchanges for other commodities, or the quantity of it which exchanges for a certain quantity of other things.... It is the total quantity of the money in any country, which determines what portion of that quantity shall exchange for a certain portion of the goods or commodities of that country. If we suppose that all the goods of the country are on one side, all the money on the other, and that they are exchanged at once against one another, it is evident ... that the value of money would depend wholly upon the quantity of it. It will appear that the case is precisely the same in the actual state of the facts. The whole of the goods of a country are not exchanged at once against the whole of the money; the goods are exchanged in portions, often in very small portions, and at different times, during the course of the whole year. The same piece of money which is paid in one exchange to-day, may be paid in another exchange tomorrow. Some of the pieces will be employed in a great many exchanges, some in very few, and some, which happen to be hoarded, in none at all. There will, amid all these varieties, be a certain average number of exchanges, the same which, if all the pieces had performed an equal number, would have been performed by each; that average we may suppose to be any number we please; say, for example, ten. If each of the pieces of the money in the country perform ten purchases, that is exactly the same thing as if all the pieces were multiplied by ten, and performed only one purchase each. The value of all the goods in the country is equal to ten times the value of all the money.... If the quantity of money instead of performing ten exchanges in the year, were ten times as great, and performed only one exchange in the year, it is evident that whatever addition were made to the whole quantity, would produce a proportional diminution of value, in each of the minor quantities taken separately. As the quantity of goods, against which the money is all exchanged at once, is supposed to be the same, the value of all the money is no more, after the quantity is augmented, than before it was augmented. If it is supposed to be augmented one-tenth, the value of every part, that of an ounce for example, must be diminished one-tenth.... In whatever degree, therefore, the quantity of money is increased or diminished, other things remaining the same, in that same proportion, the value of the whole, and of every part, is reciprocally diminished or increased. This, it is evident, is a proposition universally true. Whenever the value of money has either risen or fallen (the quantity of goods against which it is exchanged and the rapidity of

circulation remaining the same), the change must be owing to a corresponding diminution or increase of the quantity; and can be owing to nothing else. If the quantity of goods diminish, while the quantity of money remains the same, it is the same thing as if the quantity of money had been increased;" and vice versa.... "Similar changes are produced by any alteration in the rapidity of circulation.... An increase in the number of these purchases has the same effect as an increase in the quantity of money; a diminution the reverse.... If there is any portion of the annual produce which is not exchanged at all, as what is consumed by the producer; or which is not exchanged for money; that is not taken into the account, because what is not exchanged for money is in the same state with respect to the money, as if it did not exist.... Whenever the coining of money ... is free, its quantity is regulated by the value of the metal.... Gold and silver are in reality commodities.... It is cost of production ... which determines the value of these, as of other ordinary productions."¹⁵⁰

The whole wisdom of Mill resolves itself into a series of arbitrary and absurd assumptions. He wishes to prove that the price of commodities or the value of money is determined by "the total quantity of the money in any country." *Assuming* that the quantity and the exchange value of the commodities in circulation remain unchanged and that the same be true of the rapidity of circulation and of the value of precious metals as determined by the cost of production, and *assuming* at the same time that the quantity of the metallic currency increases or decreases in proportion to the quantity of money *existing* in a country, it becomes really "evident" that what was to have been proven has been assumed. Mill falls, moreover, into the same error as Hume by assuming that use-values and not commodities with a given exchange value are in circulation, and that vitiates his statement, even if we grant all of his "assumptions." The rapidity of circulation may remain the same; this may also be true of the value of the precious metals and of the *quantity* of commodities in circulation; and yet a change in the exchange value of the latter may require now a larger and now a smaller quantity of money for their circulation. Mill sees that a part of the money in a country is in circulation, while another is idle. With the aid of a most absurd average calculation he *assumes* that, although it really appears to be different, yet all the gold in a country does circulate. Assuming that ten million silver thalers circulate in a country twice a year, there could be twenty million such coins in circulation, if each circulated but once. And if the entire quantity of silver

to be found in a country in any form amounts to one hundred million thalers, it may be supposed that the entire one hundred million can enter circulation, if each piece of money should circulate once in five years. One could as well assume that all the money of the world circulate in Hempstead, but that each piece of money instead of being employed three times a year, is employed once in 3,000,000 years. The one assumption is as relevant as the other for the purpose of determining the relation between the sum total of prices of commodities and the volume of currency. Mill feels that it is a matter of decisive importance to him to bring the commodities in direct contact not with the money in circulation, but with the entire supply of money existing in a country. He admits that “the whole of the goods of a country are not exchanged at once against the whole of the money,” but that the goods are exchanged in different portions and at different times of the year for different portions of money. To do away with this difficulty he *assumes* that it does not exist. Moreover, this entire idea of direct contact of commodities and money and direct exchange is a mere abstraction from the movement of simple purchase and sale or the function of money as a means of purchase. Already in the movement of money as a means of payment, commodity and money cease to appear simultaneously.

The commercial crises of the nineteenth century, namely, the great crises of 1825 and 1836, did not result in any new developments in the Ricardian theory of money, but they did furnish new applications for it. They were no longer isolated economic phenomena, such as the depreciation of the precious metals in the sixteenth and seventeenth centuries which interested Hume, or the depreciation of paper money in the eighteenth and early nineteenth centuries which confronted Ricardo; they were the great storms of the world market in which the conflict of all the elements of the capitalist process of production discharge themselves, and whose origin and remedy were sought in the most superficial and abstract sphere of this process, the sphere of money circulation. The theoretical assumption from which the school of economic weather prophets proceeds, comes down in the end to the illusion that Ricardo discovered the laws governing the circulation of purely metallic currency. The only thing that remained for them to do was to subject to the same laws the circulation of credit and bank-note currency.

The most general and most palpable phenomenon in commercial crises is the sudden, general decline of prices following a prolonged general rise. The general decline of prices of commodities may be expressed as a rise in

the relative value of money with respect to all commodities, and the general rise of prices as a decline of the relative value of money. In either expression the phenomenon is described but not explained. Whether I put the question thus: explain the general periodic rise of prices followed by a general decline of the same, or formulate the same problem by saying: explain the periodic decline and rise of the relative value of money with respect to commodities; the different wording leaves the problem as little changed as would its translation from German into English. Ricardo's theory of money was exceedingly convenient, because it lends a tautology the semblance of a statement of causal connection. Whence comes the periodic general fall of prices? From the periodic rise of the relative value of money. Whence the general periodic rise of prices? From the periodic decline of the relative value of money. It might have been stated with equal truth that the periodic rise and fall of prices is due to their periodic rise and fall. The problem itself is stated under the assumption that the intrinsic value of money, i.e., its value as determined by the cost of production of precious metals remains *unchanged*. If it is more than a tautology then it is based on a misconception of the most elementary principles. If the exchange value of A measured in terms of B, declines, we know that this may be caused by a decline of the value of A as much as by a rise of the value of B; the same being true of the case of a rise of the exchange value of A measured in terms of B. The tautology once admitted as a statement of cause, the rest follows easily. A rise of prices of commodities is caused by a decline of the value of money and a decline of the value of money is caused, as we know from Ricardo, by a redundant currency, i.e., by a rise of the volume of currency over the level determined by its own intrinsic value and the intrinsic value of the commodities. In the same manner, the general decline of prices of commodities is explained by the rise of the value of money above its intrinsic value in consequence of an inadequate currency. Thus, prices rise and fall periodically, because there is periodically too much or too little money in circulation. Should a rise of prices happen to coincide with a contracted currency, and a fall of prices with an expanded one, it may be asserted in spite of those facts that in consequence of a contraction or expansion of the volume of commodities in the market, which can not be proven statistically, the quantity of money in circulation has, although not absolutely, yet relatively increased or declined. We have seen that according to Ricardo these universal fluctuations must take place

even with a purely metallic currency, but that they balance each other through their alternations; thus, e. g., an inadequate currency causes a fall of prices, the fall of prices leads to the export of commodities abroad, this export causes again an import of gold from abroad, which, in its turn, brings about a rise of prices; the opposite movement taking place in case of a redundant currency, when commodities are imported and money is exported. But, since in spite of these universal fluctuations of prices which are in perfect accord with Ricardo's theory of metallic currency, their acute and violent form, their crisis-form, belongs to the period of advanced credit, it is perfectly clear that the issue of bank-notes is not exactly regulated by the laws of metallic currency. Metallic currency has its remedy in the import and export of precious metals which immediately enter circulation and thus, by their influx or efflux, cause the prices of commodities to fall or rise. The same effect on prices must now be exerted by banks by the artificial imitation of the laws of metallic currency. If gold is coming in from abroad it proves that the currency is inadequate, that the value of money is too high and the prices of commodities too low, and, consequently, that bank notes must be put in circulation in proportion to the newly imported gold. On the contrary, notes have to be withdrawn from circulation in proportion to the export of gold from the country. That is to say, the issue of bank notes must be regulated by the import and export of the precious metals or by the rate of exchange. Ricardo's false assumption that gold is only coin, and that therefore all imported gold swells the currency, causing prices to rise, while all exported gold reduces the currency leading to a fall of prices, this theoretical assumption is turned into a practical experiment of putting in every case an amount of currency in circulation equal to the amount of gold in existence. Lord Overstone (the banker Jones Loyd), Colonel Torrens, Norman, Clay, Arbuthnot and a host of other writers, known in England as the adherents of the "currency principle," not only preached this doctrine, but with the aid of Sir Robert Peel succeeded in 1844 and 1845 in making it the basis of the present English and Scotch bank legislation. Its ignominious failure, theoretical as well as practical, following upon experiments on the largest national scale, can be treated only after we take up the theory of credit.¹⁵¹ So much can be seen, however, that the theory of Ricardo which isolates money in its fluent form of currency, ends by ascribing to the ebbs and tides in the supply of precious metals an influence on bourgeois economy such as the believers in

the superstitions of the monetary system had never dreamt of. Thus did Ricardo, who proclaimed paper currency as the most perfect form of money, become the prophet of the bullionists.

After Hume's theory or the abstract opposition to the monetary system was thus developed to its ultimate conclusions, Steuart's concrete conception of money was finally restored to its rights by THOMAS TOOKE.¹⁵² Tooke arrives at his principles not from any theory, but by a conscientious analysis of the history of prices of commodities from 1793 to 1856. In the first edition of his *History of Prices* which appeared in 1823, Tooke is still under the complete influence of the Ricardian theory, and vainly tries to reconcile it with actual facts. His pamphlet "On the Currency," which appeared after the crisis of 1825 might even be considered as the first consistent presentation of the views which were later given the force of law by Overstone. Continued studies in the history of prices forced him, however, to the conclusion that the direct connection between prices and the volume of currency, as it is pictured by the theory, is a mere illusion; that the expansion and contraction of currency which takes place while the value of the precious metals remains unchanged, is always the effect but never the cause of price fluctuations; that the circulation of money is in any event but a secondary movement; and that money assumes quite different forms in the actual process of production in addition to that of a circulating medium. His detailed investigations belong to a sphere outside of that of simple metallic circulation and can be discussed here as little as the investigations of WILSON and FULLARTON which belong to the same class.¹⁵³ None of these writers takes a one-sided view of money, but treat it in its various aspects; the treatment, however, is mechanical, without an attempt to establish an organic connection either between these various aspects themselves, or between them and the combined system of economic categories. They fall, therefore, into the error of confusing *money* as distinguished from *medium of circulation* with *capital* or even with commodity, although they are forced elsewhere to differentiate it from both.¹⁵⁴ When gold, e. g., is shipped abroad, it practically means that capital is sent abroad, but the same thing takes place when iron, cotton, grain, or any other commodity is exported. Both are capital and are distinguished not as capital, but as money and commodity. The function of gold as the international medium of exchange springs, therefore, not from its being capital, but from its specific character of money. Similarly, when gold, or

bank notes in its place, circulate in the home trade as means of payment, they constitute capital at the same time. But they could not be replaced by capital in the form of commodities, as has been demonstrated very palpably by crises, for instance. That is to say, it is the fact that gold is distinguished from commodities in its capacity of money and not in that of capital, that makes it the means of payment. Even when capital is exported directly as capital, as, e. g., when it is done for the purpose of lending abroad a certain amount on interest, it depends on circumstances, whether it will be exported in the form of commodities or in that of gold, and if in the latter form, it is due to the specific destination of the precious metals as distinguished from commodities to serve as money. In general, these writers do not consider money in its abstract form, as it is developed within the sphere of simple circulation of commodities, and as it spontaneously grows out of the relation of the circulating commodities. As a result, they constantly vacillate between the abstract forms of money which distinguish it from commodity and those forms of it beneath which are concealed concrete relations, such as capital, revenue, etc. [155](#)

Introduction
to the
Critique of Political Economy. [156](#)

1. PRODUCTION IN GENERAL.

The subject of our discussion is first of all *material* production by individuals as determined by society, naturally constitutes the starting point. The individual and isolated hunter or fisher who forms the starting point with Smith and Ricardo, belongs to the insipid illusions of the eighteenth century. They are Robinsonades which do not by any means represent, as students of the history of civilization imagine, a reaction against over-refinement and a return to a misunderstood natural life. They are no more based on such a naturalism than is Rousseau's "contrat social," which makes naturally independent individuals come in contact and have mutual intercourse by contract. They are the fiction and only the aesthetic fiction of the small and great Robinsonades. They are, moreover, the anticipation of "bourgeois society," which had been in course of development since the sixteenth century and made gigantic strides towards maturity in the eighteenth. In this society of free competition the individual appears free from the bonds of nature, etc., which in former epochs of history made him a part of a definite, limited human conglomeration. To the prophets of the eighteenth century, on whose shoulders Smith and Ricardo are still standing, this eighteenth century individual, constituting the joint product of the dissolution of the feudal form of society and of the new forces of production which had developed since the sixteenth century, appears as an ideal whose existence belongs to the past; not as a result of history, but as its starting point.

Since that individual appeared to be in conformity with nature and [corresponded] to their conception of human nature, [he was regarded] not as a product of history, but of nature. This illusion has been characteristic of every new epoch in the past. Steuart, who, as an aristocrat, stood more firmly on historical ground, contrary to the spirit of the eighteenth century, escaped this simplicity of view. The further back we go into history, the more the individual and, therefore, the producing individual seems to depend on and constitute a part of a larger whole: at first it is, quite naturally, the family and the clan, which is but an enlarged family; later on, it is the community growing up in its different forms out of the clash and the amalgamation of clans. It is but in the eighteenth century, in "bourgeois society," that the different forms of social union confront the individual as a

mere means to his private ends, as an outward necessity. But the period in which this view of the isolated individual becomes prevalent, is the very one in which the interrelations of society (general from this point of view) have reached the highest state of development. Man is in the most literal sense of the word a *zoon politikon*, not only a social animal, but an animal which can develop into an individual only in society. Production by isolated individuals outside of society — something which might happen as an exception to a civilized man who by accident got into the wilderness and already dynamically possessed within himself the forces of society — is as great an absurdity as the idea of the development of language without individuals living together and talking to one another. We need not dwell on this any longer. It would not be necessary to touch upon this point at all, were not the vagary which had its justification and sense with the people of the eighteenth century transplanted in all earnest into the field of political economy by Bastiat, Carey, Proudhon and others. Proudhon and others naturally find it very pleasant, when they do not know the historical origin of a certain economic phenomenon, to give it a quasi historico-philosophical explanation by going into mythology. Adam or Prometheus hit upon the scheme cut and dried, whereupon it was adopted, etc. Nothing is more tediously dry than the dreaming *locus communis*.

Whenever we speak, therefore, of production, we always have in mind production at a certain stage of social development, or production by social individuals. Hence, it might seem that in order to speak of production at all, we must either trace the historical process of development through its various phases, or declare at the outset that we are dealing with a certain historical period, as, e. g., with modern capitalistic production which, as a matter of fact, constitutes the subject proper of this work. But all stages of production have certain landmarks in common, common purposes. *Production in general* is an abstraction, but it is a rational abstraction, in so far as it singles out and fixes the common features, thereby saving us repetition. Yet these general or common features discovered by comparison constitute something very complex, whose constituent elements have different destinations. Some of these elements belong to all epochs, others are common to a few. Some of them are common to the most modern as well as to the most ancient epochs. No production is conceivable without them; but while even the most completely developed languages have laws and conditions in common with the least developed ones, what is

characteristic of their development are the points of departure from the general and common. The conditions which generally govern production must be differentiated in order that the essential points of difference be not lost sight of in view of the general uniformity which is due to the fact that the subject, mankind, and the object, nature, remain the same. The failure to remember this one fact is the source of all the wisdom of modern economists who are trying to prove the eternal nature and harmony of existing social conditions. Thus they say, e. g., that no production is possible without some instrument of production, let that instrument be only the hand; that none is possible without past accumulated labor, even if that labor consist of mere skill which has been accumulated and concentrated in the hand of the savage by repeated exercise. Capital is, among other things, also an instrument of production, also past impersonal labor. Hence capital is a universal, eternal natural phenomenon; which is true if we disregard the specific properties which turn an “instrument of production” and “stored up labor” into capital. The entire history of production appears to a man like Carey, e. g., as a malicious perversion on the part of governments.

If there is no production in general, there is also no general production. Production is always some special branch of production or an aggregate, as, e. g., agriculture, stock raising, manufactures, etc. But political economy is not technology. The connection between the general destinations of production at a given stage of social development and the particular forms of production, is to be developed elsewhere (later on).

Finally, production is not only of a special kind. It is always a certain body politic, a social personality that is engaged on a larger or smaller aggregate of branches of production. The connection between the real process and its scientific presentation also falls outside of the scope of this treatise. [We must thus distinguish between] production in general, special branches of production and production as a whole.

It is the fashion with economists to open their works with a general introduction, which is entitled “production” (see, e. g., John Stuart Mill) and deals with the general “requisites of production.”

This general introductory part treats or is supposed to treat:

1. Of the conditions without which production is impossible, i.e., of the most essential conditions of production. As a matter of fact, however, it dwindles down, as we shall see, to a few very simple definitions, which flatten out into shallow tautologies;

2. Of conditions which further production more or less, as, e. g., Adam Smith's [discussion of] a progressive and stagnant state of society.

In order to give scientific value to what serves with him as a mere summary, it would be necessary to study the *degree of productivity* by periods in the development of individual nations; such a study falls outside of the scope of the present subject, and in so far as it does belong here is to be brought out in connection with the discussion of competition, accumulation, etc. The commonly accepted view of the matter gives a general answer to the effect that an industrial nation is at the height of its production at the moment when it reaches its historical climax in all respects. Or, that certain races, climates, natural conditions, such as distance from the sea, fertility of the soil, etc., are more favorable to production than others. That again comes down to the tautology that the facility of creating wealth depends on the extent to which its elements are present both subjectively and objectively. As a matter of fact a nation is at its industrial height so long as its main object is not gain, but the process of gaining. In that respect the Yankees stand above the English.

But all that is not what the economists are really after in the general introductory part. Their object is rather to represent production in contradistinction to distribution — see Mill, e. g. — as subject to eternal laws independent of history, and then to substitute bourgeois relations, in an underhand way, as immutable natural laws of society *in abstracto*. This is the more or less conscious aim of the entire proceeding. On the contrary, when it comes to distribution, mankind is supposed to have indulged in all sorts of arbitrary action. Quite apart from the fact that they violently break the ties which bind production and distribution together, so much must be clear from the outset: that, no matter how greatly the systems of distribution may vary at different stages of society, it should be possible here, as in the case of production, to discover the common features and to confound and eliminate all historical differences in formulating *general human* laws. E. g., the slave, the serf, the wage-worker — all receive a quantity of food, which enables them to exist as slave, serf, and wage-worker. The conqueror, the official, the landlord, the monk, or the levite, who respectively live on tribute, taxes, rent, alms, and the tithe, — all receive [a part] of the social product which is determined by laws different from those which determine the part received by the slave, etc. The two main points which all economists place under this head, are: first, property; second, the protection

of the latter by the administration of justice, police, etc. The objections to these two points can be stated very briefly.

1. All production is appropriation of nature by the individual within and through a definite form of society. In that sense it is a tautology to say that property (appropriation) is a condition of production. But it becomes ridiculous, when from that one jumps at once to a definite form of property, e. g. private property (which implies, besides, as a prerequisite the existence of an opposite form, viz. absence of property). History points rather to common property (e. g. among the Hindoos, Slavs, ancient Celts, etc.) as the primitive form, which still plays an important part at a much later period as communal property. The question as to whether wealth grows more rapidly under this or that form of property, is not even raised here as yet. But that there can be no such a thing as production, nor, consequently, society, where property does not exist in any form, is a tautology. Appropriation which does not appropriate is a *contradictio in subjecto*.

2. Protection of property, etc. Reduced to their real meaning, these commonplaces express more than what their preachers know, namely, that every form of production creates its own legal relations, forms of government, etc. The crudity and the shortcomings of the conception lie in the tendency to see but an accidental reflective connection in what constitutes an organic union. The bourgeois economists have a vague notion that it is better to carry on production under the modern police, than it was, e. g. under club-law. They forget that club law is also law, and that the right of the stronger continues to exist in other forms even under their “government of law.”

When the social conditions corresponding to a certain stage of production are in a state of formation or disappearance, disturbances of production naturally arise, although differing in extent and effect.

To sum up: all the stages of production have certain destinations in common, which we generalize in thought; but the so-called general conditions of all production are nothing but abstract conceptions which do not go to make up any real stage in the history of production.

2. THE GENERAL RELATION OF PRODUCTION TO DISTRIBUTION, EXCHANGE, AND CONSUMPTION.

Before going into a further analysis of production, it is necessary to look at the various divisions which economists put side by side with it. The most shallow conception is as follows: By production, the members of society appropriate (produce and shape) the products of nature to human wants; distribution determines the proportion in which the individual participates in this production; exchange brings him the particular products into which he wishes to turn the quantity secured by him through distribution; finally, through consumption the products become objects of use and enjoyment, of individual appropriation. Production yields goods adopted to our needs; distribution distributes them according to social laws; exchange distributes further what has already been distributed, according to individual wants; finally, in consumption the product drops out of the social movement, becoming the direct object of the individual want which it serves and satisfies in use. Production thus appears as the starting point; consumption as the final end; and distribution and exchange as the middle; the latter has a double aspect, distribution being defined as a process carried on by society, while exchange, as one proceeding from the individual. In production the person is embodied in things, in [consumption¹⁵⁷] things are embodied in persons; in distribution, society assumes the part of go-between of production and consumption in the form of generally prevailing rules; in exchange this is accomplished by the accidental make-up of the individual.

Distribution determines what proportion (quantity) of the products the individual is to receive; exchange determines the products in which the individual desires to receive his share allotted to him by distribution.

Production, distribution, exchange, and consumption thus form a perfect connection, production standing for the general, distribution and exchange for the special, and consumption for the individual, in which all are joined together. To be sure this is a connection, but it does not go very deep. Production is determined [according to the economists] by universal natural laws, while distribution depends on social chance: distribution can,

therefore, have a more or less stimulating effect on production: exchange lies between the two as a formal (?) social movement, and the final act of consumption which is considered not only as a final purpose, but also as a final aim, falls, properly, outside of the scope of economics, except in so far as it reacts on the starting point and causes the entire process to begin all over again.

The opponents of the economists — whether economists themselves or not — who reproach them with tearing apart, like barbarians, what is an organic whole, either stand on common ground with them or are *below* them. Nothing is more common than the charge that the economists have been considering production as an end in itself, too much to the exclusion of everything else. The same has been said with regard to distribution. This accusation is itself based on the economic conception that distribution exists side by side with production as a self-contained, independent sphere. Or [they are accused] that the various factors are not treated by them in their connection as a whole. As though it were the text books that impress this separation upon life and not life upon the text books; and the subject at issue were a dialectic balancing of conceptions and not an analysis of real conditions.

a. Production is at the same time also consumption. Twofold consumption, subjective and objective. The individual who develops his faculties in production, is also expending them, consuming them in the act of production, just as procreation is in its way a consumption of vital powers. In the second place, production is consumption of means of production which are used and used up and partly (as e. g. in burning) reduced to their natural elements. The same is true of the consumption of raw materials which do not remain in their natural form and state, being greatly absorbed in the process. The act of production is, therefore, in all its aspects an act of consumption as well. But this is admitted by economists. Production as directly identical with consumption, consumption as directly coincident with production, they call productive consumption. This identity of production and consumption finds its expression in Spinoza's proposition, *Determinatio est negatio*. But this definition of productive consumption is resorted to just for the purpose of distinguishing between consumption as identical with production and consumption proper, which is defined as its destructive counterpart. Let us then consider consumption proper.

Consumption is directly also production, just as in nature the consumption of the elements and of chemical matter constitutes production of plants. It is clear, that in nutrition, e. g., which is but one form of consumption, man produces his own body; but it is equally true of every kind of consumption, which goes to produce the human being in one way or another. [It is] consumptive production. But, say the economists, this production which is identical with consumption, is a second production resulting from the destruction of the product of the first. In the first, the producer transforms himself into things; in the second, things are transformed into human beings. Consequently, this consumptive production — although constituting a direct unity of production and consumption — differs essentially from production proper. The direct unity in which production coincides with consumption and consumption with production, does not interfere with their direct duality.

Production is thus at the same time consumption, and consumption is at the same time production. Each is directly its own counterpart. But at the same time an intermediary movement goes on between the two. Production furthers consumption by creating material for the latter which otherwise would lack its object. But consumption in its turn furthers production, by providing for the products the individual for whom they are products. The product receives its last finishing touches in consumption. A railroad on which no one rides, which is, consequently not used up, not consumed, is but a potential railroad, and not a real one. Without production, no consumption; but, on the other hand, without consumption, no production; since production would then be without a purpose. Consumption produces production in two ways.

In the first place, in that the product first becomes a real product in consumption; e. g., a garment becomes a real garment only through the act of being worn; a dwelling which is not inhabited, is really no dwelling; consequently, a product as distinguished from a mere natural object, proves to be such, first *becomes* a product in consumption. Consumption gives the product the finishing touch by annihilating it, since a product is the [result] of production not only as the material embodiment of activity, but also as a mere object for the active subject.

In the second place, consumption produces production by creating the necessity for new production, i.e. by providing the ideal, inward, impelling cause which constitutes the prerequisite of production. Consumption

furnishes the impulse for production as well as its object, which plays in production the part of its guiding aim. It is clear that while production furnishes the material object of consumption, consumption provides the ideal object of production, as its image, its want, its impulse and its purpose. It furnishes the object of production in its subjective form. No wants, no production. But consumption reproduces the want.

In its turn, production:

First, furnishes consumption¹⁵⁸ with its material, its object. Consumption without an object is no consumption, hence production works in this direction by producing consumption.

Second. But it is not only the object that production provides for consumption. It gives consumption its definite outline, its character, its finish. Just as consumption gives the product its finishing touch as a product, production puts the finishing touch on consumption. For the object is not simply an object in general, but a definite object, which is consumed in a certain definite manner prescribed in its turn by production. Hunger is hunger; but the hunger that is satisfied with cooked meat eaten with fork and knife is a different kind of hunger from the one that devours raw meat with the aid of hands, nails, and teeth. Not only the object of consumption, but also the manner of consumption is produced by production; that is to say, consumption is created by production not only objectively, but also subjectively. Production thus creates the consumers.

Third. Production not only supplies the want with material, but supplies the material with a want. When consumption emerges from its first stage of natural crudeness and directness — and its continuation in that state would in itself be the result of a production still remaining in a state of natural crudeness — it is itself furthered by its object as a moving spring. The want of it which consumption experiences is created by its appreciation of the product. The object of art, as well as any other product, creates an artistic and beauty-enjoying public. Production thus produces not only an object for the individual, but also an individual for the object.

Production thus produces consumption: first, by furnishing the latter with material; second, by determining the manner of consumption; third, by creating in consumers a want for its products as objects of consumption. It thus produces the object, the manner, and the moving spring of consumption. In the same manner, consumption [creates] the *disposition* of

the producer by setting (?) him up as an aim and by stimulating wants. The identity of consumption and production thus appears to be a three fold one.

First, direct identity: production is consumption; consumption is production. Consumptive production. Productive consumption. Economists call both productive consumption, but make one distinction by calling the former reproduction, and the latter productive consumption. All inquiries into the former deal with productive and unproductive labor; those into the latter treat of productive and unproductive consumption.

Second. Each appears as the means of the other and as being brought about by the other, which is expressed as their mutual interdependence; a relation, by virtue of which they appear as mutually connected and indispensable, yet remaining outside of each other.

Production creates the material as the outward object of consumption; consumption creates the want as the inward object, the purpose of production. Without production, no consumption; without consumption, no production; this maxim figures (?) in political economy in many forms.
